[Plenty's Press Drill or Land-Presser.]

Where the soil is good, with a porous subsoil, the greatest care should be taken not to go too deep; but where the subsoil is compact and impervious to water, but not wet for want of outlet or draining, it is useful to stir the soil to a great depth, but without bringing it to the surface, which may be done by a plough without a mould-board following a common plough in the same furrow. This is an excellent mode of draining, and at the same time keeping a reservoir of moisture, which in dry weather ascends in vapours through the soil and refreshes the roots.

The mode in which the soil is prepared most perfectly for the reception of the seed is best shown by following the usual operations on fallows. After the harvest, the plough is set to work, and the stubble ploughed in. The winter's frost and snow mellow it, while the stubble and weeds rot

below. In spring, as soon as the weather permits, it is ploughed again, the first ridges being turned over as they were before: this completes the decomposition of the roots and weeds. It is then stirred with harrows, or other instruments, which tear up the roots which remained, and some of these, not being easily destroyed, are carefully gathered and burnt, or put in a heap to ferment and rot, a portion of quick lime being added. Another ploughing and stirring follows, at some interval, till the whole ground is mellow, pulverized, and free from weeds; manure is put on, if required, and immediately spread and ploughed in; the land is then prepared for the seed.

This has been the method universally followed by all industrious husbandmen from the oldest times. The Romans had names for each of the ploughings: the first was *fringere*

Fig. 5.

[Plenty's Scarifier.]

the next *vertere*, the third *refringere*, and the fourth *revertere*; more ploughings were often given, and in modern agriculture the direction of the third ploughing is sometimes changed across the old furrows, at a right, or acute angle, as Virgil recommends (*Georgica*, i. 98), by which the earth is still better divided and mixed.

Various instruments have been invented to stir the earth and mix it, without so often using the plough, and also to loosen and separate roots and weeds; of these the principal are, the cultivator or scarifier, which enters but a few inches into the ground, and moves a great surface by means of tines, or iron teeth of various constructions. The whole instrument is made of iron: *aa* is the frame; *b*, the beam; *c*, rods by which it is drawn, the horses being attached by a hook at the point *d*; *ee*, the handles; *fff*, different shaped shares and tines to be used according to the state of the soil; *ggg*, contrivances by which the teeth are fixed to the frame at any required distance from each other, and lengthened or shortened; *hhh*, three wheels to regulate the depth of the ground moved. By raising the beam and

fixing it higher or lower on the piece (*g*), by means of an iron pin passed through the different holes, the whole instrument is raised or depressed in the ground.

This instrument divides the soil, but does not turn it over; it is well calculated to destroy roots and weeds, and let in the air; but, evidently, is only adapted to tolerably loose and mellow soils, where there are no large stones.

An ingenious harrow or cultivator has been invented by Finlayson, which rakes the weeds out of the ground, and throws them on the surface without clogging the instrument; it is excellent in light soils.

When the soil turned up by the plough is in large hard lumps, a roller, sometimes with spikes in it, is drawn over the land to break the clods, or mallets are used to break them by hand; but this is seldom necessary except where very stiff soils have been ploughed when too wet, and the ridges have dried, and been ploughed again in dry weather. Deep wet clay soils should be carefully watched, to know when is the proper time to plough them; nothing pulverizes them like frost, and if they are kept from wet by

Fig. 6.

a, a, The iron frame. *b, b,* The teeth, shaped so as to throw the weeds over.
c, c, c, Three small wheels, of which the foremost is brought forward by depressing the lever *d*, and raising the teeth out of the ground.
d, Is a contrivance to keep the lever, *d*, in any required position, so as to regulate the depth to which the teeth, *b, b*, enter the ground.
f, Is the hook by which the instrument is drawn.

careful draining and numerous water furrows in autumn, they will be loose and friable in spring; they had better not be touched than worked when too wet. On light soils the plain roller is used to advantage to produce firmness, without which the plough cannot so well turn the ground over completely, but merely pushes it to the right and left.

The great expense of teams for the plough has led to expedients and inventions to lessen the labour, but, in general, a more imperfect cultivation has resulted from it. Columella mentions one Celsus, whom he blames, because, to 'save the expense of a stronger team, he only scratched the ground with small shares and toothed instruments (*exiguis rom-*

thorve well as long as the supply lasted: but in the end it was exhausted: and the warmest admirers and supporters of Tull's system, Du Hanel and De Chateaubieux, besides many others, found to their cost, in practice, that pulverizing alone will not restore fertility. The system of drilling and horse-hoeing, when united with judicious manuring, has, however, been found a great improvement in agriculture.

In describing the various processes in general use in the cultivation of the soil, we have taken the year when the land is fallowed, because it is then that it receives the most perfect culture, which enables it to produce several crops afterwards with a much smaller quantity of labour. By such fallowing and proper manuring, the soil is fully restored to its highest degree of fertility. In light soils, which are generally poorer, turnips or other green crops are sown, on which sheep are folded, who, by their manure, still more enrich the soil, and it is only when this manure is ploughed in, that the land may be considered as possessing the proper degree of fertility.

There are some soils which are so mixed with pebbles and stones, that the foregoing observations will scarcely be applicable, and the instruments must be adapted to their texture. Some of these soils, abounding with chalk, are tolerably fertile, and the stones, when they are not so large as to impede the operations, are rather beneficial than otherwise. Theophrastus mentions a field which had been deprived of its fertility by the removal of the stones, and others have learned the same from experience. Pebbles prevent too great evaporation, shelter the young plants in exposed situations, and reflect the light and heat of the sun. The only inconvenience found from them in good soils is that they occupy the room of better earth, and wear out the instruments used, which, in consequence, are made stronger and blunter. When there is a crop to be mown with the scythe, the stones must be removed from the surface, but not otherwise, at least in light soils.

When the land has been duly prepared, the seed is sown. This is done sometimes before the last ploughing, but then

Fig. 8.

[Dibbling.]

ribus et dentalibus); and a modern agriculturist of some note has revived the practice of Celsus. General Beatson, who had been in India, and had seen the simple instruments used there by the natives, has substituted for the plough and cultivators in common use, various light instruments, of which he has published an account. He recommends stirring the soil only a few inches deep, except occasionally; and, by means of burnt clay, which he uses in great abundance, he has produced a succession of good crops: but he has too high an opinion of the fertilizing qualities of burnt clay, which makes him undervalue animal and vegetable manure; and although he may improve the texture of his heavy soil by the burnt clay, which is insoluble and absorbent, he will soon find out, like the followers of Tull, that manures which contain soluble extract, or from which it can be formed, can alone maintain fertility.

The influence of the atmosphere on the soil, and the increased fertility produced by pulverizing and stirring heavy lands, has led to the notion adopted by Jethro Tull, that labour might entirely supersede the necessity of manure: hence the origin of the horse-hoeing husbandry, which at one time was so highly thought of as to be called, by way of distinction, the *new* husbandry. Fallows and manuring were both discarded as unnecessary; the seed was sown in rows with wide intervals, which were continually kept worked and stirred. At first the result was highly satisfactory; all the humus, by exposure to the air, was converted into soluble extract, and taken up by the plants, which

the manure should have been ploughed in before; for, except in planting potatoes, which are not a seed, but a bulb, the manure should always be deeper, and not in contact with the seed. When the seed is ploughed in, the furrow should not be above two or three inches deep, and eight or nine wide; and it is only in particular soils that this mode is to be recommended. The most common method is to sow the seed on the land after the last ploughing, and draw the harrows over to cover it: when the land has been well ploughed, and especially if the press-drill has followed the plough, the seed will mostly fall in the small furrows made by two adjoining ridges, and rise in regular rows. But by far the most perfect way is, to sow it at a regular depth, by means of a machine, and in rows at regular distances [see

DRILL], or to *dibble* it, which is an operation performed only in a few parts of England, especially in Suffolk, Essex, and Norfolk. A man makes small holes at the distance of four or six inches, and in rows nine to twelve inches asunder, with two rods about thirty inches long, one in each hand, having an oval ring for a handle at one end, and, at the other, an inverted cone three inches in the axis, and one and a half inch diameter at the base, which he pushes and turns with his hands in the ground to prevent the earth adhering, and makes the holes rapidly going backwards along the furrows; two or more children follow and drop three or four grains in each hole; a bush-harrow is drawn over the ground, and fills the holes with loose earth; when the corn comes up, it looks like a regular plantation.

Fig. 9.

[Bush-Harrow.]

The proper season for sowing each kind of grain, the choice of seed, and other particulars, will be given under the name of the different seeds usually sown. As a general rule, it may be observed, that the smaller the seed, the less it must be covered, and clover or grass seed are not usually harrowed in, but only pressed in with the roller.

Of the succession of crops or rotations.—It has been found by experience, that besides the general exhaustion of humus produced by vegetation, especially by those plants which bear oily or farinaceous seeds, each kind of crop has a specific effect on the soil, so that no care, or manure, can make the same ground produce equal crops, of the same kind of grain, for any length of time without the intervention of other crops. Whether this be owing to any peculiar nourishment necessary to each particular kind of plants, or because plants not indigenous degenerate in a foreign soil, the fact is certain with respect to most crops usually raised, and particularly red clover. This points out the advantage of varying the crops, according as they are found to succeed best after each other. In general, all kinds of grain succeed best after a crop which has been cut before the seed has ripened, or the stem is dried up. Those plants which have a naked stem with few leaves thrive best after leguminous plants, which have more succulent stems and more leaves, and which bear their seeds in pods, as peas, beans, tares or vetches; or after esculent roots, which strike deep into the ground, as carrots, parsnips, beet-roots, and turnips. From this circumstance, confirmed by universal experience, the different systems of rotation have had their origin, taking the nature of the soil into consideration.

The simplest rotation, and one which can only be adapted to the richest strong alluvial soils, is that of wheat and beans, alternately, and without any intermission. It is in use in some parts of Kent and Essex, and in a few places in Germany. The land is well prepared and manured for the beans, which are set or drilled in rows, so as to admit of horse-hoeing between, as in Tull's method, till the beans get to a considerable height; besides this, careful hand-hoeing and weeding are practised, by which the land is cleaned and stirred as in a regular fallow. The beans being cut, the ground is ploughed once, and the wheat sown. It is the practice in some places to scarify the land immediately after harvest, to cut up the stubble. It is done in Kent with a plough without a mould-board, and with a very broad share, hence called *broad-sharing*, but most usually by the scarifier mentioned before: the stubble and weeds, if any, are raked up and burned: this is an excellent practice. Another equally simple rotation, on very poor light land, is that of turnips and barley alternately, which is mentioned by Arthur Young as being in use in the county of Durham, with the simple variation of clover occasionally. The turnips are always fed off by sheep folded on them. Where winter food for the sheep is scarce, this rotation may answer, but otherwise cannot be very profitable.

The oldest rotation known, and which was almost universal in Europe, from the time of the Romans, wherever any regular system of agriculture prevailed, is the triennial rotation of fallow, winter corn, and summer, or lent corn; that is, wheat or rye sown in autumn, and barley or oats sown in spring. This was called the three-field system; and on every farm, the arable land was divided into three parts, one of which was in fallow, one in winter corn, and one in summer corn. When properties were much intermixed and subdivided, the whole of a considerable tract was divided into three fields, and it was almost impossible for any individual to deviate from the established course; especially as a right frequently existed of pasturing all the sheep of the parish or district on the fallow field in summer, and on all the others after harvest. In England, this impediment was removed by the legislature passing acts of inclosure; but it is still felt in many parts of the Continent. This rotation had its advantages, or it could never have been so long in use. Where a sufficient quantity of manure could be collected by means of cattle fed on pastures and commons in summer, and in the strawyard in winter, to give a regular dressing to the fallows every third year, good crops were produced, and the fertility kept up. The labour was very equally divided throughout the year; and such was the regularity of every operation, that a large quantity of land might be cultivated by a proprietor at a considerable distance, with only occasional inspection, without an overseer or bailiff, provided he had honest servants. But, when pastures came to be broken up, and converted into arable land, and cattle consequently diminished, the land could not be manured on every fallow; the crops suffered; less straw being grown, the quantity of manure was diminished, and the land became gradually less and less productive, till, from necessity, a portion was left uncultivated, and returned to natural and inferior pasture; this gave the idea of laying the land down regularly to grass by sowing seeds, and gradually introduced the alternate and convertible system of which we will take notice hereafter.

The apparent loss of a third part of the land by the fallows introduced various crops, which were supposed not to exhaust the soil, but rather to enrich it: of this kind, one of the first was clover, introduced by the Flemish; and afterwards turnips, which have been found of such importance in light soils and moist climates. By substituting turnips for an entire fallow, or, more properly, sowing them early on the regular fallow, and interposing the clover between the summer and winter corn, the highly-improved Norfolk rotation has been obtained, viz. 1. Turnips, well manured. 2. Barley. 3. Clover. 4. Wheat, by which a sufficiency of food for sheep and cattle is obtained, without natural pastures, and the land, manured every fourth year at least, is kept in a regular state of progressive improvement. The advantages of this rotation have made it a condition in many leases of light land, under heavy penalties in case of deviation. The first and principal inconvenience

found in it was the failure of the clover in most soils, if sown every fourth year: this obliged the farmer to have recourse to other less profitable crops, such as ray-grass, peas, or tares, which, in light lands, are not equal to broad clover as a preparation for wheat. Where the soil is firm and rich, and at the same time mellow, a rotation may be introduced, compounded of the first and last mentioned; that is, beans, wheat, turnips, barley, clover, wheat, making rotation of six years. This can only be introduced with advantage where there are considerable pastures, and much cattle is kept to supply manure for the land *twice* in the rotation, viz., for the turnips and for the beans, and where the drill husbandry admits of hoeing and weeding thoroughly; but with these advantages, no course can be more profitable, as is found in those parts of Kent and Essex where marsh pastures are attached to the farms. If the soil is too heavy and wet for turnips, and they cannot well be drawn off nor fed on the land, without injuring it, a clean fallow is substituted for the turnips, the other crops remaining the same: or cabbages are planted for the cattle, but seldom to a great extent. A long fallow from after harvest until the second spring, including two winters, prepares the land admirably for barley, so that it can be sown without any manure, which is reserved as a top-dressing for the young clover after the barley. This is a very excellent method. The clover or ray-grass will be more abundant, and the wheat after it will not be in danger of running to straw, or lodging, that is, falling down for want of a sufficient hold of the ground by the roots.

These rotations are sufficient to give some idea of the principles on which they have been adopted. In Scotland they adhere less strictly to particular rotations, nor are the tenants in general so much tied down as in England: seasons and circumstances cause deviations, which are sometimes judicious and often unavoidable. It is best, however, to follow some regular course, and in the end it will be found most profitable. A very common rotation in Scotland is fallow, wheat, clover, or grass, fed one, two, or three years, then oats, peas, or beans, and wheat again, if the land is clean and in good heart: for there is no rule better established, than that of never allowing the soil to be exhausted beyond a certain point, where manure and tillage can readily recruit it. The greedy cultivator is sure to pay dearly in the end for every crop forced from the land unreasonably.

Without preventing the tenant from using his discretion as to the mode in which his farm is best cultivated, a proprietor may be sufficiently protected against wanton deterioration of the land, by insisting on a green crop or fallow intervening between every two crops of grain, and consuming all the fodder and roots on the farm. For this subject we must refer to the article FARM. A proprietor with skill and experience, cultivating his own land, need only consider the state and quality of his fields, and what will most likely grow well in them; what is most in request, both for his own use and in the market; what will keep his men and cattle in most regular work, without confusion or hurry. If he allows his land to be impoverished for want of manure, or to run wild with weeds, for want of hoeing or fallowing, he has not the experience and judgment which are necessary for his pursuits.

The Flemish husbandry proceeds much on this principle. The greatest attention is paid to manuring and weeding. Much more manual labour is bestowed than with us, and the crops seem more certain, varied, and abundant. That it is not unprofitable we may conclude from the wealth of the peasants, the comfort of the labourers, and the sleek appearance of the cattle. From the very interesting account of Flemish agriculture in the work of Mr. Van Aelbroek of Ghent, written in Flemish, translated into French, and published at Paris in 1830, we learn with what care the soil is cultivated in Flanders. After ploughing into lands as we do, every intervening furrow is deepened and cleared with the spade, the earth being thrown over the bed sown. Liquid manure (which is sadly thrown away in this country), chiefly the urine of animals and drainings of dung-hills, is carefully collected, and is carried on and distributed over the poor light soils, by means of water-carts, before sowing, and again when the crop is come up. By this means such lands are made to yield crops of rape seed, clover, lucern, flax and corn, equal in luxuriance to those on the richest soils. Fallows are rendered unnecessary by the careful destruction of weeds. In short, it is a garden

culture on an extended scale. All the land is in tillage, except where rivers occasionally overflow, and render the meadows rich and profitable. The cattle are mostly kept in stables, and fed with green food cut and brought to them; by which means one acre of clover, lucern, or other artificial grass, will maintain five times as many beasts, or more, as an acre of the best pasture: but the great object is to increase manure, especially in a liquid state, which is carefully preserved in reservoirs, without loss or waste, till wanted for the land. This system is also followed in Switzerland, which, considering its soil and climate, is one of the best cultivated countries in Europe.

We observed before, that the want of a sufficient supply of manure on the old three-field system led to the laying down arable land to pasture for a time and then breaking it up again. This was first practised in a regular rotation in Holstein and Mecklenburg, and raised these countries rapidly amongst agricultural nations.

In Holstein, on moderately good soil, they adopt the following course:—1. Oats, on newly broken up grass land. 2. A fallow to destroy grasses and weeds, and accelerate the decomposition of their roots. 3. Wheat with or without manure, according to the state of the land. 4. Beans, barley, or oats. 5. Wheat, manured, unless it has been done for the beans the year before. 6. Grass seeds pastured for three years or more, when the rotation begins again.

A Mecklenburg rotation, not unlike the Scotch, consists of,—1. Beans well manured, or potatoes. 2. Wheat or oats. 3. Barley or oats, unless sown the year before. 5. Peas or tares, manured. 6. Wheat. 7. White clover and grass seeds, which were sown among the wheat the year before, and are kept in pasture the 8th and 9th. There is no fallow, and in a moist climate it will be difficult to keep the land clean. It might, however, easily be introduced, as in the Holstein rotation.

Another rotation is,—1. Oats. 2. Beans well manured. 3. Wheat. 4. Tares manured. 5. Barley. 6. Clover and grass seeds mown for hay and green fodder; 7 and 8. ditto, fed. All these are excellent for a moderately good soil well managed. If the soil is very rich, the following is the most profitable of any:—1. Rape seed well manured. 2. Wheat. 3. Beans or potatoes manured and hoed. 4. Barley. 5. Clover. 6. Wheat. 7. Oats with white clover and grass seeds pastured two or three years. The principal object in this convertible system is to lay the land down in good heart, and as clear of weeds as possible: the grass will then be abundant, and continue good for several years. Liquid manure, carried upon it in spring, will so enrich it as to admit of making the crop into hay, or cutting it green for the cattle in the stables. In light soils, the tread of sheep and cattle is of great use: in heavy, wet soils, they would do harm. No wet land will bear this rotation.

We have now given a brief outline of the manner in which arable land may be cultivated and improved. If we should be asked, whether so much attention and labour upon land of a proper quality will be repaid by the value of the produce, after deducting the portion due to the landlord, or to the state? we shall answer, without any hesitation, in the affirmative, provided the cultivator is possessed of knowledge, judgment, and experience, and devotes all his time to the superintendence of his farm. The calculations on which this opinion is founded cannot be introduced here; some idea of them will be given in the article FARM. Agriculture is so healthy, so agreeable, and so moral an occupation, that it can never be extremely profitable: the competition for land will always prevent this. The butcher and cattle-dealer will always, if successful, make far greater profits than the farmer; and a decent livelihood, with a moderate interest on the capital laid out, is the most that a farmer can expect, even with the greatest assiduity. If he neglects his business, and leaves it to others less interested in the result, he must be a loser. Gentlemen who cultivate for pleasure, and employ bailiffs, are fortunate if they get a moderate rent after paying expenses. For careless farmers, the simplest system alone can prevent great loss; and grass land may be profitable in the hands of a proprietor, who would probably be ruined if his land were all arable and in his own hands.

Our limits will not permit us to enter into the important subject of improvements,—nor into the question of great or small farms, as most beneficial to the community:—these and various other branches of the subject will be found under proper heads; such as BARREN LAND, FARM,

DRAINING, IRRIGATION, MANURE, LABOUR, GRASS-LAND, CATTLE, &c.; and for the peculiar cultivation of the various products of agriculture, see **WHEAT, BEANS, BARLEY, CLOVER, OATS, PEAS, &c. &c.**

We shall only add the names of a few authors whose works may be studied and consulted with advantage, by all those who desire to have a competent knowledge of agriculture, either as a branch of general knowledge, or for the purpose of its practical application.

Of the Greek writers on husbandry we have hardly anything left, except in the collection of Cassianus Bassus, entitled *Geoponika* (earth-labouring). This collection, in twenty books, was made at the command of the Emperor Constantinus Porphyrogenetus, and was chiefly compiled from Greek writers, whose names are given. We are not aware that there is any foreign translation of the *Geoponika*, except the old German version of *Herren*, first printed at Strasburg in 1515, 4to. The Latin writers, Cato, Varro, Virgil in his *Georgics*, Columella, and Palladius, are well known: their works, especially the last two, will be found to contain many valuable remarks; and abridged translations of them, or extracts, would be very useful even to modern agriculturists. Of the above, the following have been translated by the Rev. T. Owen, rector of Upton Sandamen, Wilts:—1. *The Three Books of M. Terentius Varro, concerning Agriculture*. London, 1800. 8vo. 5s. 6d. 2. *The Fourteen Books of Palladius on Agriculture*. London, 1807. 8vo. 8s. The same author has also published *Agricultural Pursuits, translated from the Greek*. London, 1805, 2 vols. 8vo. 15s. Of the earlier English writers, we shall only mention Fitzherbert, Blythe, Haulib, and Weston. Afterwards came Evelyn, Tull, Hale, and the great oracle of modern husbandry, Arthur Young; with Sir John Sinclair, to whom, as President of the Board of Agriculture, much useful information was communicated, which he industriously compiled. (Sinclair's *Journal of Systems of Husbandry*, &c., 2 vols. 8vo.) The Surveys and Reports on the agriculture of the different counties, prepared for the Board of Agriculture, are replete with useful information as to what is the actual practice; and among a multitude of agricultural publications, journals, and proceedings of societies, we may notice London's *Encyclopædia of Agriculture*, as a useful book of reference.

The French are rich in elementary works, among which the *Théâtre d'Agriculture*, par Olivier de Serres, is a standard work. It was written at the express desire of Henry IV. and his minister Sully, and published in 1600; the last edition, in four volumes quarto, Paris, 1804, with numerous additions, and the *Cours Complet d'Agriculture*, by various members of the Institute of France, published in 1820, contain every thing that was then known of the science of agriculture. A little work of much merit may be mentioned, called *Le Manuel Pratique du Laboureur*, by Chambouillé Dupetitout, Paris, 1826, two volumes, duodecimo; and also *Le Calendrier du bon Cultivateur*, par C. I. A. Mathieu de Dombasle (on the plan of Arthur Young's *Farmer's Calendar*), Paris, 1833, duodecimo, is a very useful work. Innumerable works on particular branches, and the annals and memoirs of various agricultural societies, appear daily. Among the German authors we shall only mention Thaer, whose works we have quoted above, and which form a most complete body of theoretical and practical agriculture: his experiments made on a large scale at the national farm of Mögeln near Frankfort on the Oder, and repeated for many years, can be fully depended upon. We have also quoted the work of Mr. Van Aelbroek, *De l'Agriculture Pratique de la Flandre*, Paris, 1830, octavo, as a useful and interesting work.

ARABS' GULF, a bay on the north coast of Africa, lying between Alexandria and some point west of Alexandria, which is not well defined. Ras-el-Kanys, 115 miles west of Alexandria, is the first very salient point as we advance westward.

The bay called *Plinthinotes* (Herod. ii. 6) corresponded to, or formed a part of, the Arabs' Gulf.

ARACAN, or RAKHAIN, is a country of Asia, lying on the eastern shore of the bay of Bengal, and forming the westernmost part of the Peninsula beyond the Ganges. It extends from 20° 46' to about 18° N. lat., and lies between 92° and 95° E. long. Its extreme length from N.N.W. to S.S.E. may amount to upwards of 230 miles, and its average breadth to about 50 miles. Its surface is estimated to contain 11,500 English square miles, so that it exceeds the principality of Wales by more than 3000 miles.

It is bounded on the east by a range of mountains, which separates it from the Burmese empire, from which it is also divided on the south by a small mountain-river. On the west it extends to the bay of Bengal, and on the north to Chittagong, a province of Bengal, and to the mountainous and woody tract which extends between Chittagong and Muneepoor. It is separated from Chittagong by the river Naf, or Nauf.

This country, which in 1826 was acquired by the East India Company from the Burmese, contains three districts, Proper Aracan, or Akyah, Sandoway, and Ramree.

Aracan Proper consists of a valley stretching nearly parallel to the shore, between a range of mountains and a ridge of hills. The mountain-range which divides it on the east from Ava is called Yeomadong by the Aracanese, and Anapetomiu by the Burmese: it extends from Cape Negrais (16° 2' N. lat.) to the Tipperah Hills lying east of Dacca in Bengal, which, together with the hills bounding Sibit on the south, may be considered as the northern extremity of this range. Its mean elevation is about 3000 feet above the level of the sea, though, in some parts, it attains the height of 5000 feet. On the east, or towards the Irrawaddy in Ava, it declines by a succession of ranges; but towards Aracan its descent is steep and abrupt. Several passes conduct over these mountains to Ava, but only two can be passed with ease.

The heights which extend along the Bay of Bengal at no great distance from the shore and separate the valley from the sea, do not, probably, rise to more than 700 feet. They generally assume a conical shape, and do not form a continual range; some are insulated, others connected by narrow ridges, but all are scattered in an irregular manner and separated by many ravines, valleys, and confined level spots, each occupied by a stream, a lake, or a marsh. On the shore they are intersected by many rivers, creeks, and inlets of the sea, so as to form a series of peninsulas, isthmuses, and islands, by which the land communication is completely interrupted. The coast is fringed by numerous islands, moderately high and thinly inhabited.

The valley, which lies between the two ranges, varies in breadth: in some parts the hills advance from the shore so far to the east as to narrow it to 10 miles, and even less, whilst in other places they leave a space of 40 miles between them and the mountains. This valley is so little above the level of the sea, that the tide, which in the straits, rivers, and harbours rises 14 feet at full and change, inundates the flat borders of the rivers to a considerable extent, and its ebb converts them into a noisome swamp. With the exception of this swampy ground, the soil consists of rocks, crumbling on the surface, and covered by a thin layer of loose black soil. Where this layer has not been washed away by the rains, the country is covered with grass and jungle-shrubs. In July, when the periodical rains become very abundant, the whole valley is inundated, and resembles a channel of the sea, in which the few towns and villages appear like islands scattered in a large lake.

The small rivers which intersect this valley are so numerous as to form a complete labyrinth, one winding creek leading to another, so as to form an inland water-communication between the villages and towns for the greatest part of the year. Most of the small streams run to the northward, where the valley is lowest and broadest, and where the hills on the shore terminate, or rather leave a wide opening. Here they fall into a kind of bay full of islands of considerable extent, which seem to be low and partly uninhabited. This bay receives also the principal river of the country, the Keladyne or Huring, which rises in the mountainous tract between Chittagong and Muneepoor, and may have a course of about 250 miles. The rivers, which, farther to the south, intersect the hills, as the Talak Keon and the Yanaway Keon, are small, but commonly navigable for boats eight or nine months in the year.

Many causes concur to render this ill-ventilated valley extremely unhealthy—the heat, the inundations, and the general moisture. Even in the dry season, in November, December, and January, occasional and sometimes heavy showers occur. In February, March, and April, they become more frequent, and still more in May and June, when the periodical rains set in and last till November. The rain in July amounts to nearly 60 inches, and in August to 43½. From the beginning of June to the end of September, it amounted, in 1824, to 196 inches, and then nearly the whole surface of the valley was under water. Heavy dews and

thick fogs prevail during the nights even in the dry season, and great heat in the day-time. The thermometer rises in July to 89°, and in August to 94°, and is never under 77° in these months.

The fertility of this country is very great, and its soil fit for the culture of nearly all tropical productions; but in the actual state of agriculture rice only is cultivated to any great extent. Indigo, cotton, and tobacco, as well as hemp, are also raised, and their culture has lately increased, but not so as to produce any for exportation. Sesamum and mustard-seed are cultivated, on account of the oil which is extracted from them and largely used. The sugar-cane grows very luxuriantly, and might be cultivated to a great extent. Black pepper of a good quality grows wild near Aeng, but it is nowhere cultivated. Fruit is plentiful and of excellent quality. The pine-apples and plantains are, perhaps, the finest flavoured in the world, and are produced in the greatest abundance. Mangoes, jack-fruit (*Artocarpus integrifolia*, Linn.), sweet limes, and cocoa-nuts are also plentiful, but oranges are scarce. Of the vegetables raised, the principal are onions, garlic, and turmeric; but bhanganas, red pepper, cucumbers, water-melons, papeyas, and raktalus are also abundant. No forest-trees grow in the valley, nor, as it seems, on the hills along the shore; but extensive forests of teak abound in the mountains at the sources and along the upper course of the Huritung; their great distance from the coast, however, and the want of roads prevent the people from bringing them to the more inhabited part of the country. This timber, therefore, is imported from Rangoon in Ava, or from Bengal. Other forest-trees abound in the same mountains and on the borders of Chittagong.

The zoology of this country is very little known. We learn only that the jungles abound in tigers and wild elephants, and that the latter are much more dangerous to the cultivated fields, than the former to the cultivators themselves. Of domestic animals only poultry and buffaloes are mentioned. The latter are most esteemed from their being docile and useful in cultivating and treading out rice. Silk is raised, but not enough for the consumption of the inhabitants. Bees abound in the country near the mountains. Fish is so plentiful that it not only supplies the principal food of the inhabitants, but also, when dried, an article for exportation.

Still less is known of its mineral riches. Silver, it is said, has been ascertained not to exist in the mountains, but there is iron-ore in abundance, and this is all we know. Salt is made in a great many places, and is an important article of exportation.

Aracon, 20° 43' N. lat. and 93° 31' E. long. the ancient capital, is built on a plain entirely surrounded by hills, and intersected by several streamlets, which occasionally join each other or fall immediately into the river Huritung. One of these streamlets runs through the town and divides it into two parts connected by strong but clumsy wooden bridges. This stream ebbs and flows with the tide, and at high-water boats are able to navigate it. During the periodical rains the greater part of the town is inundated, and on this account here, as well as in the villages on the plain, the houses are raised upon piles or strong posts of timber, little more than four feet above the ground, that the water may have a free course under them. These houses, or rather huts, are miserable structures, only one story high, and thatched with straw or mats. They are ranged with considerable regularity in streets, the chief of which skirts the stream on each side. This town is about four miles in circumference, and of a quadrangular form. Before its occupation by the British troops (in 1824) it is said to have contained 13,000 houses and 95,000 inhabitants. Its actual population is not known, but it is certain that it has much declined since it has ceased to be the seat of the government of the country, which by the Company has been transferred to other places; and it is probable that at present it does not contain one-fifth of the number of inhabitants formerly assigned to it.

Within the town is a fort, a very ancient building; the date of its erection is unknown. It is surrounded by three quadrangular concentric walls, each about 20 feet high and of considerable thickness. There are also four pagodas, built in the centre of the town on a hill about 100 feet high, and inclosed by a quadrangular wall. They contain numerous images of Gaudama, from one inch to twenty feet in height; but what renders them especially remarkable are some ancient sculptures found in and about them, among which

some sphinxes are observed, which confirm the striking analogy between the hieroglyphics of Ava and Egypt observed by Symes. Except the fort, the pagodas are the only stone-buildings in Aracon.

The heights which surround the town are covered with pagodas, the gilt spires of which, shooting up like pyramids from every pinnacle around and glittering in the sun, contribute greatly to the singular and picturesque appearance of this place. Upwards of sixty of these temples, of various forms, may be counted at once.

Akyah, the capital of the district which comprehends Aracon Proper, has a good harbour, but is little frequented, on account of its unhealthfulness. Two other places are worth notice, *Talak*, on the Talak Keon, and *Jeng*, on the Yanaway Keon. Both are places of some commerce, and owe this advantage chiefly to their being situated where the roads traversing the mountains terminate, and on the banks of rivers navigable for boats from June to April. The country along these rivers is improving in cultivation.

The district *Sandoway* comprehends chiefly the mainland between 19° and 18° N. lat., and is a mountainous country, intersected by valleys running east and west. Not being exposed to inundations, nor subject to fogs, it is tolerably healthy, and enjoys a cool sea-breeze, with temperate nights, nearly through the year. Agriculture is increasing, on account of the neighbourhood of Kyauk Phyo. The capital, Sandoway (18° 28' N. lat., and 94° 27' E. long.), lies on a navigable river, and is a thriving town.

The district *Ramree* contains the two large islands of *Ramree* and *Chudaba*, and several smaller ones. The island of Ramree is of considerable extent, and divided from the main land by a narrow but navigable channel. It consists of hills, intermingled with much level ground, and has generally a very fertile soil. Besides the common productions of the country, excellent oranges are raised; horticulture is improving, and the cinnamon tree, which lately has been introduced, promises very well. On the southern extremity of the island is a ridge of hills, among which are several volcanoes, reported to discharge flames occasionally and a quantity of iron pyrites, but in their tranquil state only a greasy mud bubbles up, mixed with a little petroleum.

Kyauk Phyo (meaning the white stones, because small white pebbles are washed on the beach during the S.W. monsoon) is at present the capital of Aracon, and begins to be a place of some trade. It is situated at the northern extremity of the island of Ramree, on a beautiful plain, with much high land in its vicinity, which is covered with forest trees, yielding timber of superior quality for masts and yards, and perhaps for other naval purposes. The harbour is spacious and good, free from fogs, with abundance of water and fire-wood. Lately a few cargoes of rice and dried fish have been shipped from this place to the Mauritius.

At the south end of Ramree is a safe harbour, called *Ramree*, or *Anherst Harbour*.

The island of *Chudaba* is divided from Ramree and the main land by a channel some miles broad, and navigable, but no safe harbour is found on it. From north-west to south-east the island extends about twenty-one miles, by about fifteen miles in breadth. It is of moderate height, with several hummocks on it; its soil is excellent, and well watered by hill-streams, on the banks of which rice, tobacco, cotton, red pepper, hemp, and sugar-cane, are cultivated. But the larger part of the island is still covered with jungle. In 1827 it contained about 2300 houses, and 12,000 inhabitants. Here also are several volcanoes, mostly of the description called mud volcanoes, strongly impregnated with sulphur. They are worshipped by the inhabitants, who think them occasioned by the great naga or serpent which supports the world, and takes this method of giving vent to its agony.

The actual population of Aracon is stated to amount to little more than 200,000 inhabitants, but it seems somewhat under-rated, if it be true that 400 square miles of the country are under cultivation. The aborigines, who to all appearance form almost exclusively the population, are called *Muses* by the inhabitants of Bengal, but their national name is *Yakain*, or *Ma-ran-ma*. They are short, squat, robust, and fleshy, and differ in features greatly from Europeans. Their face is somewhat of the shape of a lozenge, the forehead and chin being sharpened, but the face at the cheek-bones very broad. The eyebrows project very little, and the eyes are very narrow, and placed rather obliquely in the head, the external angles being the highest. Their nose is very small, but has not, like that of the negro, the appear-

ance of having been flattened; the hair is harsh, lank, and black. Though living in a very hot climate, they have not the deep hue of the negro or Hindu. From this description, it is evident that they belong to the same race as the Chinese.

Their language is one of those which may properly be called monosyllabic, from the mass of their radical words being monosyllables, like the spoken dialects of China. They have borrowed a considerable number of terms from the Peli, which exists among them as the language of learning and science; but in adopting these polysyllables, they suit them to their peculiar enunciation by pronouncing every syllable as a distinct word. Though monosyllabic, their language is quite distinct from that of China, but exhibits a very great affinity to that spoken by the Burmese, who consider the Rakhain, or language of Aracan, as the most ancient and original dialect of the Burma language. According to Dr. Leyden, their literature is not scanty, for he enumerated twenty-nine different Rakhain compositions, of which, however, the greatest number are translations from the Sanscrit.

Though far from being civilized, according to our notions, they do not neglect education. A person rarely is met with who cannot read and write. Their records are kept on palha-leaves, beautifully lacquered in japan and red, generally on a gilt ground with dark letters. Their common accounts are written with a chalk pencil, resembling tale, on folds of paper made of the bark of a tree, and then covered with lamp-black, or on a smooth board smeared with the same substance. They have thirty-six letters in their alphabet, written from left to right, and in writing they hold the pen or pencil as we do, the lines being as fine and the characters as beautifully formed as if made with a pen and ink.

Their religion is that of Buddha: their priests seem entirely occupied in the education of the children. In every village are two or three, and their schools are open to all. Their only remuneration seems to be a sufficient quantity of food, and the erection of a house, which answers as a residence, temple, and school-room, with generally a small pagoda annexed to it, having a number of poles and pendants hanging from it, much after the manner represented on common china-ware. Indeed all their habits, as well as their persons and dress, resemble those of the western parts of China.

The Mugs are distinguished for their simple honesty and inoffensive disposition: they are perfectly free from the servile hypocrisy of the Hindoos, and equally unlike them as to probity, their word being generally trustworthy. In dealing, they ask the price which they think the article to be worth, and no more. They are averse to lying, so that when detected after the commission of any felonious act, however serious, they almost invariably, and with the utmost frankness, confess the crime, and detail with the greatest minuteness the manner in which it was committed. Their religion enjoins them not to take away animal life; but they do not seem very bigoted to this part of their creed, as they have no objection to part with their oxen and buffaloes, and to eat every part when dead, even to the offal usually given to dogs.

The women dress much after the Chinese manner; but they are by no means secluded, having a full share in the common intercourse and transactions of life. As they are not precluded from instruction, they are often shrewd and intelligent. A peculiar usage of this nation is, that when a man wants to raise money, he pawns his wife for a certain period, or until the debt is liquidated.

The mountains which separate Aracan from the Burmese empire are inhabited by a nation called by the Burmese *Kyau*, but who term themselves *Koloou*, and whose language is peculiar, having little or no affinity to either Rakhain or Burma. They have preserved their independence, not by resisting the invasion of their more powerful neighbours, but by withdrawing themselves to other places in the interior of the range. They are a harmless and industrious race, cultivating rice in the valleys, fishing in the rivers, gathering the honey and wax of the wild bees, and fabricating a sort of cloth, called *pupung*, of the cotton of the wild cotton-tree, which abounds in the mountains. Dried fish, bees' wax, honey, and *pupung* are exchanged by them in Ava, or Aracan, for a few manufactured articles. They seem not to adhere to the doctrines either of Brahma or Buddha.

A considerable traffic was formerly carried on between Aracan and Ava, the first exporting Hindostanee and Eu-

ropean goods, such as velvet, broad-cloth, piece-goods, muslins, betel-nut, salt, &c., and receiving in return ivory, silver, copper, sugar, tobacco, oil, and lacquered ware. It seems that this commerce has been considerably reduced since the occupation of the British, but no later statement informs us to what extent it is still carried on by the passes over the mountains. The commerce by sea is not important. A few boats coasting along the shore to Chittagong, and from thence through the Sunderbunds to Calcutta, are sufficient for all their trade to the northward. About the same number goes to Rangoon in Ava, whence they bring back silk and other articles manufactured in that country, which are much superior to those made by themselves, and more valued than any yet brought by Europeans.

This country is dependent on the presidency of Calcutta. Each of the three districts, Akyab (Aracan), Sandoway, and Ramree, is governed by a civil judge or superintendent, under the immediate inspection of a commissioner, who usually resides at Chittagong. The revenue derived from it does not exceed three lacs of rupees and a half (360,000*l.*), produced principally by the rental of the land, the Company, as sovereign, considering themselves the proprietors of the soil. This revenue barely suffices to defray the expenses, though the garrison only consists of eight companies of sepoys, two at Akyab, two at Sandoway, and four with the head quarters of the regiment at Kyauk Phyon. (See Symes's *Embassy to the Court of Ava*; Francis Buchanan, Dr. Leyden, Paton, and Traut, in the *Asiatic Researches*; *Journal of the Lond. Geogr. Society*, vol. i.; *Asiatic Journ.*)

ARACHIS, in Botany, the generic name of a kind of pulse, called the Earth-nut, which is much cultivated in the warmer parts of the world: it belongs to the pea tribe, to which and the bean it is botanically related. The circumstance by which the arachis hypogaea is particularly remarkable is the manner in which its fruit is produced: instead of hanging down from among the leaves in the manner of other plants, this conceals itself in the earth, in which it is deeply buried at the period when it becomes ripe, a phenomenon which happens thus: The young fruit, instead of being placed at the bottom of the calyx, as in other kinds of pulse, is found at the bottom and in the inside of a long slender tube, which looks like a flower-stalk. When the flower has withered, and the young fruit is fertilized, nothing but the bottom of this tube with its contents remains. At this period, a small point projects from the summit of the young fruit, and gradually elongates, curving downward, towards the earth. At the same time the stalk of the fruit lengthens, until the small point strikes the earth, into which the now half-grown fruit is speedily forced, and where it finally ripens in what would seem a most unnatural position. When mature, it is a pale yellow, wrinkled, oblong pod, often contracted in the middle, and containing two or three seeds the size of a hazel nut. These are considered a valuable article of food in Africa, and the tropical parts of Asia and America. In flavour the nuts are as sweet as an almond, and they yield, when pressed, an oil in no respect inferior to that of olives.

The plant will only grow in a light sandy soil, in which its pods can readily be buried, and it requires a climate as hot at least as that of the south of France. Its stems grow from one to two feet high: its leaves are composed of four broad and blunt leaflets; and its flowers are small and of a pale yellow colour.

ARACHNIDA, a class of animals including spiders, mites, and scorpions, all ranked by Linnaeus under Insects, but which are very properly separated from them, on account of external form, structure, and habits. The separation was first made, we believe, by Fabricius, who, looking chiefly at the structure of the mouth, characterized the greater number of the animals now ranked under arachnida, by the jaws (*maxilla*) being horny and furnished with a claw (*Unogala*). M. Lamarck afterwards made the arachnida a distinct class; but we owe to M. Latreille and Dr. Leach the establishment of characters more precise and extending to a greater number of genera. Much has been done in perfecting the knowledge of their structure, manners, and numerous species by Clerck, De Geer, Walekenaer, Treviranus, Leon Dufour, Herold, Straus-Dürckheim, Blackwall, and others. We shall condense into as short a compass as we can the most important points investigated by these naturalists.

The arachnida (*Acera*, Virey) differ from insects in having no antennæ; in the eyes being in most species eight,

and, even when only two in number, never being placed laterally on the head; in the legs being usually eight, though in some species six, and in others ten; and in their respiratory apparatus consisting of radiated *tracheæ*, communicating with a sort of gills inclosed in pouches in the lower part of the abdomen.

The skin or crust of arachnida is in general more leathery than horny; but whether it be soft, as in most species, or hard, as in a few, it performs a similar office to the bones of larger animals in giving support to the soft parts and attachment to muscles, the legs being jointed upon, and radiating from, a common breast-plate (*sternum*) externally; while, according to Straus-Dürckheim, there is also an internal breast-plate of a gristly texture (*an sternum cartilagineum interieur*) in form of a horseshoe, the two ends of which are directed forwards.

The greater number of the arachnida are carnivorous, and are furnished with appropriate organs for their predatory life. Some parasitic species, such as the minute parasite mites (*Lepti*, De Geer), which we have observed infesting numerous species of insects, from the largest butterflies to the smallest gnats, are furnished with a sucker, in some respects constructed like that of the gadfly (*Tabanus*). In other species, there may be distinguished a pair of upper jaws (*mandibula*), a pair of under jaws (*maxilla*), carrying jointed feelers (*palpi*), and between them a sort of tongue formed by a projection from the breast. At the back part of the mouth is placed a piece of a horny texture, which Savigny, Latreille, and Audouin term the *pharynx*, forming the entrance into the gullet. The gullet, together with a bulging on the fore part of it, termed the stomach, as well as the intestines, run in a straight line from the pharynx to the vent. Near the upper portion of the gullet are found salivary vessels, whose exterior aperture is in the first joint of the upper jaws. The saliva secreted by these vessels appears to be poisonous. Lower down are the biliary vessels, which resemble those of insects.

In the greater number of arachnida, there is a complete and very distinct circulatory system. The heart, which differs materially from the dorsal vessel, by some termed the heart in insects, occupies the abdomen, and its pulsations may be distinguished externally. It is a thick longitudinal vessel, giving origin to a certain number of arteries, and receiving veins by which the blood returns from the respiratory organs in other parts of the body.

The respiratory organs have two striking peculiarities, upon which M. Latreille founded his two great divisions of arachnida.

The division furnished with air-pipes, similar to those of insects, comprises harvest or shepherd spiders (*Phalangia*), mites, and several other genera. 'The presence of air-pipes (*tracheæ*),' says M. Latreille, 'excludes all complete circulation, that is, the distribution of blood to different parts, and its return from the respiratory organs to the heart.'

The other division of the class comprises the numerous species of spiders, and the scorpions which M. Straus-Dürckheim and Leon Dufour place first. Their respiratory apparatus consists of small cavities formed by the union of a great number of triangular white laminae of extreme thinness. The number of these is usually two, but in some species there are four, and in others eight. The external apertures of these, termed spiracles, and, as M. Latreille well remarks, objectionably *stigmata*, are transverse chinks, corresponding in number with the pulmonary pouches.

The nervous system of the arachnida is ganglionic, consisting of nerve-knots (*ganglia*). In man and the larger animals a ganglion is composed of two substances similar to the cortical and medullary substances of the brain, and differs from nerves in being firmer in texture, and covered with a membrane of closer tissue. In the arachnida these nerve-knots are more concentrated, if the term may be used, than in insects, and they are uniform in composition, rather than a chain of ganglions equally separated. Thus in the harvest spiders (*Phalangia*) there are a pair of nerve-knots in front of the gullet, and at the back of the gullet a medullary mass, apparently consisting of three ranges of nerve-knots united.

We know nothing of the organ of hearing in arachnida, though it is certain enough that they do hear. Their eyes are all simple, not composite, like those of many insects. 'The eyes of spiders and scorpions,' says Swammerdam, 'are externally formed exactly in the same manner, and are smooth, glittering, and without divisions; and are as

much dispersed as those that are disposed at random over the body. The wolf-spider, which catches its prey by leaping on it, has its eyes placed in the same manner.' In the greater number of spiders they are eight in number, but in some six (*Dysdera* and *Segestria*), and in others two (*Phalangium*). The arrangement of the eyes, when more than two, varies considerably in the different genera, and is taken advantage of in arranging them systematically, on the principle first, we believe, pointed out by Dr. Lister, and improved upon by Latreille, Leach, and Walekenzer. Figures of various arrangements of the eyes in spiders may be seen in *Insect Miscellaneæ*, pp. 125, 126, after Audouin.

With regard to the sexes, male spiders are always much smaller than the females, being often not more than one fourth the size. The feelers (*palpi*), also, in the male are furnished with organs at the tip, which are of various forms, but usually bulging, whereas the feelers in the female taper gradually to a point.

Looking at the size of the female spider, and the eggs which she lays, it appears almost incomprehensible how they could be contained in so small a body. But, by observing them more closely, it may be discovered that they have not, like the eggs of birds, a hard shell, but, on the contrary, are soft and compressible. Accordingly, before they are laid they lie in the egg-bag (*ovarium*) within the spider's body, squeezed together in a flat manner; and only come into a globular form after they are laid, partly in consequence of the equal pressure of the air on every side, in the same way as we see dew-drops and globules of quicksilver formed from the same cause.

The eggs of spiders, it is worthy of remark, are in most cases, though not always, placed in a roundish ball, and, as there is nothing in nature without some good reason, if we can discover it, we may infer that this form is designed to economize the materials of the silken web, which the mother spins around them by way of protection. Whether we are right or not in this conjecture, there can be no question as to the manner in which the ball is shaped, as the writer has often observed the process. The mother spider, in such cases, uses her own body as a gauge to measure her work, in the same way as a bird uses its body to gauge the size and form of its nest. The spider first spreads a thin coating of silk as a foundation, taking care to have this circular by turning round its body during the process. It then, in the same manner, spins a raised border round this till it takes the form of a cup, and at this stage of the work it begins to lay its eggs in the cup, not only filling it with these up to the brim, but piling them up above it into a rounded heap as high as the cup is deep. Here then is a cup full of eggs, the under half covered and protected by the silken sides of the cup, but the upper still bare and exposed to the air and the cold. It is now the spider's task to cover these, and the process is similar to the preceding, that is, she weaves a thick web of silk all round them, and, instead of a cup-shaped nest like some birds, the whole eggs are inclosed in a ball much larger than the body of the spider that constructed it.

There is a singular mechanism for the purpose of placing the eggs in the proper position. The eggs, different from what takes place in birds, are excluded from a cavity just behind the breast. Here there is an organ placed somewhat in form of a hook or a bent spatula, which the spider can move in such a manner as to direct every individual egg which it lays to the exact spot in the nest-cup, where it wishes it to be placed. The sense of touch in this organ must of course be very acute, as by touch it must be wholly guided, for its eyes, though eight in number, and very piercing, are situated on the upper part of the head, and cannot be brought within sight of the nest.

The hatching of the eggs of one species (*Epeira diadema*) has been traced with great minuteness, and the successive evolution of the embryo figured with great skill, by M. Herold of Marburg.

M. Latreille, whose method has been generally followed both in Britain and on the continent, arranges the arachnida into two orders:—

I. *Arachnida pulmonaria*, or *pulmonata*, distinguished by having pulmonary cavities for the purposes of respiration, and from six to eight simple eyes.

II. *Arachnida tracheana*, or *trachearia*, distinguished by having air-pipes (*tracheæ*), like insects, and more than four simple eyes.

Each of these orders comprises a number of genera which shall be noticed in their proper places.

ARACK, or **ARRAC**. This word is derived from the Arabic word *arak*, which properly signifies *perspiration*; hence *juice*, *sap*, and thus, lastly, *ardent spirit*. Under various modes of spelling it is employed as a general name for distilled spirits along the northern coast of Africa, including Egypt, over all Asia, and even in the north and eastern parts of Europe. This spirit is prepared from different substances, more especially from sweet juice (toddy) extracted from the unexpanded flowers of different species of the palm tribe. In Ceylon, where a large quantity of arack is manufactured, it is entirely distilled from coco-nut tree toddy. [See COCO-NUT TREE.] Some authors assert that toddy is extracted from the branches of palm-trees, and even from incisions made in the stem, but erroneously. The 'toddy topes,' or coco-nut tree orchards, are very extensive in Ceylon, and their produce is collected for the distillation of arack, and the manufacture of sugar and oil.

In Ceylon, when it is intended to draw toddy from a tope, the toddy-drawer selects a tree of easy ascent near to the centre of the tope, the stem of which he surrounds with a number of bands made of creepers, about a foot distant from one another. Upon these bands he ascends the tree, and by means of the stems of creeping plants or coir ropes, he connects the heads of a number of trees, so as to enable him to pass from tree to tree in the subsequent operation of collecting the produce.

The ordinary implements of a toddy-drawer are a large broad knife, which he carries in a coffer or basket suspended by a cord tied round his body; a mallet, consisting of a piece of hard wood about a foot in length; and the shell of a large gourd, which is suspended round his waist. When a tree is in a state fit for yielding sweet juice, the toddy-drawer ties the flowering spath in different places, by means of the white leaves of young branches. This process has the effect of preventing a bud from blowing. The spath is then bruised along its whole length by means of slight blows with the mallet or bat of hard wood. This operation occupies a few minutes, and requires to be regularly repeated every morning and evening for six or seven days. In a few days after the spath has been tied, a few inches of it is cut off by means of the broad knife. Two or three days after it is thus truncated, sweet juice exudes from the cut surface, which is received in an earthenware vessel attached to the spath. The liquor issues, drop by drop, and a good healthy blossom will yield from two to four English pints in twenty-four hours, and continue to afford that quantity for a period extending from three to five weeks. As the coco-nut tree blossoms every four or five weeks, two spaths on one tree sometimes yield sweet juice at the same time. The toddy-drawer generally ascends the trees, for the purpose of collecting the sweet juice that has exuded into the toddy pots, both morning and evening, and to cut off a fresh portion of the flowering spath. The toddy is poured from the earthen vessels into the gourd, which is conveyed to the ground by means of a line. The gourd is emptied into a large vessel by a person at the foot of the tree, and drawn up by the toddy-drawer for the purpose of being refilled.

Arack may be distilled from toddy the same day it is drawn from the tree, but sometimes this operation is delayed until it becomes sour. The process of distillation is carried on in the maritime provinces in copper stills, but in the interior of the island earthen vessels are chiefly employed. Toddy yields by distillation about one-eighth part of proof-spirit.

On the peninsula of India, arack is distilled from the flowers of the *Bassia longifolia*, Tell mee (*Cingalese*), the *Mahwah*-tree, and the *Bassia latifolia*. Mahwah-arack may be procured at the rate of an English pint for less than one penny.

Arack is prepared in the island of Java, where it is known by the name of *kneip*, from a mixture of molasses, palm-wine, and rice, in the following proportions.

Molasses	62 parts
Palm-wine (toddy)	3 ditto
Rice	35 ditto

100 parts of these materials yield 23½ of proof spirit.

The rice is first boiled, and after being cooled, a quantity of yeast is added to it and pressed into baskets. Each basket is placed over a tub for about eight days, during which time a quantity of fluid passes through the basket into the tub; this fluid is added to the molasses and toddy in large fermenting vats, where the mixture is allowed to remain until it is fit for distillation.

In most parts of Turkey, arack (*raki*) is made from the skins of grapes. It is flavoured with aniseed, and sometimes contains a solution of gum-mastic. The mountain Tartars distil it from sloes, elder berries, wild grapes, plums, &c., and the Calmuck Tartars distil it from milk.

Ceylon exports annually, and for the most part to the presidencies of Bengal, Madras, and Bombay, from 5000 to 6000 leaguers of arack, each containing 150 gallons. The custom duty on the exportation of arack amounts to 20 per cent. *ad valorem*, and in 1813, the Madras government imposed an excise duty of 440 per cent. upon Ceylon manufactured spirits. The prime cost of arack at Colombo varies from 8d. to 10d. per gallon. Ceylon arack is superior to Batavian arack, and it commonly brings a higher price of from 10 to 15 per cent. on the peninsula of India, than Javanese manufactured spirits. The quantity and estimated value of arack exported from Ceylon in 1825 amounted to 611,218 gallons, value 21,500*l.*, which is at the rate of nearly 8½*d.* per gallon. The following is a schedule of duties levied on the coco-nut plantations in Ceylon, average of three years, 1827-8-9, which will show the importance of the manufacture of arack in political and commercial points of view.

Distilling of arack	£ 3,641
Retail of ditto	21,975
Export of ditto	3,136
Export of coir	154
Export of jaggery	162
Export of copperas	1,539
Export of coco-nuts	1,551
Export of coco-nut oil	413
	£ 35,573

The tariff duty levied upon arack imported into the United Kingdom is 15*s.* 6*d.* per gallon. (See *Marshall's Contribution to a Natural and Economical History of the Coco-nut Tree*; and *Bartolacci on the Revenue and Commerce of Ceylon*.)

ARAD ISLAND. [See *BAHREIN*.]

ARÆOMETER. [See *HYDROMETER*.]

ARÆOSTYLE. This is a term composed of two Greek words, *ἀράος*, signifying *rare* or *few*, *thin*, *weak*, and *στυλος*, *a column*. It is used by writers on architecture, who follow the absurd system of Vitruvius, as a name for one of what he terms 'the five species of temples.' As the term itself imports, it refers rather to the arrangement of columns than to the composition or structure of a temple. The kind of temple called aræostyle is, according to Vitruvius himself, that in which 'the columns are placed more distant from each other than in fact they ought to be.' This, the commentators upon that writer say, is when the space between columns, or the intercolumniation, is from four to five diameters. The aræostyle intercolumniation is generally assigned by the same authorities to what in the Vitruvian system is called the Tuscan order; for as the remains of the more classical architectural works of the Greeks and Romans, on which the system *professes* to be based, exhibit no examples of either the aræostyle intercolumniation, or of the Tuscan order of columns, each could with safety be assigned to the other. The east or market front of St. Paul's church, Covent Garden, in London, exhibits an example of what the followers of Vitruvius would term a Tuscan portico *in antis*, though the columns are hardly set widely enough to come up to the character which they have assigned to the aræostyle intercolumniation. [See also *EUSTYLE*.]

ARÆOSYSTYLE. This term is compounded of *aræo* and *systyle*, and was formed to designate an arrangement of columns not mentioned by Vitruvius. The French architect, Perrault, is understood to have introduced the term aræosystyle to designate an alternately very wide and very narrow intercolumniation, or, what is familiarly called coupled columns. This arrangement is alternately *aræostyle*—columns too far apart; and *systyle*—columns too close together.

Perrault's front of the palace of the Louvre in Paris, the western portico of St. Paul's cathedral, the porticoes, pavilions, and colonnades of the Pimlico palace, and numberless other edifices in London, exemplify the peculiarly inelegant mode of arranging columns which the term aræosystyle designates.

ARAFAT is the name of a hill near Mecca, where, ac-

cording to the belief of the Mohammedans, Adam, conducted by the angel Gabriel, met Eve, after they had been separated for two hundred years, in consequence of their disobedience, and banishment from Paradise. The Mussulman pilgrims, after having visited the town of Mecca, perform their devotions on Mount Arafat on a fixed day, the ninth of Dhu'l-hijab, the last month of the Mohammedan year. Burckhardt, who, in 1811, visited those territories which the Mohammedans regard as sacred, in the disguise of a *haji* or pilgrim, describes Mount Arafat as a granite hill, rising on the north-east side of a plain, closely encompassed by mountains, but separated from them by a rocky valley. The hill is, according to him, about a mile or a mile and a half in circuit; its sides are sloping, and its summit is nearly two hundred feet above the level of the plain. 'On the eastern side,' says he, 'broad stone steps lead up to the top, and a broad unimpeded path on the western, over rude masses of granite, with which its declivity is covered. After mounting about forty steps, we find a spot a little on the left, called Molaa Seydna Adam, where, according to Mohammedan tradition, the angel Gabriel first instructed Adam how to adore his Creator. On the summit of the hill the place is shown where Mohammed used to take his station during the pilgrimage: a small chapel, formerly stood over it, but this was destroyed by the Walahabites. The steps and the summit are covered with handkerchiefs to receive the pious gifts of the pilgrims. The top of the hill commands an extensive prospect. Several large reservoirs lined with stone are dispersed over the plain: they are filled from a fine aqueduct which supplies Mecca with fresh water from the eastern mountains.' From the summit of Arafat, Burckhardt counted about three thousand tents scattered over the plain; but the greater number of the pilgrims were without tents. The number of persons assembled here from all the Mohammedan countries he estimated at about seventy thousand, and that of the camels at from twenty to twenty-five thousand. 'There is, perhaps,' says he, 'no spot on earth where, in so small a place, such a diversity of languages are heard: I reckoned about forty, and have no doubt that there were many more.' The essential part of the ceremony at Mount Arafat consists in a procession of all the pilgrims towards the hill, the sides of which they cover from top to bottom; and in hearing a sermon, which is usually delivered by the kadhî of Mecca, and which lasts from about three o'clock in the afternoon till sunset. No pilgrim, although he may have visited all the holy places of Mecca, is entitled to the name of *haji* unless he has been present on this occasion. (See Burckhardt's *Travels in Arabia*, London, 1829, 8vo. vol. ii. p. 40, &c.)

ARAGON, or ARRAGON, kingdom of, one of the provinces of Spain, situated between 40° and 42° 55' N. lat., 35° E. and 1° 55' W. long., is bounded on the east by Catalonia and part of Valencia; by Navarra and Old Castile on the west; on the south by Valencia; and on the north by the Pyrenees. It extends, in its greatest length, about a hundred and thirty miles from east to west, and two hundred from north to south. Aragon may be compared to a large basin surrounded on all sides by mountains. The Pyrenean chain and its ramifications separate it from France, the Sierras of Molina and Cuenca from Castile, and those of Morella from Valencia. The principal of these mountains is the great Pyrenean chain. The offsets of this range, which penetrate into Aragon, form a number of lateral valleys with a rapid slope to the south. Taking Monte Perdido or Mont Perdu, elevated 11,168 feet above the sea, as a central point, the range descends westward in eight successive steps to the ocean. On the east, the same gradual descent is observed as far as the frontier of Catalonia, where it rises again in the Peña Maladeta to 11,424 feet; it again descends as far as the valley of Andorra, where it rises in the Moncal to 10,663 feet; from which point it makes another inclination, and rises again in the Canigú to 9141, and then makes a rapid descent to the Mediterranean. This circumstance at first led to the erroneous idea that the Canigú was the highest point of the range, for a spectator on its summit might observe the chain appear to descend in all directions, while the distance diminished the apparent height of the other summits; but by exact measurements this error has been rectified.

The first valley of Aragon which we find in the Pyrenean chain, as we advance from the east, is that of Benasque, the capital of which is the town of the same name, with a fortress

and a custom-house. Proceeding westwards, we find the valleys of Bió, Brotó, Tena, the capital of which last is Sallen, in the centre of the range: about two miles from Sallen is the source of the river Gallego (an affluent of the Ebro), and not far from it are the mineral waters of Panticosa; then follows the valley of Canfranc (the Puerto, or opening which bears that name, is 6713 feet high); those of Aragües, Hecho; and the last, Ansó, on the frontier of Navarra. Every valley is separated from the adjoining by the gigantic offsets of the Pyrenees, which, running in an irregular southern direction from the main mass, form these lateral valleys. All the summits of the Pyrenees in this part are covered with snow nine months in the year, and even in June it is found five or six feet deep. The secondary chain of this province is that called by some geographers the Iberian, which runs in a direction from N.W. to S.E., under the names of Montes de Oca, 5436; Sierra de Moncayo (the Mons Caunus of the ancients), elevated 4921 feet; Sierra de Molina, 4188; Sierra of Teruel, 4331, at the city of that name; and then enters Valencia, and terminates on the shore of the Mediterranean near the *desierto de las Palmas*.

Almost all the rivers of Aragon have their source in these two chains of mountains, and run in different directions to their common receptacle, the Ebro. This river crosses the province from N.W. to S.E. and divides it into two parts almost equal. Its affluents on the right bank within Aragon are, the Huecha, Jalon, Huerva, Aguas, Martín, Guadalupe and Matarranya, which latter serves as the line of boundary between Aragon and Cataluña; and on the left, the Arvo, Aragon, Gallego, and Segre. (See EBRO.)

Several roads cross the province, passing through all the principal towns. The Canal Imperial de Aragon was commenced in 1529, by order of Charles V. The water was taken from the Ebro at Fontellas; a basin and a house were constructed three miles below Tudela in Navarra, and the canal was continued parallel to the river. This work was abandoned, and remained unfinished for nearly two hundred years. Under Charles III., in 1772, the conduct of the undertaking was entrusted to Don Ramon Pignatelli, a man of great activity and skill, under whose direction it was continued and carried six miles below Zaragoza. This canal crosses the Huecha, Jalon, and Guerva. If we consider it with respect to its width, we may assuredly say that it is one of the finest in Europe, but the benefits derived at present from it are very inconsiderable. There is sufficient water for vessels of from sixty to eighty tons, but in consequence of the canal not reaching the sea the trade is very limited: if ever the original project is completed, and the navigation continued to Tortosa, the advantages which Aragon, Navarra, and Catalonia will derive from it are incalculable. In 1819, the produce of this canal amounted to about 13,352*l*. The object of this canal is double, being designed both for irrigation and navigation.

The climate of Aragon varies according to the elevation and particular situation of the different districts, but in general, except on the mountainous parts, it is adapted to most of the productions of temperate climates. The winds that chiefly prevail are the Cierzo, or N.W., and the Bochorno, or S.E. These two continue during nine months in the year. The period that the S. or S.W. blows is very short. The W., which the Aragonese call *fagüello*, and the Castilians *faronio*, is always welcomed by the husbandman, as it never fails to bring along with it abundant showers, which are favourable to vegetation.

The productions of the soil are, wheat, barley, rye, oats, Indian corn, leguminous vegetables, esparto, or Spanish broom, flax, hemp, sumach, barilla, madder, saffron, liquorice, fruits, oil, wine, and timber. The productions of the mineral kingdom are gold, silver, copper, iron, lead, quicksilver, cobalt, alum, jet, coals (near the source of the Martín, a tributary of the Ebro), and copperas; few of these mines are now worked. The chief mine is one of rock-salt at the village of Remolinos, near Alagon, which, supplied Aragon and Catalonia with this article. Peat earth, which has been compared with that of Holland, is found in the district of Teruel, and used for fuel. The mountains abound in game; wolves and bears are likewise found, and numerous herds of cattle feed in the valleys. Before the Peninsular war, the number of sheep was 2,050,000 heads. The rivers produce exquisite fish, particularly trouts and eels; of the latter, the most celebrated are those of a lake, or rather pond, near Alcañiz. The produce of grain and wine is more than sufficient for the con-

sumption; but there is a deficiency of horned-cattle and mules, which are supplied from France. The industry of Aragon is very limited, and consists principally in manufactures of common cloth, hemp sandals, sacks, and cordage, hats, leather, paper, earthenware, and some iron-foundries.

Aragon is, in a considerable degree, impregnated with salt; the water of many of its rivers is as saline as that of the sea, particularly the spring near Bujaraloz. At the bottom of the lake Gallocanta, between Bello and Tornos, fuci and other sea plants are found. Thermal springs are abundant both in the Pyrenees and the Iberian chain.

The province is divided into thirteen districts, or *corregimientos*, viz., Albarracin, Alcañiz, Barbastro, Benavente, Borja, Calatayud, Cinco-villas, Daroca, Huesca, Jaca, Tarazona, Teruel, and Zaragoza; the capitals of these districts are the towns of the same name, which are likewise the principal towns in the province.

The population of Aragon, according to the census of 1803, amounted to 657,376 upon a surface of 12324 square leagues; the number of souls for a square league being 533, a proportion by no means great, even if we consider that mountains occupy a great part of the surface. (Antillon.) Asso states the area at 2000 square leagues, of 25 to a degree, which is equal to about 15,346 English square miles.

Aragon contains 1 archbishopric, 6 bishoprics, 8 collegiate churches, 1396 parishes, 228 convents of both sexes, 29 military commanderies, 23 hospitals, 2 universities, 12 cities, 239 villages, 688 hamlets. Like the rest of the peninsula, Aragon was successively under the dominion of the Carthaginians, Romans, and Goths. When the Arabs invaded Spain, those Aragonese who escaped the sword of the invaders sought a refuge in the fastnesses of the Pyrenees, where they assembled together in the valley of Sobrarbe in Navarra, and chose for their leader Garcia Iñiguez, called also Iñigo Arista, on account of his nimbleness, about A. D. 819. They stipulated with him that since by common consent they had elected him their chief, and put him in possession of the territory which they had wrested from the Moors, he was bound to swear to them, first, to maintain their fueros, or privileges, and to improve them; secondly, to divide with them the territory he should conquer from the enemy; not to enact laws without the advice and consent of his subjects; not to declare war, or make either peace or truce with any sovereign, without the assent of twelve of the most noble and twelve of the oldest and wisest men of the country. The chief agreed to these conditions, and declared that if he ever violated the compact established between them, they were free from their engagement, and might elect another chief, either Christian or Pagan (Zurita, book i. ch. v. p. 9). The Aragonese, not content with setting these boundaries to the royal authority, created a magistrate or officer peculiar to them, whom they denominated the *Justicia*. This officer was the guardian of the laws and the mediator between the king and the people. He was at first appointed by the king and the Cortes together, and his office was for life. His person and property were sacred; he was the supreme interpreter of the law: to him both king and subjects applied for redress against wrong; his decisions were without appeal, and he was only answerable to the nation duly assembled in Cortes. Once elected, he could neither be arbitrarily removed by any power, nor renounce the office. He had two substitutes, or lieutenants, to act for him, when he was unable to perform his duties. These officers were at first appointed by him, and enjoyed the same privileges as he did. Both the *justicia* and his substitutes were chosen from the order of caballeros, or middle class between the nobles and the commons. In 1461, a law was enacted by which the kings were empowered to nominate the deputies of the *justicia*. The Cortes deposited in a box the names of eight individuals as candidates for that office, out of which the king chose two by lot, when it was necessary to fill up the vacancies of those whose term had expired, or who had died. Their office lasted only three years, and none could be re-elected before the same number of years had elapsed. It is impossible to say when the office of the *justicia* began; Zurita and all the other historians of Aragon make its creation contemporary with that of the fuero of Sobrarbe, but no mention is made of the *justicia* before the conquest of Zaragoza.

The Cortes were composed of four *brazos*, or orders,—the ecclesiastics, the nobility, the caballeros, and the people.

he ecclesiastics were not admitted into the Cortes until 301. (Blanca's *Modo de Proceder en Cortes*, ch. vi. p. 14.) The first Cortes, where the *brazo* of the *universidades* or commons is distinctly mentioned, are those of Monzon, in 1131. These orders formed one house. Every *brazo* gave its vote separately, and the majority in each *brazo* decided the vote of that *brazo*, but the unanimous consent of the four *brazos* was requisite to the enactment of any law. Any individual might stop the proceedings of the Cortes by giving his veto in writing. The number of the nobles that generally sat in the Cortes were eight; the ecclesiastic *brazo* consisted of twenty-three, and the cities and boroughs that returned members were thirty-one. The number of the members for the cities and boroughs was not fixed. In the Cortes of Zaragoza, A. D. 1163, fifteen deputies from that city, besides many from Huesca, Jaca, Calatayud, Daroca, and Tarazona were present; and those of Lerida, in 1214, were attended by ten deputies from every principal city and borough in the realm. Thus Aragon had a popular representation nearly a century before any other nation in Europe.

The Cortes were summoned by the king, and were also dissolved by him. After the convocation, they adjourned from day to day, for an indefinite period of time. The adjournment was made by the *justicia*: if before the opening of the sessions, in virtue of his authority, as *jefe* of the Cortes; and if after, by the order of the king and at the will of the Cortes themselves. When the king absented himself from the place where the Cortes were assembled, they were dissolved. The king presided in the Cortes in person, and when he was unable to do so, that body empowered the crown prince, or some other individual of the royal family, to supply his place.

On the opening of the assembly, a discourse was pronounced by the king, called the *proposicion*. In former times every *brazo* answered separately to the speech from the crown, but subsequently the archbishop of Zaragoza addressed the king in the name of the four *brazos*. On the first sitting every *brazo* appointed a certain number of individuals of their respective order to prepare and put in a proper shape the matters which were to be laid before the general assembly. These were called *promovedores*, or promoters, and *tratadores*, or discussers. Of the *promovedores*, two were so by virtue of their office, viz., the archbishop of Zaragoza for the ecclesiastic, and the *jurado* of the same city for the commons: the rest were elected by their respective *brazos*. The *promovedores* proposed the subject; and petitions which were to be subjected to discussion, and the *tratadores* examined and arranged them in proper order.

From the first opening of the Cortes, the *justicia* was obliged to sit in a place below the throne to hear the *queixas*, or grievances, which any Aragonese had to make against any individual, high or low, for infractions of the *fueros*, and 'this,' says Martel, 'was not done by way of supplication, but as a matter of right.' Certain officers called *recojedores* and *examinadores de queixas*, or collectors and examiners of grievances, were appointed, to decide whether the complaint presented was a constitutional greuge or not. When the king or any of his ministers were affected by the greuge, he was excluded at the time of giving the sentence, which was pronounced by the *justicia* and the Cortes. Both the positive infraction of the law, and the nonfulfilment of it, were a subject of greuge. As these complaints were more frequently made by persons of rank, some have erroneously supposed that this was a privilege of the nobility: but Blancas says, that if any officer of the crown had put to the torture (a thing contrary to the fueros) the most miserable farmer of the meanest village in the kingdom, the latter had a right to complain to the Cortes, and he should not only be attended to, but even be furnished by the nation with the necessary means for the prosecution of his cause.

The *servicio* or supplies were granted by the Cortes, but not until the several petitions of the deputies had been first granted. In former times, it was not called *servicio*, but *proferia* or *socorro*, offer or succour, and was made not in money, but in men. The first time that the kings of Aragon asked for the *servicio* in money was at the Cortes of Monzon, 1376, when Pedro IV. demanded a certain sum to pay one thousand lancers to continue his war with France. 'The deputies,' says Blancas, 'were amazed at this novelty, never before heard of in the kingdom, and answered his highness, "that the Aragonese were not accustomed to

serve their kings except with their persons; that it was the Jews and Moors that served theirs with money.' The following still more striking fact is recorded by the same historian:—In the Cortes of Teruel, 20th of March, 1428, Miser Juan de Marguillen, treasurer to the queen, presented to the tratadores of the Cortes and the king an humble petition from *la Señora Reina*, requesting some pecuniary assistance for her support; to which they answered that such a thing had never before been done, and it was their opinion that it could not be done without great detriment to their liberties; a thing which *la Señora Reina* neither could nor ought to wish, and therefore they begged *Su Mercé* to bear patiently their refusal. On the treasurer's requesting them to consider again, both the petition and the answer they had given, their reply was, that they stood firm to what they had said, and they neither could nor would alter it in the least. In 1383, Pedro IV. obtained of the Cortes a loan of 60,000 florins, about 9000*l.*, a *buena tornar*, to be duly returned. In 1412, another sum was lent to Fernando I. upon the same condition. In course of time these debts were remitted to the kings, and by little and little, the custom was introduced of granting supplies of money, the first of which was the one made to Fernando el Católico, for the conquest of Tunis and Bugia. The ordinary expenses of the state were defrayed by means of certain taxes imposed by the Cortes, which were granted generally for six years. These taxes were either direct, as the *bovage*, or a certain sum paid for every couple of oxen, the *monelage* or property tax, and the *focage* or house tax; or indirect, as the *sisas*, or a tax upon the articles of food. After the period for which these contributions had been granted, nobody could exact them, under the penalty of excommunication.

The last sitting of the Cortes was that called the *solio*, in which all the laws that had been enacted were solemnly proclaimed and sworn to, first by the king and the justicia, and then by two individuals for each brazo, and by all the public functionaries. The sanction of the king was absolutely requisite for the validity of any law; if he refused to give it, the deputies might insist, with all due respect, until the king signified that it was not his pleasure that it should be insisted upon any further. Though the king was present during the discussion, he was obliged to leave the Cortes when the vote was given.

By the Cortes and the justicia two deputies were appointed for each brazo to sit permanently until the next general assembly. The *diputación*, in union with the justicia, watched over the observance of the law, and examined the accounts, and every thing in the financial department.

Among the many privileges of the Aragonese, the most notable were, the *privilegio de la manifestacion*, and those of the *union*. By the privilege of the manifestacion, when any Aragonese was injured by any tribunal of the king contrary to the fueros, he appeared before the justicia, and being asked by him whether he desired to be *manifestado*, if he answered in the affirmative, he was placed in the prison of the justicia, called the prison of the *manifestacion*, and his cause was taken from the judges of the crown, and examined by the court of the justicia. The privileges of the union were granted by, or rather wrested from, Alonso III. This prince having assumed and exercised the royal dignity without having first taken the necessary oath of allegiance to the constitution, his subjects formed a union, and with the Cortes at their head, threatened to withdraw their allegiance, unless he consented— not to prosecute capitally any member of the union, not to cause him any injury, or even to imprison him without previous sentence of the justicia to that effect, and with the approbation of the majority of the Cortes; secondly, that the king should be obliged thenceforward to assemble the Cortes every year at Zaragoza in the month of September, and to give the deputies the power to appoint his ministers, councillors, and other officers of the crown, and even the officers of his household, with the condition that the persons appointed should first swear to advise him well and loyally; and that in case he or any of his successors infringed any of these privileges, the members of the union would not acknowledge him as their king, and, without any charge of treason, might choose another. As a security for these privileges, seventeen castles in Valencia and Aragon were placed in the hands of the representatives of the *union*. This extraordinary transaction took place on the 29th of December, 1288. Pedro IV. abolished these privi-

leges in the Cortes of Zaragoza, 1348; still the justicia of Aragon, in union with the diputacion of the Cortes, preserved the constitutional right of calling the nation to arms against the king, when he invaded the fueros of the kingdom.

The Aragonese devised an oath calculated to remind their monarchs of this privilege. 'The king,' says Antonio Perez, 'upon his accession to the throne, kneeling before the justicia, the latter being seated and with his head covered, swears solemnly to observe the fueros of the nation; then the justicia, in the name of the Cortes, says, *Nos, que valemos tanto como vos, os hacemos Rey y Señor, con tal que nos guardéis nuestros fueros y libertades, y sino, no*; that is, We, who are worth as much as you, make you our king and lord, provided you keep our laws and liberties, otherwise not.' (*Relacion de Antonio Perez*, p. 132.)

Under the monarchs of the Austrian dynasty, these institutions, which had lasted nearly eight centuries, began first to be undermined. The justicia Juan de Lanuza IV., having in virtue of his authority rescued Antonio Perez from the grasp of the king and the inquisition, seeing that the Castilian army was in march to invade the kingdom, called the Aragonese to arms, and the priests, both in the pulpit and in the confessional, exhorted the people to come forward in defence of their liberty; but the unfortunate Lanuza was shamefully deserted by the nobility, imprisoned while in the performance of his duties, and without any trial publicly beheaded. The king, Philip II., in a letter written with his own hand, without any signature of either secretary or minister, after the fashion of an Asiatic tyrant, said to his general, 'As soon as you receive this letter, you are to proceed to the imprisonment and execution of the justicia Don Juan de Lanuza, and let me hear of his execution as soon as of his imprisonment.' This order was strictly obeyed, and between the arrest and execution of Lanuza there was only the lapse of twenty hours. His charge, says Perez, was his arrest, and his defence his martyrdom. From that time the constitution of Aragon became an empty sound; but it was not actually abolished until the eighteenth century, when Philip V., the first of the Bourbon dynasty in Spain, abolished it, not only in virtue of the sovereign authority residing in him, but by the right of conquest, as the decree states. In civil concerns, however, the Aragonese are still governed by their own laws, and only apply to those of Castile in cases where their fueros are deficient.

The crown in Aragon, as well as in all the rest of Spain, from the time of the Goths, was elective: and although the king was generally chosen out of the family of the deceased monarch, following the order of primogeniture, until the fifteenth century, yet instances may be adduced both in Aragon and in Castile, of the nation having departed from this custom, and appointed as successor another in opposition to the one who might be called the rightful heir. We are not aware that there existed any positive law on this subject, previous to the constitution of 1812.

In accordance with its political constitution, all the other codes of Aragon were dictated by a more liberal and humane spirit than those of the neighbouring states; thus, while, in the surrounding nations, a criminal, or perhaps an innocent person, was inhumanly tortured, the Cortes of Zaragoza, in 1325, declared it unlawful to put any Aragonese, of whatever rank or condition, to the torture, or to confiscate his property; neither could foreigners be subjected to it, except for forgery.

Aragon was formerly the most powerful nation in the Peninsula: it embraced the provinces of Navarra, Catalonia, and Valencia; abroad, it possessed the Balearic islands and Sardinia. Ferdinand, the catholic, king of Aragon, was also king of the two Sicilies, and by his marriage with Isabel of Castile, the two kingdoms of Aragon and Castile were united under one sceptre.

The Aragonese are sullen and stern, scrupulously honest in keeping their word; brave, firm, and tenaciously opposed to all foreign dominion: the firmness of their character is proverbial, and often carried to excess.

A Chronological Table of the Kings of Aragon, from the separation of that kingdom from Navarra to its union with Castile, showing the years of accession:—

- A. D.
1035. Ramiro, son of Sancho el Mayor.
1063. Sancho, son of Ramiro.
1094. Pedro, son of Sancho.

1104. Alonso, brother of Pedro.
 1134. Ramiro II., brother of Alonso,
 1137. Petronila, daughter of Ramiro II. Aragon and Catalonia were united by the marriage of this queen to Raimundo III., count of Barcelona.
 1162. Alonso II., son of Petronila.
 1196. Pedro II., son of Alonso II.
 1213. Jaime, son of Pedro II.
 1276. Pedro III., son of Jaime.
 1285. Alonso III., son of Pedro III.
 1291. Jaime II., brother of Alonso III.
 1327. Alonso IV., son of Jaime II.
 1336. Pedro IV., son of Alonso IV.
 1387. Juan, son of Pedro IV.
 1395. Martin, brother of Juan.
 1412. Fernando, brother of Enrique III., king of Castile, and nephew to Martin.
 1416. Alonso V., son of Fernando.
 1458. Juan II., brother of Alonso V.
 1479. Fernando II., son of Juan II., married Isabel of Castile, and thus Aragon and Castile were united under one sceptre in 1516.

See Zurita, *Anales de Aragon*; Blancas, *Rerum Aragonensium Commentarii*, *Modo de proceder en Cortes*; Martel, *Modo de celebrar Cortes*, *Eneros y Observancias del Reino de Aragon*; Miñano, *Antillon*, *Geografia de España*; Antonio Perez, *Relacion*; Cox's *Memoirs of the House of Bourbon*. There is a work entitled *Historia de la Economia Politica de Aragon*, por D. J. de Asso, Zaragoza, 1798, small 4to. Antillon, in the preface to his *Geography*, gives it a qualified character.

ARAL, SEA OF, a great inland lake of Asia, situated east of the Caspian Sea, between the forty-third and forty-seventh degrees of north latitude, and the fifty-eighth and sixty-second degrees of east longitude. The only exact astronomical observation which has been made with the view of determining the position of the Aral Lake is that of M. Lemm, who found the longitude of the western shore, in latitude $45^{\circ} 38' 30''$, to be $56^{\circ} 8' 59''$ east of the meridian of Paris, or $58^{\circ} 29' 14''$ east of that of Greenwich. Its greatest length is about 290 miles from N. to S.: its breadth from E. to W. is irregular, but it is no where less than 130 miles, and in some places 250. In superficial extent it far exceeds any lake in the eastern hemisphere, except the Caspian. Its depth is not great, and it abounds so much in sand-banks near its shores, that the Kirghiz fishermen, its only navigators, are obliged to use flat bottomed boats. The southern extremity is studded with innumerable small islands at the mouth of the river Amoo, and from this circumstance it has received its name, Aral, which in the Tartar language signifies *island*.

The water is salt, but no experiments appear as yet to have been made to ascertain its specific gravity, and the nature of its saline contents—how far these are similar to the salts contained in sea-water: the probability is, that they are very different in quantities, and, in some respects, in their nature. It would be important to determine this with accuracy, in order to compare the results with those of similar experiments in future years; a great diminution of its superficial extent has taken place within a very recent period, and seems to be in progress, and it would be interesting to know whether any corresponding increase takes place in the saltiness of its waters. Two rivers of considerable magnitude discharge their waters into this lake; the Syr-daria or Sihoun, the ancient Iaxartes, flows into it from the east; the Amou or Jhoïn, the Oxus of the ancients, enters it from the south. The lake, like the Caspian, has no outlet; and the whole of the water supplied by these rivers, as well as that of some minor streams, must be carried off by evaporation. The evident proofs of a gradual lowering of the level of the lake, which we shall afterwards mention, show that the supply of water is not equal to the waste; in the heat of summer, the evaporation from so vast an expanse must be enormous, and the quantity poured in during this period must be greatly diminished, for the two great rivers become fordable in places where, in the spring, they are navigable, and the channels of the streams which flow from the steppes on the north become quite dry.

It has been ascertained, that in this part of Asia the continent, over an extent of more than 18,000 square leagues, is depressed below the level of the ocean; the Caspian Sea occupies the lowest parts of this depression. It was long

suspected that the Caspian was lower than the Black Sea, and the fact was ascertained with great accuracy, in the year 1811, by the Russian travellers, Engelhardt and Parrot, who were sent by the Academy of Sciences at St. Petersburg to examine the mountainous region of the Caucasus. By a series of levellings at fifty-one different stations across the mountains, and by means of barometrical observations, they found the surface of the Caspian to be $54\frac{1}{2}$ toises or 348.39 English feet lower than that of the Black Sea. This depression extends to a great distance on the north, for by the barometrical measurements of Helmersen and Hofmann in the years 1828 and 1829, the town of Orenbourg, on the Ural or Iaik river, is only fifty-two toises or 332.41 English feet above the Caspian, consequently very nearly sixteen feet lower than the level of the Black Sea. Now Orenbourg is 500 versts, or about 335 miles, in a direct line from the shores of the Caspian; and Humboldt is of opinion that the northern boundary of the depression runs between the neighbourhood of the towns of Orenbourg and Saratov, and consequently includes all the country lying between the Volga and the Ural south of that line, these rivers being in some places more than 300 miles distant from each other. Humboldt further states, that the great chain of the Himalaya extends westward, until, passing to the south of the Caspian, it joins the tableland of Azerbajan, south-east of the Caucasus, and forms the southern boundary of the great depression.

On the north of the Aral Lake is a wild hilly region, thinly inhabited by half-civilized nomadic tribes, who are to be found all round the lake, wherever an *oasis* in the desert enables man to subsist. The Monghodjar mountains, which occupy the highest part of these steppes, are a continuation of one of the groups into which the great Ural chain divides itself towards its southern termination: the insulated cone, called Airouk, the highest point, is only 960 feet above its base. The Urals in the neighbourhood of Orenbourg are composed of a red sandstone, and the same rock extends into these steppes of the Kirghiz. Dr. Pander, the naturalist, attached to the Russian embassy to the Khan of Bokhara, found between Orenbourg and the Monghodjar mountains the red sandstone replaced by a pudding-stone composed of quartz pebbles united by a quartzose cement, and then passing into a white sandstone; he observed a stratum of coal in the bed of a brook in this sandstone; he found the pudding-stone covered by a limestone full of shells, with sharks' teeth, many belemnites and ammonites, some of the latter two feet in diameter; and he discovered beds of gypsum associated with the limestone: the Monghodjar mountains are composed of the sandstone associated with porphyry and greenstone. The hilly region gradually sinks to sandy plains towards the south and east, no branch of the Urals being prolonged so as to reach any part of the Altai chain. These plains are composed of clay, marl, and calcareous tufa, covered by loose sand, which is blown up into hillocks from thirty to forty feet high, and the aspect of the country is thus changed after every storm of wind. In these desert plains between the base of the hilly region and the shores of the Aral Lake are two ranges of low hills called the Great and Little Bourzouk; the latter terminates in a promontory, at the north-east angle of the lake, but the Great Bourzouk extends considerably westward. North-east of the Little Bourzouk are some hills composed of indurated marl full of marine shells, and the formation extends to the shores of the lake. The hills of Aigour and Sari-boulak, forty miles inland, are composed of it, and they seem to have been the ancient shores of the lake. The northern sides of the hills, or those sloping from the lake, are gradual and covered with shrubs; but the side of Sari-boulak next to the lake presents a face of naked marl, furrowed by torrents, with conical masses cut by precipitous sides from 120 to 180 feet high, and the marl contains beds of shells and fishes' bones, from three to four feet thick. 'I mentioned to our Kirghisians,' says Baron Meyendorff, 'the traces of water on Sari-boulak, and they assured me that their fathers had seen the waters of the Aral Lake extend to the foot of this hill, although it is at present sixty versts distant from it. So great a number of the Kirghisians have told me the same thing, that I consider it as an undoubted fact, and it proves how very considerable, and at the same time how rapid, the diminution of the waters of the Aral Lake has been. It continues to diminish, and one of our guides pointed out a place in our route, far inland, which he himself remembered to have seen the waters reach.' This remarkable fact may be compared with the state-

ment of Colonel Monteith (*Journal of a Tour through Azerdijan and the Shores of the Caspian*, in the third volume of the *Journal of the Royal Geographical Society*), that during his residence in that part of Asia from 1811 to 1828, the Caspian Sea, 'as well as every other lake in Persia, had decreased most sensibly in depth.'

From the foot of the Monghodjar mountains to the banks of the Syr-daria, a distance of more than 270 miles, not a single river traverses the sandy desert, which is covered with a number of shallow salt-water lakes, and has exactly the appearance of land from which the sea has retreated. These lakes are in some places dried up, and have left a cake of salt of dazzling whiteness, covering a surface of sometimes six or seven square miles. From the north-eastern part of the Aral Lake to the mouth of the Syr-daria, there is a great sandy desert called Cara-Coum (meaning *black sand*), which is in some places 175 miles broad. The country along the banks of the Syr, and especially near its mouth, is tolerably fertile, but that fertility is confined to a narrow band between the desert of Cara-Coum on the north, and one no less sterile on the south, the Kizil-Coum (or *red sand*), which extends to the banks of the Amou, an ocean of sand without one drop of fresh water. The base of the Kizil-Coum is an argillaceous red sandstone, which in some places rises above the surface; the plain is covered with sandy hillocks rising from twelve to sixty feet, and the view from the top of one of these is like looking over a stormy ocean transformed into sand.

The country between the Aral Lake and the Caspian, the Turcomanian isthmus, is but little known. Humboldt says that the southern prolongation of the Ural mountains may be followed from the table-land of Gouberlinsk near Orenbourg to Oust-ourt, between the Aral Lake and the Caspian. The chain of low hills of the Great Bourzouk, on the northern side of the lake, spreads out towards the west, and turning south extends through the isthmus to within ten days' journey of the town of Khiva; and there is a range of mountains in the isthmus called by the Kalmucks Mangislowski Gori. The caravans between Astracan and Khiva, and between Orenbourg and Khiva, pass through this isthmus, the route to Orenbourg lying along the shore of the Aral Lake, and the distance between the two places being about 470 miles. The English traveller, Thompson, who accompanied this caravan in 1710, describes the lake as being bounded on the north-west by rocky cliffs.

It has been supposed that the Aral Lake and the Caspian were at one time united; the Greek geographers appear to have been of this opinion, or rather were ignorant of the existence of the Aral Lake, for they make the Oxus and the Iaxartes flow into the eastern part of the Caspian. But until we are better acquainted with the structure of the isthmus, no sound opinion can be formed on the subject. That this part of Asia has undergone great changes in its physical structure, and that the relative position of land and water has materially altered since the existence of the Caspian Sea, there can be no doubt; but to what extent these have taken place within the historical æra can only be determined by a much more minute examination of the country than has yet been made, and by careful researches into the nature of the organic remains which are imbedded in the soil that has been abandoned by the waters. The narrowest part of the isthmus is not less than 150 miles wide, and a series of barometrical measurements by Messrs. Duhamel and Anjou of the French navy, from the Caspian to the Bay of Mervoy Koultouk, on the western shore of the Aral Lake, have proved that the surface of the lake is 117 feet above that of the Caspian.

These steppes and sandy deserts cannot, from their nature, support a great variety of animals and plants. Violent heats in summer, succeeded by very rigorous winters, are unfavourable to the growth of trees or even of shrubs. Poplars and willows, which attain a height of five or six feet, are met with in groups in those oases where a river has overflowed its banks and deposited a covering of fertile soil, or where there are springs of fresh water. A species of tamarisk is common, and attains in favoured spots a height of twelve or fourteen feet. Liliaceous plants of the genera *hypoxis*, *iris*, *anthericum*, *asphodelus*, &c., are very generally diffused, and their bulbous roots are the principal food of the mammiferous quadrupeds found in these countries. These are chiefly of the smaller sized kinds, and such as burrow in the ground. Different species of the rat, mouse, dormouse, and marmot, are abundant, and the Baikal hare

is not uncommon. Among carnivorous animals there are different species of the fox, marten, weasel, &c. For the botany and zoology of these countries the reader may consult Pallas's *Travels*, and Dr. Pander's *Appendix to Meyendorff's Travels*; A. W. Kephallides, *De Historia Maris Caspii*; Engelhardt and Parrot, *Reise in den Kaukasus*; Meyendorff, *Voyage d'Orenbourg à Boukhara*; Humboldt, *Fragmens Asiaticques*.

ARALIA'CEÆ are a small natural order of plants, nearly related to the umbelliferous tribe, from which they are solely known by their young fruit consisting of more parts than two. They are frequently shrubby, and not uncommonly furnished with powerful hard prickles; but they often are also herbaceous and unarmed, like umbelliferous plants themselves. As an illustration of the order, the American ginseng, *Panax quinquefolium*, may be taken.

[*Panax quinquefolium*.]

1. A barren flower.
2. A fertile flower.
3. Ovarium and styles.
4. Fruit cut in half, with the seeds projecting.
5. A section of a seed, showing its minute embryo.

This plant, which is nearly related to the celebrated stimulating drug called *ginseng* by the Chinese (see *PANAX*), is found occasionally on the mountains of America, from Canada to the Carolinas. It has long since been introduced into our gardens, but it is now seldom seen. This natural order seems to possess little or no sensible properties, for the singular invigorating power ascribed to ginseng by the Chinese is considered to be apocryphal.

ARAM, אֲרָם, literally, the *high land*, is a geographical designation given in the Old Testament to all the countries between Phœnicia, Palestine, Arabia, the Tigris, and Armenia, or to those countries which the Greeks called Syria and Mesopotamia (Jer. vii. 8; 1 Kings xx. 26). Aram was divided into

1. Aram of Damascus אֲרָם דַּמְשֶׁק, the territory of Damascus, whose rulers waged almost continual war with the Hebrews from the time of David to that of the Babylonian exile (2 Sam. viii. 6; 1 Kings xi. 24, seq.; xvi. 5, seq.).
2. אֲרָם צֹבָה, Aram-Zobah, which was, according to Syrian authorities, Nisibin, the Greek Nisibis. But this cannot be, because Nisibin is in Aram Naharam, or Mesopotamia, which according to Psal. lx., differs from Aram-Zobah. The passage to which we refer belongs to the

Israel, carried to Assyria by Shalmaneser, retained their former language, and caused it to spread in the neighbourhood of their places of residence, even before the destruction of the kingdom of Judah. At a later period, the Babylonish-Chaldean governors who ruled over Palestine; the standing forces which they had brought with them for the preservation of tranquillity, and which were composed of Aramaeans and Chaldeans (2 Kings xxiv. 2); the host of foreign officers in their train, and the transactions of all public business in the Babylonish-Aramaean dialect, must have greatly tended to restrain the use of the national Hebrew dialect, since the Jews, who held public offices, or stood in any other near connexion with the new rulers, were compelled to become familiar with the ordinary dialect of these rulers. There is also reason to suppose that the Babylonish had still earlier been the court language at Jerusalem (see 2 Kings xvii. 26.)

The Aramaean language derives peculiar interest from having been spoken generally by the inhabitants of Palestine, from the Babylonian captivity to the final and general dispersion of the Jews. We find that Jesus Christ, when repeating on the cross the beginning of the twenty-second Psalm, does not quote the Hebrew original, but the Aramaic version. Many other occasional quotations and expressions used in the New Testament and in the writings of Josephus indicate the prevalence of the Aramaic language in Palestine in the age of Christ. The Greek, however, had been long firmly established in Palestine, where it was first introduced by the Macedonian conquests, and extended under the dynasty of the Seleucidae. We know, both from positive testimony and the indirect evidence of inscriptions, &c., that Greek must have been as common in Palestine at this period as the French now is in Alsace, though it was no more the native tongue than the French now is in the province just mentioned. Greek was also the language of science and learning, as it contained nearly all the knowledge which at that time existed. Concerning the language of Palestine in the age of Christ, compare the dissertations of De Rossi and Pfannkuche, and a chapter in Hug's introduction to the New Testament; which have been translated partly in America, by Robinson, in the *Biblical Repository* for 1831, and partly in Edinburgh, in the *Biblical Cabinet*, 1833, vol. i. The standard work on the Aramaic language is, *Andreae Theophili Hofmanni Grammaticae Syriacae libri tres, cum tabulis varia Scripturae Aramaeae genera exhibentibus*, Halle, 1827, 4to.

English readers may compare Yates's *Syriac Grammar*; Harris's *Chaldee Grammar*, 1824, 8vo.; and ספר השו"ס, a Hebrew and English Lexicon, containing all the words of the Old Testament, with the Chaldee words in Daniel, Ezra, and the Targums, and also the Talmudical and Rabbinical words derived from them, by Selig Newman, London, 1824, 8vo., price 21s.

Strabo calls the Aramaeans (*Geogr. i. p. 112, ed. Siebenk.*) Ἀραμαῖοι καὶ Ἀραμαῖον, and Ἀραμαῖον. Comp. Stephanus Byz. under Ἀραμα; and Gesenius, *Commentar zum Jesaiah*, l. i. 688, to chap. xxii. 6.

ARANDA, DON PEDRO PABLO ABARCA DE BOLEA, COUNT OF, descended from a very ancient and noble family in Aragon, was born about the year 1718, and embraced the profession of arms. In 1743 he was severely wounded in an engagement against the Austrians, near Bologna in Italy, and left for dead on the field. The day after the battle one of his servants happened to pass by, and having recognised his master among a heap of bodies, procured him the necessary assistance. Aranda was appointed ambassador to Frederic Augustus II., elector of Saxony and king of Poland. On his return to Spain, he was sent to Portugal to supersede the Marquis of Sarria in the command of the Spanish army then invading Portugal. In August, 1762, he reduced Almeida and other places; and soon after peace was made. In 1765 Aranda was appointed captain-general of Valencia, and in the following year he was called to Madrid, that capital being then in a state of violent commotion against the minister Squillace. The conduct of Aranda in this emergency fully corresponded to the confidence placed in his talents. He was honoured with the presidency of the council of Castile. Not only was tranquillity restored in that capital, but by making a new municipal division of the city, by the establishment of a permanent garrison, and by other prudent regulations, the count prevented the recurrence of similar riots. During his travels in Europe, Aranda had improved his natural talents and knowledge.

In Prussia, he had devoted his attention in particular to examine the military tactics adopted by the great Frederic, which were then the admiration of Europe, with a view to apply them to the military system of his own country. With a courage, firmness, and perseverance which no obstacle could daunt, he undertook the reform of abuses in every branch of the administration, and the adoption of those improvements of which his country stood so much in need. He diminished the asylums, confining their number to two churches in the capital of every province, and he reformed the municipal system by the establishment of the *diputados del comun*, or, deputies of the commons. The coin, which was greatly debased, was called in and replaced by sound money; a new and improved plan was adopted for recruiting the army; the order of the Jesuits was abolished, and new houses of education established; and the thickets of the Sierra Morena, until then the abode of wolves and desperate banditti, were colonized with an industrious population of Germans, Swiss, and French, through the efforts of the philanthropic Olavide. Aranda also endeavoured to check the papal power in Spain by reforming the tribunal called the *municiatura*, which he composed of six native ecclesiastics proposed by the king, and confirmed by the pope, instead of a body of Roman jurists appointed by the pope alone, of which it formerly consisted; and by establishing a law that no papal decree should be valid in Spain without having first received the sanction of the council of Castile. The *pasos de semana santa*, or, holy week dramatic processions, the *rosarios*, and other pious or rather impious exhibitions, were also abolished by him. The power of the Inquisition was greatly diminished by the establishment of a political censorship, and, indeed, had it not been for the imprudence of the French encyclopedists, he would, perhaps, have abolished that sanguinary tribunal. When at Paris, Aranda frequented the society of Voltaire, D'Alembert, and other philosophers of that period, where he had often expressed his intention to abolish the Inquisition if ever he came into power. Not long after his appointment to the presidency of the council of Castile, an article appeared in some of the publications of the encyclopedists (see Coxe's *Memoirs*, vol. iv. ch. 67, p. 408, 4to. edit. 1815), wherein this confidential conversation was revealed to the world. When Aranda read this account, he was greatly vexed, and said, 'this imprudent disclosure will ruin me, and foil all my plans.' He was not mistaken in his conjecture: such a ferment was raised against him, that foreseeing his ruin unavoidable, he solicited to be appointed ambassador to France, and retired from the administration A.D. 1773. Aranda returned from Paris in November, 1787, but still remained in disgrace, with the honorary title of counsellor of state. After the accession of Charles IV. in 1788, Aranda superseded count Florida Blanca in the office of prime minister (1792); but he was not long after dismissed through the intrigues of Godoy. He retained, however, the presidency of the council of Castile until he was exiled to his native province, where he died, according to some authorities, in 1794, and according to others, which appear more to be depended on, in 1799, leaving behind him a young widow, without any children.

Aranda was a man of profound mind, and of a firmness characteristic of the Aragonese. Coxe relates the following anecdote. One day when Aranda was urging, with his usual perseverance, one of his measures of improvement, the king, who had exhausted all his objections against it, said: 'Count, you are as obstinate as an Aragonese mule.' 'Please your majesty,' replied the minister, 'I know another who is more obstinate than I.' On the question 'who?' 'His sacred majesty, Charles III., king of Spain and the Indies,' answered Aranda. The king smiled at the sally of his minister, and dismissed him with his usual complacency. The Marquis Caraccioli compared Aranda's mind to a deep well with a narrow mouth. (See Coxe's *Memoirs of the House of Bourbon*, vol. iv. ch. 67.)

ARANJAA. [See SPIDER.]

ARANJUEZ (Ara Jovis), a town in Spain near the confluence of the Tagus and Jarama, in a plain surrounded by high and bleak hills, in 40° 2' N. lat., 3° 36' W. long., twenty-six miles S.S.E. of Madrid. Aranjuez was once a country-residence of the master of the order of Santiago; it came afterwards into the possession of the crown, and the kings selected it for their residence during the spring months, on account of its advantageous situation and the mildness of its climate. Philip II. was the first king

who possessed it. The palace is a very handsome square building, with twenty-one windows in front, and a turret at each extremity. It was designed by the architect Juan de Herrera, and was begun under Philip II.; Philip V., Fernando VI., and Charles III. continued it, and Charles IV., who delighted in this residence, greatly contributed to its embellishment. The gardens, which are watered by the Tagus, are particularly admired for their natural beauties. In the time of the Peninsular war, this place suffered a truly Vandalic devastation. Not only the gardens were destroyed, but even the Ceres, a fine statue of the fountain of that name, entirely disappeared.

The town is of modern construction; the streets are broad, very well paved, and intersect each other at right angles. The actual population of Aranjuez amounts to 5245, which number is more than doubled during the residence of the court. In 1808, part of the ground, which had till that time been uncultivated, and was retained by the king as an appendage to the palace, was let to farmers, and brought into cultivation by them. From that period the population became more numerous; and the increased production of grain in consequence has had considerable influence on the markets of Madrid. Charles IV. established here a farm-house and menagerie, in which various foreign animals were very successfully reared. Trees and other productions of distant climates were also cultivated. The loss caused during the war has been partly repaired. (See Miñano; Ponz, carta v. vol. i.)

ARARAT (ԱՐԱՐԱՏ), the name of a region in the centre of the high-lands of Armenia, which was included in the former Persian province of Aran, but now in the present Russian government of Armenia (2 Kings xix. 37); the Armenians call it to this day Ararat. The mountains of this region are called the mountains of Ararat, on which the Ark rested (Gen. viii. 4). The whole of Armenia is called the kingdom of Ararat (Jer. li. 27). That Ararat was originally a name of the region appears from Moses of Chorene (*Compendium Geographice Universalis*, p. 46, 52), who derives the name from Araji Arat, the spot of Araji, who was king of Armenia in the days of Semiramis. (See Schroeder's *Thesaurus Lingue Armeniacæ*, p. 55; and Moses Chorenensis, *Hist. Armen.* ed. Whiston, pp. 289, 308, 358, 361.)

The ancient interpreters render **ԱՐԱՐԱՏ**, Ararat, in Genesis and 2 Kings, by the word Armenia, as Aquila did with Symmachus, Theodotion, and the Vulgate. At present the Armenians give the name Ararat in preference to that mountain, which they call also Macis or Massis, and the Persians, Koh-i-Nuh, the mountain of Noah. (See Wahl's *Asien*, pp. 518, 806, &c.; Gesenii *Thesaurus*.)

ARARAT, MOUNT, a celebrated mountain of Armenia, situated to the south-west of the town of Erivan, about five miles from the right bank of the river Aras, the ancient Araxes. It rises majestically from the midst of a great plain, detached from the other mountains of the country, in two conical peaks, one of which rises far above the limit of eternal snow. Humboldt, on the authority of the Russian traveller, Parrot, states its height above the level of the sea to be 2700 toises, which is equal to 17,260 English feet. Thus it is 6389 feet higher than *Ætna*, 4792 feet higher than the volcanic peak of Tenerife, and exceeds by 1528 feet Mont Blanc, the point of greatest elevation in Europe. It does not, however, ascend to this great height from its base, for it stands upon the table-land of Armenia, which is stated by Ritter to be 7000 feet above the level of the sea. The smaller cone is separated from the greater by a plain of great extent, and is considerably lower, for the snow disappears from its summit in summer, and it serves as a calendar to the surrounding people, who regulate their agricultural operations by the progress of the melting of the snow on the little Ararat. The appearance of this mountain is well described in the travels of Sir R. Ker Porter and of Mr. Morier. The former approached it from the north, and paints in glowing colours the magnificence of the spectacle when he first came in sight of Ararat, rising from a widely-extended green plain, fertilized by the clear waters of the Araxes, and covered with villages. He had the advantage of seeing it unveiled by clouds from its base to its summit, and the ice-clad cones shone with dazzling splendour against the clear blue expanse of the heavens. Mr. Morier, who approached it from the south, speaks in strong terms of admiration of the beauty of its form. Such a mountain must natu-

rally be seen from a vast distance, and it is said to serve as a landmark to the navigators of the Caspian sea. A remarkable circumstance, as connected with the traditions belonging to this mountain has been observed, namely, that when seen from afar and in certain positions, the summit has a striking resemblance to a ship. The whole country round is full of traditionary stories about Noah's ark and the flood. The Armenians call Ararat, Massisseusar, or Mountain of the Ark, the Persians Koh-i-Nuh, or Mountain of Noah. It is a common belief that the remains of the ark still exist on the summit, and that the wood is converted into stone. In a church at Nova Schamachia, near the junction of the Aras with the Kur, they show a cross, made many centuries ago, out of a plank of the ark. Peter the Great, in 1720, sent some Armenians and Russians to ascertain the fact, and they reported that, to their amazement, nothing of the kind was to be seen. The report, however, in no way shook the faith of the true believers; who, with great reason, rested upon the conviction that the summit of the mountain is unapproachable. The Armenian monk who brought the plank from which the cross was formed, when nearly exhausted in his effort, was met by an angel, who had compassion on him, and handed to him the precious relic. The higher regions are usually covered with clouds, and when these are dispersed and the summit is unveiled, the devout Armenians fall on the ground, cross themselves, and pray. At Erivan, they show the spot where Noah first planted the vine, and the name of another town, Nachichevan, or Nakhdjovan, means, according to Chardin, 'place of descent,' being the place where Noah first settled when he came out of the ark.

Several attempts have been made to reach the top of the mountain, but no one has got much beyond the snow limit. The enterprising Tournefort, in 1700, made the attempt: but after undergoing great fatigue he was obliged to give it up. About twenty-five years ago, a Turkish pacha fitted out an expedition and built huts well supplied with provisions at different stations; but his people suffered severely in their struggle amid the snow and masses of ice in so rarefied an atmosphere, and returned without accomplishing their purpose. From all the accounts we have of its structure, there is little reason to doubt that Ararat is, partly at least, a volcanic mountain. Its conical shape and its detached position are in favour of this supposition. Tournefort, describing the ascent, says, that they passed over a great and beautiful plain to the base of the mountain; that at the beginning of the ascent they found moving sand, which continued for a great way up, their feet sinking in it so that they slipped back at each step, which made the ascent exceedingly laborious; that they afterwards came upon sharp fragments which cut their shoes to pieces, and then to large blocks piled upon one another. This description indicates a volcanic mountain covered with ashes and lava in a state of decomposition, but it is rendered still more clear by what Colonel Monteith says in his Memoir in the third volume of the *Journal of the Geographical Society*. He ascended some way up Mount Ararat, and says that he passed great quantities of pumice-stone. On the side of the greater cone there is a vast cleft, which Tournefort describes as a deep abyss, with lofty precipitous sides, and sharp pinnacles of black rock. This cleft is so great that it can be seen distinctly from Erivan; and between it and the foot of the mountain there is a succession of low round-topped eminences. One can hardly hesitate to consider this hollow as the crater of an eruption from the side of the mountain, an event which would be in accordance with the phenomena observed in all volcanos of great elevation; for in these, such as the Peak of Tenerife and *Ætna*, there is seldom an eruption from the top, but almost always from the sides, as if the great mass heaped up by successive ejections afforded a greater resistance to the volcanic force than the sides. But no eruption, nor any indication of volcanic action, has been recorded within the historical era. In the Chronicle kept by the monks of the monastery of Etschmajadzen, in which everything relative to this sacred mountain has been carefully recorded for the last 800 years, there is no mention of any eruption. Many parts of the region around Ararat are decidedly volcanic: Sevellan, a mountain 13,000 feet high, between Ararat and the Caspian, is volcanic, and Colonel Monteith thinks that it has perhaps been the latest in activity in that country. Extensive beds of lava are visible on its side, and there are warm springs all round the base. The same traveller, describing the lake of Goukka, or Sevan, a body of water 47 miles long,

and in some places 21 broad, situated eastward of Erivan and between Ararat and Sevelan, says, that he found on its banks high perpendicular cliffs of lava, vast quantities of obsidian or volcanic glass scattered over the country, and the shore of the lake covered with pumice-stone, light enough to float on the water.

A remarkable circumstance is mentioned by Tournefort connected with Mount Ararat, namely, that the middle region, and even the borders of the snow limit, are inhabited by tigers. He says that he saw them within 700 yards of him, and that he and his people threw themselves on the ground for the sake of concealment while the tigers passed by. He adds that the young ones are caught in traps by the people round the mountain to be exhibited in shows of wild beasts throughout Persia. (Tournefort, *Voyage dans le Levant*; Sir R. Ker Porter's *Travels*; Mr. Morier's *Travels*; Humboldt, *Fragments Asiatiques*; Von Hoff, *Geschichte der Veränderungen der Erdoberfläche*; Monteith's *Tour through Aserbaidjan*, &c.)

ARARAT, or PILOT MOUNTAIN. [See NORTH CAROLINA.]

ARAS, or ERAS, is a large river of Armenia, mentioned by Greek and Roman writers under the name of Araxes. It rises at Dekman in Mount Bin-Ghent, from a number of sources, about 20 miles S.E. of Erzerum, and about 39° 47' N. lat., 41° 9' E. long. A branch of the North Fræt or Euphrates rises on the opposite or western side of the same elevation, a fact known to Pliny (vi. 9). Its general course from this point is east, with a slight deviation to the north, through Basen and along the borders of the province of Curs to within eight or ten miles of Erivan, at a place called Sabathaphos. From this point it takes a bend to the S.E. (passing the eastern base of Ararat) as far as the ruins of old Julfa in the province of Nakhidjovan: at Sabathaphos, the frontier of Erivan, its breadth, according to Tournefort, is about equal to that of the Seine at Paris. Erivan and Nakhidjovan are now in the Russian province of Armenia, which was ceded by Persia in 1828. Between the bend to the S.E. and the latitude of Ararat, the river makes numerous windings. From the ruins of Julfa (within a few miles, the most southern point of the river's course) the general course of the river is E. to the limits of Khaphan, where it turns N.E., running in this part of its course, with some considerable bends, through part of Nakhidjovan, Kaplan, and the Karabagh to near Jevat, where it is joined by the Kur (Cyrus) coming from the Caucasus. The united stream, after running about thirty miles east, turns suddenly to the south, and enters the Caspian Lake by three mouths (about 39° 20' N. lat.): a long projecting tongue of land, or delta, is here formed between the Caspian on the east, and the small gulf of Kizilgatch on the west. After its junction with the Kur, the river separates Great Armenia on the south from Shirvan, and part of the antient Albania on the north. Its length cannot be less than 600 or 700 miles, if its general course on our maps is correct; but the Djihan-Numa assigns to it a length of only 150 parasangs.

The Araxes receives numerous tributaries, but none of them are of any considerable magnitude compared with the chief stream: on the north side, the Hassan-Caleh in Basen, the Dhenkli, which comes from a lake of the same name in Curs, and the Arpatchai (according to Remel, the Harpasus of Xenophon, *Anab.* iv. 7) in the same province; the Arpatchai runs in a deep ravine, with numerous ruined castles on its high banks; the Zenghi, one branch of which flows from the large lake Sevan, said to be about 5000 feet above the sea, runs past Erivan, and joins the Araxes twenty four miles from this town: the river of Nakhidjovan, &c. Other streams of about the same size, but fewer in number, enter it on the south bank. There is a bridge at Dekman, one in the province of Basen, a third at Khaphan, and a fourth at Jevat, below the junction of the Kur. There was a bridge at Julfa (38° 54' N. lat.), of which the ruins remain, and similar traces of bridges are seen in other parts of the river. The Aras, when not swollen by sudden rains or the melting of the snow on the high mountains of Armenia, is easily passed either in boats or at the fords, particularly in the upper parts; but in its swollen state the current is extremely impetuous and dangerous. In Khaphan there is a considerable cataract at a place called Erespar; it is said (*Journal Asiatique*), that the fall leaves at the bottom a space wide enough to allow men and a whole caravan to pass. But there is pro-

bably some exaggeration in this statement, if these falls are the same which Colonel Monteith describes as not more than six feet high, and which he considers to be the falls of Erespar, or Aras Bar. This is probably the cataract alluded to by Strabo (p. 531), according to whom there was an old tradition, that the Araxes, after its exit from the high mountain region, spread out into a great lake, till at length a rent was effected in the mountain barrier like that which made a passage for the waters of the Penens in Thessaly, and the plain was drained. The position of this cataract appears also to correspond to the great break in the mountain chain which Colonel Monteith places about forty miles below Julfa. (See Monteith's *Map*, and Rennell's *Atlas*.)

Many of the alluents of the Araxes rise in mountains covered with oaks, pines, and firs. The water of the river is pure and wholesome. It abounds in a great variety of excellent fish, of which the chief are the janar, a fish of large size and delicate flavour, met with in the province of Basen; the leog, still larger than the janar, a long slender-shaped fish; the deglin-port, which sometimes weighs an okla (15 ounces, if that of Constantinople is meant), and the carmrakhet (red-skin), so called from its external colour, but the flesh itself is white.

The Araxes was known to Herodotus, though only from hearsay (i. 202, iv. 40); he describes it as flowing eastward from the country of the Matieni, and dividing at its approach to the Caspian into forty channels, only one of which made its way clear to the Lake, the rest being obstructed so as to form swamps. This seems in substance to agree with Strabo's description of the outlets of the Cyrus and the Araxes (p. 501). It is a question much disputed, what river Herodotus means by the Araxes; but we think there is little doubt that he meant the Aras of Armenia. If this supposition will not reconcile all the difficulties, as it certainly will not, his ignorance of the regions bordering on the west, east, and south of the Caspian, helps to complete the solution of our difficulties. (See Mannert, *Geog. der Griechen und Römer, Armenien*.)

Strabo, according to the fashion of his countrymen, explains the word Araxes as being of Greek origin, and having reference (according to its supposed derivation from ἀράσσω, to strike, or break) to the gap where it passes through the mountains. 'The Penens of Thessaly,' he adds, 'was once called Araxes on account of its having separated (καὶ τὸ ἀραππῆσαι) Ossa from Olympus by forming the gorge of Tempe.' Such remarks are mere trifling; and it is more important to observe that the name Araxes was given to various rivers and places in countries widely separated. An Araxes (now the *Bund Emir*) flowed through mountainous Persia and entered the Lake of Bakhtegan. Xenophon, in his *Anabasis*, gives the name of Araxes to the Aborras, or Chaborras, now the Khabour, an affluent of the Euphrates. Araxus was also the name of a promontory on the N.W. coast of the Peloponnesus, near the confines of Elis and Achaia. (See *Journal Asiatique de Paris*, No. 71, 1833; *Journal of London Geographical Society*, vol. iii.)

ARAT'US, the author of an astronomical poem in Greek, which has come down to us. Neither the date of his birth nor death is exactly known; but, from other circumstances, we infer that he must have been alive in the 125th Olympiad, that is, he lived about the time of the first Punic war, and must be placed, as to the time of his notoriety, between Euclid and Apollonius of Perga, with both of whom, in the most extended sense, he may have been contemporary. The materials for his life are chiefly collected from an anonymous account of him in Greek, printed by Petavius in his *Uranologion*, and various scattered notices and allusions in classical authors. There are, in fact, three anonymous lives of Aratus, besides the notices in Suidas and Eudocia. All that is worth recording amounts to this, that he was certainly born in Cilicia, some say at Tarsus, others at Soli (afterwards called Pompeiopolis); that his calling was medicine; that he was invited to the court of Antigonus Gonatus, king of Macedon, son of Demetrius Poliorcetes, where he passed the rest of his days. It is also stated that he was educated by a Stoic named Dionysius Heracleotes in the principles of that sect.

By the desire of Antigonus, Aratus turned the *Phænomena* of Eudoxus into verse. It does not appear whether he had any remarkable astronomical qualification for the task. It is a question whether he made any original observations or not; but it is certain, from the commentary of the celebrated Hipparchus, which is yet extant, that he made many altera-

tions: for this commentator frequently cites the prose of Eudoxus and the poetry of Aratus together. The work of the former has not come down to us; in fact, Aratus is the second Greek writer on astronomy extant, Autolyceus being the first. We are inclined to think that Aratus was neither an observer nor a mathematician, and for this reason, that, in his description of celestial phenomena, he uses no higher degree of precision than might have been attained by a mere spectator of the heavens. For instance: he describes the head of the dragon as never setting, but only just touching the waves. This, at his era, answered to a latitude of $38^{\circ} 7'$; but, in another place, he describes the intersection of the northern tropic and the horizon as if he was in latitude $10^{\circ} 54'$, more than $2\frac{1}{2}^{\circ}$ greater than the former. The second latitude answers to some of the southern parts of Macedonia.

The poem of Aratus is divided into two parts: the *ῥασιγέρα* or *Phænomena*, and the *δοσσηαία* or *Prognostics*; the first contains 732 lines, the second 417. It opens with a declaration of the dependence of all things upon Jupiter, whose children all men are, and who has given the stars as the guides of agriculture. The passage in italics (*ὅτι γὰρ καὶ ἄλλος λατρεῖ*) is remarkable as having been, at a much later period, quoted by St. Paul in his address to an Athenian audience (Acts of the Apostles, chap. xvii. v. 28), 'For in him we live, and move, and have our being: as certain also of your own poets have said, For we are also his offspring.' If the words in italics represent the correct text, they remarkably serve to show the notoriety of the poem, if it be recollected that Paul was a countryman of Aratus; but some manuscripts of the New Testament (see Griesbach's edition) support the reading *καὶ ἡμεῖς*.

Aratus then proceeds to lay down the doctrine of the immovability of the earth and the motion of the heavens round a fixed axis. He describes the names and configurations of all the constellations then in use, their relative times of rising and setting, the march of the sun through the zodiac, and the milky way, which is described as one of the great circles of the heavens. The planets are simply mentioned as bodies having a motion of their own, but no idea is given of the length of periods. There is nothing on the orbit of the moon, or on the unequal motion of the sun in longitude. There are many mistakes as to the placing of the stars: for example, it is said that Lyra has none but small, and Cygnus none but moderate, stars, though there is one of the first magnitude in both. There are various phenomena which are irreconcilable with any one latitude, an instance of which we have noticed: and there are others which could not have coexisted at any one epoch; for example, his separate description of the winter and summer solstice belongs to periods distant by 900 years from each other.

The book of *Prognostics* consists of predictions of the weather from observation of astronomical phenomena: except that the celebrated cycle of 19 years is mentioned in it, it adds nothing to our knowledge of the existing state of astronomy. It contains various accounts of the effect of weather upon animals, with directions, and is, on the whole, more like the *Georgics* of Virgil than any other poem of antiquity. The latter work contains several imitations of the *Prognostics*. There is not a word of astrology either in the *Phænomena* or the *Prognostics*.

Aratus is also said to have written poems on Homer, on the *Iliad*, on osteology, on medicine, a hymn to Pan, a funeral ode on his brother Myris, and a poem called *Σκυθικόν* or *Scythian*. More than thirty epistles of his were extant at the time of his anonymous biographer.

The number of commentators upon Aratus is very great. The elegance of the verse caused his work to be for a long time in circulation among the Greeks. Petavius gives a list of thirty-six commentaries in Greek; among the authors of which are Aristarchus, Geminus, Eratosthenes, and Hipparchus. The last has come down to us, and owes its origin to the difference which Hipparchus had observed between the descriptions of Aratus and his own observations. According to his account, Aratus had frequently altered Eudoxus for the worse; but the latter is also shown to have so far fallen short of what might have been expected even with the then existing means of observation, that Delambre conjectures the whole system to have been formed, not from the heavens, but from a globe, on which the stars had been incorrectly laid down.

A full account as well of Aratus as of his commentators will be found in Delambre's *Histoire de l'Astronomie An-*

cienne. The anonymous *Life of Aratus*, is, as before noticed, in the *Uranologion* of Petavius, together with the commentary of Hipparchus and another, which has been attributed sometimes to Hipparchus, sometimes to Eratosthenes, but which is given by Petavius to Achilles Tatius.

The *Phænomena* was translated into Latin by Cicero when a very young man. Several fragments of this translation still exist, and are given by Grotius in his edition of Aratus. It was also translated by Germanicus Cæsar and by Festus Avienus, both of which versions are to be found in the same edition, which was published at Leyden in 1600, and contains also the original Greek with notes.

There are numerous editions of Aratus. The first is by the elder Aldus, Venice, 1499, folio; this edition contains other writers on astronomy. The latest is by Bekker, with cholia, Berlin, 1828, 8vo. J. H. Voss published a critical edition of the Greek text of Aratus, at Heidelberg, 1824, 8vo., and accompanied it with an excellent German poetical version.

ARAT'US, son of Cleinias, was born at Sicyon 271 B.C. His native city, distinguished in the history of Greece as a school of art more than for its political importance, had long been harassed by the conflicting pretensions of various persons, who in succession became, to use the language of Greece, its tyrants or princes. Cleinias held that precarious dignity for a short time: but he was killed by Abantides, who assumed his power, and suffering a like fate gave way to Pseas, who was succeeded by Nicoteles. Aratus was but seven years old at his father's death. He fled in the tumult, and falling into humane and honourable keeping, was concealed for a time, and then conveyed to Argos. There he grew up to manhood, distinguished for his bodily powers, a frequenter of the *palaestra*, or place of exercises, and a frequent victor in the rough games which the youth of Greece loved to practise and were proud to excel in. When Nicoteles succeeded to the tyranny, Aratus was just entering upon manhood, and he became the object of that person's especial fear. This jealousy was not unfounded. Aratus already meditated the bold enterprise of restoring himself to his native country; and he endeavoured to associate in his views the numerous exiles who had been banished from Sicyon in its successive changes of masters. A few only joined him; the greater number doubted the capacity of the young and inexperienced plotter to conduct such an enterprise, and shrunk from its dangers. He persevered however, and carried on his design with secrecy and boldness. He deceived the spies whom Nicoteles employed to watch his motions, by an affectation of carelessness and riotous extravagance; and when his plans were ripe, he made a night march from Argos to Sicyon, with a small number of followers, whom his own resources, and those of his friends, enabled him to arm and retain. The details of this spirited enterprise may be read with pleasure in his life by Plutarch; he succeeded in scaling the walls, forced his way to the tyrant's residence, and mastered his guard. Nicoteles escaped by secret passages. Aratus immediately sent round the city to summon his friends: and at break of day the population assembled in the theatre, where proclamation was made that Aratus, son of Cleinias, invited the citizens to resume their liberties. This striking revolution was effected, B.C. 251, without the loss of a single life, either in the heat of contest or as a measure of policy or revenge. Still the new order of things was far from being safely established. Both justice and expedience prompted the restoration of all exiles to their civil rights: and those who returned, in number near 600, naturally sought to recover the possessions which they had formerly enjoyed. This difficulty of adjusting the conflicting claims of emigrants and actual possessors was recently experienced in France, after the restoration of the Bourbons. Aratus, seeing the newly-recovered liberty of Sicyon threatened at once by civil discord and by the ambition of Antigonus Gonatas, king of Macedonia, whose policy was directed to the establishment of tyrants in all the Grecian cities, gave up something of independence for greater security, and procured the enrolment of Sicyon as a member of the Achaean confederacy. [See ACHÆI.] Aratus had cultivated the friendship of Ptolemy Evergetes, king of Egypt, by sending presents of the most valuable productions of Grecian art; and he now undertook a voyage to Egypt, and gained so much upon the king's esteem, that he presented him with a large sum of money (150 talents), the whole of which Aratus employed, on his return to Greece,

in satisfying the indigent exiles and re-establishing concord. He was appointed commissioner, with full power to adjudicate all questions connected with their claims. Unwilling, however, to bear the whole responsibility, he associated fifteen citizens in the task; which was fulfilled with so much justice and liberality, that the restored exiles erected a brazen statue of him, with a laudatory inscription, in testimony of their gratitude.

The talents and services, and perhaps the intrigues, of Aratus soon made him captain-general (*strategus*) of the Achaean league; which under his prudent counsels grew up from a confederacy of a few insignificant cities for mutual defence into a formidable body exercising a powerful influence in Greece. He held this office for the first time B.C. 245; in which year he invaded Locris and Calydonia, on the northern side of the Corinthian gulf. Being re-elected in 243, after the necessary interval of a year, he conceived the project of wresting Corinth from Antigonus. The Acrocorinthus, or citadel, was considered the key of southern Greece. Antigonus, after long coveting, at last gained possession of it by treachery, and held it with a strong garrison. But the faithlessness of two soldiers in his service disclosed a weak point in the fortifications and a practicable path up the precipitous mountain; and Aratus undertook the bold enterprise of mastering the strongest fortress of Greece, by night, with only 400 men. For the particulars of this remarkable escalade we must again refer the reader to Plutarch. It proved successful, though not without much difficulty; and the advantage gained was secured by the arrival of a larger body of Achaean troops, to whom the Corinthians gladly gave admittance. Early in the morning the citizens assembled in the theatre, and Aratus, appearing on the stage in his armour, was received with the warmest demonstrations of joy and gratitude. He restored to them the keys of the city, which, since the reign of Philip of Macedon, they had not had in keeping, and invited them to join the Achaean league. They acceded to the proposal; and the Acrocorinthus was thenceforward occupied by an Achaean garrison. Aratus also gained possession of Lechæum, one of the ports of Corinth, and before the end of his year of office prevailed on the state of Megaris to join the league. Troezen and Epidaurus soon followed the example, and the confederacy was further strengthened by the friendship and support of the king of Egypt.

The powerful city of Argos had long been held by a succession of tyrants. To re-establish the commonwealth was a favourite object with Aratus; and he made several attempts, which proved abortive, not being seconded by the temper and wishes of the people. It was not until B.C. 227 that Aristomachus, being tyrant for the time, was induced by the counsels of Aratus to resign his power, and bring over Argos to the Achaean league. Cleonæ, an ancient city of the Argian territory, had become a member of it some time before. Philus was admitted to it at the same time. The resignation of Aristomachus was probably prompted by the example of Lysias, tyrant of Megalopolis, who, emulating the virtues and the reputation of Aratus (if Plutarch rightly represents his motives), had retired into private life, and induced his city to join the league, B.C. 232. Lysias was rewarded by the popular favour, and was three times chosen strategus, alternately with Aratus. Each probably felt jealous of the other, for continual bickerings existed between them. Lysias was killed in battle with the Lacedæmonians, about B.C. 225.

In prosecution of his favourite policy, Aratus made several attempts to drive the Macedonians from Athens. That which he could not obtain by arms, he effected by money, soon after Antigonus, surnamed Doson, began to reign, B.C. 237, when Diogenes, the Macedonian governor, delivered up the fortresses which he held, together with the isle of Salamis, for a bribe of 150 talents, of which Aratus contributed twenty from his private fortune. At the same time Argina, Hermione, and a considerable part of Arcadia joined the Achaean league.

It will be seen, on reference to the map of Greece, that during a period of about twenty years, in which the affairs of the Achaean league had been chiefly managed by Aratus, that body had grown up from the union of a few weak cities for mutual defence into a powerful confederation, including the whole northern coast of Peloponnesus from the promontory of Araxus to Scyllæum, with the lands of Corinth and Megara, and the greater part of Arcadia. This change was wrought, in a great measure, by the probity and high personal

character of Aratus; who, as we are told by Plutarch, even during those years when the forms of the constitution prevented his having the name of strategus, still had the authority of the office, 'because the people saw that he set neither glory, nor wealth, nor the friendship of kings, nor the good of his own country, nor any other thing, before the general advantage of the Achaean league.' Accordingly, he was elected general oftener, it should seem, than the law strictly allowed; for in a period of thirty years from his first elevation, B.C. 245, to his death, B.C. 213, he held the office seventeen times. The leading feature of his policy was the expulsion of those petty tyrants whom it had been the favourite object of the Macedonian kings to establish in all the cities of Greece, as the readiest way of retaining them in subjection; to exclude the Macedonians from Peloponnesus; and to give vigour to the Greek nation by uniting them in one confederacy of well-organized commonwealths. We have seen that he succeeded to a great extent in this virtuous, and judicious, and truly patriotic design. But he was constantly opposed by the Macedonian kings, Antigonus and his son Demetrius, and very frequently by the Ætolians, a warlike and turbulent people, who derived much of their wealth from plunder, and were ever opposed to peace and to good order. Hence, though sometimes led to alliance with the Achæans by a common jealousy of the power of Macedon, they were much more frequently arrayed against them; and in one of their predatory incursions into Peloponnesus, they were defeated by Aratus at Pellene with considerable slaughter. By this victory Aratus acquired considerable renown: for the most part, however, he was unsuccessful in the open field, and cautious to excess in his movements; a singular fault in one who was so bold in attempting, and so successful in effecting, the capture of the strongest fortresses by sudden assault, a species of enterprise in which, above all others, prompt contrivance and bold execution are required. His personal courage did not escape unquestioned, and in certain circumstances he doubtless betrayed a weakness and want of steady purpose. He seems to have done best where he had least time for reflection: he saw and did what was expedient on the spur of the moment, but hesitated and became perplexed where he had time to deliberate: so that, according to Polybius, qualities totally opposite were united in him, and in different circumstances he was no longer the same man.

Shortly after the accession of Argos to the Achaean league, war broke out (B.C. 226) between the Lacedæmonians and Achæans; a war to which neither party seems to have been averse. The Achæans looked with contempt upon the youth of Cleomenes, king of Sparta; and Cleomenes was both desirous of military fame, and hoped to find in the events of war some favourable opportunity for effecting the civil changes at home which he desired. Aristomachus, the late tyrant of Argos, was strategus when the war began. Aratus had dissuaded him from engaging in it, and had sufficient influence to prevent his giving battle when the hostile armies were first opposed to each other at Pallantium, in Arcadia, though the Achæans were 20,000 strong, and the Lacedæmonian army consisted of only 5000 men. This raised the spirits of the Lacedæmonians, and in the following campaigns Cleomenes was generally successful. He defeated Aratus in the next year at Mount Lyceum in Arcadia; but the Achaean general retrieved this mishap by gaining possession of Mantinea in his retreat. Soon after, another battle was won by Cleomenes under the walls of Megalopolis, in which Lysias was killed; and on this occasion Aratus was loudly, and it should seem justly, censured for his slowness and want of enterprise. The war languished while Cleomenes was occupied by the revolution in Sparta; but when that was completed, he resumed his successful career. He regained Mantinea, invaded Achæa, and won a great victory at Dyme; he took Pellene and some other towns; Argos, Philus, Epidaurus, Træzen, Hermione, went over to him; and Corinth passed into his hands, with the exception of the Acrocorinthus, which still remained in custody of the Achæans. Aratus, though re-elected, had refused to accept the office of strategus, whether from anger at some censures which had been passed on him after his late defeats, or from a fear of being unable to extricate the Achæans from the difficulties in which the war with Sparta had involved them. He was much censured, both in his own time and afterwards, for having brought the vessel of the state into danger, and then abandoning the helm to others. Though ostensibly in a private station, he

continued to exercise his usual controlling influence. To extricate himself from the difficulties in which he was involved, he adopted the disgraceful expedient of inviting back the Macedonians, whom he had been at so much pains to expel from the Peloponnesus. He had been already engaged in negotiation with Antigonus Doson, during that course of successes which put Argos and so many other places into the hands of Cleomenes. Having prepared the way for reconciliation, and ascertained that Antigonus was not unwilling to form an alliance with the Achæans after the battle of Dyne, he advised them to make a formal application to that monarch for assistance. Antigonus, however, required that the Acrocorinthus should be placed in his hands as the price of his services; and this open invasion of the liberties of Corinth, a confederate city, could not be tolerated. But the voluntary revolt of the Corinthians removed this difficulty, and the Achæans forthwith transferred the citadel to the custody of Antigonus. Cleomenes took up a station to defend the Isthmus, but he was obliged to abandon it in consequence of a counter-revolution at Argos, which returned to the Achæan alliance, and Antigonus entered Peloponnesus unopposed (B.C. 224). He took several cities in Arcadia, which he delivered to the Megalopolitans, and going to Ægium to confer with the Achæan congress, was appointed commander-in-chief of the confederate army. In the following year he took Tegea, Orchomenus, and Mantinea; but this success was counterbalanced by the loss of Megalopolis, which Cleomenes plundered, and almost destroyed. In the following year, B.C. 222, Antigonus defeated Cleomenes in the decisive battle of Sellasia, which put an end to the war. The Macedonian king entered unopposed into Sparta, but he treated it with respect, and contented himself with undoing the changes which Cleomenes had made. Cleomenes fled to Egypt, where he died, and Antigonus died shortly after in Macedonia, enjoining Philip, his nephew and successor, to regulate his policy in Greece strictly by the counsels of Aratus.

Peace followed the battle of Sellasia, and for a time Peloponnesus was quiet. This, however, was of short duration. Of the character of the Ætolian tribes we have already spoken. Sometimes in alliance, sometimes at war, with the Achæans, as their interest prompted, they were never in firm friendship with a people whose conduct was directed in the main to the upholding of peace and order, while they led themselves a life of rapine, gathering by the strong hand those luxuries from their neighbours which they were too indolent or ignorant to procure by honest industry. A series of gross provocations induced the Achæans to declare war against these turbulent mountaineers. Aratus took an active part in urging this measure, and being elected strategus for the ensuing year (it was near the period of changing officers when these transactions occurred), he anticipated by five days the proper time for entering on his office, that he might hasten his march against the Ætolians, who were already engaged in ravaging Messenia. He failed signally in the conduct of this campaign: once at Caphyæ, by giving battle too hastily, in which he was defeated, B.C. 220; afterwards by suffering the enemy to continue their depredations unchecked, and neglecting opportunities of which a more active general would have availed himself. Great complaints were made at the next congress; and Aratus himself seems to have been sensible that his conduct was open to exception, since, in defending himself, he urged his former services as a plea for passing lightly over his error, if it should be judged that any fault had been committed by him. The appeal was probably successful; and he continued to retain his wonted influence.

In the course of this war, Philip II., the young king of Macedonia, acted as general of the Macedonian and Achæan army. For some time he observed his uncle's dying commands, and regulated his own conduct strictly after the counsels of Aratus; and he displayed such ability, prudence, and justice, as gave rise to the fairest expectations of his reign. Some however of his confidential ministers, jealous of the influence, and opposed to the views of Aratus, used every means to destroy that statesman's weight with their prince, and they induced Philip to procure the election of Eperatus as strategus, an avowed opponent of Aratus, to the exclusion of Aratus himself. This interference produced much discontent among the Achæans. The successful candidate was a person of little estimation, and humble ability, and affairs went on so ill in his hands, that Philip was forced to seek a reconciliation with Aratus.

The war was then prosecuted with success both in Ætolia and Peloponnesus. All parties, however, became desirous of peace. Philip sought to take advantage of the distress to which the Romans were reduced by Hannibal; the Achæans wished to conclude peace while the advantage was on their side; and the Ætolians were glad to put an end to a struggle in which they had the worst. Peace was concluded B.C. 217, each party retaining what they then possessed.

The extensive prospects of ambition opened to the Macedonian king brought to light the seeds of evil in his character. Hitherto his conduct towards his Grecian allies had been generous and faithful; henceforth his desire was to reduce all Greece under his power, and he scrupled at few things which promised to forward his views. The counsels of Aratus became distasteful to him, and the authority which that statesman had insensibly acquired over him became irksome. Latterly indeed the policy of Philip became so hateful, that Aratus withdrew entirely from his court and society, fearing to incur the odium of the crimes which he was constantly committing. Still the recollection of Aratus checked, and rendered him uneasy; and to rid himself of this restraint (if Plutarch's tale be true, and it is confirmed by Polybius), he procured the death of his old friend and guide by a slow poison. Aratus felt the blow, and knew the author; but feeling that complaint was useless, he endured it in silence, with the single exception that he once observed to a friend who was shocked at seeing him spit blood, 'Such, Cephælon, are the rewards of the friendship of kings.' (Polyb. viii. 14.) He died B.C. 213. The honour of being his burial-place was disputed between Sicyon and Ægium in Achæa, where he died, and adjudged by the Delphian oracle to the former. He was splendidly interred there, and a monument erected to him. He was honoured by the Sicyonians as the father, founder, and saviour of their city; and twice a year, on the anniversary of his birth, and of the restoration of liberty to the city, a religious festival was celebrated in his honour.

He wrote a history of his own times, entitled *Commentaries* (ending with the year 220), which, unfortunately, have not come down to us. It has received high praise from Polybius, as containing 'very faithful and clear memorials of his own times;' and from the close of this work Polybius chose to commence his own history. Particulars of the life of Aratus will be found in Polybius, lib. ii. to ix. inclusive; and in Plutarch, *Lives of Aratus, and Cleomenes*.

There is a chapter devoted to this subject in the *Encyclopædia Metropolitana*, from which the dates here given sometimes vary. We have followed our usual guide, Clinton, in his *Fasti Hellenici*, from the 121th Olymp. to the death of Augustus. See also Schlosser's *Universalhistorische Uebersicht* (ii. 1.), whose judgment on the character of Aratus is unfavourable, and perhaps just.

ARAUCANIANS, the name given to a South American tribe, inhabiting a country comprised between 36° 44' and 39° 50' S. lat., and 70° and 74° 30' W. long., and bounded on the E. by the great Cordillera of the Andes, by the Pacific Ocean on the W., by the river Bio-bio on the N., and by the Valdivia or Callacalla on the S. It extends about 186 miles along the coast; the breadth from the sea to the crest of the Andes is perhaps about 150 miles. The people take the name of Araucanians from the province of Arauco, which is the smallest in the state; and pride themselves in being called Auka, which, according to Molina, means frank, or free. The Spaniards, who have served in the Netherlands, and afterwards fought in Chili, called the country Araucanian Flanders, or the Invincible State. The productions of the soil are in general the same as those of Chili.

The territory of Araucania has been divided from time immemorial from north to south into four parallel *ruthan-mapus* (otherwise written *uthalmapus*), or tetrarchies, almost equal in extent, which are called *lauguen-mapu*, or the maritime country, *leleu-mapu* or plain country, *inapi-e-mapu* or country at the foot of the Andes, and *pire-mapu* or country of the Andes. Every *ruthan-mapu* is subdivided into five *illarehues* or provinces, and every *illarehue* into nine *rehues* or districts. The maritime country comprises the provinces of Arauco, Jucapel, Illicura, Boroa, and Nagtolten. The plain country includes those of Encol, Puren, Repocura, Maquegua, and Mariquina. That at the foot of the Andes comprises the districts of Marven, Colihue, Chaico, Quecheregua, and Guanagua. The province of the

Andes was formerly possessed by a separate tribe, called *Puelches*, which afterwards became united to the Araucanians.

The government of the Araucanians is aristocratical, and is composed of three orders: the *toquis*, the *apo-ulmenes*, and the *ulmenes*. The *toquis* are four independent chiefs, every one presiding over one *vuthan-hapu*: their name is derived from the verb *toquin*, to judge or rule. Though independent of one another, they form a federal union for the public welfare. The *apo-ulmenes* have the command of the provinces under their respective *toquis*, and the *ulmenes* preside over the *rehues* or districts. The badge or device of the *toqui* is a porphyry or marble axe. The *apo-ulmenes* and *ulmenes* have staves with silver heads, but the former are distinguished by a silver ring round the middle of their staves. All these dignities are hereditary in the male line, in the order of primogeniture. The *toquis* possess but a shadow of sovereignty; the real power resides in the *vultucayag*, or *ataucayag*, the great council, or council of the Araucanians. This diet is composed of the *toquis*, the *apo-ulmenes* and *ulmenes*, and is held in some plain or valley, whenever any affair of importance is to be decided upon. Previous to their meeting they have their games and sports.

Their *admapu* or code of laws consists simply of traditional customs. The laws which are the most distinctly defined are those which regard the district of every *toqui*, and the succession and union of the tetrarchies. The election of the principal officers in time of war and the convocation of the diet reside in the *toquis*. No *toqui* can ever rule over more than one tetrarchy. The subjects are not bound to render their chief any sort of personal service except in time of war; he supports himself by his own private property. When the male line of the chief becomes extinct, the people choose another ruler out of the family that is most agreeable to them, but before giving the new sovereign his power, they present him to the other *toquis* to be acknowledged by them.

The crimes which are visited with the greatest severity of the law are treason, murder, adultery, theft, when to any considerable amount, and witchcraft: the murderer may escape punishment by compounding with the offended family. Fathers possess the right of punishing their children, or any other individual of their family, even with death, whenever they may think proper. The sorcerer is first tortured by fire in order to compel him to declare his accomplices, and then stabbed. The smaller crimes are punished by the law of retaliation, called by them *thaulenco*. Any one found guilty of a capital offence is immediately put to death, prisons not being in general use when Molina wrote.

The military government of the Araucanians, though not more complete than the civil and criminal codes, shows a considerable degree of intelligence. When the council has decided upon war, they proceed to choose a commander from among the four *toquis*, but if none of them possess the necessary qualifications, an *ulmen*, or even any other inferior officer, is chosen. The general having accepted the office, assumes the title of *toqui*, and takes the axe, which all the other *toquis* are obliged to lay down during the time of his dictatorship. This ceases with the war. Both the *toquis* and all the other officers swear allegiance to him: the general then appoints a vice-*toqui* and the officers of his staff, the latter nominating their subaltern officers. The vice-*toqui* is generally taken from the tribe of the *Puelches*. A messenger, called *huerquen*, is then sent to announce the war to the friendly tribes, and even to the Indians who live among the Spaniards. His credentials consist in a small bundle of arrows tied with a red thread; if the war has already begun, they put in the centre the finger of a dead enemy. This expedition is called the *pu' itun* or running the arrow, and is done with such secrecy, particularly in the possessions of the Spaniards, that it has rarely been discovered. The dictator then requires from each of the *toquis* his allotted contingent of men, and the levy is made by the *apo-ulmenes* and *ulmenes* without any difficulty, as no Araucanian ever refuses to come forward in defence of his country's liberty. Thus the army is formed with the greatest facility and promptitude. It consists generally of five or six thousand men, besides a large body of reserve.

The Araucanian army consists of cavalry and infantry: the former was not known among them before the arrival of the Spaniards: but they soon reared a fine breed of horses, and in 1568 they were able to equip some squadrons for the field. The *toqui* Cadeguala was the first who established

a regular body of cavalry in 1585. The infantry is formed into regiments, each consisting of 1000 men divided into ten companies; every regiment has a flag with a star embroidered upon it, which is the arms of the nation. The cavalry is divided in the same way, but the number of horse-men is not always the same. The soldiers wear no uniform, but they put on, under their usual dress, a cuirass made of leather hardened by means of a certain varnish. Their helmets and shields are also constructed of the same material. The cavalry are armed with lances and swords, and the infantry with pikes and clubs furnished with iron. Formerly they used the sling and the bow, but experience has taught them that close combat was more effectual against the fire-arms of the Spaniards. The Araucanians have never been able to discover the secret of manufacturing gunpowder. They were at first very anxious to possess it. Having observed some negroes among the Spaniards, they supposed that gunpowder, from its blackness, was extracted from their bodies. One of these poor negroes having had the misfortune to fall into their hands offered them the opportunity of trying the experiment. He was first flayed from head to foot, and then burnt to cinders, but the result only served to show them the fallacy of their chemical knowledge. They have occasionally made use of the guns which they have at different times taken from the Spaniards, but, perhaps from their strong prejudice against anything derived from the Europeans, they have never generally adopted them. The army, on its march, is always preceded by an advanced guard to prevent any surprise. The infantry is usually all mounted on horseback until they discover the enemy, when they immediately dismount and form themselves into companies. Each soldier carries with him his own provisions, consisting of some roasted meal or flour in a bag, a small quantity of which mixed with cold or warm water serves them for food until they arrive at the enemy's territory. In this manner their armies, unincumbered with any sort of baggage, move with great expedition. The prudence displayed in their encampments, particularly at night, is admirable. Having formed an entrenchment round the camp with ditches covered with branches of trees and brambles, they place their sentinels around. Every soldier, to show his vigilance, is obliged to keep a fire all night before his tent.

After the battle, every soldier is the rightful master of the prize which he himself has made, but when the booty has been taken in common, it is divided equally among them all, the *toqui* himself having no greater share in it than the private soldier.

One of the laws of the military code of the Araucanians prescribes, that after the battle one of the prisoners must be sacrificed to the manes of the heroes who have fallen. This ceremony is called the *pruloncon* or dance of the dead. Fortunately this horrid custom is so rarely performed, that in the space of two hundred years, it is said, only two of these festivals occurred.

When the enemy sues for peace, a great congress is held, generally in an extensive plain between the rivers Bio-bio and Dunqueco, on the boundaries of Chili and Araucania. The Spanish president and the Araucanian *toqui*, accompanied by four deputies from the respective *uthalmapus*, without the unanimous consent of whom the peace cannot be ratified, repair thither. The two nations then encamp at the distance of two miles from each other. The conference is opened by many tedious compliments on each side, and in sign of reciprocal friendship, the staves of the *ulmenes* and that of the Spanish president are tied together, and placed in the middle of the assembly. An Araucanian orator then makes a long harangue in the Araucanian language, expatiating at great length on the evils of war and the advantages of peace: a similar one from the Spanish president is made in reply, which is translated word for word by an interpreter. The articles of the treaty are then signed and ratified by the sacrifice of several Chilihueques or Chilian llamas, with the blood of which the *toqui* sprinkles a branch of cinnamon, and presents it to the president as a token of friendship. A festival is then held, in which the Spanish president dines with the *toqui* and the *ulmenes*, and makes them a magnificent present in the name of his sovereign.

The religious system of the Araucanians is in accordance with their political system of government. They acknowledge a Supreme Being, whom they call *Pillan*, a word derived from *pulli*, 'the soul,' which means the essential soul or

spirit. They give him the epithets of *Guenu-Pillan*, or 'the Spirit of Heaven,' *Vuta-Gen*, 'Great Being,' *Vilemvoe*, 'Creator of All,' &c. The universal government of their *Pillan* is similar to his own. He is the great toqui of the universe, and has his apo-ulmenes and ulmenes to preside over the inferior affairs. The principal of these inferior deities are, the *Epunamum*, or 'god of war,' and the *Meulen*, 'the beneficent god, the friend of the human kind.' There is also the *Guccubu*, or *Huccuvu* (for it is indifferent which initial letter is used), who is the author of evil. No misfortune happens to an Araucanian which is not attributed to this malignant being. If a horse is tired, the *Guccubu* has been riding on its back; if the earth quakes, it is because the *Guccubu* has shaken it; if a friend dies, he has been suffocated by the *Guccubu*. On the contrary, the good *Meulen*, by the agency of his celestial ulmenes, is constantly endeavouring to check his malignant influence. These spirits or genii are male and female; the former are called *Gen*, and the latter *Amei-Malghen*, or spiritual nymphs, one of which latter is constantly attendant on every Araucanian; and so firmly are they persuaded of the truth of this influence, that when any one has been fortunate in anything, he expresses his satisfaction by saying, *Nien cai ñi Anchi-Malghen*, that is, 'I have my nymph by me.' As their earthly rulers require no particular service of them, the Araucanians suppose that the Supreme Being also requires no sort of worship; accordingly, they have neither temples, idols, nor priests, and offer no sacrifices except on some solemn occasion, when they offer a llama, and burn tobacco, as the incense most grateful to their divinities. They are very superstitious: an Araucanian, who faces a cannon with intrepid valour, is terrified at the sight of an owl.

One of the chief articles of their religion is, the immortality of the soul. They acknowledge that man is formed of two substances, the *anet*, or body, and the *am* or *putli*, soul, and that the latter is *ancanolu*, or incorporeal, and *mugeadu*, immortal. After the death of the body, the soul is taken by a spirit to a place called *guetcheman*, or the abode of the men on the other side of the mountains, which place, according to some, is divided into two regions, one of bliss for the good, and another of misery for the wicked; but others pretend that they will all be there eternally happy, and that their actions during the life of the body have no influence on their future state.

As soon as an Araucanian dies, the body is laid upon the ground, and all the friends of the deceased sit round it uttering mournful lamentations for some time. It is then placed on a high bier, clad in the richest garments, and the night is passed in weeping, eating, and drinking. This funeral festival is called *curicahuñ* or the black festival, that colour being with them the colour of mourning. On the following day, and sometimes two or three days after death, the body is taken to the *eltun*, or burial-ground of the family, which is generally on some high hill or in a wood. Two young men on horseback, running at full speed, precede the funeral procession; these are followed by the bier, which is carried by the nearest relations of the deceased. A number of women accompany the procession, uttering lamentable cries, and another woman follows behind, strewing the road with ashes, which they imagine will prevent the soul returning to its earthly abode. When they arrive at the burial-ground, the body is placed in the grave, surrounded by his arms if a man, and by female implements if a woman, together with several dishes full of victuals, and some vessels full of *chicha*, or wine. Sometimes a horse is killed, and buried with the body. It is then covered with earth, and several stones piled up in the form of a pyramid. A great quantity of *chicha* is then poured upon it as a funeral libation, and the company return home.

In the new state of existence, the soul being free from the incumbence of the body, pursues with greater facility and perfection all the occupations that it had in the body. Wives return to the bosom of their husbands, and children rejoin their parents, but no new children are born.

They also preserve the tradition of a universal deluge from which a few persons were saved on the top of a mountain having three points, called by them the *Thegtheg* or 'Thundering Mountain,' which floated upon the waters. As this deluge was preceded by an earthquake and a volcanic eruption, whenever these phenomena take place the inhabitants betake themselves to one of those mountains in the Andes which resembles the *Thegtheg*, carrying with them an abundant supply of provisions, and several wooden plates to

protect their heads against the excessive heat of the sun in case the mountain should be raised too high.

The Araucanians divide their years into seasons, months, and days, as we do. Their year is solar, and begins on the 22d of December, or immediately after their summer solstice, which they call *thamathipantu*, that is, 'the end and beginning of the year,' and the winter solstice they call *udanthipantu*, or 'divider of the year.' These points they determine with some degree of accuracy by the solstitial shadows. Their *thipantu*, or year, is divided into twelve *cuyen*, or moons, of thirty days each, and five days are added, probably, to the last month. They name their months from some occurrence which takes place in each, as *Avun-cuyen*, 'month of the fruit,' which corresponds to our January; *Coji-cuyen*, February, or the 'harvest month,' &c. They divide the natural day into two equal parts, and these again they subdivide into twelve parts, six for the day and six for the night; thus their *ugantu*, or hour, is equal to two of ours. They measure their hours by the altitude of the sun in the day, and by the stars at night, without the aid of any instruments. In civil affairs they reckon their time by days, mornings, or nights. They divide the stars into *pal*, constellations, and distinguish them by the number of stars which every one consists of: thus, the pleiades they call *caju-pal*, or 'the constellation of six.' They also distinguish them from the planets, which they call *gan*, from the verb *ganu*, to wash, supposing that when they set they sink into the sea. They believe them to be inhabited, for which reason they call them countries, as *cuyen-mapu*, the country of the moon. Eclipses are not considered by these people as bad omens, but as simple natural phenomena, the cause of which they do not know. An eclipse of the sun they call *lay-antu*, and that of the moon *lay-cuyen*, that is, 'the death of the sun or moon.' Comets are considered by them as terrestrial exhalations which become ignited in the atmosphere, but they are not terrified by their appearance.

The only sciences which they cultivate are, oratory, poetry, and medicine. Of these sciences oratory is that which they hold in the highest esteem. The eldest son of an ulmen who is not a proficient in this art is excluded from the succession: for this reason they take their children to their national assemblies, and accustom them, at a very early period, to speak in public. Their poets are called *gempin*, or lords of speech. Their poems, which are transmitted from father to son, generally have reference to the exploits of their heroes, and the measure most generally adopted in their compositions is that of eight or eleven syllables. They are so careful to preserve their language in all its purity, that when a foreigner settles among them he is obliged to change his name for an Araucanian one; even the missionaries have been compelled to adopt that practice, and to submit to be interrupted in their sermons by their auditory at every fault they make. Though many Araucanians know the Spanish language, they will rather submit, on all public occasions, to the tedious explanation of an interpreter than adopt the Spanish tongue.

The language, though not written by the Araucanians, is very copious. Molina says that, according to the vocabularies which are in existence, the best of which is far from perfect, its radical words, which are generally monosyllables or dissyllables, amount to 1973. These roots are susceptible of an indefinite number of combinations. Owing to the want of guttural and harsh sounds, and to the great variety in accentuating the words, it is very sweet and harmonious: its etymology is very simple and regular. There is not a single noun or verb irregular. One declension serves for all nouns, and the signs of the different cases are the same in the singular, dual, and plural: thus they say *chao-ai*, of the father; *chao-egu-ñi*, of the two fathers; and *pu-chao-ñi*, of the fathers. The genders are confined to words designating animate beings. The masculine is expressed by *huentu*, a male, and the feminine by *domo*, a female—e.g. *huentutchehua*, a dog, *domotchehua*, a bitch. In the masculine the sign is generally omitted. The mechanism of the conjugation is also very simple. The terminations of the indicative present are *n*, *imi*, *i*, for the singular; *iu*, *inu*, *igu*, for the dual; and *ign*, *imen*, *igen*, for the plural, which terminations are the same in all tenses. The number of tenses in the indicative and subjunctive is, two for the present, three for the past, two for the future, and two aorists. The characteristic sign of every tense is placed between the radical and the termination. Thus from *chun*, I give, is formed *clu-a-n*, I will give, and *clu-bu-n*, I did give: the

passive is formed with *gen*, to be; e. g. *clu-gen*, I am given; *clu-ge-a-n*, I will be given. Substantives, adjectives, adverbs, and even interjections, are converted into verbs by adding an *n* to the word—e. g. *clu*, a gift, *clu-n*, to give; *cume*, good, *cume-n*, to be good; *ina*, close, *inan*, to be close by; *alulú*, ah! *alulán*, to feel a pain. Adjectives are converted into abstract substantives by adding *gen* to them

e. g. *cume*, good; *cumegen*, goodness. Intransitive verbs are changed into active by means of certain particles: thus from *in*, to eat, *ileln*, to cause one to eat. There is in this language a great latitude for stringing words together, and very often a single word expresses one or two sentences: thus the word *rucatunmaclopaen* means, 'pray come and help me to build a house;' which word is composed of *ruca*, a house; *tun*, build; *ma*, a sign of entreaty; *clo*, help; *paen*, come. The only books existing in this language are catechisms, sermons, prayers, and other religious books, translated or composed by the Jesuits, to whose labours we are also indebted for most of the grammars and dictionaries of this tongue.

The physicians are of three classes,—the *ampives*, or empirics, the *vileus*, or methodical, and the *machis*, who cure by spell; the first of these physicians employ principally simples in curing diseases, and are excellent practitioners; the *vileus* pretend that all contagious diseases proceed from insects. When all the efforts of the *ampives* and *vileus* have proved inefficient in curing a patient, a *machi* is sent for, who, after practising some mysterious ceremonies, pretends he has discovered the place where the magic poison lies, and reveals the name of the person supposed to have administered it, hereby very frequently endangering the life of some innocent individual. They have likewise two sorts of surgeons,—the *gutarre*, who cures fractures, dislocations, ulcers, &c.; and the *enpore*, or anatomizers, so called because they are principally employed in opening the bodies of such as die of unknown maladies. Besides the above-mentioned professions, they have mechanics, such as blacksmiths, silversmiths, carpenters, &c.

The Araucanians have as many wives as they can support, or rather are able to purchase; but, as in all other countries where polygamy is permitted, it is only the rich who enjoy this privilege: the poor content themselves with one or two. Celibacy is disgraceful among them. An old bachelor is called *ruchiapra*, which means a useless old man; and *cudepra*, a useless old woman, is the word by which they designate an old maid. The marriage ceremony is very simple, and consists in carrying off the bride by pretended violence. When the bridegroom has fixed with his future father-in-law the sum that he is to give him for his daughter, he goes, accompanied by some of his friends, to surprise the bride in some retired spot; she is then seized, placed upon the horse of her future husband, and conducted to the house of the bridegroom, where the nuptial festival is celebrated. The first wife, called *unendomo*, is always considered the legitimate one, and respected as such by all the *inandomo*, or secondary wives. Each wife is obliged to present her husband every day with a particular dish cooked by herself at her own fire. Thus the most civil manner of asking an Araucanian how many wives he has is, *miru cuthalgeimi*? or, 'how many fires have you?' It is, besides, the duty of every wife to furnish her husband with the necessary articles of dress, and with one *poncho* every year. The Araucanian women are noted for the cleanliness not only of their houses and clothes, but even of their persons. They comb their hair twice a day, and wash their head at least once a week with the bark of the *quillay*, or *quillaja saponaria*, which they make use of instead of soap. Their habitations are placed near the banks of rivers, in which, during summer, the men bathe several times a-day, and in winter at least once a-day. The women also bathe regularly, and on the very day of giving birth to a child they wash both the infant and themselves in the stream, and then lay it upon a sort of rush cradle, which is hung on the ceiling, covered with soft skins, and return to their daily occupations. The child is generally unclothed until it begins to walk, when they put on it a very loose gown. Their moral education is not more constrained than their physical. Their parents instruct the males in the management of arms, and in speaking their language with freedom, elegance, and purity, allowing them to do everything without restraint; they very seldom inflict on them any corporal punishment, as in their opinion this practice tends to degrade them and make them cowards.

The Araucanians are of a moderate stature, strong, muscular, and well-built, and naturally have a very martial air. It is exceedingly rare to find among them a deformed person; not because, as some have erroneously supposed, they destroy the infants who are born with any imperfection, but because the modes of life and other obstacles, which among civilized nations prevent the action of nature, are unknown among them. Their colour, like the rest of the Americans, is that of copper, although somewhat lighter; their face is oval, their eyes small, but lively and full of expression, the nose rather flat, the mouth pleasing, with fine regular teeth; the legs well formed and muscular, with small and flat feet. In general, they have no beard, because they take particular care to eradicate every hair that grows on any part of the body except the head, the hair of which they never cut, but dress it round in tresses. Old age is seldom perceptible in the Araucanians before their sixtieth year, and it is not a rare occurrence to see an Araucanian eighty years of age without a single grey hair. Frequently they attain the age of ninety or a hundred years. Their moral qualities correspond to the physical. They are bold, intrepid, courageous, constant in enduring the fatigues of war, and fearlessly expose their lives when the liberty of their country is at stake. They are also exceedingly jealous of their honour; hospitable, honest, grateful, generous, and humane to the enemies they have conquered; but they are indolent when not at war, addicted to intoxication, presumptuous, and haughty.

The dress of the men consists of a shirt, a sort of jacket, with small tight breeches, and a *poncho*, which is a piece of cloth simply with a hole in the middle for the head to pass through, falling before and behind down to the knees, and open at the sides like a cassock. The colour of their dress is generally blue, which is their favourite colour. On their heads they wear a sort of band like a diadem, which in time of war is ornamented with feathers; they also wear a sash of different colours round the waist. Persons of distinction make use of woollen boots of different colours and leathern sandals, which they call *chelle*; but the people go bare-footed.

The dress of the women is very simple and modest, consisting of a long tunic or gown without sleeves, called *chiamal*, fastened to the shoulders with silver buttons; a sash round the waist; and a short mantle called *ichellu*. This dress is never altered, but they are allowed to add to it all the ornaments which their fancy or vanity may prompt them. The colour of their dress is also blue. The hair is divided into several tresses, which they allow to fall down their shoulders; their head is adorned with false emeralds, called *llianca*, to which they attach a high value. They also wear necklaces and bracelets of glass beads, and a sort of square ear-rings made of silver. Even the poorest of the Araucanian women has upon every finger a ring of the same metal.

The Araucanians build their habitations along the banks of rivers, or in plains where there is a facility for irrigation; and every family is anxious to occupy that piece of land which they inherited from their ancestors. They never build large towns, and much less walled cities, which they consider as marks of servitude.

The games of skill with which they amuse themselves are *comican* or chess, and the *quechu*, similar to backgammon, both of which they knew previous to the arrival of the Spaniards. Gymnastic exercises they practise most passionately; besides wrestling and racing, they have a peculiar game called the *peuco*, representing a siege. Twelve young men form themselves into a ring, holding each other by the hands; in the middle a child is placed; an equal number of assailants attack the ring, and endeavour to carry off the child.

Since the first invasion in 1537, the Araucanians have sustained an almost uninterrupted war against the Spaniards for nearly three hundred years. Valdivia, one of the first who undertook the conquest of Chili, founded on the Araucanian territory the settlements of Imperial, Villarica, Valdivia, and Angol, all which were almost entirely destroyed by the toqui Paillamachu in 1602. The siege of Villarica lasted two years and eleven months. The pious Father Valdivia, a Jesuit who had been a missionary among the Araucanians, convinced the Spanish government of the necessity and advantage of being at peace with them, and the negotiations were in a state of forwardness when the unfortunate circumstance occurred of a Spanish lady, who was the slave of the toqui Ancanamón, making her escape, and

carrying with her two of his little children, and four of his wives and daughters, whom she had persuaded to embrace the Catholic religion. The Spanish governor naturally took the lady and her converts under his protection. The toqui, in high indignation at the loss he had sustained, listened to no further proposals, and the war was again renewed with fresh vigour. In 1641 the governor, Marques de Baydes, at last entered into a treaty of peace with the toqui Linco-pichion. In 1655 war raged once more from causes which are not known; and it lasted until 1773, when Spain was forced to acknowledge the Araucanians as an independent nation, and to allow them to send an ambassador, who should reside at Santiago de Chili. During the time of the presidency of Don Ambrosio O'Higgins this people continued to enjoy the blessings of peace; and we are informed by Vancouver, that this enlightened and humane governor had in some measure succeeded in introducing among them a spirit of industry, and that he had the pleasure to see them endeavouring to excel each other in the cultivation of the ground, the breeding of cattle, and other peaceful arts. In the late contest between the colonies and the mother country the Araucanian toqui promised to observe a strict neutrality, and was faithful to his promise. Schmidtmeier, who visited Chili in 1820, says, that in the independent army of that country some Araucanian youths of the first rank served as officers, and that, according to the opinion of the creoles, they fought like Mars, and drank like Bacchus; 'two characteristic national features,' adds he, 'which still appear strongly marked in that people.' The exploits of this warlike nation have been celebrated by their enemies. Six different poems are still in existence: the best of those that we are acquainted with is the *Araucana*, by Alonso de Ercilla [see ERCELLA], who was himself engaged in the wars which he describes in his poem. (See Molina's *History of Chili*, written in Italian, and translated into Spanish by Mendoza, Madrid, 1788, 2 vols. At the end of the second volume is a list of more than sixty writers and works on matters relating to Chili. *Compendio della Storia naturale e civile del Regno di Chile*, Bologna, Anonymous. Vancouver's *Voyage of Discovery to the North Pacific Ocean*, vol. iii., chap. 5. Schmidtmeier's *Travels into Chili over the Andes* in 1820-21, chap. xv. Febres's *Arte de la Lengua General del Reino de Chile*.)

ARAUCA'RIA, in Botany, is the name of a singular genus of gigantic firs, found scattered over the southern hemisphere. It is known from all the other firs by its stiff broad leaves, by a long leafy appendage with which the scales of its cones are terminated, and by its anthers having many cells. Only three certain species have been described, of each of which we shall give some account.

Araucaria excelsa, commonly called the Norfolk Island Pine, is found not only in the spot after which it has been named, but also in several other places in the South Seas, as in New Caledonia, Botany Island, Isle of Pines, and in some parts of the east coast of New Holland. It is described as a most majestic tree, growing to the height of from 160 to 228 feet, with a circumference sometimes of more than 30 feet. Its trunk rises erect, and is sparingly covered with long, drooping, naked branches, towards the extremities of which the leaves are clustered; these latter, when the plant is young, are long, narrow, curved, sharp-pointed, and spreading, but when the tree is old they have a shorter and broader figure, and are pressed close to the branches; old and young trees are consequently so different that one would think them distinct species. The bark abounds in turpentine; the wood, which is destitute of that substance, is white, tough, and close-grained. It was once expected that this tree would have been valuable for its timber, and that it would have afforded spars for the navy of great size; but it has been found on trial to be too heavy, and so unsound, that Captain Hunter could only find seven trees fit for use out of thirty-four that he caused to be felled. Its wood is, however, useful for carpenters' indoor work. Several specimens of this tree exist in the collections of this country. Unfortunately it will not live in the open air in the winter, and its growth is so rapid as to render it very soon too large for the loftiest greenhouses. A supposed species, called the Moreton Bay Pine, or *Araucaria Cunninghami*, is scarcely distinguishable from this. It is a highly interesting fact, that a plant very nearly the same as this *araucaria excelsa* certainly once grew in Great Britain. Remains of it have been found in the lias of Dorsetshire, and have been figured in the Fossil Flora, under the name of *Araucaria primæva*.

[*Araucaria excelsa*.]

Araucaria Dombeyi, or, as it is more commonly called, *A. imbricata*, is a noble species, inhabiting the mountains of the Araucanian Indians in South America, whence the name of the genus derives its origin. This species has its branches closely covered with broad, lance shaped, very rigid and pungent dark-green leaves; it produces its branches in circles around its erect stem; and when old it acquires an appearance not very unlike that of the Norfolk Island pine, only it is much less graceful. Its wood is said to be durable, and it yields a great quantity of resin. It is expected to be naturalised in this country, as some individuals now exist as far north as London, which have survived several winters with but little protection. It is, however, not a native of so low a latitude as is commonly supposed, and does not exist on the mountains farther to the southward than the volcano of Villarica.

Araucaria Brasiliensis is extremely like the last, but the leaves are longer, weaker, and less densely imbricated; and it is much more impatient of cold. It is found wild in the southern provinces of Brazil.

All these species are multiplied with difficulty, unless by their seeds; and the latter are seldom brought to England in a living state, as to render all the species still extremely rare. Travellers may, however, bring them home in safety, by packing them in earth rammed hard into boxes, and kept dry and in the dark, and exposed to as little variation of temperature as possible.

ARAVULLI is a mountain-range, which forms one of the most remarkable features of northern India. Its southern extremity may be placed where the 21st parallel is cut by the 73rd meridian, to the north of Edur, or Eder. From this point it extends in a N.N.E. direction to 25° N. lat., where it terminates some minutes to the east of 76° E. long. Its whole length, therefore, may amount to upwards of 300 miles. Its breadth is various: from the southern extremity to the fortress of Komulmair it extends about sixty miles from west to east, and is composed of numerous high ridges, generally running south-west and north-east. To the north of Komulmair it forms one uninterrupted and compact range of table-land, from six to twenty miles in width. Thus it continues up to the town and valley of Ajmeer, where it

begins to lose its tabular form, and, breaking into lofty ridges, sends numerous branches through the territories of the rajah of Tejpoor and Alwar, which terminate to the south of Kanound and Rewaree.

This mountain-chain is not remarkable for its height. On an average it does not rise to more than 3000 feet above the level of the sea, though, perhaps, some summits may attain a thousand more; but the extreme steepness of its declivity to the west renders it impossible for the boldest invader to attack India on this side. Here it is skirted by an extensive plain, the Indian desert, called by the inhabitants Marost'hali (the region of death), a country which rather resembles the high plains of Persia than the Sahara of Africa. A general might conduct an army to the foot of the Aravulli, but he would find it impossible to march over this chain, across which no carriage road can be made, at least none that is practicable for artillery. Thus every invader of India is obliged to enter that country by the plain which extends from the north-eastern extremity of the Aravulli, and of the Marost'hali, to the Himalaya mountains; and India, in a military point of view, may be considered as an island, joined to the continent by an isthmus of about 100 miles in length, and perhaps less in breadth. This circumstance must render the means of defence of that rich country easy and effective in the hands of an active and well-constituted government.

The southern extremity of the Aravulli range is united to the Vindhya mountains by an extremely hilly and broken country, extending from Edur to Lamawarra, on the river Myne, occupying all the country on the upper part of that river and its branches, and joining the Vindhya mountains near Champaur. By the same hilly country it is united to the table land Pat'har, from which the principal range is only separated by the valley of Oodpoor.

That part of the Aravulli mountains lying to the south of Komulmair is in possession of a number of communities, composed of aboriginal races, living in a state of almost savage independence, owning no paramount power, paying no tribute, and preserving all the simplicity of small republics, though their leaders, having the title of Rawut, are hereditary. The rawut of Oguma can bring into the field 5000 bows. Their habitations are dispersed through the valleys in small rude hamlets, near their pastures or places of defence. To the north of Komulmair the range is inhabited by a mountain-race called *Muir*, who formerly, when the surrounding countries were in a state of war approaching to anarchy, issued from their fastnesses, infested their neighbours, and robbed them of their most valuable property; but since the East India Company has become the protector of Rajast'han, they have been peaceable subjects. They possess upwards of 150 villages and hamlets, scattered over the rocks and valleys, which are abundantly watered, and not deficient in pasture. The produce of the cultivated ground, though of comparatively small extent, is commonly sufficient for the wants of the inhabitants; but it is raised with infinite labour on terraces, as in Switzerland and the Tyrol. This is effected by constructing, on the narrow level tract along the rivers and upon the shelving sides of the mountains and hills, a series of terraces rising over each other, and by forming above the terraces pools or reservoirs, by means of large trees, from which pools the water is conducted so as to irrigate successively the terraces, on which rich crops of sugar-cane, cotton, rice, and Indian corn are raised.

The rills which rise in the short valleys of this range are numerous, and by their union form some rivers. Those descending from the eastern declivity fall into the Bunas, a tributary of the Chumbul; and those running to the west join the Loony, or Salt River, which enters the Rin.

This range is composed of rocks of primitive formation. 'The granite reposes,' as Colonel Tod reports, 'in a variety of angles (the general dip is to the east) on massive compact dark blue slate, the latter rarely appearing much above the surface or base of the superincumbent granite. The intercal valleys abound in variegated quartz and a variety of schistus slate of every hue, which gives a most singular appearance to the houses and temples when the sun shines upon them. Rocks of gneiss and of syenite appear in the intervals; and in the diverging ridges west of Ajmeer the summits are quite dazzling with the enormous masses of vitreous rose-coloured quartz.' Tin, which also yielded much silver, was once worked; copper, of a very fine description, is still extracted in sufficient quantity to supply the currency of

Rajast'han. Garnet, amethystine quartz, rock crystal, chrysolite, and some inferior kinds of emerald, are found in a few places.

The name Aravulli implies 'the strength of refuge,' which is very appropriate, as at all times it has afforded protection to the ancient sovereigns who held dominion either to the east or to the west of it. (Tod's *Annals and History of Rajast'han*; *Maps* by the Society for the Diffusion of Useful Knowledge, *India*, VI. and IX.)

ARBE, one of the Quararo islands, in the gulf of Quarnaro, on the coast of Dalmatia, and within the circle of Zara in that province, from which it is separated by the canal of Morlaeca. It is twenty-nine miles in superficial extent, and is very mountainous; it contains four valleys, which have a very productive soil. The climate of this island, when northerly winds are prevalent, is at times so inclement, that thousands of sheep have frequently been frozen to death in one season. It produces wine, olives, figs, and corn; these, together with its fishery, salt-pans, and numerous flocks, afford lucrative occupation to its inhabitants. The latter are above 3000 in number, and dwell in the town and a market-village, or live dispersed in separate tenements; they profess the Roman Catholic faith. There are six monastic establishments and sixty ecclesiasties on the island. The town is *Arbe*, in the bay of Campora, with a good harbour; it is the seat of a bishopric, and contains about 900 inhabitants. The name of the market village is *Barbato*. Lat. $1^{\circ} 50' N.$, long. $14^{\circ} 50' E.$ (according to the twelfth edition of Stein's *Atlas*).

ARBE'LA, now Arbil or Erbil, a miserable village, which lies on the ordinary route from Bagdad to Mosul, in $36^{\circ} 11' N.$ lat., according to Niebuhr's observations. It is situated between the Little and Great Zab (the Lycus), but nearer the latter, in a hilly and tolerably fertile district. Arbela was once in possession of an hereditary race of Mohammedan princes, whose dominion extended to Tabreez in Azerdibijan, and it was then a large city, defended by a castle situated on a hill of a conical shape. Niebuhr describes the castle as existing when he passed through, though its outer wall was gone; Kinneir remarks, that the castle probably stood on the hill, from which it would be a fair inference, but perhaps not a true one, that the castle is no longer there. Part of the town, which consists of wretched houses built of sun-dried bricks, is on the hill, and part around it. There are no antiquities here, but there is a minareh belonging to a mosque at a little distance, which was erected by Sultan Masaffer. This minareh is strongly built of burnt bricks and mortar, and has two entrances facing one another, each leading to a flight of steps, by which two persons may ascend the tower without seeing one another till they meet on the top.

Arbela is best known for having given name to the last great battle between Alexander and Darius, B.C. 331. The battle was not fought at Arbela, but at a spot called Gaugamela, now Karmelis, a little place about 36 miles (Niebuhr) W. by N. from Arbela (but 600 stadia according to Arrian), on a small stream called the Chaser, the Bumadus or Bunelus of Arrian. (*Anab.* iii. 8.) After the battle, Alexander, in his pursuit of Darius, crossed the Lycus, and arrived at Arbela. [See ALEXANDER; Niebuhr's *Travels*, vol. ii. p. 342, Copenhagen edition; Kinneir's *Memoir of Persia*.]

ARBITER, was a term in the Roman law signifying a judge invested with a discretionary power, and was applied to different kinds of judicial functionaries. The *arbitrator compromissarius* answered to the arbitrator of modern jurisprudence, and his office will be treated of under the article ARBITRATION.

Another species of arbiter, peculiar to the law of Rome, partook more nearly of the character of an ordinary judge. In order to understand the nature of his office, it must be borne in mind, that all actions were commenced before the prætor, and the preliminary proceedings carried on before him; and when the alterations of the parties formally expressed had raised a question of fact disputed between them, a person was appointed to whom the adjudication of this fact was referred: the title and powers of this person depended on the nature of the action. The different kinds of actions known to the Roman law were divided into three classes: actions of strict law, actions of good faith, and arbitrary actions: under the first class were comprehended all actions upon contracts called unilateral, that is, where only one of the parties is bound, as in the case of money borrowed, where the borrower is bound to repay, but no further obligation lies

upon the lender. In these actions the person appointed to adjudicate was styled a judge (*judex*), and the only question for him to decide was, simply whether the plaintiff had completely established his case as originally stated.

In the two other classes of actions the person appointed to adjudicate was allowed a greater latitude of judgment, and was styled an arbiter. Actions of good faith were such as were founded on bilateral contracts, that is, on contracts by which an obligation is imposed on both parties, such as the contract of sale, where the seller is bound to deliver the goods, and the purchaser to pay the price. In all these actions the arbiter was not compelled, as in actions of strict law, either to grant or to reject altogether the claim of the plaintiff, but might enter into the merits of the case, and decide according to what seemed to him to be just and equitable between the parties.

To the third class, viz., that of arbitrary actions, belonged those chiefly in which the restitution of property, or some specific performance, was required of the defendant. In these cases the arbiter had authority to estimate the just claims of the plaintiff, and to condemn the defendant to some greater penalty, as for instance to pay fourfold in case of his not performing the judgment. (Just. *Institut.* lib. iv. tit. 6; *Hennecii, Elem. Jur. Civ.* § 1181, § 1196; *Idem, Antiq. Rom.* iv. 6, 36.)

ARBITRATION is the adjudication upon a matter in controversy by private individuals selected and appointed by the parties. This mode of settling differences is very frequently resorted to as a species of amicable litigation, and a means of avoiding the delay and expense of a lawsuit, and the publicity of a trial. It has the further advantage of providing an efficient tribunal for the decision of many causes

such, for instance, as involve the examination of long and complicated accounts,—which our ordinary courts of law are, from their mode of proceeding and the want of proper machinery, incompetent to investigate.

The person appointed to adjudicate is called an arbitrator, or referee. The matter on which he is appointed to adjudicate is said to be referred or submitted to arbitration. His judgment or decision is called an arbitrament, or, more usually, an award.

Any matter actually in controversy between private persons may be referred to arbitration; but a prospective agreement to refer any differences which may hereafter arise is not binding. Nor can any injury be the subject of an arbitration, unless it is such as may be a matter of civil controversy *between the parties*: a felony, for instance, which is a wrong, not to the party injured merely, but to society in general, is incapable of being referred.

There are no particular qualifications required for an arbitrator. In matters of complicated accounts, mercantile men are usually preferred. In other cases, it is generally considered advisable to appoint barristers, who, being accustomed to judicial investigations, are able to estimate the evidence properly, to confine the examination strictly to the points in question, and, in the making of the award, to avoid those informalities for which it might afterwards be set aside. Both time and expense are thus saved by fixing on a professional arbitrator. Any number of persons may be named as arbitrators: if the number is even, it is usually provided that, if they are divided in opinion, a third person shall be appointed, called an umpire, to whose sole decision the matter is then referred. [See *UMPIRE*.]

A dispute may be referred to arbitration, either 1. When there is an action already pending between the parties relating thereto, or—2. When there is no such action.

1. In the former case, the parties to the action, if *am iuris*, are in general competent to submit to arbitration. The reference may be made at any stage of the proceedings: if before trial; it is effected by a rule of the court, either of law or equity, in which the action is brought; if at the trial, by an order of the judge or an order of *Nisi Prius*, either of which may afterwards be made a rule of court. The usual mode of proceeding is for the parties to consent that a verdict shall be given for the plaintiff for the damages laid in the declaration, subject to the award of the arbitrator.

The person named as arbitrator is not bound to accept the office, nor, having accepted, can he be compelled to proceed with it. In either case, if the arbitrator refuses or ceases to act, the reference is at an end, unless the contingency has been provided for in the submission, or unless both parties consent to appoint some other person as arbitrator in his stead.

Previously to the late statute for the amendment of the law, 3 and 4 Will. IV. c. 42, the authority of the arbitrator was revocable by either party at any time before the award was made; but by that statute it is declared that the authority of an arbitrator cannot be revoked by any of the parties without the leave of the court or a judge: but it is still determined by the death of any of the parties, unless a clause to obviate this is inserted in the submission; and if one of the parties is a single woman, her marriage, being in law a civil death of all her rights, will have the same effect. The order of reference usually provides that the award shall be made within a certain period; and if the arbitrator lets the day slip without making his award, his authority ceases, but a clause has usually been inserted to enable the arbitrator to enlarge the term; and now, independently of any such clause, the court, or any judge thereof, is, by the late statute for the amendment of the law, empowered to do so. The authority of an arbitrator likewise ceases as soon as he has made or declared his award. After this (even though it be before the expiration of the time appointed) he has no longer the power even of correcting a mistake.

When the arbitrator has accepted his office, he fixes the time and place for the parties to appear before him. Each of them furnishes him with a statement of his case, which is usually done by giving him a copy of the briefs on each side; and on the day appointed he proceeds to hear them (either in person, or by their counsel or attorneys), and to receive the evidence on each side, nearly in the same manner as a judge does at an ordinary trial: but he is frequently invested by the order of reference with a power, which courts of law in no case possess, of examining the parties themselves.

No means existed of compelling the attendance of witnesses, or the production of documents, before an arbitrator, until the statute 3 and 4 Will. IV. c. 42, authorized the court or a judge to make an order to that effect: disobedience to which order, if served with proper notice of the time and place of attendance, becomes a contempt of court. The witnesses, thus compelled to attend, are entitled to their expenses in the same manner as at a trial. And where the order requires the witnesses to be examined upon oath, the arbitrator is by the same statute authorized to administer an oath or affirmation, as the case may require; and any person giving false evidence may be indicted for perjury.

The extent of an arbitrator's authority depends on the terms of the reference: it may either be confined to the action pending between the parties, or it may include any other specified grounds of dispute, or all disputes and controversies whatever existing between them at the time of the reference. Where the matters referred to him are specified, it is his duty to decide upon them all: where they are not specified, it is his duty to decide upon as many as are laid before him. In no case is an arbitrator authorized to adjudicate upon anything not in fact comprehended in the reference; such, for instance, as any claims or disputes which may have arisen after the reference was made, or, where the reference is specific, anything not expressly included in it. As nothing can be referred by the parties but the differences existing between themselves, an arbitrator can have no authority to bind any one who is not a party to the reference.

An arbitrator being a judge appointed by the parties themselves for the final settlement of their differences, his decision on the merits of the case submitted to him is conclusive: the question is set at rest, and never can be agitated between them again. But if his award be partially or illegally made, the superior courts have the power of setting it aside, upon application being made within reasonable time. This happens either, 1. where the award is not co-extensive with the arbitrator's authority: or, 2. where it appears on the face of it to proceed on mistaken views of law, or to fail in some of the qualities required for its validity [see *AWARD*]; or, 3. where any misconduct has been committed. This may happen in two cases: 1st, where the arbitrators have been guilty of corruption or other misbehaviour, as, if they have proceeded to arbitrate without giving notice of the meeting, have improperly refused to receive evidence, or committed any other gross irregularity in practice: 2dly, where it is proved that the arbitrator has been misled by fraud used by either of the parties. Where an award is absolutely void, as where it is made after the authority of the arbitrator has ceased, it is not in general necessary to set it aside, as it is incapable of being enforced.

When the award has been made and delivered, if one of the parties refuses to comply with it, the other may bring an action against him on the award. But the most prompt and efficient remedy is to apply to the court for an attachment, grounded on the contempt of court which he has been guilty of by disobeying the order of reference. [See ATTACHMENT, CONTEMPT.] In opposing this application, the other party may insist on any objection apparent on the award itself; but if there were any other objections affecting its validity, and he has neglected to apply to the court to set it aside within the time fixed by them for that purpose, it is too late for him to avail himself of them.

When, in the original action, a verdict has been given for the plaintiff subject to a reference, if the defendant does not abide by and perform the award, the plaintiff may, by leave of the court, enter a judgment and sue out execution for the whole damages mentioned in the verdict.

2. Where no action has been commenced, the parties may refer their differences to arbitration by mutual agreement. Every person capable of making a disposition of his property may be party to such an agreement: no peculiar form is necessary for its validity.

Whether the submission be verbal or in writing, it is in the power of either of the parties to revoke it, and thus put an end to the authority of the arbitrator at any time before the award is made. In order to prevent this, it is usual for the parties to make it a part of their agreement, that they will abide by and perform the award; and if after this either of them should, without sufficient reason, revoke his submission, or otherwise prevent the arbitrator from proceeding with the arbitration, he will be liable to an action for the breach of his agreement.

The time for making the award may be enlarged, if there be a clause to that effect in the agreement of submission, or if all the parties consent to it, but not otherwise. There are no means of compelling the attendance of witnesses, nor has the arbitrator the power of administering an oath; but the witnesses and—if they have agreed to be examined—the parties are sworn either before a judge, or, in the country, before a commissioner. They may, however, be examined without having been sworn, if no objection is made to it at the time.

The courts cannot enforce performance of the award by attachment; the only remedy is an action on the award itself, or rather on the agreement of submission. The defendant may insist on any objection apparent on the award itself, but where there is any other ground for setting it aside, his only remedy is by a bill in equity.

Thus it will be seen that where the reference is by agreement, many inconveniences occur, particularly from the deficiency of the remedies; but the legislature has enabled parties to put such references on the same footing as those which are made where a cause is depending, by enacting, by 9 & 10 Will. III. c. 15, that they may agree that their submission (which it is held in this case must be in writing) shall be made a rule of any of his Majesty's courts of record, (and in practice courts of equity have long enjoyed concurrent jurisdiction), and insert such agreement in their submission; and this submission may at any time afterwards be made a rule of court, by producing the affidavit of its execution made by a witness thereto. The provisions of the new statute 3 & 4 Will. IV. c. 41, apply as well to arbitrations made in pursuance of such agreements of submission, as to those made by order of court; and the law is the same in both cases, except in some few points of practice.

The settlement of disputes by arbitration seems to have enjoyed in all ages a high degree of public favour. Aristotle, to give an instance of a metaphor that is appropriate without being obvious, quotes a passage from Archytas, in which he compares an arbitrator to an altar, as being a refuge for the injured. (Arist. *Rhetor.* lib. iii. ch. 2.) There were at Athens two modes of proceeding which passed by the name of arbitration—the Greek word for which is *diata* (διατα). In one of these the arbitrators appear to have constituted what in modern jurisprudence would be called a Court of Reconciliation. A certain number of persons, of a specified age, were annually chosen from each tribe, as official referees; and from among these the arbitrators to decide upon each particular case were afterwards also chosen (*Petit. Leges Atticæ*, p. 345; *Heraldi Animadversiones*, p. 370), and were then bound to act, under pain of infamy. They sat in a public court, and their judgments were subscribed by the archons. (*Petit.*

p. 346.) An appeal lay from their decision to the ordinary courts; and sometimes the arbitrator referred the cause to their judgment at once, without pronouncing any sentence of his own. (*Heraldi Animadversiones*, p. 372.) In either case, all the writings connected with the trial were sealed up and delivered to the court before which the cause was brought. And it is said that originally no action could be introduced into the ordinary courts without having been first carried before the Court of Arbitrators. (*Petit.* p. 345; Pollux, viii. 10.) Their jurisdiction, however, was confined to Athenian citizens, and they took no cognizance of suits in which the sum in dispute was less than ten drachmæ, such smaller actions being disposed of in a summary manner by a special tribunal. (*Ibid.*) The litigant parties paid the expenses of the arbitration. (Boeckh, *Public Econ. of Athens*, i. 316, *English Trans.*) When their year of office expired, the arbitrators were liable to be called on for an account of their conduct, and if found guilty of corruption or misconduct, were punished with infamy.

In the other mode of proceeding, which was strictly in accordance with the definition which we have given of arbitration, the parties were at liberty to refer their differences to whomsoever they chose. The submission was generally made by a written agreement, which frequently contained an engagement by third persons to become sureties for its performance. (Demosthenes's *Speech against Apaturius*, chap. 4.) The arbitrator was not required to adhere to a rigid interpretation of the law, but might decide according to the individual merits of the case before him. (Aristot. *Rhet.* i. 14.) There lay no appeal from his award to any other tribunal whatever. (See the law quoted by Demosthenes against Meidias, chap. 26.)

The Roman law upon this subject is much better understood, and is of infinitely greater importance. Its influence has extended over the whole of Europe, and even in our own country it is evident that references made by virtue of a mutual agreement—apparently the first species of arbitration known in our law—are mainly founded upon the doctrines contained in the *Digests* of Justinian, lib. iv. tit. 8. The only mode of referring a matter to arbitration in the Roman law, was by an agreement called *compromissum*, which contained the names of the arbitrators (hence called *arbitri compromissarii*), the matters intended to be referred, and an undertaking by both parties to abide by the award, or in default thereof to pay to the other a certain sum of money as a penalty. The rule which forbids matters of public interest to be submitted to the judgment of a private referee, was not confined in its operation to criminal prosecutions and penal actions only, but extended to preclude arbitrators as well from entertaining any question affecting the civil condition (*status*) of any individual,—his freedom, for instance,—as from deciding on the validity of any contract which it was attempted to set aside on the ground of its having been obtained by fraud or force, &c.

The persons named as arbitrators were not bound to undertake the office, but having once done so, they might, by an application to the prætor, be compelled to go through with it. Their authority was, however, terminated by the death of either of the parties, unless his heirs were included in the submission; by the expiration of the time limited for the decision; by either party having broken the agreement, and so incurred the penalty; or by his becoming insolvent, and his property in consequence of a *cessio bonorum* being vested in his creditors. Their authority also ceased by what we should call an implied revocation, if the subject matter of the reference perished, or if the parties settled the dispute in some other way, referred it to other arbitrators, or proceeded with an action respecting it. Besides the cases in which his authority was thus at an end, an arbitrator could not be compelled to proceed with the reference if he could allege any sufficient excuse, as, for instance, that the submission was void, that there had arisen a deadly enmity between him and one of the parties, or that he had been prevented by ill-health, or by an appointment to some public office in the state.

The extent of the arbitrator's authority depended upon the terms of the submission, which might be either special or general. The submission usually appointed a certain day for the making of the award, but power was generally given to the arbitrators to enlarge the time if necessary, but they could not give their award on an earlier day without the consent of the parties. On the day originally appointed,

or on that subsequently fixed by the arbitrators, they formally pronounced their award, and (unless it had been agreed otherwise) the parties were required to be present, and if one of them failed to appear, the award was not binding, but the party who had thus prevented the arbitration being completed incurred the penalty specified in the submission. If there were several arbitrators, all were bound to attend: they were not, however, required to be unanimous, but the opinion of the majority prevailed; and if they were equally divided, it is said that they might of their own authority appoint an umpire, and in case of their refusing, the prætor had the power of compelling them to do so. When their award was pronounced, their authority expired, and they could neither retract nor alter their decision.

The award when made had not the authority of the sentence of a court of justice, nor was there any direct method of enforcing the performance of it; but as the parties had bound themselves to abide by the arbitrator's decision, if either of them refused to perform it, or in any other way committed a breach of his engagement, he was liable to an action; and however unsatisfactory the award might appear, there was no appeal to any other court. If, indeed, the arbitrators had been guilty of corruption, fraud, or misconduct, or if they had not adhered to their authority, their award was not binding; there was, however, no direct method of setting it aside; but if an action was brought to enforce the award, such misconduct might be insisted on as an answer to it. (Heineccii *Elem. Jur. Civ.* part i. § 531-543; Voetii *Commentarius ad Pandect.* vol. i. pp. 290-300.)

The Roman law was, with some slight modifications, adopted in France (Donat's *Civil Law*, part i. book i. tit. 14; and *Public Law*, book ii. tit. 7; Pothier, *Traité de Procédure Civile*, part ii. chap. iv. art. 2), and notwithstanding the changes which have been introduced from time to time, it still forms the groundwork of the system. There are at present three kinds of arbitration; the first is voluntary arbitration, which is founded, as in the Roman law, upon an agreement of the parties. The mode of proceeding in this case is treated of at considerable length, and with minute attention to details, in the *Code de Procédure Civile*, art. 1003-1028.

The ordinary courts exercise a much greater control over the proceedings in references than they do in England, but they have never had the power which the magistrates had at Rome of compelling a person who had once undertaken the office of arbitrator to proceed with it; nevertheless, if he fail to do so, without a sufficient excuse, he is liable to an action for the damages occasioned by his neglect of duty. In order to understand clearly the peculiarities of the French system, it will be necessary to bear in mind that the proceedings before the arbitrators are much more nearly on the same footing with the regular administration of justice than is the case with us, and that many of the details are merely adopted from the practice of the ordinary courts: for instance, there is a system of local judicature established in France, and as the judge is resident in the neighbourhood of the suitors, it has been found necessary—in order to guard against partiality or the suspicion of partiality—to allow either party to refuse or challenge a judge, as in England they would challenge a jurymen; and in the same manner an arbitrator may be challenged, but this can only be in respect of some objection which has arisen since his appointment, for the very act of appointing him is an implied waiver of any objections which might have existed up to that time; but if there is no ground for challenge, the arbitrator's authority cannot be revoked without the consent of both parties.

An arbitrator's decision or award is considered as a judgment, and all the formalities required for the validity of a judgment must therefore be observed; but execution of it cannot be enforced until it has received the sanction of the public authority: this sanction is conferred by a warrant of execution granted by the president of the tribunal within the jurisdiction of which the cause of the action arose: the granting of this warrant is called the homologation of the award. If the arbitrator has not strictly pursued his authority, the warrant of execution may be superseded, and the award declared null by an application to the tribunal from which the warrant issued. Besides this, the same modes of obtaining relief may be resorted to in the case of an award, as in that of any other judgment. If any mis-

conduct or irregularity has occurred, the award may be set aside by what is called a *requête civile*; and even where nothing can be alleged against the formal correctness of the proceedings, if one of the parties be dissatisfied with the judgment, he is at liberty (unless the right has been expressly renounced) to appeal to a superior court: when this happens, the whole case is re-opened before the tribunal of appeal, and the merits investigated anew; and when an award is brought under the consideration of a court in any of these ways, any final judgment which the court may have pronounced may be brought before the Court of Cassation, and there quashed if erroneous in point of law.

The second kind, which is called 'compulsory arbitration,' is where the parties are by law required to submit to a reference, and are precluded from having recourse to any other mode of litigation. The ancient laws of France introduced this species of arbitration very extensively for the settlement of disputes respecting either mercantile transactions or family arrangements; but by the codes now in force, it is admitted in one case only, that of differences between partners. Over such differences the ordinary courts have no jurisdiction whatever in the first instance, even by the consent of the parties; but the commercial courts exercise a superintending and controlling authority over the proceedings. Thus the arbitrators may either be appointed by the deed of partnership, or afterwards nominated by the partners; but if, when a dispute has arisen, one of the partners refuses to nominate an arbitrator or nominates an improper person, the commercial court, upon application made by the other partner, will appoint one for him; but the authority of the person so appointed will be superseded, if at any time before he enters upon his functions an arbitrator is duly nominated by the partner in delay: and when the firm consists of several partners, upon an application being made by any one of them, the court, after taking into consideration how far their respective interests are identical and how far they are conflicting, will regulate accordingly the number of arbitrators to be appointed by each. The sentence of the arbitrators, howsoever appointed, is decided by the majority of vote.

The authority of the arbitrators in this case partakes more of the judicial character than it does in voluntary arbitration; they are considered as being substituted for the ordinary commercial tribunal; their sentence is accordingly registered among the records of the court; and for the same reason also they stand upon the same footing with the court, both in the power of sentencing the parties to imprisonment and, unless the right has been renounced by the parties, in the liability of appeal from their decision. (*Code de Commerce*, art. 51-61.)

Besides the compulsory arbitration in matters of partnership, the parties who enter into any engagement are at liberty to stipulate that all differences arising between them shall be submitted to arbitration. This stipulation is compulsory, and the court will, if requisite, appoint an arbitrator ex officio for the party who should refuse to do so: but it is not exclusive, so as to take away the jurisdiction of the ordinary tribunals; it may be rescinded by the consent of the parties, or waived by their acts.

The third kind of arbitration is distinguished by the appellation of the persons to whom the reference is made; they are not called, as in the other cases, *arbitres*, but *amiables compositeurs*, or in the older law, *arbitrateurs*. The peculiar characteristics of this amicable composition are, that the referees are not, as in other cases, bound to adhere rigorously to the rules of law, but are authorized to decide according to what they conceive to be the real merits of the case; that in the exercise of this discretion their decision is final, and without appeal to any other tribunal. In case of irregularity or misconduct, the award may be set aside by the judgment of a court, but this judgment cannot be further questioned in the Court of Cassation. This modification of the general law may be introduced into all arbitrations, whether voluntary or compulsory. (See Pardessus, *Cours de Droit Commercial*, § 1386-1419.)

In Denmark and its dependencies, Courts of Arbitration or Conciliation were established about the year 1795, and are said to have been attended with extremely beneficial effects. In Copenhagen the court is composed of one of the judges of the higher courts of judicature, one of the magistrates of the city, and one of the representatives of the commonalty. In other towns, the chief magistrate proposes five or six of the more respectable citizens for arbitrators, of

whom the commonalty of the town elect two. In the country, the bailiffs or sheriffs are the arbitrators, and generally act as such personally; but in extensive districts they have authority to appoint deputies. All matters of civil litigation may be referred to these official arbitrators; who in the country sit once in every week, and in the capital as often as occasion requires. It appears that, after investigating a disputed case, the arbitrators in these tribunals have no power to compel the parties to settle their differences in the manner proposed by the court; if they agree, the terms of the arrangement are registered, and it has then the force of a judicial decree: if, after stating their differences and hearing the suggestions of the arbitrators, the parties still disagree, no record is made of the proceeding, and they are at liberty to discuss their respective rights in the ordinary courts of justice. It is necessary, however, that before a suitor commences an action in the superior courts, he should prove that he has already applied to one of the courts of conciliation. These courts, which are attended with very small expense to the suitors, were, soon after their establishment, multiplied rapidly in Denmark and Norway, and are said to have produced an astonishing decrease in the amount of contentious litigation. (See *Tableau des Etats Danois*, par Catteau, tome i., p. 296.)

ARBLAST, or **ARBALEST**, was the name more particularly given to the cross-bow. Robert of Gloucester, in his *Chronicle*, published by Hearne, p. 378, makes an especial difference between the bowmen and the *arblasters* or *arblastiers*, the cross-bowmen. In the Latin of the middle age it is called *arcubalista*, from *arcus*, a bow, and the Greek word *βέλος*, to cast or shoot.

The precise date and origin of the arbalest is unknown; but it seems easily derivable from the larger species of ballista. Vegetius is inclined to consider the *scorpio* to be the same as the cross-bow: he speaks of scorpions, which he says they now name *manuballistæ*; and in later writers the modern weapon is sometimes termed *scorpio manualis*.

Pitiscus, in his *Lexicon*, has assigned the introduction of the arbalest into the Roman armies to the time of Constantine, or a little earlier.

Stutt thought that the cross-bow was introduced into England about the thirteenth century; but Deines Barrington comes probably nearer to the truth (*Archæologia*, vol. vii. p. 46), when he inclines to the opinion, that it was the arbalest, and not the long bow, which was used with such destructive effect at the battle of Hastings by the Normans. There can be little doubt but that the arbalest was introduced by the Normans at their first arrival. We have no mention whatever of it in any writer or document of the Saxon times, but in the *Domesday Survey*, compiled in 1086, we have several *arbalistarii*, captains of cross-bow men, among the tenants in chief. No such appellation is given in that record to any person who held lands in the time of King Edward the Confessor.

Brompton, in Twyden's *Scriptores*, col. 1278, says, that the use of the arbalest having been laid aside, was revived by King Richard I., who was afterwards killed by an arrow shot from one at the siege of Chalus.

The arrows for the cross-bow were called quarrels, from the French *carreau*. More will be said of the use of the cross-bow in the account of **ARCHERY**.

ARBOGAST, **LOUIS FREDERIC ANTOINE**, was born at Mutzig in Alsace, in 1759. According to the account given in the *Biographie Universelle*, he was successively professor of mathematics at the school of artillery at Strasburg, and rector of the university of the same town. He afterwards represented the department of the Lower Rhine in the national convention, where, however, he took no prominent part in politics, and his name only appears to some reports on scientific subjects. He was also a principal actor in the formation of the committee of public instruction, to the affairs of which he particularly devoted himself. After the dissolution of the convention, he became professor of mathematics in the central school of his department at Strasburg, where he died April 8, 1803, leaving a name which must be placed high among those of the analysts of his day, and a character without reproach.

Arbogast's first work was presented to the Academy of Sciences, under the title of *Essai sur de Nouveaux Principes de Calcul Différentiel et Intégral, indépendants de la Théorie des infiniment Petits, et de celle de Limites*. This essay is not printed, but from his own account of it in the preface to the *Calcul des Derivations*, it appears that he had, partially

at least, anticipated the leading points of the *Théorie des Fonctions* of Lagrange.

In 1790 (Lacroix, *Calc. Diff.*, 1792; *Biog. Univ.*) he gained the prize proposed by the academy of Petersburg for an essay on the nature of the arbitrary functions contained in the integrals of partial differential equations. In this paper he takes, and in the opinion of Lacroix finally establishes, the view maintained by Lagrange and Euler against D'Alembert, in favour of the discontinuity (Lacroix, *Calc. Diff.*, vol. ii., p. 686).

But his great work is the *Calcul des Derivations*, published at Strasburg in 1800. Its main object, and we can here state no more, is the law of derivation of the successive coefficients of a development from one another, when the expression is more complicated than a function of a binomial. Therefore Taylor's theorem and common differentiation are particular cases of Arbogast's method. It is an embarrassing work to read, on account of the number of new notations, and the complexity of the algebraical part; but it contains much that is elegant, and which may eventually become useful. M. Lacroix thinks that it has not been received with sufficient favour, and cites an unpublished memoir of M. Français, who was in habits of intimacy with M. Arbogast, and corrected the proofs of his work, in which the former had applied the method to a question of mechanics, and had succeeded in a development which he (M. Lacroix) thinks would be almost impracticable by common methods.

We must not omit to mention, that the *Calcul des Derivations* contains the first use of the separation of symbols of operation and of quantity, which has since thrown so much light on the connexion of various parts of analysis. (See Lacroix, *Calc. Diff.*, vol. iii., p. 726.)

ARBOIS, a town in France, in the department of Jura, and the arrondissement of Poligny, about six miles N.N.E. from the town of Poligny, and twenty-three miles in the same direction from Lons le Saunier, the capital of the department. It is on the south bank of the little river Cuisance (a feeder of the Loue, which empties itself into the Doubs, and so into the Saône and Rhone), not far from the north-eastern ridge of Jura. It is neat and well built. The wines of the neighbourhood of Arbois are highly esteemed, especially that which, from being made at the commencement of winter, has the name of *vin-de-gelée* (frost wine). Leather, paper, and china, are among its manufactures. The population in 1800, between 6000 and 7000. It is the seat of a *tribunal première instance* (a subordinate civil and criminal court) under the *Cour Royale* (a size court) of Besançon. Before the revolution there were several religious establishments at Arbois.

It possesses some Celtic and Roman monuments, and has the ruins of an ancient castle, which is considered by the inhabitants to be haunted. The tradition is thought to have originated from, or been confirmed by, an act of cruelty committed by Mahaut of Arbois, Countess of Burgundy, who when some poor persons had taken refuge with her in time of famine, ordered them to be confined in a large building, and burnt in it. Lat. 46° 55' N., long. 5° 50' E. of Greenwich.

This town gave birth to General Pichegru. (M. Brun, Balbi, *Dict. Universel de la France*.)

ARBROATH. [See **ABERROTHWICK**.]

ARBUTHNOT, JOHN, a celebrated wit and physician in the latter part of the seventeenth and the early part of the eighteenth century. His father was a clergyman of the Scotch episcopal church.

Arbuthnot was educated in the University of Aberdeen, where he took his doctor's degree in medicine. The revolution having deprived his father of his church preferment, and a small paternal estate being insufficient for the comfortable support of the family, the Doctor came to London in pursuit of fortune. He began by teaching mathematics as a means of subsistence. Dr. Woodward's *Essay towards a Natural History of the Earth*, published in 1695, contained an account of the universal deluge, which Dr. Arbuthnot thought to be irreconcilable with philosophical truth. He therefore drew up a work entitled *An Examination of Dr. Woodward's Account of the Deluge, with a Comparison between Steno's Philosophy and the Doctor's, in the case of Marine Bodies dug out of the Earth*, 1697, 8vo., which brought him into notice as an author. His extensive learning and conversational talents introduced him gradually into practice, and he became emi-

nent in his profession. He had the good fortune to be at Epsom, when Prince George of Denmark was suddenly taken ill; and being called in to attend him, his treatment was so successful, that the prince, from the time of his recovery, employed him as his regular physician. Arbuthnot was appointed physician in ordinary to Queen Anne in 1709, and admitted a fellow of the College of Physicians. He had for some years before been a Fellow of the Royal Society.

His talents, learning, and fascinating manners, introduced him to an intimate correspondence and friendship with Pope, Swift, Gay, Parnell, and other leading wits of the period, who were all associated as members of the Scriblerus Club. In 1714 he engaged with Swift and Pope in a design to write a satire on the abuse of human learning in every branch. It was to have been executed in the humorous manner of Cervantes. Fictitious adventures were to have been worked up with mock solemnity and all the pretensions of history. But the project was stopped by the queen's death, when nothing more than an imperfect essay towards it had been drawn out, under the title of the first book of the *Memoirs of Martinus Scriblerus*. This fragment is to be found in some editions of Pope's works. There is nothing like it in our language, nor to the best of our knowledge, in any other; it is characterized by a brilliancy and exuberance, not to say extravagance, of wit and humour, which is pretty sure to tempt any who has once read it to a second perusal. *Gulliver's Travels* are said by Warburton to have been first intended as a part of these Memoirs: allusion is made to them in the 13th chapter. The treatise, *Of the Art of Sinking in Poetry, the Virgilian Restauratus*, and the report *Stradling v. Stiles*, are detached portions of the same work: of which the eminent writer above named speaks thus:—'Polite letters never lost more than by the defeat of this scheme, in which each of this illustrious triumvirate would have found exercise for his own peculiar talent, besides constant employment for that they all held in common. For Arbuthnot was skilled in everything which related to science: Pope was a master in the fine arts; and Swift excelled in the knowledge of the world. Wit they had as in equal measure; and this so large, that no age, perhaps, ever produced three men to whom nature had more bountifully bestowed it, or art had brought it to higher perfection.' The humorous political pamphlet of *John Bull*, which has served as the model for many *jeux d'esprits* upon the same plan, is generally believed to have been written by Arbuthnot, though attributed at the time to Swift, and published in the collection of his works. Swift, however, in his letters names Arbuthnot as the author. This piece, which is entitled *Laur is a Bottomless Pit, or the History of John Bull*, contains a burlesque account of the war which broke out on the accession of a branch of the house of Bourbon to the throne of Spain in 1700, and was terminated by the peace of Utrecht in 1711. The war is described under the semblance of a lawsuit, carried on by the contending parties of England, Holland, and Austria against France and Spain, which are designated by names emblematic of the national distinctive qualities usually ascribed to each of them.

The queen's death, and the consequent disasters which befell his friends, deeply affected Arbuthnot's spirits. As a relief to his melancholy, he went to Paris; but after a short stay returned to London, and having lost his place and official residence at St. James's, he took a house in Dover-street, observing to Swift, that he still hoped to be able to keep a little habitation warm in town. In 1705 he published *Tables of Antient Coins, Weights, and Measures*, &c., in octavo, republished in 1727 in quarto. He continued the practice of medicine with success, and amused his intervals of leisure in writing papers of wit and humour. In 1731 he published his *Essay on the Nature and Choice of Aliments*, which was followed the year after by an *Essay on the Effects of Air on Human Bodies*. He is thought to have been led to the subjects of these treatises by studied attention to his own asthma, which had gradually increased with years, and at length was found to be incurable. In 1734 he retired to Hampstead in hope of some relief; but died at his house in Cork-street, Burlington-gardens, in February 1735. He was married and had four children.

His son George enjoyed a profitable place in the Exchequer, and was one of Pope's executors. Two daughters survived him, but died unmarried. Anne was honoured by a legacy in Pope's will. His son John died two years before him; and from Arbuthnot's affectionate expression,

that he 'would willingly have redeemed his life with his own,' it is probable that grief aggravated his disease, and hastened its termination.

Pope, in a letter to Digby, says that the first time he saw the Doctor, Swift observed to him that the Doctor was a man who could do everything but walk. The observation was made in reference to a peculiar slouch in his gait, upon which Swift comments in one of his letters. Arbuthnot appears to have been in every respect a worthy and accomplished man. He was inferior to none of his brilliant contemporaries in humour, liveliness, and learning, and few of them could compare with him in the strict performance of moral duties, or in acts of humanity and benevolence. The fortitude displayed in his letter to Pope, written almost on his death-bed, could have been inspired only by a conscience void of offence, and the calm retrospect of a well-spent life. No person of right mind and feelings can read that letter without admiring the writer, and feeling better from the perusal. In 1751 two volumes in 12mo. were published at Glasgow, entitled the *Miscellaneous Works of the late Dr. Arbuthnot*. It is stated in an advertisement, that 'the contents of these volumes, and what is inserted in Swift's *Miscellanies*, comprehend all the pieces of wit and humour of this admirable author.' The collection contains many of his undoubted productions; but the genuineness of several pieces is negatived both by the internal evidence of discrepant style and inferior taste, and by the direct testimony of Mr. George Arbuthnot. To his other accomplishments, Dr. Arbuthnot added the knowledge of music, and some skill in composition. Sir John Hawkins, in his *History*, mentions an anthem composed by him. Kippis, *Biog. Britann.*; also Pope and Swift's *Correspondence*.

ARBUTUS, a genus of evergreen shrubs, belonging to the natural order *Ericææ*. It is characterised by its fruit being a berry, containing many seeds. The most remarkable species is the arbutus of Virgil, now called *A. unedo*, or the strawberry tree, from the resemblance borne by its berries to that well-known fruit. It is a native of the south of Europe and the Levant; in our gardens it proves a hardy evergreen tree, sometimes as much as eighteen or twenty feet high, bearing its greenish-yellow blossoms in October and November, and its bright yellow and red berries, which are studded with little projections, in November and the succeeding months. The most interesting specimens in this country are at the lake of Kulsberg, where they form groves of great beauty: the plant can scarcely, however, be considered indigenous to Ireland on this account. Its berries are hardly eatable: taken in too great quantities they are apt to produce stupefaction: nevertheless a wine, said to be pleasant enough, is prepared from them in Corsica. Three varieties are found in the nurseries: one with deep red flowers, called the scarlet arbutus, which is much more beautiful than the original species; a second, with double greenish flowers and a smaller foliage; and a third, with leaves which are not at all cut at the edges: the two last are mere objects of curiosity. They are not raised by grafting upon the wild species, and by eating several layers of the young shoots: the wild kind itself sprouts up into the trunk only, by means of which it may be multiplied in great abundance. Considering this circumstance, and its great beauty, it is quite surprising that we do not see it more frequently planted in large masses.

The *Oriental Arbutus*, *A. andreastrum*, is superior to the last in beauty both of leaves and flowers, but it is much more tender, and does not bear fruit in Great Britain. It is readily known by its broader and less serrated leaves, and by its bark peeling off so as to leave the stem always smooth and of a clear, bright cinnamon-brown. Native of the Levant.

A. hybrida, or the mule arbutus, is apparently a hybrid between the two last, agreeing with *A. unedo* in the general aspect of its foliage, which is, however, larger and more handsome, and with *A. andreastrum* in flowers and in the deciduous bark. It is hardy, and very ornamental, but it does not bear berries.

The other species are chiefly American, and of less general interest: one of them, *A. procera*, exists in the gardens of this country, but it does not seem likely to be able to endure our climate. It is a native of New Abion, where it forms a moderately-sized tree; another, *A. mucronata*, from the Straits of Magellan, is a hardy evergreen bush, with small, very dark, pointed and serrated leaves, among which

hang numbers of solitary white blossoms. It has lately begun to flower about London, but is still a rare plant. It requires to be grown in peat soil.

For other species of arbutus see *ARCTOSTAPHYLOS*.

ARC, from the Latin *arcus*, a bow, signifies any part of a curve line, as A C B. The straight line A B, which joins the extremities of the arc, is called its CHORD.

For the arc of a *circle*, see *ANGLE*, where the method of finding the arc from its angle, and the converse, is given. For the properties of the arcs of various curves, see their several names.

It is found necessary to assume the following axiom previously to any general investigation of the properties of an arc. Every arc is greater than its chord, but, when concave to the chord throughout, is less than the sum of the sides of any rectilinear figure which contains it. Thus A C B is greater than A B, but less than the sum of A D, D E, and E B. If x and y be the co-ordinates of any point in the curve, the general method of finding the arc is by the integration of the formula

$$\sqrt{dx^2 + dy^2},$$

or, in the language of the fluxional calculus,

$$\text{fluent of } \sqrt{x^2 + y^2}.$$

The practical method of finding the length of an arc, which is an approximation to the preceding process, is as follows. Divide the arc into a number of smaller arcs, making the number large in proportion to the degree of accuracy required, and add together the chords of the smaller arcs. The sum of the chords will differ very little from the arc, even when the number of sub-divisions is not very large. For instance, the arc of the quadrant of a circle, whose diameter is ten million of inches, is 7,853,982 inches, within half an inch. Divide this quadrant into ten equal parts, and the sum of the chords is 7,845,910 inches; divide the quadrant into fifty parts, and the same sum is 7,853,659 inches, which is not wrong by more than one part out of 24,316. For only twenty subdivisions the sum of the chords is 7,851,963 inches, wrong only by one part out of 3890. Therefore, for every practical purpose, an arc of a circle (and the same may be said of every other curve) is the polygon made by the chords of a moderate number of sub-divisions of the arc.

The preceding property is (but in what manner our limits will not permit us to show) a consequence of the following proposition. Let there be a number of arcs, such as A C B, cut off the same curve, having their chords parallel to the tangent

X C Y. Then, as A B moves parallel to its first position towards X Y, C D not only decreases without limit, but its proportion to A B decreases without limit; that is, let any number, however great, be named; then shall A B, before it reaches X Y, reach a position in which it contains C D more than that number of times. This proposition is startling to the beginner in mathematics, and should be considered by him with great attention. It may be illustrated in the following manner:—Suppose that while A B moves from its first position towards X Y, and has reached ab , a microscope moves with and over it, which increases in magnifying power as ab moves in such a manner that ab always appears in the glass as large as A B to the naked eye. Then $a C b$ will not be magnified into the form A C B, but into A Q B, where Q D grows less and less without limit, as ab approaches towards X Y. But if two straight lines had been taken, as in the following figure, ab could not have been magnified to A B without changing $a C b$ into A C B.

Formerly, the term arc was frequently confounded with angle, which arose from the practice of measuring angles by arcs of the circle. For such terms as ARC OF ELEVATION, &c., we refer to ANGLE OF ELEVATION, &c.

ARC, JOAN or JEANNE OF, surnamed the 'Maid of Orleans,' from her heroic defence of that city, was born about the year 1410 or 1411, in the little hamlet of Domremy, near the Meuse, and about three leagues south of Vaucouleurs, on the borders of Champagne. Her parents were humble and honest peasants. The district was remarkable for the devout simplicity of its inhabitants, as well as for those romantic superstitions which in a rude age are so often allied with religion. It appears from the copious depositions of witnesses from the neighbourhood of Domremy, examined at Joan's trial, that she was unremitting in her prayers, and other religious exercises, and was strongly imbued, at a very early age, with the prevailing superstitions of her native place.

During that period of anarchy in France, when the supreme power which had fallen from the hands of a monarch deprived of his reason was disputed for by the rival houses of Orleans and Burgundy, the contending parties carried on war more by murder and massacre than by regular battles. When an army was wanted, both had recourse to the English, and these conquering strangers made the unfortunate French feel still deeper the horrors and ravages of war. At first, the popular feeling was undecided; but when, on the death of Charles VI., the crown fell to a young prince who adopted the Armagnac side, whilst the house of Burgundy had sworn allegiance to a foreigner (Henry V.) as king of France, then, indeed, the wishes and interests of all the French were in favour of the Armagnacs, or the truly patriotic party. Remote as was the village of Domremy, it was still interested in the issue of the struggle. It was decidedly Armagnac, and was strengthened in this sentiment by the rivalry of a neighbouring village which adopted Burgundian colours.

Political and party interests were thus forced upon the enthusiastic mind of Joan, and mingled with the pious legends which she had caught from the traditions of the Virgin. A prophecy was current, that a virgin should rid France of its enemies; and this prophecy seems to have been realised by its effect upon the mind of Joan. The girl, by her own account, was about thirteen when a supernatural vision first appeared to her. She describes it as a great light, accompanied by a voice telling her to be devout and good, and promising her the protection of heaven. Joan responded by a vow of eternal chastity. In this there appears nothing beyond the effect of imagination. From that time the voice or voices continued to haunt Joan, and to echo the enthusiastic and restless wishes of her own heart. We shall not lay much stress on her declarations made before those who were appointed by the king to inquire into the credibility of her mission. Her own simple and early account was, that 'voices' were her visitors and advisers; and that they prompted her to quit her native place, take up arms, drive the foe before her, and procure for the

young king his coronation at Rheims. These voices, however, had not influence enough to induce her to set out upon the hazardous mission, until a band of Burgundians, traversing and plundering the country, had compelled Joan, together with her parents, to take refuge in a neighbouring town: when they returned to their village, after the departure of the marauders, they found the church of Domremy in ashes. Such incidents were well calculated to arouse the indignation and excite the enthusiasm of Joan. Her voices returned, and incessantly directed her to set out for France; but to commence by making application to De Baudricourt, commander at Vaucouleurs. Her parents, who were acquainted with Joan's martial propensities, attempted to force her into a marriage; but she contrived to avoid this by paying a visit to an uncle, in whose company she made her appearance before the governor of Vaucouleurs, in May, 1428. De Baudricourt at first refused to see her, and, upon granting an interview, treated her pretensions with contempt. She then returned to her uncle's abode, where she continued to announce her project, and to insist that the prophecy, that 'France, lost by a woman (Isabel of Bavaria), should be saved by a virgin from the frontiers of Lorraine,' alluded to her. She it was, she asserted, who could save France, and not 'either kings, or dukes, nor yet the king of Scotland's daughter'—an expression which proves how well informed she was as to the political events and rumours of the day.

The fortunes of the dauphin Charles at this time had sunk to the lowest ebb; Orleans, almost his last bulwark, was besieged and closely pressed, and the loss of the 'battle of Herrings' seemed to take away all hope of saving the city from the English. In this crisis, when all human support seemed unavailing, Baudricourt no longer despised the supernatural aid promised by the damsel of Domremy, and gave permission to John of Metz and Bertram of Poulengy, two gentlemen who had become converts to the truth of her divine mission, to conduct Joan of Arc to the dauphin. They purchased a horse for her, and at her own desire furnished her with male habits, and other necessary equipments. Thus provided, and accompanied by a respectable escort, Joan set out from Vaucouleurs on the 13th of February, 1429. Her progress, through regions attached to the Burgundian interest, was perilous, but she safely arrived at Fierbois, a place within five or six leagues of Chinon, where the dauphin then held his court. At Fierbois was a celebrated church dedicated to St. Catherine, and here she spent her time in devotion, whilst a messenger was despatched to the dauphin to announce her approach. She was commanded to proceed, and reached Chinon on the eleventh day after her departure from Vaucouleurs.

Charles, though he desired, still feared to accept the proffered aid, because he knew that the instant cry of his enemies would be, that he had put his faith in sorcery, and had leagued himself with the infernal powers. In consequence of this, Joan encountered every species of distrust. She was not even admitted to the dauphin's presence without difficulty, and was required to recognize Charles amidst all his court; this Joan happily was able to do, as well as to gain the good opinion of the young monarch by the simplicity of her demeanour. Nevertheless, the prince proceeded to take every precaution before he openly trusted her. He first handed her over to a commission of ecclesiastics, to be examined; then sent her for the same purpose to Poitiers, a great law-school, that the doctors of both faculties might solemnly decide whether Joan's mission was from heaven or from the devil; for none believed it to be merely human. The greatest guarantee against sorcery was considered to be the chastity of the young girl, it being an axiom, that the devil would not or could not take part with a virgin; and no pains were spared to ascertain her true character in this respect. In short, the utmost incredulity could not have laboured harder to find out imposture, than did the credulity of that day to establish its grounds of belief. Joan was frequently asked to do miracles, but her only reply was, 'Bring me to Orleans, and you shall see. The siege shall be raised, and the dauphin crowned king at Rheims.'

They at length granted her request, and she received the rank of a military commander. A suit of armour was made for her, and she sent to Fierbois for a sword, which she said would be found buried in a certain spot within the church. It was found there, and conveyed to her. The circumstance became afterwards one of the alleged proofs of her sorcery

or imposture. Her having passed some time at Fierbois amongst the ecclesiastics of the place must have led, in some way or other, to her knowledge of the deposit. Strong in the conviction of her mission, it was Joan's desire to enter Orleans from the north, and through all the fortifications of the English. Dunois, however, and the other leaders, at length overruled her, and induced her to abandon the little company of pious companions which she had raised, and to enter the beleaguered city by water, as the least perilous path. She succeeded in carrying with her a convoy of provisions to the besieged. The entry of Joan of Arc into Orleans, at the end of April, was itself a triumph. The hearts of the besieged were raised from despair to a fanatical confidence of success; and the English, who in every encounter had defeated the French, felt their courage paralyzed by the coming of this simple girl. Joan announced her arrival to the foe by a herald, bearing a summons to the English generals to be gone from the land, or she, the Pucelle, would slay them. The indignation of the English was increased by their terror; they detained the herald, and threatened to burn him, as a specimen of the treatment which they reserved for his mistress. But in the mean time the English, either from being under the influence of terror, or through some unaccountable want of precaution, allowed the armed force raised and left behind by Joan, to reach Orleans unmolested, traversing their entrenchments. Such being the state of feeling on both sides, Joan's ardour impelled her to take advantage of it. Under her banner, and cheered by her presence, the besieged marched to the attack of the English forts one after another. The first carried was that of St. Loup, to the east of Orleans. It was valiantly defended by the English, who, when attacked, fought desperately; but the soldiers of the Pucelle were invincible. On the following day, the 6th of May, Joan, after another summons to the English, signed 'Jhesus Maria and Jehanne La Pucelle,' renewed the attack upon the other forts. The French being compelled to make a momentary retreat, the English took courage, and pursued their enemies: whereupon Joan, throwing herself into a boat, crossed the river, and her appearance was sufficient to frighten the English from the open field. Behind their ramparts they were still, however, formidable; and the attack led by Joan against the works to the south of the city is the most memorable achievement of the siege. After cheering on her people for some time, she had seized a scaling-ladder, when an English arrow struck her between the breast and shoulder, and threw her into the fosse. When her followers took her aside, she showed at first some feminine weakness, and wept; but seeing that her standard was in danger, she forgot her wound, and ran back to seize it. The French at the same time pressed hard upon the enemy, whose strong hold was carried by assault. The English commander, Gladesdall, or Glacidas, as Joan called him, perished with his bravest soldiers in the Loire. The English now determined to raise the siege, and Sunday being the day of their departure, Joan forbade her soldiers to molest their retreat. Thus in one week from her arrival at Orleans was the beleaguered city relieved of its dreaded foe, and the Pucelle, henceforth called the Maid of Orleans, had redeemed the most incredible and important of her promises.

No sooner was Orleans freed from the enemy, than Joan returned to the court, to entreat Charles to place forces at her disposal, that she might reduce the towns between the Loire and Rheims, where she proposed to have him speedily crowned. Her projects were opposed by the ministers and warriors of the court, who considered it more politic to drive the English from Normandy, than to harass the Burgundians, or make sacrifices for the idle ceremony of a coronation; but her earnest solicitations prevailed, and early in June she attacked the English at Jargeau. They made a desperate resistance, and drove the French before them, till the appearance of Joan chilled the stout hearts of the English soldiers. One of the Poles was killed, and another, with Suffolk the commander of the town, was taken prisoner. This success was followed by a victory at Patay, in which the English were beaten by a charge of Joan, and the gallant Talbot himself taken prisoner. No force seemed able to withstand the Maid of Orleans. The strong town of Troyes, which might have repulsed the weak and starving army of the French, was terrified into surrender by the sight of her banner; and Rheims itself followed the example. In the middle of July, only three months after Joan had come to the relief of the sinking party of

Charles, this prince was crowned in the cathedral consecrated to this ceremony, in the midst of the dominions of his enemies. Well might an age even more advanced than the fifteenth century believe, that superhuman interference manifested itself in the deeds of Joan.

Some historians relate that, immediately after the coronation, the Maid of Orleans expressed to the king her wish to retire to her family at Domremy; but there is little proof of such a resolution on her part. In September of the same year, we find her holding a command in the royal army, which had taken possession of St. Denis, where she hung up her arms in the cathedral. Soon after, the French generals compelled her to join in an attack upon Paris, in which they were repulsed with great loss, and Joan herself was pierced through the thigh with an arrow. It was the first time that a force in which she served had suffered defeat. Charles immediately retired once more to the Loire, and there are few records of Joan's exploits during the winter. About this time a royal edict was issued, ennobling her family, and the district of Domremy was declared free from all tax or tribute. In the ensuing spring, the English and Burgundians formed the siege of Compiègne; and Joan threw herself into the town to preserve it, as she had before saved Orleans, from their assaults. She had not been many hours in it when she headed a sally against the Burgundian quarters, in which she was taken by some officers, who gave her up to the Burgundian commander, John of Luxemburg. Her capture appears, from the records of the Parisian parliament, to have taken place on the 23rd of May, 1430.

As soon as Joan was conveyed to John of Luxemburg's fortress of Beaufort, near Cambrai, cries of vengeance were heard among the Anglican partizans in France. The English themselves were not foremost in this unworthy zeal. Joan, after having made a vain attempt to escape by leaping from the top of the donjon at Beaufort, was at length handed over to the English partizans, and conducted to Rouen. The University of Paris called loudly for the trial of Joan, and several letters are extant, in which that body reproaches the bishop of Beauvais and the English with their tardiness in delivering up the Pucelle to justice.

The zeal of the University was at length satisfied by letters patent from the King of England and France, authorizing the trial of the Pucelle, but stating in plain terms that it was at the demand of public opinion, and at the especial request of the bishop of Beauvais and of the University of Paris. - expressions which, taken in connexion with the delay in issuing the letters, sufficiently prove the reluctance of the English council to sanction the extreme measure of vengeance. After several months' interrogatories, the judges who conducted the trial drew from her confessions the articles of accusation: these asserted, that Joan pretended to have had visions from the time when she was thirteen years old; to have been visited by the archangels Gabriel and Michael, the saints Catharine and Margaret, and to have been accompanied by these celestial beings to the presence of the Dauphin Charles: that she pretended to know St. Michael from St. Gabriel, and St. Catharine from St. Margaret; that she pretended to reveal the future; and had assumed male attire by the order of God. Upon these charges her accusers wished to convict her of sorcery. Moreover, they drew from her answers, that she declined to submit to the ordinances of the church whenever her voices told her the contrary. This was declared to be heresy and schism, and to merit the punishment of fire.

These articles were dispatched to the University of Paris, and all the faculties agreed in condemning such acts and opinions, as impious, diabolical, and heretical. This judgment came back to Rouen; but it appears that many of the assessors were unwilling that Joan should be condemned; and even the English in authority seemed to think imprisonment a sufficient punishment. The truth is, that Joan was threatened with the stake unless she submitted to the church, as the phrase then was, that is, acknowledged her visions to be false, forswore male habits and arms, and owned herself to have been wrong. Every means were used to induce her to submit, but in vain. At length she was brought forth on a public scaffold at Rouen, and the bishop of Beauvais proceeded to read the sentence of condemnation, which was to be followed by burning at the stake. Whilst it was reading, every exhortation was used, and Joan's courage for once failing, she gave utterance to words of contrition, and expressed her willingness to submit, and save herself from the flames. A willing

form of confession was instantly produced, and read to her, and Joan, not knowing how to write, signed it with a cross. Her sentence was commuted to perpetual imprisonment, 'to the bread of grief and the water of anguish.' She was borne back from the scaffold to prison; whilst those who had come to see the sight displayed the usual disappointment of unfeeling crowds, and even threw stones in their anger.

When brought back to her prison, Joan submitted to all that had been required of her, and assumed her female dress; but when two days had elapsed, and when in the solitude of her prison the young heroine recalled this last scene of weakness, forming such a contrast with the glorious feats of her life, remorse and shame took possession of her, and her religious enthusiasm returned in all its antient force. She heard *her voices* reproaching her, and under this impulse she seized the male attire which had been perfidiously left within her reach, put it on, and avowed her altered mind, her resumed belief, her late visions, and her resolve no longer to belie the powerful impulses under which she had acted. 'What I resolved,' said she, 'I resolved against truth. Let me suffer my sentence at once, rather than endure what I suffer in prison.'

The bishop of Beauvais knew that if Joan were once out of the power of the court that tried her, the chapter of Rouen, who were somewhat favourably disposed, would not again give her up to punishment; and fears were entertained that she might ultimately be released, and gain new converts. It was resolved, therefore, to make away with her at once, and the crime of relapse was considered sufficient. A pile of wood was prepared in the old market at Rouen, and scaffolds placed round it for the judges and ecclesiastics: Joan was brought out on the last day of May, 1431; she wept piteously, and showed the same weakness as when she first beheld the stake. But now no mercy was shown. They placed on her head the cap used to mark the victims of the Inquisition, and the fire soon consumed the unfortunate Joan of Arc. When the pile had burned out, all the ashes were gathered and thrown into the Seine.

It is difficult to say to what party most disgrace attaches on account of this barbarous murder: whether to the Burgundians, who sold the Maid of Orleans; the English, who permitted her execution; the French, of that party who brought it about and perpetrated it; or the French, of the opposite side, who made so few efforts to rescue her to whom they owed their liberation and their national existence. The story of the Maid of Orleans is throughout disgraceful to every one, friend and foe; it forms one of the greatest blots and one of the most curious enigmas in historic record. It has sometimes been suggested that she was merely a tool in the hands of the priests: but this supposition will hardly satisfy those who read with attention the history of Joan of Arc.

It is asserted (*Biog. Univ.*, art. Jeanne d'Arc), and probably correctly, that there is no genuine likeness of Joan of Arc extant. Our medal is taken from a French work: *Les Familles de la France illustrées par les monumens, &c. Tirées des plus rares et curieux cabinets du Royaume, &c.* Par J. de Bie Calcographe, Paris, 1634.

The works on the subject of Joan of Arc are very numerous. M. Chaussard enumerates upwards of four hundred, either expressly devoted to her life or including her history. Her adventures form the subject of Voltaire's poem of *La Pucelle*, and of a tragedy by Schiller; but perhaps the best production of the kind is Mr. Southey's poem bearing her name.

(The sources which have been here consulted are the original memoirs of the times, together with the numerous biographies. That of M. Lebrun des Charmettes is the fullest. It was written by a prefet, at the epoch of 1815, to flatter the Bourbons. The publication by M. Laverdy, however, of extracts from MSS. in the Bibliothèque du Roi, contains every thing relating to the trials of the Pucelle; and is a source at once ample and respectable. Unfortunately, the very trials themselves are full of partiality, that which took place afterwards for the reversal of Joan's condemnation records the testimony of witnesses, given all one way, and dictated evidently by the reaction of the period.)

ARCADE signifies a series of arches on insulated piers, forming a screen, and also the space inclosed by such. This is, perhaps, a limitation of the term within that usually given to it; but arcade is properly a correlative of *colonnade*, and should not therefore have a more extensive signification

What, by a strange perversion of the term, are in this country called *piazas*, and most particularly the part so termed of the buildings in Covent Garden, London, are strictly *arcades*; and the new market within the inclosed area of that same place or square, to which the term *piazza* properly applies, exemplifies, in a great part of its exterior, the correlative term *colonnade*.

Arcade is but another and a substantive form of *arched*; and although it may be well to restrict it, as a substantive, to the meaning given above, yet it may be conveniently and appropriately used, as an adjective, instead of *arched*, as in the description of the ancient Roman aqueduct; though it would be somewhat absurd to designate such works as the bridges over the Thames at London *arcades*, or to speak of them as *arcaded*.

ARCA'DIA, one of the ancient provinces of the Peloponnesus, now the Morea, comprising the central part of the peninsula, and bounded on all sides by mountains. It extended from about $37^{\circ} 15'$ to 38° N. lat., and from $21^{\circ} 52'$ to $22^{\circ} 36'$ E. long. Its greatest length from Kalávryta, the ancient Cynæthia in the north to Samará in the south, near which it must have been separated from Laconia, was about 50 miles. Its breadth varied from 35 to 41 miles.

On the north and north-west it was separated from Achaia and Elis by a range of mountains, which branching off from Cyllene (now Zyria), the highest point of the Peloponnesus, said to be about nine stadia, or 5100 Greek feet in height (Steph. Byz.), ran in a westerly direction, and was known by the several appellations of Aroanius, Lampeia, Erymanthus and Pholœ: on the west it was separated from Triphylia by mountains which are a southerly continuation of Pholœ, but the names of which have not been transmitted to us: on the south, its boundary towards Laconia may be considered the high land from which the water flows in opposite directions, southwards into the Eurotas and northwards into the Alpheus: its separation from Messenia was the high land W. of Lycosura, running between the bed of the Neda and the sources of the Panisus, and containing the great mountain Tetrázi (Ceraurium), a part of Lycæum. On the east it was separated from Argolis by the ridge known under the several appellations of Parthenium, Artemisium, and Trachy. Its area is calculated by Mr. Clinton (*Fasts Hellenici*, i. 385) at 1701 English square miles, being next in size to Laconia, which was the largest and most populous province of the Peloponnesus. According to the calculation of the same author, the free population of Arcadia may have amounted to 107,850 persons, and by adding half that number of slaves, he makes the aggregate amount 161,750—about ninety-five persons to each square mile, which, considering that a large part of Arcadia is fertile, is probably below the truth, at least in its most prosperous days.

Arcadia may be regarded as the Switzerland of Greece, though its mountains are of much less elevation. The centre of the Morea may be considered as a high table land, which is traversed by numerous ridges of hills: the valleys of Tegea, Mantinea, Orchomenus, and Caphyæ, which run from south to north on the east side of Arcadia, are of considerable extent when compared with others in the Morea, and show the general level of the eastern side of this table-land: from the west side of these valleys the long slope lies westward, as we see by the course of the Alpheus and its tributaries; that to the eastern coast is more steep and shorter. The plains of Caphyæ, Tegea, Mantinea, and Orchomenus, which last is only separated from that of Mantinea by a low narrow ridge, may be considered as one: its length is about twenty-five miles, with a breadth varying from one to eight. The modern town of Tripolitza (probably on the site of Pallantium) is on this elevated plain, where, in the month of March, the ground is often covered with snow, while the sea-coast enjoys warm and pleasant weather. These eastern valleys have a very peculiar appearance, from being so enclosed by mountains that the water is often unable to find an outlet. At the lowest parts of them small lakes and marshes are formed, though sometimes the water is carried off by subterraneous tunnels. Such phenomena are of frequent occurrence in this part of Arcadia, which is a limestone country: these high valleys, in fact, belong neither to the water system of the Alpheus nor to that of the small streams which enter the sea on the east coast. Being now entirely deprived of wood, and of its three great cities, Tegea, Mantinea, and Orchomenus, the extensive plain of Tripolitza presents one dull, uninteresting level.

In the south and west, along the valleys of the Alpheus, the Arcadian scenery exhibits its most picturesque features, recalling to our recollection all the beautiful descriptions of the poets. The valley of Megalopolis still abounds in delightful scenery. The sides of the majestic mountains are covered with oaks, chestnuts, and plane-trees, while the lower hills are clothed with underwood, and refreshed by numerous rivulets.

The Alpheus, the principal river of the Peloponnesus, has its source near the southern frontier of Arcadia, and runs N.W., not far from the western boundary of the province, till it encounters the slopes of Mount Pholœ, when it enters the valley of Olympia, and, flowing in a westerly direction, reaches the sea. (See ALPHEUS.) It is joined on the east by the rivers Helisson, Gortynius, Ladon, and Erymanthus, celebrated in mythology for the scene of Hercules' exploit in killing the savage boar; on the west the mountains approach so closely to its banks that the courses of its tributaries are short, and in summer most of them dry.

The Arcadians were divided into many independent states, and each of these contained several inferior towns or villages. Of their number some idea may be formed from the fact that the inhabitants of forty of them were transferred, B.C. 371, to form the new state of Megalopolis, which was founded near the frontiers of Laconia, and which seems to have had a territory assigned to it more extensive than that of any other Arcadian state, running northwards for about twenty-three English miles. (Pausan. viii. 27. 5. 35. 5. 36. 2.) At the time when Strabo wrote, about A.D. 14, he tells us that there was scarcely a city in the whole extent of its territory, and that even Megalopolis had been reduced almost to a desert. There are now a number of insignificant villages in Arcadia, but the only place of any importance is Tripolitza, which during the existence of Turkish oppression in this unfortunate country was the chief residence of the pacha. We may mention a few of the principal ancient cities, though the sites of some of them are unknown, or at least doubtful. In the north lay Psophis, near the modern Khan of Tripotamo, on the banks of the river Erymanthus, remarkable for the strength and singularity of its site: Cynæthia, probably Kalávryta, whose inhabitants were distinguished from the rest of the Arcadians by the peculiar savageness and ferocity of their disposition, qualities which Polybius (iv. 21) attempts, at great length, to prove arose from their hatred to music, which was particularly cultivated by their fellow-countrymen: Stymphalus, the remains of which are found about an hour W.S.W. of the village of Zaraka, on the banks of the Palus Stymphalia, once the fabled haunt of the birds called Stymphalides: Caphyæ, the remains of which are found at Khotisa, celebrated for the defeat of Aratus and the Achæans [see ARATUS] by the Ætolians in the Social War: Orchomenus, at Kalpaki, under which is a plain in a great measure occupied by a small lake formed from the rain-water which descends from the surrounding hills: on the east lay the important city of Mantinea, at the site of Paleopoli, celebrated for the death of Epaminondas in the great battle between the Thebans and Lacedæmonians, B.C. 362: Tegea, at Paleo Episcopi, once one of the most powerful states of Arcadia: on the west there were no cities of any great importance.

Besides the ancient authorities already quoted, the reader may consult Strabo, viii. 388; Pliny, iv.; and also Breitenbach, *Geschichte von Arcadien*, Frankfurt. 1791; Leake's *Morea*; Gell's *Narrative of a Journey in the Morea*.

ARCADIANS, an indigenous race, according to their own account, who had occupied the central parts of the Peloponnesus from time immemorial. According to Aristotle (see Scholium on the Clouds of Aristophanes, l. 397), the Arcadians expelled a prior race from the country, and were therefore not the primitive possessors, if we adopt this tradition. We have no difficulty, however, in making out that they were a branch of the great Pelasgi nation, which seems to have extended, at one time, nearly in a continued line from the Italian peninsula to Asia Minor. A strong confirmation of this statement is, that Arcadia furnishes specimens of ancient polygonal walls, (such as at Mantinea, and at Lycosura)—a species of architecture supposed to be peculiar to the Pelasgi; and their first king is reported to have been the earth-born Pelasgus. Pausanias, in his account of its early history, presents us only with fable; and it is therefore unnecessary to enumerate the names of the kings, which he pretends to have learned from diligent investigation.

As Arcadia is a mountainous country, and abounds in forests and grass lands, the character of its antient inhabitants and their mode of life were, to a great extent, determined by these physical circumstances. The tending of cattle and hunting were their chief occupations, and we find them often represented in all the rudeness of an uncultivated state. Men and swine alike lived on acorns, and Philostratus (lib. iii.) paints the Arcadians as little superior to the animals which they fed. With these testimonies, therefore, as to their character, we cannot but wonder how the Arcadian shepherds could have acquired their reputation for mildness and innocent simplicity, qualities by which they are best known to us. Polybius, their countryman, partly explains this circumstance, when he tells us that the Arcadians, at first fierce and savage, were softened by their diligent application to music.

In the second Messenian war, B.C. 685-668, we find the Arcadians under the command of a king, Aristocrates, whom they stoned to death on account of his treacherous behaviour to the Messenians, and the country was then divided into a number of small republics. Herodotus (vii. 202) tells us that they took part with their countrymen against Xerxes, B.C. 480, and that they sent to Thermopylæ a body of 2120 men to oppose that monarch. But if they had no larger number in the field than this, it does not speak highly for their patriotism, nor do we think that their subsequent history proves that they possessed the feelings of a united people. They were mere soldiers of fortune, ready to draw their swords in defence of any one willing to pay them. In the celebrated Sicilian expedition, B.C. 415, they were found in the ranks of both armies, nor do they appear to have acted as a nation till they had founded, under Epaminondas, the city of Megalopolis, B.C. 371, which became the metropolis of the country. From this time the Arcadians appear as a confederated state with a general council to manage the affairs of the nation. It is said to have consisted of 10,000 members (*oi pñpion*), and if it were not frequently mentioned by antient writers under this appellation, we should be inclined to imagine that there must be some mistake. What makes it still more inexplicable is, that it possessed the executive and judicial powers, but not the legislative, which resided in the whole assembled people. Pausanias, in his *Arcadica* (chap. xxxii.), mentions the council-chamber (*βουλευτήριον*) of the Ten Thousand. It was Epaminondas and the Boeotians who assisted the Arcadians in establishing this constitution, and in rendering them independent of the power of the Spartans. On the death of Alexander, B.C. 323, we find the country a prey to a number of petty tyrants, and the part they took in the Achaean league did not relieve them from their difficulties, or enable them to re-establish peace and security. The Romans at last made themselves masters of their country, and included it in the province of Achaia, but their days of prosperity never returned. Strabo states, that in his time the country was desolate, and that Tegea was the only city of importance which it contained; but Strabo himself did not visit Arcadia. Pausanias, who examined Arcadia about A.D. 174, gives a minute account of its ruined cities, and of the numerous antiquities with which it abounded. (See Pausanias, book viii.; Thucydides, vii. 57; Xenophon, *Hellenica*, vii.; Diodorus, book xv.; Herodotus, viii. 73, &c.)

ARCADIUS, emperor of Constantinople, son of Theodosius the Great, whom he succeeded A.D. 395. Neither his personal character, nor the transactions in which he was engaged, are of a nature to attract much of our attention. He was a mere puppet in the hands of ambitious men, who pursued their own interests without reference to the prosperity of the empire or the happiness of the people. The genius of Rome expired with Theodosius; he was the last of the successors of Augustus and Constantine who was acknowledged by the whole Roman empire, and who appeared at the head of its armies. By his will he divided this mighty empire between his two young sons, Arcadius and Honorius. Arcadius became emperor of the east, reigning over the provinces of Thrace, Asia Minor, Syria, and Egypt, from the lower Danube to the confines of Persia; Honorius became, at least, nominal emperor of the West. The line which separated the two kingdoms was, in fact, much the same as that which now divides the empire of Austria from Turkey. The accession of Arcadius marked the final establishment of the empire of the East, which subsisted, till the taking of Constantinople by the Turks, during a period of 1058 years, in a state of continual decay.

It is curious, that though the period is copiously furnished with historical materials, it is not possible to fix on a single action which properly belongs to the son of Theodosius the Great. His history is nothing else than that of the men to whom he entrusted the affairs of his empire. He was at first the submissive tool of Rufinus, who had raised himself by his talents to the notice of Theodosius, and was employed by him to direct the studies of the young prince Arcadius. Rufinus employed all his influence to inveigle Arcadius into a marriage with his daughter, but failing in this object, he was accused of inviting the Huns and Goths into Asia and Greece, and was at last murdered in the presence of the emperor by the soldiers of the celebrated Stilicho. His place was soon supplied by a eunuch, Eutropius, who exceeded even Rufinus in acts of oppression and cruelty. Arcadius saw every thing with equal indifference, and cared neither for his own honour nor the security of his subjects, provided he was allowed to enjoy the pompous luxury which we find described in the eloquent sermons of St. Chrysostom, an eye-witness of the scenes which he narrates. We cannot, perhaps, give a clearer insight into the sort of life spent by these pageant emperors than by the following quotations from St. Chrysostom. (*Opera*, tom. xiii. p. 192-196.) 'The emperor wears on his head either a diadem or a crown of gold decorated with precious stones of inestimable value. These ornaments and his purple garments are reserved for his sacred person alone; and his robes of silk are embroidered with figures of golden dragons. His throne is of massive gold. Wherever he appears in public, he is surrounded by his courtiers, guards, and attendants. Their spears, shields, cuirasses, the bridles, and trappings of their horses, have either the substance or the appearance of gold. The two mules that draw the chariot of the monarch are perfectly white, and shining all over with gold. The chariot itself, of pure and solid gold, attracts the admiration of the spectators, who contemplate the purple curtains, the snowy carpet, the size of the precious stones, and the resplendent plates of gold that glitter as they are agitated by the motion of the carriage.' In the later years of his life, Arcadius was entirely under the control of his wife, Eudoxia, whose character is best shown by the fact that she persecuted the virtuous St. Chrysostom. Arcadius died May 1, 408, leaving his empire to his infant son, Theodosius. The facts of his life are to be gleaned from Claudian, Suidas, and Theodoretus.

ARCESILAÛS was born at Pitana, a city of Æolis in Asia Minor; of his personal history we are able to collect a few facts from Suidas, and his *Life* by Diogenes Laërtius. He was born B.C. 316, and began, according to Apollodorus, to attract the attention of the learned by the acuteness of his remarks before he had reached the age of seventeen. He died B.C. 241, at the age of seventy-five. He was the pupil of the mathematician Autolycus, his compatriot, and afterwards proceeded to Athens, where it was intended that he should devote his time to the study of rhetoric. Philosophy, however, had greater charms for him, and accordingly he became the pupil of Theophrastus the peripatetic, and then of Crantor. He also made himself acquainted with the subtle dialectics of the Megaric school, and the scepticism of that of Pyrrho. He attached himself more particularly to the Academic sect, and became one of their leading philosophers, though he introduced so many changes, that he was considered the founder of what has been called the Middle Academy. The Academic sect was instituted by Plato, and continued through Speusippus, Xenocrates, Crantor, Polemo, and Crates, to Arcesilaüs. It is a point which has been disputed, whether Arcesilaüs had established his school in the lifetime of Polemo and Crates, or whether we are to consider him as the successor of Crates; but we think that Mr. Clinton (*Past. Hellenici*, vol. i. p. 367) satisfactorily proves, by reference to many passages in antient authors, that Arcesilaüs established his school at the death of Crantor, who died before Polemo and Crates; that from this period he was the rival of Zeno and Epicurus; that Polemo and Crates, strictly speaking, had no successors; that the old academy expired with them, and was superseded by the school of Arcesilaüs, which had been founded in their lifetime.

Arcesilaüs revived the Socratic mode of teaching, which had fallen into disuse; he propounded no dogmatic principles of his own, but discussed with much eloquence and art the points proposed to him by his pupils. He brought forward all the arguments that could be suggested

on both sides of a question, and endeavoured to prove that there was no certainty in philosophical knowledge, and that in all purely speculative subjects we must refrain from coming to a decision, because the mind of man cannot sufficiently distinguish truth from falsehood. He does not, however, appear to have carried these sceptical opinions into the every-day affairs of life, but to have restricted them to philosophy and science, though his opponents asserted, and with much reason, that such doctrines as he advocated tended to undermine all virtues and morality. In the world he admitted we must act as others do. The saying of the philosopher Cleanthes respecting him, clearly proves that his doctrines were not carried beyond his closet, and that in the world he was strictly attentive to all the duties of life. 'Leave him to himself,' says Cleanthes to some who lamented the tendency of his doctrines, 'for if Arcesilaüs loosens the ties of morality by his words, he knits them again by his actions.' Yet he is accused by some of carrying the pleasures of love and wine to an excess little suited to his character as a philosopher; but we think that all such accusations ought to be received with considerable caution. He was succeeded in his school by Lacydes, B.C. 211. The reader may consult the fourth book of Cicero's *Academic Questions* for an eloquent and masterly exposition of the arguments for and against the philosophical doctrines of Arcesilaüs and the sect which he founded.

ARCH, the same word as are in its etymological derivation, and an older English form (having been always used in the sense of are until that continental form superseded it), is now applied to any solid work, whether of masonry or otherwise, of which the lower part is formed into an are of a curve supported at the two extremities. We proceed to give some idea of the question of theoretical mechanics connected with this word, referring, for all matters connected with the support, to **ABUTMENT**, **BUTTRESS**, **IMPOST**, **PIER**, and for history and general information to **BRIDGE**.

In practice, we have not only the arch itself to consider, but the loose matter with which the space above it is filled, and the roadway or building thereon constructed. The two extreme effects of this load may be thus stated. If it were fluid, the common law of hydrostatics would direct us to consider every small portion *ab* (fig. 1) of the arch as sustaining a pressure perpendicular to itself, equivalent to the weight of a column of fluid having the horizontal base *ab*, and the mean of *ac* and *bd* for its altitude. On the other

hand, if the whole superincumbent load could be considered as perfectly solid and wholly unsustained by lateral pressure, the portion *pqh* might be considered as a part of the arch-stone underneath. In the absence of all trustworthy experiments to determine how far the real superincumbent pressure, where resulting from loose materials, partakes of one or the other supposition, we shall adopt the latter as probably nearer the truth than the former: which is equivalent to treating of the arch only after its superincumbent weight has been added to each arch stone.

A C and **B D** are called the piers of the arch; it is said to *spring* from **A** and **B**; **A E** and **B F** are the flanks, and **G** the *crown*. The lower line of the arch stones is called the *intrados* or *soffit*, the upper, the *extrados* or *back*: the arch-stones are called *voussours*, and the highest stone, **G**, the *key-stone*. **A B** is the *span* of the arch, and **G H** its *height*. The *voussours* are cemented together, and if the cement were sufficiently strong, any form might be given to the arch, or at least any form which would stand if cut out of the solid material. If we suppose the stones uncemented, their friction upon one another would tend to prevent the disturbance of equilibrium, and allow considerable variety of form in arches constructed with stones of the same weight. But if we suppose the stones

perfectly smooth, so that each of them is kept from slipping only by the pressure of the adjoining two, then each intrados has one particular form of extrados and one only, so long as the manner in which the stones are cut follows one given law.

Let **P Q**, **R S** (fig. 2.) be parts of the pier, which we suppose firmly fixed, and let there be no key-stone, or suppose the key-stone divided in the middle at **A B**. Let the portion

Fig. 2.

A C D B be taken, composed of several arch-stones, and let its centre of gravity be **G**. Then the weight of **A B C D**, collected at **G**, is sustained by pressures at the surfaces **A B** and **C D**, perpendicular to those surfaces. Take **E F** in the continuation of **A B**, of any length, and draw **F H** parallel to **C D**. It is a known theorem, that any three forces which balance each other, are proportional to the three sides of a triangle, the directions of the sides of which are perpendicular to the direction of the forces. In the present case, **H E F** is such a triangle: for **H E** being horizontal is perpendicular to the direction of all weights: **F E** is the continuation of **A B**, and therefore perpendicular to the pressure at **A B**, while **F H**, being parallel to **C D**, is perpendicular to the pressure at **C D**. Hence **H E** bears to **E F** the same proportion as the weight of **A C D B** to the pressure at **A**. In the same manner it may be shown that, **F M** being parallel to **K L**, the weight of the portion **A B K L** is to the pressure at **A B** as **M E** to **E F**, from which it follows that the weight of **A K L B** bears to that of **A C D B** the proportion of **M E** to **H E**. Hence the following theorem:

Let **E F** be vertical, **E S** horizontal, and **F M**, **F N**, &c., parallel to the divisions between the *voussours* of an arch which is divided at its highest point: then, no friction being supposed, there can be no equilibrium unless the weights of the successive *voussours*, reckoned from the highest point, are to one another as **E M**, **M N**, **N P**, &c.

It is also necessary to the equilibrium that the vertical drawn through the centre of gravity **G** of the part **A C D B** should cut the parallelogram **1 2 3 4**, made by perpendiculars to **A B** and **C D** drawn from their extremities: for otherwise there would be no point in the vertical through **G** (at some part of which the weight must be supposed to act), at which the directions of the perpendicular pressures could meet, and no three forces can maintain equilibrium unless their directions pass through one point.

The application of analysis to the preceding conditions gives the common theory of arches. It may be found in most elementary works on statics; but we do not proceed further here, because, as will presently appear, nothing but a very considerable departure from the principles of it can endanger the construction of an arch. We need not therefore dwell upon this.

An arch constructed upon the preceding principles would, if the stones were perfectly smooth, be totally overturned by the least addition to, or subtraction from, the weight of any one arch-stone: for each arch-stone is only just kept in equilibrium by the pressures of the two adjoining. Such an arch, therefore, would not serve for a bridge, which must bear a considerable addition to its weight at different times.

It is to the friction and cements that the power of sustaining additional weights is due. It is evident that before the arch, kept in equilibrium as above, can be overturned, the additional pressure must be such as to overcome the friction against some one arch-stone exerted by the two adjoining. And the advantage is the greater, since the additional pressure itself increases the friction which opposes it. The effect of friction may be thus represented. First ascertain

the stone plane BC until the least additional elevation would make it slide down. Measure the angle CBD.

Now suppose PQ RSTV to be part of an arch kept in equilibrium without friction. From T on both sides make the angles QTX, QTY equal to CBD above measured: then the effect of friction is this, that instead of the two arch stones meeting in TQ, their line of junction might have been

anywhere in the angle YTX, without endangering the more equilibrium. Or if, as in a preceding figure, FM and FN are parallel to the lower sides of two arch-stones, and the angles MFY, NFX, NFY, be made equal to the angle BCD above-measured, then, instead of its being required that the proportions of the weights resting on those sides should be strictly

that of EM to EN, they may be in the proportions of any two lines, which, being set off from E towards S, have the end of the first between X and Y, and that of the second between X and Y. The great latitude which this gives to the construction (since BCD is, for some materials, as great as 40°) renders attention to the system of equilibrium without friction almost unnecessary, so that any arch which does not very materially differ from the arch kept in equilibrium without friction, may be considered as safe from all fracture which arises from the slipping of an arch-stone. We can find no instance mentioned of an arch which broke in this manner.

The difficulty in the way of determining the best figure of an arch, lies in our comparative ignorance of the manner in which pressure is actually communicated. The materials supposed in mechanical problems are usually perfectly rigid; those of nature are compressible: and though it is clear that a very slight alteration of form might throw the pressure of one arch-stone almost entire upon a very small part of the adjoining, we do not know enough of the nature of the materials even to guess at the law of distribution. Again, if a part of an arch be overloaded, but prevented from falling by the friction or cement, a new force, not contemplated in the preceding theory, is exerted upon the remainder. Dr. Robison, as far as we know, was the first who brought

forward this method of considering the subject. He was led to it by observing an arch which fell, the account of

which we give in his own words (*Mechanical Philosophy*, vol. i. p. 640): 'It had been built of an exceedingly soft and friable stone, and the arch-stones were too short. About a fortnight before it fell, chips were observed to be dropping off from the joints of the arch-stones, about ten feet on each side of the middle, that is at H and F, and also at another place on one side the arch about twenty feet from its middle, that is at I and G. 'The masons in the neighbourhood prognosticated its speedy downfall, and said it would separate in those places where the chips were breaking off. At length it fell: but it first split in the middle, and about fifteen or sixteen feet at each side, that is at D and B, and also at the very springing of the arch, that is at K and L. 'Immediately before the fall, a shivering or crackling noise was heard, and a great many chips dropped down from the middle between the two places from whence they had dropped a fortnight before, that is from a and b. 'The joints opened above at these new places more than two inches, and in the middle of the arch the joints opened below, and in about five minutes after this the whole came down. Even this movement was plainly distinguishable into two parts. The crown sunk a little, and the haunches rose very sensibly, and in this state it hung for about half a minute. The arch-stones of the crown were hanging by their upper corners. When these splintered off, the whole fell down.'

The preceding method of fracture also took place in several model arches of chalk, loaded for the purpose, and Dr. Robison explains the phenomena as follows. He supposes that the pressure from the crown is communicated in a straight line along as many voussoirs as one straight line will pass through. That is, he considers each of the four parts ED, DA, AB, BC, as one separate stone, not liable to be broken. The preliminary chipping from I, H, F, and G he supposes to have arisen from the whole superincumbent pressure being there sustained at the corner of the arch-stones. When the arch opened underneath A, the whole pressure was supported at a and b, since the opening at B and D deprived the arch of the support at those points. This occasioned the chipping there observed just before the fall. We must, however, remark, that the loose manner in which the preceding account is given renders it impossible to say whether or no Dr. Robison was justified in supposing the line of communication of the pressure to be straight. His hypothesis might equally apply, if AHD were a convex curve, touching the intrados at H. This experiment should be repeated, with more attention to minute circumstances and actual measurement.

This very ingenious and probable explanation, which, supposing the slipping of individual voussoirs to be impossible, may be considered as almost unobjectionable, led its author to recommend that the arch should always be made so flat as to admit the same straight line being drawn so as to pass through some point of every voussoir on each side of the key-stone. That such an arch cannot be destroyed without either removing the pier, or crushing the material, is evident in the case of a triangular arch, *slipping being supposed impossible*, since there is no part of the arch

which exerts any effort to overturn the rest, but only to crush it. Blackfriars bridge has arches of this kind, not indeed triangular, but so flat that a straight line can be drawn through all the voussoirs, in the manner recommended by Dr. Robison.

On this subject we refer the reader to Dr. Robison's work above cited, and to the article 'Bridge' in the *Encyclopædia Britannica*. For the method of building an arch, see CENTERING, to which also we must defer the account of a method of constructing arches lately invented by Mr. Brunel, in which the stones are so joined that each half of the arch supports itself independently of the other.

ARCH. The origin of that species of construction called an arch is still unknown; it cannot be stated with any degree of certainty, either in what country or at what epoch it was first used. There is good reason to think that it was unknown to the Greeks at the time when they produced

their most beautiful temples, in the fifth, fourth, and third centuries before the Christian era. No structure answering to the true character of an arch has been found in any part of those works, though many occasions occur in which the application of the arch would have been of great service, and could not have been passed over by an intelligent and ingenious people like the Greeks, if they had been acquainted with the principle. The want of the arch would necessarily lead them to contract the intercolumniation, or spaces between the columns, and to the general and frequent adoption of columns as the only mode of supporting a superstructure. That the Greeks, before the time of Alexander, and perhaps even at a somewhat later epoch, were not acquainted with that mode of arranging materials upon which arching depends, might perhaps be considered sufficient evidence that it was unknown in Asia and Africa, even if the Indian, Egyptian, and other monuments of early date did not prove the same thing. If these nations had known this admirable expedient they would doubtless have applied it in many instances in which it is obvious that it would have been of the greatest use; and if it had been used in Egypt, it could hardly have remained unknown to those nations who were in the habit of trading with the Egyptians. We know that both the European and the Asiatic Greeks had commercial factories in Egypt, even in the reign of Amasis. (Herod. ii. 178.) [See AMASIS.]

It is maintained, however, by some, that there are brick-arches at Thebes in Egypt, which belong to a very remote epoch, and one long prior to the Greek occupation of that country. Minutoli (*Reise zum Tempel des Jupiter Ammon*) has given two specimens of Egyptian arches, one of which is a false and the other a true arch. The first specimen is from the remains at Abydos in Egypt (p. 215), where the roof has the appearance of an arch, but is formed by three horizontal stones, of which that which occupies the centre and lies over the other two, is the largest; the three stones are cut under in such a way as to form a semicircle. The true specimens are at Thebes, on the west side of the river (p. 260), near and behind the building which contains the fragments of the enormous statue. They are circular arches, and formed of four courses of bricks (see pl. 29), and on the walls there are Egyptian paintings and hieroglyphies. (See also Belzoni's *Plates*, No. 41, and his remarks on the brick arches of Thebes.) Should these be admitted to be old Egyptian arches, it seems difficult to conceive why the arch should not have come into more general and early use. The stone arches in the Nubian pyramids can hardly be adduced in proof of the origin of the arch, as these edifices are probably not of very high antiquity. (See Cailland's *Plates*, No. 43.) Etruria seems, from the best evidence that can be obtained, to have been the birth-place of the arch, and to the Etrurians, with great probability, may be assigned the honour of the invention, and certainly that of its earliest applications, as far as our positive and undisputed information goes. The great sewer of Rome, commonly called the Cloaca Maxima, is an arched construction, which can hardly be referred to any period in the history of the city with so much probability as to that to which it is assigned by uniform tradition, namely, the age of the Tarquins. But though we may readily admit this early date, we cannot say who were the architects, whether they were Roman or Etrurian.

The application of the arched structure is one of the most useful mechanical contrivances ever discovered by man. By means of it small masses of burnt clay, and conveniently sized pieces of soft and friable sandstone, are made more extensively useful for the economic purposes of building, than the most costly and promising materials were in the hands of the Greeks and Egyptians. By means of it cellars are vaulted; subways, or sewers, are made to pass under heavy structures and along streets with certainty and safety; and secure and permanent road-ways for every purpose of communication are formed across wide, deep, and rapid rivers.

Extensively as they made use of the arch, the Romans did not deviate much from the semi-circular form. Arches of smaller segments were certainly used by them, as well as elliptical arches, but in these cases they were fortified with enormous abutments, which proves that the architects, who probably in nearly all cases were Greeks, knew very well the weak points of such a construction. It was reserved for the architects of the middle ages, or rather those of the twelfth, thirteenth, and fourteenth centuries, to show what could be done by varying the form and construction of the arch.

The pointed arch, upon its invention or first introduction into Europe, seems to have exercised the ingenuity of architects in varying its form and application. This we observe in the numerous ecclesiastical structures in this country, in our beautiful pointed styles, and most particularly in some of the greater churches and cathedrals.

The origin of the pointed arch has been almost as much disputed as the discovery of the principle of the arch itself. It became general in most parts of Europe at nearly the same time, and about the period of the return of the warrior-priests and pilgrim-soldiers of the first crusade. This, and other circumstances which might be adduced, added to the tolerably well ascertained fact of the pointed arch being used in Asia before that period, and that an arch of the pointed form cannot be satisfactorily shown to have been used at all in the northern and western parts of Europe anterior to it, give, in the opinion of some people, a reasonable degree of certainty to the supposition that the notion was brought from the east by the crusaders. Its origin may be this:—Before arching was understood, or its principle known, the use of long lintel stones was sometimes avoided, and, indeed, a trifling degree of strength was gained, by jutting stones over from each side of an opening in three or four courses until

they nearly met in the middle: then a stone of common size and ordinary length only was required to close in at the top, instead of a long and large one to serve as a lintel. The projecting lower angles of the stones, which corbelled or battened over, were disagreeable to the eye, and might also be inconvenient: and therefore they would be generally cut off, as indicated by the dotted lines, leaving the head in the form of a pointed arch. Such an explanation is, however, far from satisfactory: and it appears to us that the following extract from Mr. Rickman (*An attempt to discriminate the Styles of English Architecture*, by Thomas Rickman) contains a more probable solution of the difficulty, at least as far as concerns the origin of the pointed arch in early English buildings.

"Intersecting arches were most likely an early, and certainly a very widely-spread mode of embellishing Norman buildings, and some of them were constructed in places and with stones requiring centres to turn them on, and the construction of these centres must have been by something equivalent to compasses. Thus, even supposing (which could hardly have been the case) that the arches were constructed without a previous delineation, the centres would have led to the construction of the pointed arch: and when once formed, its superior lightness and applicability would be easily observed. To this remark it may be added, that the arches necessarily arising in some parts from Norman groining, would be pointed. A careful examination of a great number of Norman buildings will also lead to this conclusion, that the style was constantly assuming a lighter character, and that the gradation is so gentle into early English, that it is difficult in some buildings to class them, so much have they of both styles: the same may be said of every advance; and this seems to be a convincing proof that the styles were the product of the gradual operation of a general improvement guided by the hand of genius, and not a foreign importation."

We propose to treat of the various forms and decorations of the arch under the several divisions indicated in the article ARCHITECTURE.

ARCH, TRIUMPHAL, a structure which the Romans used to erect across their roads, or bridges, or at the entrance of their cities, in honour of victorious generals or emperors. They were of two kinds; tempo ary arches made of wood, on the occasion of a triumph, when the procession passed under the arch, and the conqueror had the triumphal crown placed on his head. These arches were removed after the ceremony. The others were permanent structures, built first of brick, afterwards of hewn stone, and lastly made of, or at least cased with, marble. Their general form is that of a parallelepipedon, which has an opening in the longer side, and sometimes a smaller opening on each side of the large one. These openings are arched over with semicircular arches, and the fronts are decorated with columns and their accessories on lofty pedestals: the whole

is surmounted by a heavy attic, on the faces of which inscriptions were generally placed.

Triumphal arches were erected under the Republic. An arch of P. Cor. Scipio Africanus (Liv. xxxvii. 3.) is mentioned as having been built on the Clivus Capitolinus. (See also Liv. xxxiii. 27, on the arches of L. Stertinius.) The Fabian arch is mentioned by Cicero (*Pro Plancio*) under the name of 'Fabianus fornix': it stood by the Via Sacra, near the spot afterwards occupied by the temple of Antoninus and Faustina. It was raised in honour of Fabius, surnamed Allobrogus from his victory over the Allobroges. This arch is also mentioned by Seneca, who calls it 'Fabianus arcus.' The term used by Dion Cassius for a triumphal arch is ἀφίς τροπαιοφόρος. The arches of Stertinius and Scipio were ornamented with gilded statues: and that of Scipio with two horses also. Whether they precisely resembled the later arches as to their columns, reliefs, and other accessory parts, we cannot say. As far as we can judge from medals, these early triumphal arches consisted of a single arch with a column on each side, without a stylobate; the arch was surmounted by a simple border as a kind of architrave.

Under the emperors these monuments became very numerous, and were overcharged with ornaments. Drusus, the stepson of Augustus, is mentioned as the first who had one raised to him after death, and Livia, the wife of Augustus, was the first woman to whom a similar honour was decreed. Augustus himself had several triumphal arches erected to him, of which the one at Rimini, where the Flaminian Way terminated, still remains, and serves as a gate to the town on the side towards Rome. Another arch, also erected to Augustus, though inferior in beauty to that of Rimini, exists at Susa, at the commencement of the road which leads over Mont Genève into France. Of the triumphal arches remain-

ing at Rome, that of Titus is the oldest. It was erected to him after his death by the senate in memory of his conquest of Judæa. This arch is ornamented with sculptures representing the triumph of the conqueror, and with the ornaments of the temple of Jerusalem which he brought as spoils to Rome. But arches were not erected solely to commemorate victories and conquests; they were also raised in honour of emperors for benefits conferred on their country on some particular occasions: such is the fine arch of Trajan on the old mole of Ancona. It is of white marble, and chaste in its style; the inscription states that it was raised 'by the senate and people of Rome to Trajan, Emperor and Cæsar, son of Nerva, the conqueror of the Germans and Dacians, high pontiff, &c., a most provident prince, for having at his own expense constructed the mole, and thus rendered the access to Italy on this side safer to navigators.'

Bronze statues of Trajan, of his wife Plotina, and his sister Marciana, were placed on the summit of the arch, but they have been destroyed. Another fine arch in memory of

[Arch of Constantine.]

Trajan exists at Benevento; it is ornamented with fine reliefs, and is in very good preservation. All these are single arches; but others have two smaller archways, one on each side of the great central one. These are consequently oblong in their shape, and have a heavier appearance than the single arch. Two of these triple arches still exist at

Rome, that of Septimius Severus, and that called the arch of Constantine, which we have chosen for our illustration. The view here given is from an original drawing. The arch of Constantine is in the valley at the foot of the Palatine Hill, and near the Colosseum. It is the most complete of all the triumphal arches at Rome: that of Titus has

only a central archway, and that of Septimius Severus is more dilapidated, and more encumbered by accumulations of soil. The style of Constantine's arch is also, for the most part, superior to that of the age in which it was executed, as it consists, in great measure, of the materials of a similar monument which had been erected to Trajan. But at the same time, owing to its being chiefly built of old materials, and owing to want of skill in the architect and sculptor, it presents some striking discrepancies of parts, and some specimens of bad taste. The captive Parthians, and other sculptures, which were historically appropriate on the arch of Trajan, are here employed to decorate that of Constantine. Our view indicates an excavation, bounded by a wall of an elliptical form, within which the monument stands. Accumulations of soil had raised the level of the ground nearly up to the bases of the columns; the excavation was made for the purpose of clearing away the rubbish, and the wall with the view of protecting the monument.

The number of marble arches, in honour of emperors and other personages, existing in ancient Rome alone, is stated to have been at one time thirty-six: only five or six are now remaining. Other arches are found in various parts of Italy, at Aquino, Aosta, Pola in Istria, &c.: several in the south of France, of which those of Nîmes and Orange are the best preserved; several in Macedonia, at Athens, and in other parts of Greece, all however belonging to the Roman period; several in Syria, and in Barbary, particularly one at Tripoli; and another at Constantina, described by Shaw. In modern times, triumphal arches have been raised in imitation of the Roman ones. Those of the gate St. Denis and the gate St. Martin at Paris were raised in honour of Louis XIV. Bonaparte also had one constructed on the Place du Carrousel; it is a triple arch, and has all the heaviness of that particular species of structure. Another, and a much finer one, was begun by his order at Milan, on the opening of the famous road across the Simplon. It was interrupted by the overthrow of the French empire, but has since been continued by order of the Austrian government, under the appellation of the Arch of Peace. It is now nearly finished. In London, two structures of the same kind have been raised of late years, a single arch at Hyde Park Corner, and a triple one in front of the Piccadilly palace. On Roman triumphal arches the reader may consult Pitiscus, *Lexicon Antiquitatum Romanorum*, art. Arcus.

The arch of Augustus at Rimini is sixty feet in height and twenty-seven in depth or thickness; the gateway is thirty-one feet, being the widest opening among all the ancient arches in Italy. The front is decorated with two Corinthian columns thirty-two feet high. It is made of Istrian marble.

The arch of Septimius Severus is sixty-one feet high, seventy-one feet long, and twenty-two feet deep. The central archway is thirty-six feet high, and twenty-two feet wide. The side arches are twenty-two feet high and ten wide.

The arch of Orange, in the south of France, supposed, but upon no certain grounds, to have been erected in honour of Caius Marius, is seventy feet high and sixty-six long. It is a triple arch.

ARCHANGEL, or properly ARKHANGELSKOE, 'the land of the archangel,' was one of the three roofs from which the gigantic empire of all the Russias has sprung. 'Great is our land, and rich in fruits; but there reigns no order in it. Come, then, ye princes unto us, and hold dominion over us.' At this summons from the Slavonians of Nowgorod, Rurik, Sineus, and Truwor, three brothers, chieftains of note among the warlike Varages, or Waragie-Russians, with whom both Normans and Anglo-Saxons claim kinship, descended from the Gulf of Bothnia, and divided the sovereignty of their adopted country among them. Rurik selected Nowgorod for his residence; Truwor established himself at Isborsk; and Sineus, receiving the northernmost lands for his share, took up his quarters at Bielo-Osero, or 'the White Lake.' The two younger brothers having died within two years after their arrival, Rurik, the survivor, in 864 became sole ruler over the three states, and the founder of a new empire, which is known among northern writers by the name of the 'Holmgard Empire.' Archangel is no less celebrated, in the description given by Alfred the Great of the Scandinavian nations, as the seat of the extensive empire of Biarmia (or Permia), which rose at the mouth of the Dwina, and spread across the countries which range between that stream

and the sources of the Volga. Tradition reports, that even in those early times navigators were accustomed to sail round the coasts of Norway in quest of the produce of Biarmia.

The province of Archangel is now one of the nineteen provinces, or governments, which constitute that portion of the Russian dominions called 'Great Russia;' and is not only the most northern but the most extensive province of Russia in Europe. It comprehends part of ancient Biarmia, Russian Lapland, the range of country inhabited by the Wainotan branch of the European Samoides, Nowana-Zemlya, or Nova-Zembla, and other islands in the Icy Ocean. Its most eastern limit is about 66° E. long., and its most western 29° 54'; its southernmost point is in 61° 10' N. lat., and its most northern limit extends to lat. 76°, the extreme point of Nova Zembla. The superficial extent of this province is variously estimated; by some writers at two hundred, by others at two hundred and seventy, and by more than one even at three hundred and fifty thousand square miles. Including the 27,000 miles contained in the recent addition of the circle of Kem, we conceive that its superficial extent may be safely set down at upwards of 300,000 square miles. In this respect, therefore, it exceeds the superficial area of the whole of the Austrian dominions, and is more than three times as large as Great Britain. But its population does not exceed 280,000 souls at the utmost, or about one to a square mile. Its continental limits are the government of Tobolsk on the north-east and east, Wologda on the south and south-east, Olonetz on the south-west, and Finland on the north-west; its northern shores are washed by the Icy Ocean, and the great gulf of the White Sea. The northern part of the main land in this province is situated within the Frigid Zone, and presents as desolate and sterile an aspect as the eye can dwell upon: this is particularly the case towards the east, where an immense tract of black soil, covered with moss and crusted with ice for nine months in the year, is better known among the natives by the name of the 'Tundri.' It stretches 150 miles into the country from the seacoast; and except its mossy coat, a little sorrel, and an occasional handful of berries, exhibits few signs of vegetation. South of the Tundri lie forests of pines, birches, alders, and willows. The land in the north abounds in lakes and swamps, and is traversed by several rivers, but is not capable of cultivation; the westernmost part of it only, formerly called Russian Lapland, produces here and there a few cabbages, turnips, and other sorts of vegetables, as well as berries. Even that portion of the province, which lies most to the south, affords but a scanty and precarious return to the husbandman; though in proportion as we leave the northern regions, vegetation becomes more vigorous, and grass and extensive forests show themselves. The province is in general a continuous flat, particularly that part of it which lies to the west, between the frontiers of Finland and the river Mezen: the only exception arises from the course of the Scandinavian range of mountains through the circle of Kem and Lapland: it is in this direction that they terminate in the promontories of Orlov on the White Sea, and Swiatoi Noss or 'Holy Point' on the Icy Ocean. In the eastern parts of the province two ridges encircle the bay of Tsheskai, the westerly branch of which ends at Cape Kanin: these are independent of the low chain of hills which crosses the steppe of Tundri, and rising at a distance of seventy miles from the banks of the Petshora, takes a north-easterly course, and joins the Ural, from which point the latter forms the boundary between Archangel and Siberia. This portion of the Ural range is called 'the desert Ural.'

The great river of the province is the Dwina, or 'the double river.' In its upper course from Lake Kubinskoi, it bears the name of 'Sukhona,' which it retains north-eastwards as far as Ustyug-Weliki; there it receives the name of the 'Jug,' or Upper Dwina, and afterwards that of the Dwina. It abounds with fish, and is navigable for 300 miles and upwards to the frontier of the province of Wologda; it widens to a breadth of nearly five miles at the town of Archangel, whence it flows by three channels into the White Sea. [See DWINA.] The Sukhona communicates with the Neva and Volga by means of the Kubinskoi canal and the lake of Bielo Osero. The Onega, whose whole length is nearly 400 miles, is likewise a navigable stream of some consequence; it enters the province from the adjoining government of Olonetz, and flows into a bay of the White Sea studded with islands. The same sea, west of Archangel bay, also receives the Panoi, the longest river in Lapland; and

the Mezen, a considerable stream, which rises in the marshes of the steppe of Petshora, and flows in a north-westerly direction for nearly 500 miles. The Petshora rises in the Ural mountains, ranges over a distance of full 700 miles of dreary waste, and, before it crosses the boundary between the provinces of Wologda and Archangel, receives the Usa and Elma, and then enters the sea, between Capes Bolvanski and Kostinnoi, where its surface is spotted with islands: it is navigable immediately after quitting the Ural mountains, but is locked up by ice for nine months in the year; its dreary banks are rarely the resort even of the hardy Samoiede.

The province of Archangel abounds in lakes, separated by sterile rocks, in almost countless numbers; the most considerable lie in that part of it which is situated immediately north and west of the White Sea. Amongst these are the Imandra, Kowda, Toposero, Angosero, and upper and lower Koutno.

The climate of this province, particularly the northern districts, partakes both of the extremes of heat and cold. The heat of the summer season is often oppressive; and the transition from heat to cold, on a change of wind, is frequently so instantaneous, that a man who has been working in his shirt is forced to have immediate recourse to his fur-cloak. But the climate becomes more intensely severe in proportion as we advance eastward. Every river between the Mezen and Petshora is frozen up by the end of September or beginning of October; the Dwina, on the other hand, does not usually close until a month later, and is again free from ice by the end of April or the first week in May. In those parts which lie between the Petshora and Siberia, the Samoiede himself yields to the inclement cold: no stream is open until June, and scarcely one is free from ice by the middle of September. Spring, summer, and autumn are thus reduced to an interval of three months.

The northern districts of Archangel are wholly uncultivable, and its soil, even in the south, does not yield grain enough even for the support of its scanty population. The bread in use is a compound of meal, moss, scrapings of the bark of the pine, and grated roots; yet this food, coarse as it is, is unknown to more northern palates, which must be content with dried fish. The southern districts grow hemp and flax, and a few kinds of vegetables; and in some parts, on each side of the Dwina more especially, there is pasture ground of good quality. But Archangel contains a still unexhausted mine of wealth in its forests, which give profitable employ to the labourer, the artisan, boatman, mariner, shipwright, merchant, and even the more humble gleaner of the berries which grow beneath their shade. The predominant species of timber are firs, pines, birches, alders, and larches, which are of great dimensions and lofty growth. These forests are the resort of a variety of wild animals, which the natives turn to good account. In the Tundri and sea-coast are the bear, wolf, rein-deer, squirrel, ermine, hare, martin, glutton, fox (both the common species and the beautiful polar-fox), wild duck and goose, swan, water-hen, and cider-fowl. To these may be added an abundance of marine animals, in pursuit of which hunting parties resort to Nova Zembla in particular, where they build cabins with the wood they have brought with them, and pass the winter, employing themselves in catching seals, sea-cows, and morse, or in hunting the polar-bear, fox, or rein-deer. The seas, lakes, and rivers of Archangel furnish food to the inhabitants from their ample store of whittings, pikes, eels, salmon, perch, and other fish. The only domestic companion of the Laplander and Samoiede is the rein-deer; their stock of this invaluable animal forms the criterion of wealth; hence the individual who has two thousand is accounted rich, but the man is poor who cannot muster more than thirty or forty. Archangel is but slenderly supplied with horses and cattle, and they are in general of diminutive size: the districts of Kolmogory and Shenkursk, however, which are rich in pastures, have formed an exception ever since the time of Peter the Great, when a handsome race of oxen, which have no way degenerated, were imported from Holland by that monarch; the calves of this species are kept warm, and fed on milk for nine months; at this age they weigh sometimes as much as six or eight hundred pounds, and are so white and delicate in flesh, that they are sent to St. Petersburg, where they fetch uncommonly high prices. Neither sheep, swine, nor goats are bred in any considerable numbers; what little mutton is eaten is of indifferent quality, and the fleece

is fitted only for making the coarse cloth termed wadmal. The country is also so well-stocked with game, that scarcely any poultry beyond the cock and hen are kept. With regard to minerals, salt is the staple product of this province: it is obtained in various quarters, particularly in the neighbourhood of Totma, and from the waters of the Kouda and Lesenga by the process of boiling. Bog-iron is found in considerable abundance, and between 700 and 800 tons of it are exported annually.

The manufacturing and mechanical industry of the people is principally confined to ship-building, the preparation of pitch and tar, and the weaving of linen, which latter occupation fills up the leisure hours of the peasant's wife in the circles of Kolmogory and Archangel, and constitutes a lucrative branch of their commerce with St. Petersburg, Moscow, and other Russian marts. In some years, 3000 tons of pitch have been boiled down, and 13,000 barrels of it exported; whilst the ports of the White Sea have despatched tar to the extent of 25,000/, in value to foreign parts. There are four refineries for sugar in the province, and seven rope-manufactories, but only three of them can be said to be of any importance. From 400,000 to 500,000 deals are often exported from the capital in a single twelvemonth. Tallow also is shipped in very large quantities from the White Sea, sometimes to the extent of 2500 tons and upwards yearly; but the bulk of this article is brought down from the adjacent provinces. The less important productions of Archangel which find their way outwards, are train-oil, hemp, flax, mats, canvas, skins, and furs.

The majority of the population of Archangel is of Russian extraction, in the proportion of ninety-five out of every hundred souls; the remaining portion consists of about 7000 Samoiedes, 6000 Syraenese (or Siriani, a Samoiede race, who inhabit the districts lying around the upper banks of the Petshora), and 1700 Laplanders, besides a few Fins, who are domesticated in the circles of Kem and Kola. The tenets of the Greek faith are professed by all but a few thousand pagans, amongst whom the forcible conversion directed by an ukase of the year 1825 has, we trust, been as successful in respect of their religious convictions, as it has been of their numbers; for within five years from the sending out of the missionaries three churches were built for the use of the 3500 heathens who had been prevailed upon to embrace Christianity. These converts consist almost exclusively of the Samoiede hordes who inhabit that part of the province of Archangel which stretches from the Mezen to the frontiers of Siberia,—a tract of country than which Russia in Europe does not contain a colder, wilder, or more inhospitable climate. This uncivilized race of beings, whose name implies 'eaters of one another,' though there is no trace whatever of their having deserved to be branded as cannibals, originally migrated from Siberia; but they are not the primitive inhabitants of the soil; for the ruins of whole lines of ancient dwellings, which are found on the banks of lakes and rivers, show that the Samoiede was by no means the first occupant of this country. The name has been in use among the Russians ever since the eleventh century; but the Samoiede himself admits no other than that of Chasowa, signifying, in his own language, 'man.' He is of middling stature, has a broad, flat, round face, brownish-yellow complexion, small black eye, black hair and eyebrows, and but a slender beard,—in every respect the counterpart of his Asiatic brethren, who are far more numerous in the north of Siberia, where there are upwards of 60,000 of them. The dialect of the European Samoiede is poor and imperfect, and spoken by no stranger but a few Cossack dealers; the use of written characters is unknown among them. They seldom attain to a greater age than sixty or seventy, lead a wandering life, and, with the assistance of their rein-deer, shift their encampment as inclination or necessity prompts them. They live by breeding that animal, catching fish, and following the chase; which enables them to discharge their annual 'Jassak,' or tribute of furs and hides, to the Russian crown. This is fixed at three foxes' skins for every Samoiede who carries bow and quiver; and is collected by the oldest among them, who must make their appearance at Mezen in the months of December or January, and deliver the yearly quota to the Russian authorities. What they succeed in collecting for their individual benefit is sold to the travelling Russian dealer, or carried to the open markets in the adjacent provinces. Indeed they are frequently known to transport their merchandise 500 miles and upwards for a sale; many

of them resorting to so distant a spot as Obsdorsk in the month of February, where they exchange their wares for Russian bread. Erman, indeed, tells us that they will at times trace the immense distance of 1500 miles, which lies between Archangel and Turukhansk on the Jenisei, from mere fondness for shifting their quarters. [For further details, see the article SAMOIEDES.]

Archangel consists of eight circles, namely, the city and dependencies of Archangel, Kholmogory, Shenkursk, Pinega, Onega, Kem, and Mezen. Independently of Archangel itself, the circle of that name contains Nowa-Dwinskaia-Krepost, a fortress, about ten miles distant from the capital, on an island of the Dwina, the entrance of which it defends; close upon the ramparts is a town of about two hundred houses, which are mostly used as stores by the merchants of Archangel. The island of Solowezkoi, in the White Sea, is also within the limits of this circle: it is the largest of a cluster lying about 150 miles N.W. of Archangel, and, besides a monastery, to which numbers of pilgrims resort, contains a borough town, the inhabitants of which prepare a peculiarly pure description of isinglass, considered by some to be the finest that Russia produces. The chief town in the circle of Kholmogory bears the same name, and is situated on an island in the Dwina, thirty-five miles south of Archangel: it has a building-yard for ships, and a school for navigation; its environs afford pasturage for the finest breed of cattle in this quarter of the world. The population scarcely exceeds 500 souls. Shenkursk is the capital of the circle so called, and lies on the Waga, about 170 miles S.E. of Archangel: it is said to have been inhabited by the Tshudes, who are supposed to have been a Finnic race, before the Russians settled in the country; and the remains of a fort, built by them, are still to be seen on an adjacent eminence. In the circle of Pinega is the inconsiderable town of the same name, on the banks of the Pinega, which flows into the Dwina. The chief town in the circle of Onega bears the same appellation, and is situated at the mouth of the Onoga, which runs into the bay of that name in the White Sea. It lies about 80 miles S.W. of Archangel, and possesses a good harbour, is engaged in ship-building, and exports timber, tar, and pitch. The number of its inhabitants is about 2000. Kem, the capital of the circle of that name, which once formed part of the province of Olonetz, and has latterly been incorporated with that of Archangel, is a small town with a harbour, not far from the afflux of the Kem into the White Sea. Kola, or Kolkoï-Ostrog, the principal place in Russian Lapland, in 32° 30' E. long. 68° 20' N. lat., is the northernmost town of Russia in Europe, and next to Wardöe, a port on a promontory in eastern Finmark in Norway, which lies in 31° 7' 30" E. long., 70° 22' 36" N. lat., and to Hammerfest, which is on an island likewise on the Norwegian coast, (70° 38' N. lat., 23° 49' E. long.) is the northernmost town in Europe: it is situated close upon an arm of the White Sea, between two rivers, the Tuloma and Kola, and possesses a harbour formed by the mouth of the latter stream. Its inhabitants, in number about 1200, are employed in catching walrus, cod, and whales, and traffic in furs and hides. There is a copper-mine in its vicinity, and at the extremity of the gulf is the port of Ekaterî nakaia. Kola is about 630 miles north of St. Petersburg. It should here be observed, that the Filled districts, formerly belonging to Norway, have constituted a portion of Russian Lapland, by virtue of the frontier treaty concluded between Russia and Sweden, ever since the year 1826. Part of the river Pasvig, and the Jacob's Elve, now separate Swedish from Russian Lapland. Neiden and Peise, two places within the latter, are the resort of the native traders. The capital of the circle of Mezen, as well as the chief town in the territory of the European Samoiedes, bears the same name as the circle, and lies on the river Mezen, twenty-eight miles from the Icy Ocean, where it forms a harbour: it is inhabited wholly by Russians, who make excursions on an extensive scale to Spitzbergen and the islands of Kalguiew and Nova-Zembla, and bring back with them the produce of their toils by land and sea, in such quantities as to give rise to considerable traffic. It is about 140 miles E.N.E. of Archangel. The other spots deserving of notice in the land of the European Samoiedes are Pust-Osersk, the central point of their dealings, which lies on a lake of the same name connected with the Petshora, consists of about fifty houses, and has seventeen villages dependent upon it: this place is resorted to even by the fur-dealers of Wologda,

St. Petersburg, and Moscow, who reach it in October and November, and leave it shortly before Christmas. The natives breed rein-deer in such large numbers that many of them possess herds of 1000 each. Pust-Osersk is about 150 miles to the N.E. of Mezen, and lies on a lake near the mouth of the Petshora. About 110 miles eastwards of Pust-Osersk lies Ust-Zülma, on the right bank of the Petshora; it contains 120 houses, and has four villages within its district: besides rearing rein-deer and raising barley, the inhabitants deal largely with the Russian traders in furs and the produce of their fisheries. And about sixty miles farther onwards stands Ishma (or Ishemskaja-Slobodka) on the banks of the Ishma; it consists of sixty-four houses, and has several villages within its jurisdiction. Rye and barley are cultivated near this spot; the natives breed considerable numbers of rein-deer, and carry on a thriving trade in furs, tallow, butter, and dried fish.

The islands of Kalguiew, Warandei, Waigatz, Nova-Zembla, and Tshornî, which are the chief among the insular dependencies of the province of Archangel, will be noticed under their respective heads.

ARCHANGEL (known amongst the Russians by the name of *Gorod Arkhangel'skoi*, or town of the convent of 'St. Michael' the archangel) is the capital of the province of Archangel, and the most northern emporium of trade in the Russian dominions. Its site is a low flat; it extends about two miles along the right bank of the Dwina, and is forty miles from the mouth of that river. It is not accessible to vessels of heavy burthen, owing to the shallowness of the stream and a bar which runs across it, with only twelve feet of water, about five miles below the town. Archangel is the oldest port in the Russian dominions: in the eyes of our own countrymen, however, no circumstance can render it an object of greater interest than its celebrity in the annals of British enterprise. The discovery of a passage to the coasts of the White Sea has been truly said to have formed an epoch in the history of commerce: for it gave an entirely new direction to the trade of the north. This took place in 1553, when Richard Chancellor, the commander of a vessel which was despatched, in company with two others, to find out a north-eastern passage to China, navigated the White Sea and sailed up the bight of St. Nicholas, into which the Dwina pours its waters. From this point he made his way to the court of Ivan II., who, being thus convinced of the practicability of navigating seas hitherto deemed inaccessible to the mariner, gave directions shortly afterwards for building the port of Archangel, which was commenced by Nashitshokh, the woiwode of those parts, in the year 1584, upon a spot previously selected as a home-stead by the members of a religious establishment. Russia at this time possessed no ports on the Baltic; and, indeed, for a long period subsequent, no other port but Archangel in its whole dominions. It is now become the chief mart of its northern trade, as it was, in its early days, the centre of all traffic between Muscovy and foreign parts. The benefit of the discovery, after it had been for some time confined to our own countrymen, was afterwards shared with the Dutch and Hamburgese. Archangel is mentioned in the travels of the Holstein ambassadors to Muscovy and Persia, as a considerable port in 1636; it is remarked, that from 300 to 400 ships, principally English and Dutch, were sometimes seen in the port. (Olearius, *Voyage de Moscovie*, p. 159.) The prosperity of the port received however a shock from the establishment of St. Petersburg, from which it did not recover till the Empress Elizabeth placed its immunities on a level with those of the metropolis in the year 1762. It has since been increasing gradually in importance. During the hundred years which preceded 1827, the exportations of Archangel did not amount to more than 23,350,000*l.*, or, on an average, 233,500*l.* a-year: whereas, in 1829, they were to the extent of 562,000*l.* In that year, too, the number of vessels which entered was 412; being an excess of 95 over the return for 1825. Its trade has been improved of late years by the opening of a communication by canal with Moscow and Astrachan. The bulk of its shipments still consists, however, of the growth and manufacture of Siberia, and more northerly latitudes; such as fish, fish oils, tallow, candles, timber wrought and unwrought, pitch, tar, wax, iron, linseed, furs, hides, feathers, caviar, &c. When the navigation of Archangel is open, the river, from the roadstead to the town, is covered with vessels and boats of all sizes; the quays and shores are

peopled with multitudes, variously and actively employed; and the great road from Siberia is covered with travellers and loaded carts and waggons. Archangel does not contain above 2000 houses, and its inhabitants do not exceed 15,000: in both respects it stands much on a par with Berwick-upon-Tweed. Mixed with the native born subjects of Russia are a few Englishmen, Dutchmen, and Germans, who are, almost without exception, merchants or mechanics. In a manufacturing point of view, Archangel is of minor importance: there are some sugar-refineries, and manufactories of canvas and cordage; there is also much ship and boat building going on; and eleven miles below the town lies the government yard, with three slips for building ships of war. This establishment is protected by the lines of Nowadwinka, which command the entrance into the Dwina, and afford security to the property of the Archangel merchants, which is deposited in the adjacent storerooms. The females employ themselves in spinning yarn, and making a coarse sort of linen, both of which are in much request in the interior of Russia. The houses are almost universally constructed of wood, the external covering being laid horizontally, and, in some instances, doubly covered, and coloured outside: most of them are two stories high; they form a comfortable residence, and, when inhabited by the wealthier class, are provided with every species of convenience, and indeed luxury. The most striking of the stone edifices is the Gostinnoi-Dwor (caravansera, or court of the trading guests), an extensive mart for the exhibition and sale of goods, which is surrounded by high walls, with six large towers, and a ditch. The churches are eleven in number; ten for the Greek and one for the Protestant form of worship; but most of them are built of wood, and the Greek churches gorgeously decorated within. The marine hospital is a building of some extent, and open to foreign as well as native seamen. But its greatest ornament is a number of open spaces, on which the merchants and dealers erect their stalls: here all articles of the same class are ranged in successive rows, and they are of almost endless variety. There are several schools in the town, at the head of which are a seminary for ecclesiastics, a gymnasium, and academies for teaching navigation and engineering. Upon the whole, Archangel is an ill-built place; the two main streets run in a zigzag direction parallel with the Dwina, and are connected by narrow lanes; they are moderately broad, and kept tolerably clean, but, instead of pavement, are floored with timber in a rough state. Its supplies of provisions are brought from a distance, as the soil in the neighbourhood grows no grain or vegetables, and breeds no cattle; this is a consequence of its position—close upon the line at which the growth of corn and fruit ceases: this line being, near the mouth of the Dwina, under the 65th degree of latitude. An association was formed at Archangel in the year 1803, under the title of the 'White Sea Company': it despatches a fleet of vessels every year on fishery expeditions to the coasts of Nova Zembla, Kalguiew, and Spitzbergen, at the last of which the crews frequently winter. Here they contrive to maintain themselves without much difficulty by the chase, but they depend, both for their rude wintry dwellings and their fuel, on the timber thrown up by the ocean. Archangel is the seat of an archbishopric, and the residence both of a civil and military governor. The neighbouring island of Solonbalsk, which is formed by the Kushenida, contains an admiralty and marine-barracks. Archangel lies in 64° 32' N. lat., and 40° 33' E. long., or about 400 miles N.E. of St. Petersburg.

ARCHÆOLOGY, literally 'the study of antiquity or antient things,' from *ἀρχαῖος*, *antient*, and *λόγος*, *a discourse*. Though the term is often used, its meaning in this country has not always been very exactly fixed; but there is nothing properly belonging to it which is not included under the heads of **ANTIQUITY** and **ANTIQUITIES**. In general, the term *archæology* is confined to the study of Greek and Roman art, but it is sometimes used to express generally the study of all that concerns the early history of any nation or country. The divisions of the subject are consequently very numerous, and the chief works on each will be noticed under their respective heads, such as **EGYPT**, **GREECE**, **MEDALS**, **SCULPTURE**, &c.

The great extension which the study of *archæology* has received of late years, and is still receiving, seems to require now more than ever the united exertions of all who devote themselves to it. In this point of view, the *Archæological*

Institute of Rome, founded in 1829, seems likely to be of great utility. (See *Thaisachen des Archaeologischen Instituts in Rom*. Von der Eduard Gerhard, 1832.)

ARCHBISHOP. For what belongs to the episcopal character and office generally, we refer to the word **BISHOP**: we mean to confine ourselves in this article to what belongs more peculiarly to the archbishop. For though, in this country; and generally throughout Europe, the archbishop has his own diocese in which he exercises ordinary episcopal functions like any other bishop in his diocese, yet he has a distinct character, having an admitted superiority and a certain jurisdiction over the bishops in his province, who are sometimes called his suffragans, together with some peculiar privileges. This superiority is indicated in the name. The word or syllable *arch* is the Greek element *αρχ*, (which occurs in *ἀρχι*, *ἀρχος*, *ἀρχων*, &c.) and denotes precedence or authority. It is used extensively throughout ecclesiastical nomenclature, as may be seen in *Du Cange's Glossary*, where there are the names of many ecclesiastical officers into whose designations this word enters, who were either never introduced into the English church, or have long ceased to exist. Exalted officers of state have sometimes designations into which this word enters, as *arch-duke*. Why this word was used peculiarly in ecclesiastical affairs rather than any other term denoting superiority, is probably to be explained by the fact that the term *ἀρχιεπίσκοπος*, for chief-priest, occurs in the Greek text of the Christian Scriptures. *Patri-arch* is a less obvious compound of the same class, denoting the chief-father; and is used in ecclesiastical nomenclature to denote a bishop who has authority not only over other bishops, but over the whole collected bishops of divers Kingdoms or states; it is analogous in signification to the word *pope* (*papa*), a bishop to whom this extended superintendence is attributed.

Whatever might be the precise functions of the *episcopus* (*ἐπίσκοπος*, bishop), the term itself occurs in the writings of St. Paul, Phil. i. 1, 1 Tim. iii. 2, and elsewhere; but the word *ἀρχιεπίσκοπος*, or archbishop, is not found till about or after the fourth century. Cyrillus Archiepiscopus Hierosolymitanorum, and Celestinus Archiepiscopus Romanorum, occur under these designations in the proceedings of the council held at Ephesus, A. D. 431. Other terms by which an archbishop is sometimes designated are *primate* and *metropolitan*. The first of these is formed from the Latin word *primus*, 'the first,' and denotes simple precedence, the first among the bishops. The latter is a Greek term, which rendered literally into English would be *the man of the mother-city*, that is, the bishop who resides in that city where is the mother church of all the other churches within the province or district in which he is the metropolitan.

The term *metropolitan*, when thus analyzed, points out to us the origin of whatever real distinction there is between bishop and archbishop, or, in other words, the cause of that elevation which is given to the archbishop above the bishops in his province, when it is not to be attributed to mere personal assumption, or to be regarded only as an unmeaning title. The way in which Christianity became extended over Europe was this: an establishment was gained by some zealous preacher in some one city; there he built a church, performed in it the rites of Christianity, and lived surrounded by a company of clerks engaged in the same design and moving according to his directions. From this central point, these persons were sent from time to time into the country around for the purpose of promoting the reception of Christianity, and thus other churches became founded, offspring or children, to use a very natural figure, of the church from whence the missionaries were sent forth. When one of these subordinate missionaries had gained an establishment in one of the more considerable cities, remote from the city in which the original church was seated, there was a convenience in conferring upon him the functions of a bishop; and the leading design, the extension of Christianity, was more effectually answered than by reserving all the episcopal powers in the hands of the person who presided in the mother-church. Thus other centres became fixed; other bishoprics established; and as the prelate who presided in the first of these churches was still one to whom precedence at least was due, and who still retained in his hands some superintendence over the newer bishops, *arch-bishop* became a suitable designation. Thus in England, when there was that new beginning of Christianity in the time of pope Gregory, Augustine, the chief person of the mission, gained an early establishment at Canterbury, the

capital of the kingdom of Kent, through the favour of King Ethelbert. There, in this second conversion, as it may be called, the first Christian church was established, and from thence the persons were sent out, who at length christianized the whole of the southern part of England. Paulinus, in like manner, a few years later, gained a similar establishment in the kingdom of Northumbria, through the zeal of King Edwin, who received Christianity, and built him a church at York, one of his royal cities, which may be regarded as the chief city of Edwin's kingdom. From York the light of Christianity was diffused over the northern parts of England, as from Canterbury over the southern. It seems to have been the peculiar diligence and dignity of Paulinus which procured for him the title of archbishop, and gave him a province, instead of a diocese only, as was the case with the other members of the Augustinian mission. This was done by special act, under the authority, it is said, of Justus, an early successor of Augustine. But the precedence of the real English metropolitan is acknowledged in two circumstances: in the style, the one being a primate of England, and the other the primate of all England; and in the rank, precedence being always given to the archbishop of Canterbury, and the lord chancellor of England being interposed in processions between the two archbishops.

There is evidence sufficient to show that Christianity had made its way long before the time of Gregory among the Roman inhabitants of Britain and the Romanized Britons; and it is not contended that either Scotland or Ireland owed its Christianity to that mission. Wales has no archbishop; whence it seems to be a legitimate inference that the Welsh church is only a fragment of a greater church in which the whole of England and Wales was comprehended, the church, as to what is now called England, being destroyed by the Saxons, who were Pagans. Yet some have contended that there was an archbishop at Caer-Leon; and others, on grounds equally uncertain, that bishops, under the denomination of archbishops, were settled in those early times at London and York.

The precise amount of rights of superintendence and control preserved by the archbishops over the bishops in their respective provinces, does not seem to be very accurately defined. Happily, these rights are very seldom called into exercise. Yet it seems to be admitted that if any bishop introduced irregularities into his diocese, or was guilty of scandalous immoralities, the archbishop of the province in which his diocese lay might visit, inquire, call to account, and punish. He might, it is said, even deprive. Whether he could depose is a more doubtful point.

One right he possesses of so remarkable a character as to require a specific notice. Every bishop has the patronage of certain dignities or benefices within his diocese, that is, the right of nominating the person who is to enjoy them. At every consecration of a new bishop, or every translation of a bishop from one see to another, the archbishop in whose province the bishopric is has the right of selecting one of these dignities or benefices to be filled up by his nomination whenever it becomes vacant. This is called the archbishop's option; and the right is now regarded as belonging so much to the person of the archbishop and not to his office, that if the archbishop die before the incumbent of such benefice or dignity, the right of nominating descends to the heir or devisee of the archbishop. This existed originally in the form of a demand of the archbishop on each bishop to provide for some one of his chaplains.

The archbishop also nominates to the benefices or dignities pertaining to the bishops in his province, if not filled up within six months from the time of the avoidance.

Certain of the bishops are nominally officers in the Cathedral of Canterbury, or in the household of the archbishop. The archbishop has also certain honorary distinctions; he has in his style the phrase 'by Divine providence,' but the bishop's style runs 'by Divine permission;' and while the bishop is only installed, the archbishop is enthroned.

The archbishops may nominate eight clerks each to be their chaplains. The archbishop of Canterbury claims the right of placing the crown upon the head of the king at his coronation; and the archbishop of York claims to perform the same office for the queen consort. The archbishop of Canterbury is the chief medium of communication between the clergy and the king, and is consulted by the king's ministers in all affairs touching the ecclesiastical part of the constitution; and he generally delivers in parliament what, when

unanimous, are the sentiments of the bench. The two archbishops have precedence of all temporal peers, except those of the blood-royal; and except that the lord chancellor has place between the two archbishops. Before the Reformation, the archbishop of Canterbury occupied a very elevated station with reference to the whole church, having at general councils the precedence of all archbishops, and being regarded somewhat in the light of a patriarch, presiding, as he was supposed to do, over the several kingdoms of England, Wales, Scotland, and Ireland.

The province of the archbishop of York consists of the six northern counties, with Cheshire and Nottinghamshire; to these were added, by Act of Parliament in the time of Henry VIII., the Isle of Man: in this province he has four suffragans, the bishop of Man, the bishop of Durham, the only see in his province of Saxon foundation, and the bishops of Carlisle and Chester. Of these, the bishopric of Carlisle was founded by King Henry I. in the latter part of his reign; and the bishopric of Chester by King Henry VIII.; so thinly scattered was the seed of Christianity over the northern parts of the kingdom in the Saxon times. The rest of the kingdom forms the province of the archbishop of Canterbury, in which there are twelve bishoprics of Saxon foundation; the bishopric of Ely, founded by Henry I.; the bishoprics of Bristol, Gloucester, Oxford, and Peterborough, founded by Henry VIII.; and the four Welsh bishoprics, of which St. David's and Llandaff exhibit a catalogue of bishops running back far beyond the times of St. Augustine. The twelve English bishoprics of Saxon foundation are London, Winchester, Rochester, Chichester, Salisbury, Exeter, Bath and Wells, Worcester, Hereford, Lichfield and Coventry, Lincoln, and Norwich. The dioceses of the two English archbishops, or the districts in which they have ordinary episcopal functions to perform, are, for Canterbury, the greater part of the county of Kent, a portion of that county forming the diocese of Rochester, a number of parishes distinct from each other, and called Peculiars, in the county of Sussex, with small districts in other dioceses, particularly London, which belonging in some form to the archbishop, acknowledge no inferior episcopal authority. The diocese of the archbishop of York consists of a great portion of the county of York, and the whole county of Nottingham, with some detached districts. Exact knowledge of the diocesan division of the country is of general importance as a guide to the depositaries of wills of parties deceased; but since the introduction of the funding system, there being scarcely a family which has not a share in the kind of property thus created, wills are generally proved in the court of the archbishop of Canterbury, as the Bank acknowledges no probates but from thence.

Lives of all the archbishops and bishops of England and Wales are to be found in an old book entitled *De Presulibus Angliæ Commentarius*. It is a work of great research and distinguished merit. The author was Francis Godwin, or Goodwin, bishop of Llandaff, and it was first published in 1616. A new edition of it, or rather the matter of which it consists, translated and recast, with a continuation to the present time, would form a useful addition to our literature. There is also an octavo volume, published in 1720, by John le Neve, containing lives of all the Protestant archbishops, but written in a dry and uninteresting manner. Of particular lives there are many, by Strype and others; many of the persons who have held this high dignity having been distinguished by eminent personal qualities, as well as by the exalted station they have occupied.

St. Andrew's is to Scotland what Canterbury is to England; and while the episcopal form and order of the church existed in that country, it was the seat of the archbishop, though till 1470, when the pope granted him the title, he was known only as the *Episcopus Maximus Scotiæ*. In 1491, the bishop of Glasgow obtained the title of archbishop, and had three bishops placed as suffragans under him.

In Ireland there are four archbishoprics, Armagh, Dublin, Tuam, and Cashel. Two of these, Tuam and Cashel are, by the Act 3 and 4 Will. IV., c. 57, to be reduced to bishoprics on the occurrence of the next vacancies. Catalogues of the archbishops of Ireland and Scotland may be found in that useful book for ready reference the *Political Register*, by Robert Beatson, Esq., of which there are two editions.

To enumerate all the prelates throughout Christendom to whom the rank and office of archbishop are attributed would extend this article to an unreasonable length. The

principle exists in all Catholic countries, that there shall be certain bishops who have a superiority over the rest, forming the persons next in dignity to the great pastor of the church, the pope. The extent of the provinces belonging to each varies, for these ecclesiastical distributions of kingdoms were not made with foresight, and on a regular plan, but followed the accidents which attended the early fortunes of the Christian doctrine. In Germany, some of the archbishops attained no small portion of political independence and power. Three of them, viz. those of Treves, Cologne, and Mentz, were electors of the empire. In France, under the old regime, there were eighteen archbishoprics, all of which, except Cambray, claimed to have been founded in the second, third, and fourth centuries; the foundation of the archbishopric of Cambray was referred to the sixth century. The French have a very large and splendid work, entitled *Gallia Christiana*, containing an ample history of each province, and of the several subordinate sees comprehended in it, and also of the abbeys and other religious foundations, with lives of all the prelates drawn up with the most critical exactness.

The word *suffragan*, used in this article, may require some explanation. A *suffragan*, in the more ordinary sense of the term, is a kind of titular bishop, a person appointed to assist the bishop in the discharge of episcopal duties; and among the reforms meditated at the close of the reign of King Henry VIII., was the introduction of a considerable number of *suffragan* bishops of this class, and some persons were actually consecrated. But every bishop within his province is sometimes spoken of as a *suffragan* of the archbishop, being originally, in fact, little more. Questions have been raised respecting the origin of the word *suffragan*, which is by some supposed to be connected with *suffrages* or votes, as if the bishops were the voters in ecclesiastical assemblies; but more probably, if connected with *suffrages* at all, the term has a reference to their claiming to vote in the election of the archbishop. A great question respecting the right of election of an Archbishop of Canterbury, between the *suffragans* of his province and the canons of Canterbury, arose in the time of King John, and is a principal occurrence in the contest which he waged with the pope and the church.

ARCHDEACON. In contemplating the character and office of the bishop in the early ages of the church, we are not to regard him as a solitary person acting alone and without advice. He had a species of clerical council around him, persons who lived a kind of collegiate life in buildings attached to the great cathedral church, each of whom, or at least several of whom, possessed distinct offices, such as those of chancellor, treasurer, precentor, and the like. These persons are now often called canons; but the most general name by which they are to be known, as the institution existed in remote times, is that of deacon, a term of which dean is a contraction. Deacon appears to come from the Greek term *διάκονος*, the name of that officer in the church of whose appointment we have an account in Acts, cap. vi. To one of these deacons precedence was given, and no doubt some species of superintendence or control, and to him the title of *archdeacon* was assigned.

In the name, then, there is no indication of any peculiar employment. What now belongs to the archdeacon was anciently performed by the officer in the bishop's court, called the *chorepiscopus*; and the manner in which the archdeacon usurped upon this obsolete officer and attracted to himself the functions which belonged to him, is supposed to have been this:—being near the bishop and much trusted by him, the archdeacon was often employed by the bishop to visit distant parts of the diocese, especially when the bishop required particular and authentic information, and to report to the bishop the actual state of things. Hence it was, that the archdeacon was spoken of by very early Christian writers as being the *bishop's eye*; and from this power of inspection and report the transition was easy to the delegation to him of a portion of episcopal authority, and empowering him to proceed to reform and redress, as well as to observe and report.

If this is a just account of the origin of the archdeacon's power, it is manifest that originally the power would be extended over the whole of a diocese; but at present it is confined within certain limits. In England, according to the *Valor Ecclesiasticus* of King Henry VIII., there are fifty-four archdeaconries or districts through which the visitatorial and corrective power of an archdeacon extends. This

distribution of the dioceses into archdeaconries cannot be assigned to any certain period; but the common opinion is, that it was made some time before the conquest. Each of these districts is assigned to its own archdeacon, with the same precision and certainty as other and larger districts are assigned to the bishops and archbishops; and the archdeacons are entitled to certain annual payments, under the name of procurations, from the benefices within their arch-

deaconry. The archdeacon in ancient times intruded upon the *chorepiscopus*, so in recent times he has extinguished the authority and destroyed almost the name of another officer of the church, namely, the rural dean. The archdeaconries are still subdivided into deaneries, and it is usual for the archdeacon when he holds his visitations to summon the clergy of each deanery to meet him at the chief town of the deanery. Formerly, over each of the deaneries a substantive officer, called a dean, presided, whose duty it was to observe and report, if he had not even power to correct and reform; but the office has been laid aside in some dioceses, though in others it has been re-established. But where it has been superseded, the duties are discharged by the archdeacon. It may be added, that though the office of rural dean has been found extremely useful, no emolument whatever is attached to it.

The archdeacons are nominated by the respective bishops. Their duty now is to visit their archdeaconries from time to time; to see that the churches are kept in repair, and that everything is done conformably to the canons and consistently with the decent and orderly performance of public worship; and to receive presentations from the churchwardens of matter of public scandal. They have the power in their courts to enforce reform or to punish the contumacious; an appeal, however, always lies to the superior court of the bishop.

In the revenue attached to the office of archdeacon, we see the inconvenience which attends fixed money payments in connexion with offices which are designed to have perpetual endurance. It arises chiefly from pensions paid by the incumbents. These pensions originally bore no contemptible ratio to the whole value of the benefice, and formed a sufficient income for an active and useful officer of the church; but now, by the great change which has taken place in the value of money, the payments are little more than nominal, and the whole income of the archdeacons is very inconsiderable. The office, therefore, is generally held by persons who have also benefices or other preferment in the church.

Catalogues of the English archdeacons may be found in a book entitled *Fusti Ecclesie Anglicanae*, by John le Neve.

ARCHELAUS, a Greek name composed of two words, signifying *rule* and *people*. Moreri has distinct articles on fourteen persons who bore this name; and the reader will find a list of authors so called, in the index to Fabricius's *Bibliotheca Græca*, with some account of them in the body of the work. We shall only notice,

1. **ARCHELAUS**, king of Sparta, known only as one of the reigning kings when Lysurgus remodelled the constitution.

2. **ARCHELAUS**, son of Perdicas, king of Macedon, who succeeded his father B.C. 413 (Clinton), early in the year. The chronology of his reign has been a subject of controversy; and some writers have erroneously supposed that he was succeeded by a son of the same name. Not much is known of him: the most certain facts are comprised in one sentence of Thucydides, who says that 'Archelaus, son of Perdicas, having become king, built the fortifications now in the land, and cut straight roads, and set the military affairs of the nation on a better footing, as to the provision of arms, horses, and other equipments, than all the eight kings who had preceded him.' (lib. ii. 100.) He is connected with the history of Athens through one event, the revolt of Pydna, a valuable sea-port of Macedonia, towards the close of the Peloponnesian war. He besieged that town, and took it, B.C. 410; and to diminish the chance of future insurrections, by rendering it harder to call in foreign aid, he removed the city farther inland by a distance of twenty stadia, about two miles. These scanty indications seem to point him out as a wise and useful prince. Though he improved the military establishment, he seems to have cultivated peace, for the only war in which we know him to have been engaged, is that for the reduction of Pydna: the few other notices of his reign refer either to his private character, or

to his patronage of arts and literature. The tragic poet Euripides resided for some time at his court, and died there. Plato is said to have been 'very dear' to him; and he sent a pressing invitation to Socrates, who declined to accept it. Zouxis visited and executed many pictures for his palace, which in consequence became a place of great resort for strangers. He established games at Dium in honour of Jupiter and the nine Muses, which, from the description, 'magnificent religious festivals and dramatic contests' (*θυσίας μεγαλοπρεπείς καὶ σκηνοκοδὸς ἀγῶνας*, Diod. xviii. 36), we may presume to have been of as literary and refined a nature as the great festivals of southern Greece.

[From a silver coin in the British Museum.]

The character of this prince, however, has been drawn in darker colours by Plato, who says, that Archelaus was of illegitimate birth, the son of Perdiccas by a slave, and that he gained the kingdom by a series of murders. (*Gorg.* 471, vol. iii. p. 208, ed. Priestley.) His private character was open to various imputations, for which the reader who is curious on this head may consult Bayle; and there is the testimony of Plato and Aristotle, that his excesses led to his death by conspiracy. Diodorus (xiv. 37) says, that he was killed accidentally when hunting, by his favourite, Craterus, or Cratenas. The close resemblance between this tale and that of William Rufus's death cannot fail to strike the reader. Archelaus died B.C. 399, after a reign of fourteen years. (See Mitford, chap. xxxiv. sect. 1; and Clinton, Appendix 1, besides the authorities above quoted.)

3. **ARCHELAUS**, an eminent general in the service of Mithridates, king of Pontus, and the opponent of Sylla when the Mithridatic war was carried on in Greece. In the celebrated siege of Athens, when that city was taken by Sylla, he threw himself into the Peiræus, and defended it obstinately. Compelled at last to evacuate his stronghold, he retreated into Thessaly. He was twice defeated by Sylla, after which he received instructions from his master to make peace on the best terms which could be obtained. Being apprehensive of danger from the jealous temper of Mithridates, he went over to the Romans, by whom he was well received. (See Appian, *Mithridatica*; Strabo, l. xii. and xvii.)

4. **ARCHELAUS**, son of the preceding, obtained the dignity of high-priest of the temple of Comana in Pontus, where there was a temple sacred to Enuo, to which a considerable tract of land and numerous slaves were annexed. He served in the expedition to Egypt of Gabinus, to reinstate Ptolemy Auletes on the throne then occupied by his daughter Berenice; but having gained the affections and the hand of Berenice under the false pretence that he was the son of Mithridates, he went over to her party, and after a six months' reign was slain in battle against the Romans.

5. **ARCHELAUS**, son of the above, succeeded him as high-priest of Comana, and was expelled by Caesar, B.C. 47, to make room for Nicomedes the Bithynian. Between his wife, Glaphyra, and Mark Antony, an intrigue is said to have subsisted; and from Antony,

6. **ARCHELAUS**, son of Archelaus and Glaphyra, received the kingdom of Cappadocia, B.C. 36. He fought on Antony's side at the battle of Actium, and yet had the rare good fortune to retain his kingdom under Augustus, and even to enlarge it by the acquisition of the lesser Armenia and part of Cilicia. Incurring the displeasure of Tiberius, as it is said, because he neglected the future emperor during his exile at Rhodes, he was summoned to Rome, where he died, A.D. 16, apparently by a natural death brought on by age and infirmity. He is said by Dion to have counterfeited dotage for the purpose of turning aside the tyrant's suspicions. (Tacitus, *Ann.* ii. 42; Dion, lvii.; Bayle, *An. Un. Hist.*)

ARCHELAUS the Milesian, an eminent philosopher of the Ionic school, and the last who presided in it in direct

succession from Thales. He succeeded Diogenes Apolloniates as the recognised leader of that school; and was the pupil of Anaxagoras, the predecessor of Diogenes. Removing to Athens, he left no one to occupy his chair; and it may be from this circumstance, or from his having taught publicly what Anaxagoras only taught in private (for Anaxagoras clearly taught the same or similar doctrines before him), that Archelaus is said to have transferred the Ionic school of philosophy to Athens, where he became popular, and numbered Socrates, and according to some authorities, Euripides, among his hearers. He was called 'physicus,' either because physical doctrines formed the most prominent part of his system, or because he was the first who openly taught in Athens the physical doctrines of the Ionic school; and Suidas says, that he composed a work on physics (*συνέταξε φυσιολογίαν*).

His principal doctrines, so far as we are acquainted with them, are these:—

The principles of all things he taught to be air and infinity (*τὸ ἀπείριστον*). What he meant by infinity is a question which Brucker, in his history of ancient philosophy, professes himself unable to decide. Some, however (as Plutarch, *Plac. Philos.* i. 3), say that he supposed infinite air, by its rarefaction and condensation, to be the cause of all things.

The principle of motion he defined to be the mutual secession of hot and cold: the hot being in motion, and the cold stationary.

The sun he thought to be the largest of the stars; the earth round or egg-shaped, and in the centre of the universe.

He taught that men and animals were originally generated out of mud or slime by the heat of the earth, and he attributed mind to both alike.

He taught, like his master, Anaxagoras, that everything was made up of small parts similar to itself as wood of atoms of wood, metal of atoms of metal, bone of atoms of bone, &c.

Speech he defined to be motion of the air; but this correct view is also attributed to Anaxagoras.

He maintained the dangerous doctrine, that just and unjust are produced entirely by law; and that, anterior to law, nothing is either one or the other. It appears probable that by law he meant solely human institutions; but we do not know enough of his doctrine to assert positively that he meant to exclude a moral law of conscience derived from the Deity.

Archelaus seems to have commenced teaching at Athens about B.C. 450, in the interval between the first and second visit of Anaxagoras to that city (see Clinton on that year): the dates of his birth and death we do not find clearly laid down. (Diog. Laert.; Brucker, *Hist. Philos.* vol. i. p. 518; Fabricius, *Bibl. Gr.*)

ARCHELA'US, bishop of Carrhæ in Mesopotamia, is remarkable only for his dispute with the heretic, Manes, about A.D. 278. He published the controversy in two books, entitled *Acta Disputationis*, &c., in Syriac, which were translated into Greek by Hegemonius. A fragment of this work is extant, edited by Valesius, in the notes to his Socrates (pp. 197, 203, lib. i. c. 22); and again in a more complete form by Zaccagnius, in his 'Collectanea Monumentorum veterum Ecclesiæ Græcæ,' Rom. 1698. (Fabricius, *Bibl. Gr.*)

ARCHELA'US, the second son of the fifth wife of Herod the Great: his mother, Malkaba, was a Samaritan. His father's last will declared him heir to the throne. Immediately after the death of Herod, A.D. 3, he exercised the regal power, but did not assume the title till his nomination should be confirmed by the Roman emperor. As soon as he had celebrated the obsequies of his father, he received the homage of the people. The Jewish nation having long groaned under the yoke of Herod, received with joy the fair promises which the uncertainty of Roman favour extorted, at the commencement of his reign, from the policy of Archelaus. But before he received the imperial sanction to his authority, he gave abundant proof of a temper as cruel, and a purpose as tyrannical, as those which had characterized his father's reign. On the feast of the Passover a number of factious Jews stationed themselves in the temple, and instigated the populace to demand that Archelaus should avenge the death of two favourite teachers who were executed during Herod's reign for having destroyed a golden eagle. Archelaus sent a party of his guards to seize the ringleaders, but the rabble killed most of the soldiers. Upon

this he employed the whole force of his arms against the rioters, and 3000 of them were massacred. The rest escaped to the neighbouring mountains.

Archelaus presented himself in person before Augustus at Rome, and solicited the ratification of his power on the grounds of being the successor appointed by his father, and of his attachment to the Roman customs and government. His claim was disputed by many members of his family, who produced a former testament of Herod, in which Antipas was named as heir to the throne. Petitions against his appointment were also presented to the emperor by the Jewish nation, who deprecated the confirmation of the authority of Archelaus, on the ground of his having already exercised injustice and cruelty, and they requested an alteration in the form of government. Archelaus was also accused of retaining the legacies of Herod. The emperor gave a patient hearing to all parties. He considered that it would be impolitic to accede to the demands of the Jews, but he placed only the districts of Judæa Proper, Idumæa, and Samaria, forming about half of the dominions of Herod, under the government of Archelaus. The rest, with some small exceptions, was divided between Herod Antipas and Philip. These three princes were not called kings but ethnarchs, and their territories were not called kingdoms but ethnarchies. Archelaus built the city called after his own name, Archelais. We learn from Josephus (ed. Hudson, i. 865), that Archelais was built before the tenth year of Archelaus's reign. He married Glaphyra, widow of his brother Alexander, by whom she had children: this was a direct violation of the Jewish laws. Irritated by his conduct, and weary of the oppressive tyranny of his administration, in the tenth year of the reign of Archelaus the Jews again appealed to Augustus. Their complaints appearing well founded, and being accompanied by accounts of frequent insurrections, the emperor dispossessed Archelaus of his authority, banished him to Vienna in Gaul, and confiscated his property. It is supposed that he ended his days in the place of his exile, leaving no posterity.

To understand the history of Archelaus in connexion with preceding and subsequent events, the reader must refer to Josephus, *On the Jewish War*, from book i. chapter 28, to book ii. chapter 8; and the *Antiquit.* book xvii. Compare נוריון בן יוספון, ed. Breithaupt, v. 35, from page 497 to 528, and also page 564.

ARCHENHOLTZ, JOHANN WILHELM VON, was born at Danzig in 1745. He entered the Prussian army, in which he served during the whole of the seven years' war, and was made a captain. He afterwards retired from the service, and travelled over a considerable part of Europe, and at last settled at Hamburg, where he published several works, which became very popular in Germany. The first work that established his literary reputation was his *England und Italien*, published in 1785, in which he gave, not the journal of a tour, but a methodical description of the two countries, especially with regard to their social and moral features, and their political institutions. The part concerning England is the most elaborate, and may be considered upon the whole as one of the most detailed accounts of this country given by a foreigner. Archenholtz had visited England repeatedly and stayed there nearly six years between 1769 to 1779. He had been likewise several times in Italy, and had resided there about three years. He dedicated his book to his friend Wieland, who was then at Weimar. The work went through several editions, and was translated into French. In the preface to the second German edition, 1787, Archenholtz replied to the charges of injustice and asperity towards Italy with which he had been reproached. In fact he had placed in juxtaposition two countries widely dissimilar; he had viewed Italy with the eye of a political and moral philosopher, rather than with that of a poet, or painter, or classical scholar, and the point of view which he chose was the most unfavourable to that country. Italy has changed considerably since that time, and many of Archenholtz's observations are no longer applicable. Archenholtz's admiration of England, on the other side, displeased many persons on the continent; he cannot, however, be called a blind admirer, for he points out many faults in the English institutions at that period, and exposes with no sparing hand the vices and follies of London. The next work of Archenholtz was a *History of the Seven Years' War*, in which he collected the information scattered through many memoirs and records of those memorable campaigns, and especially consulted the valuable work of Major Tempelhof of the Prussian artillery, *Geschichte des Siebenjährigen Kriegs*, published at Berlin in 1785. But these were professional works, and Archenholtz's object was to write a history suited to the common reader. His *Seven Years' War* was published at Hamburg in 1788. It was translated into Latin by Professor Reichard, 'for the benefit,' as the Professor states, 'of readers of other countries who were unacquainted with the German language, and published at Baireuth in 1792, under the title of *Historia Belli Septennis in Germania*. Archenholtz next wrote a history of Gustavus Vasa, the restorer of Swedish independence, preceded by a summary of the history of Sweden from the oldest records to the end of the sixteenth century. In prosecuting his researches on this subject, he consulted the old Swedish and Danish chroniclers, and his work is valued for its accuracy. It was published at Hamburg in 1801, and was translated into French and published at Paris, under the title of *Histoire de Gustave Vasa*, 2 vols. 8vo. 1803. Archenholtz wrote also several other minor works. About the time of the French revolution, he became editor of the *Minerva*, a German literary journal, published at Hamburg, which enjoyed considerable reputation for many years. In the number for February, 1793, Archenholtz warmly remonstrated against the imprisonment of General La Fayette, who, having escaped from the proscription of the French terrorists, was arrested by the allies and confined in the fortress of Olmutz in Moravia. Archenholtz died in 1812.

ARCHER (*Toxotes*, Cuv.), in zoology, a genus of acanthopterygious fishes, belonging to the family squamipennæ, or those which are distinguished by having, not only the soft parts, but often the very spines of the dorsal and anal fins, covered with scales like the rest of the body, and not always very easily distinguished from it. Though the single species upon which this genus is founded had been long known to naturalists, and described under the various names of *Scarus schlosseri*, *Scæna jaculator*, *Labrus sagittarius*, and *Cœlus chatareus*, by the different writers on ichthyology, yet it was left for Baron Cuvier to point out its appropriate generic characters, and to distinguish it definitely from the different groups with which it had been previously confounded. These characters are found in the short and compressed form of the body; in the dorsal fin being situated very far back, provided with very strong spines, and like the anal, which is placed very nearly opposite to it, covered on its soft parts with large tough scales; in the short, depressed shape of the muzzle, and in the length of the under jaw, which considerably surpasses the upper, and entails upon the animal the singular habit from which it has derived the name of *the archer*. The gills have six branchiostegous rays; the teeth are small, sharp, and dispersed over the jaws, tongue, and palate; the stomach is short and broad, the air-bladder large, and the pylorus provided with twelve caecal appendices. The only known species is

The Toxotes jaculator of Cuvier, which is found in Java and Sumatra, and has been long celebrated for the singular instinct which it displays in catching flies and other insects which are its prey. Comparatively speaking, there are very few species among the numerous class of fishes distinguished by superiority of instinct or address: but the very rarity of their occurrence makes the partial instances which are occasionally met with still more remarkable, and among these the means which the archer and a species of chætodon (*C. Rostratus*) employ for procuring food are entitled to especial notice. The tubular form of the mouth in these animals permits them to squirt or project small quantities of water to some distance, and with considerable force; when, therefore, the archer perceives a fly or other insect resting on the leaves of the aquatic plants which overhang or swim on the surface of the stream, it projects, or, as it were, shoots a single drop, not directly towards the insect, but obliquely upwards, in such a manner as to strike it in falling, thus preventing it from perceiving its danger and escaping in time. With such accuracy is the aim taken, that though frequently projected to the height of four or five feet, the drop seldom fails to hit the mark and precipitate the insect into the water, where it is, of course, within reach of the archer. The fish itself is of a yellowish colour, marked on the back with five brown spots.

The *Toxotes jaculator* of Cuvier, which is found in Java and Sumatra, and has been long celebrated for the singular instinct which it displays in catching flies and other insects which are its prey. Comparatively speaking, there are very few species among the numerous class of fishes distinguished by superiority of instinct or address: but the very rarity of their occurrence makes the partial instances which are occasionally met with still more remarkable, and among these the means which the archer and a species of chætodon (*C. Rostratus*) employ for procuring food are entitled to especial notice. The tubular form of the mouth in these animals permits them to squirt or project small quantities of water to some distance, and with considerable force; when, therefore, the archer perceives a fly or other insect resting on the leaves of the aquatic plants which overhang or swim on the surface of the stream, it projects, or, as it were, shoots a single drop, not directly towards the insect, but obliquely upwards, in such a manner as to strike it in falling, thus preventing it from perceiving its danger and escaping in time. The fish itself is of a yellowish colour, marked on the back with five brown spots.

ARCHERY, the art of shooting with a bow and arrow. With respect to the origin of archery, the use of the bow may be traced to the remotest antiquity, and it occurs in the

history of many different nations; but some people, the ancient Britons for instance, did not use the bow. The first notice which we find of it is in Genesis (xxi. 20), where it is said that Ishmael the son of Abraham 'dwelt in the wilderness and became an archer:' a bow-shot too is mentioned in an earlier verse of the same chapter as a measure of distance. In the Greek mythology we find Apollo armed with the bow and arrow (Homer, *Iliad*, i. 45), and Hercules also, as described in the *Odyssey* (xi. 606). The use of these weapons we may therefore conclude to be of very high antiquity among the Greeks. In the war of Troy, the main force of the Greeks appears to have consisted of soldiers who had heavy defensive armour; but the soldiers of Philoctetes were archers. The Cretans maintained their reputation as skilful bowmen to a late period in their history; and we find Meriones, the companion of the Cretan king Idomeneus, carrying off the prize from Teucer himself (*Iliad*, xxiii. 882). Teucer, the brother of Ajax, who came from the island of Salamis, excelled in the use of the bow and arrow, which appear however to have been considered less honourable weapons than the spear and sword. Ulysses in the *Iliad* fights with the spear and sword, but in the *Odyssey* we find the strength of the suitors tested by the bow which Ulysses had left at home, and which he afterwards uses against his domestic enemies.

In the later times of Greece, archers formed a part of the light-armed troops, in the same manner as the Sagittarii among the Romans afterwards formed a part of the Velites. Procopius records it as a great improvement when the Roman auxiliaries were instructed to draw the right hand to the ear. But the practice itself is of much greater antiquity, as we see in the representations of the sea-fight on the walls of Medinet-Habou, at Thebes in Egypt. (*Egypte, Antiq.*, vol. ii.) It was also, as we learn from Procopius, the fashion with the ancient Persians.

[Egyptian Archer.]

The time when the use of the long-bow commenced in England, as a military weapon, is unknown. That which the Normans used at the battle of Hastings was the *arbalest* or *cross-bow*. In the reign of Henry II. we find several facts recorded which show the continuance of the use of the cross-bow; and in that of Henry III. we find cross-bowmen forming the vanguard of the army. As a military weapon of England, the arbalest, in all probability, was last used at the battle of Bosworth in 1485, though as late as 1572 Queen Elizabeth engaged by treaty to supply the King of France with 6000 men, armed partly with long, partly with cross bows. It was also used on the Continent in the wars of the sixteenth century.

From the reign of Edward II. the mention of the *long-bow* becomes frequent in our history. At Crécy, at Poitiers, and at Agincourt, as well as in several battles which were gained over the Scotch, the victory is ascribed to the English bowmen; and it is particularly noticed that at Crécy the rain, which had slackened the strings of the Genoese cross-bows, had not weakened the effect of the

long-bows which our countrymen used. Edward III. enjoined the use of the long-bow in two precepts addressed to the sheriffs of counties; and in the reign of Richard II. an act was passed to compel all servants to shoot with it on Sundays and holidays. By the 7 Hen. IV. the heads of arrows were to be well boiled or brazed, and hardened at the points with steel; all heads otherwise manufactured were to be forfeited, and the makers imprisoned: all arrow-heads, moreover, were to be marked with the maker's name. Henry V. ordered the sheriffs of several counties to procure feathers from the wings of geese, picking six from each goose. Two feathers in an arrow were to be white, and one brown or grey; and this difference in colour informed the archer in an instant how to place the arrow. In the time of Edward IV. an act passed ordaining that every Englishman should have a bow of his own height; and butts were ordered to be constructed in every township for the inhabitants to shoot at on feast days; and if any neglected to use his bow, the penalty of a halfpenny was incurred. An act, 1 Richard III., complains, that by the seditious confederacy of Lombards using divers parts of this realm, bow-staves were raised to an outrageous price; that is to say, to eight pounds a hundred, whereas they were wont to be sold at forty shillings. This act provided that ten bow-staves should be imported with every butt of malmsey or Tyre wines, brought by the merchants trading from Venice to England, under a penalty of 13s. 4d. for every butt of the said wines in case of neglect. By 6 Henry VIII., chap. 2, all male servants were to provide themselves with one bow and four arrows, which their master was to pay for, stopping the purchase-money out of their wages. Another statute, enjoining the use of archery more extensively, was passed in 33 Henry VIII. It ordained that every man under sixty, except spiritual men, justices, &c., should use shooting with the long-bow, and have a bow and arrows continually in his house; that he should provide bows and arrows for his servants and children; that every servant, above seventeen and under sixty years of age, should pay 6s. 8d. if he was without a bow and arrows for one month. The inhabitants of every city, town, and place were to erect butts, and practise shooting on holidays, and at every other convenient time. Latimer, in one of his sermons before King Edward VI., published in 1549, enforced the practice of archery from the pulpit. 'Men of England in times past,' he says, 'when they would exercise themselves (for we must needs have some recreation, our bodies cannot endure without some exercise), they were wont to go abroad in the fields of shooting, but now it is turned into glosing, gulling, and whoring within the house. The art of shooting hath been in times past much esteemed in this realm; it is a gift of God that he hath given us to excel all other nations withal; it hath been God's instrument whereby he hath given us many victories against our enemies. But now we have taken up whoring in towns instead of shooting in the fields. A wondrous thing, that so excellent a gift of God should be so little esteemed! I desire you, my lords, even as ye love the honour and glory of God, and intend to remove his indignation, let there be sent forth some proclamation, some sharp proclamation to the justices of peace: for they do not their duty. Justices now be no justices: there be many good acts made for this matter already. Charge them upon their allegiance that this singular benefit of God may be practised, and that it be not turned into bowling, glosing, and whoring within the towns: for they be negligent in executing these laws of shooting. In my time, my poor father was as diligent to teach me to shoot, as to learn me any other thing, and so I think other men did their children. He taught me how to draw, how to lay my body in my bow, and not to draw with strength of arms as other nations do, but with strength of the body. I had my bows bought me according to my age and strength; as I increased in them, so my bows were made bigger and bigger: for men shall never shoot well except they be brought up in it. It is a godly art, a wholesome kind of exercise, and much commended in physic.' Holinshed reports that Henry VIII. shot as well as any of his guards.

The encouragement thus given to shooting with the long-bow caused archery to become a fashionable amusement after the bow had ceased to be used as an instrument of war. Edward VI. was fond of this exercise; and there seems every reason to believe that it was practised by King Charles I. This monarch issued a proclamation in the eighth year of his reign, to prevent the fields near London

from being so inclosed as 'to interrupt the necessary and profitable exercise of shooting.' He is also represented in the frontispiece of Markham's *Art of Archery*, 1634, in the dress and attitude of a bowman. Public exhibitions of shooting with the bow were continued in the reigns of King Charles II. and King James II.; and an archer's division, at least till within these few years, formed a branch of the Artillery Company.

The most important society of this kind now existing is 'The Royal Company of Archers, the King's body-guard of Scotland.' The exact time of its institution is unknown, but it is referred by the Scottish antiquaries to the reign of their James I., when a commission being appointed to oversee and enforce the exercise of archery in different counties of that kingdom, the most expert bowmen were selected from the mass of those raised, to form a body-guard for the king on perilous occasions; and are stated to have conducted themselves with skill, loyalty, and courage. The rank of the King's body-guard for Scotland was understood from tradition to be vested in the Royal Company, and they accordingly claimed the honour of acting in this capacity to his majesty King George IV. on the occasion of his visit to Scotland in 1822. They attended his majesty at court and on all state ceremonies during his residence in Scotland, and accompanied him on his visit to Hopetoun House, from whence he embarked for London. The captain-general has since been appointed gold-stick for Scotland, and the Royal Company now forms part of the household.

From their own minutes, still extant, it appears that an act of the privy council of Scotland was passed in 1677, conferring on this body the name and title of 'His Majesty's Company of Archers,' and granting a sum of money for a piece of plate to be shot for as a prize. No permanent king's prize, however, was established till 1788, when a sum of money was granted by King George III. to be shot for annually, with which a piece of plate was to be purchased.

During the Revolution of 1688 the Royal Company were opposed to the principles then espoused, and were all but suppressed. On Queen Anne's succession they were revived, and in 1703 received a royal charter confirming all their former rights and privileges, and conferring others upon them. The affairs of the Royal Company, which now consists of about 500 members, are managed by a council of seven, who are chosen annually by the members at large, and in whom is vested the power of receiving or rejecting candidates for admission, and of appointing the officers of the company civil and military. The field uniform of the Royal Company is of dark green cloth, faced with black braiding, with a narrow stripe of crimson velvet in the centre. The hat is of the same colour, with a handsome medallion in front, and a plume of black feathers. They have two standards. New colours, as well as a confirmation of the Royal Company to be the king's body-guard for Scotland, have been given to them by King William IV.

About fifty years ago, the revival of archery as a general amusement was attempted, under the patronage of the then Prince of Wales; and at that time, and subsequently, numerous societies of archers were formed, many of which printed their rules and orders. Some few, it is believed, are still in existence.

The more curious books on the subject of archery are Ascham's *Torophilus*, 4to., 1545, 1571, 1589; *Certain Discourses, written by Sir John Smythe, Knight; concerning the Long Bow, as also the great Sufficiency, Excellence, and wonderful Effects of Archers*, &c., 4to., London, 1590; *A Brief Treatise to prove the Necessitie and Excellence of the Use of Archerie*, by R. S., 4to., London, 1596; *Nead's Double-Armed Man*, 4to., London, 1625; Markham's *Art of Archerie*, 8vo., London, 1634; and Wood's *Bowman's Glory*, 8vo., 1682. To these may be added, the *Agne for Finsburie Archers*, 12mo., London, 1628; and the *Agne for the Archers of St. George's Fields*, 8vo., 1661.

The distance to which an arrow could be shot from the long-bow depended much upon the strength and art of the bowman; but, in general, the distance was reckoned from eleven to twelve score yards. In 1794, the Turkish ambassador's secretary, in a field behind Bedford Square, near the Toxophilite ground, with a Turkish bow and arrow, shot 415 yards partly against the wind, and 482 yards with the wind. He said that the then grand sultan shot 500 yards, which was the greatest performance of the modern Turks; but that pillars stood on a plain near Constantinople, com-

memorating ancient distances about 800 yards. The Baron de Tott says, in his *Memoirs*, Paris, 1785, tom. ii., p. 107, 'Les empereurs Turcs ont eu presque tous la vanité de prétendre à ce genre de célébrité.' 'Nearly all the Turkish emperors have had the vanity of wishing to acquire this kind of celebrity.'

Ascham has enumerated fifteen sorts of wood, of which arrows were made in England in his time, namely, brazell, turkieewood, fusticke, sugarcheste, hardbeame, byrche, ashe, oak, servive-tree, alder, blackthorn, beach, elder, aspe, and salow. Of these, asp and ash were preferred to the rest, the one for target-shooting, the other for war. Whistling arrows have been once or twice found on fields of battle of the time of Edward IV. They were chiefly used, it is believed, for giving signals in the night. The Chinese have used whistling arrows from time immemorial. The arrows shot from cross-bows were called quarrels, or bolts. They were usually headed with a large square pyramid of iron; but had sometimes other forms given to them.

For many of the materials of this article, we are indebted to Barrington's *Observations on the Practice of Archery in England*, printed in the *Archæologia*; and to the late Mrs. Banks's *Manuscript Collections on Archery*, preserved in the British Museum.

ARCHES, COURT OF, is the supreme court of appeal in the archbishopric of Canterbury. It derives its name from having formerly been held in the church of St. Mary le Bow (*de Arenbus*), from which place it was removed about the year 1567 to the Common Hall of Doctors' Commons, where it is now held. The acting judge of the court is termed Official Principal of the Court of Arches, or more commonly Dean of the Arches. This court has ordinary jurisdiction in all spiritual causes arising within the parish of St. Mary le Bow and twelve other parishes, which are called a deanery, and are exempt from the authority of the bishop of London. The Court of Arches has also a general appellate jurisdiction in ecclesiastical causes arising within the province of Canterbury, and it has original jurisdiction on subtraction of legacy given by wills proved in the prerogative court of that province. The Dean of the Arches for the time being is president of the College of Doctors of Law practising in the Ecclesiastical and Admiralty Courts, incorporated by royal charter in 1763, and the advocates and proctors who practise in these courts receive their admission in the Arches Court. The judge deputy of the archbishop, who is, in legal consideration, the judge of the court. The Dean of Arches has always been selected from the College of Advocates. There are four terms in each year, and four sessions in each term. Causes are conducted by libel (*libellus*, a little book) and answers, or by articles, according to their respective nature. Responsive pleas are termed allegations. Depositions of witnesses are taken in private by examiners of the court appointed for that purpose by the registrar, with the approbation and sanction of the judge and archbishop. The evidence being read either before trial by the judge, or read over at the trial, and the case argued by counsel, judgment is pronounced in open court. For the last twenty years and upwards, reports of decisions in the Ecclesiastical Courts have been laid before the public, which was not the case formerly. Execution of the sentence may be enforced by the compulsory process of contumacy, significavit, and attachment. An appeal lay from this court to the Court of Delegates, or more strictly to the king in chancery (1st, 25 Henry VIII. c. 19), by whom delegates were appointed to hear each cause, the appeal being to him as head of the church in place of the Pope. By 2 and 3 Wm. IV. c. 92, appeals are transferred from the Court of Delegates to the king in council. The ecclesiastical courts are competent to entertain criminal proceedings in certain cases, and also to take cognizance of causes of defamation; for which last offence persons were formerly directed to do penance, but this has very rarely been required by the Arches Court of late years. There is no salary attached to the office of judge; and his income arising from fees, as also that of the registrar, is very small. One judge has for many years presided in the Arches and in the Prerogative Courts. It is understood that a measure is in preparation by which this court, in common with all the ecclesiastical courts, will be much modified.

ARCHIAS, A. LICINIUS, a Greek poet of Antioch in Syria, whose name would never have reached us but for the beautiful oration of Cicero, pronounced in his defence. We cannot, however, regard him as anything else.

than a fly preserved in amber: nor are we inclined to think, though he was the intimate friend of many illustrious men at Rome, and gave lessons to Cicero in Greek philosophy and rhetoric (*Arch.* c. i.), that his talents were of that high order which Cicero would have us believe. He had undertaken to celebrate, in verse, the grand event in the orator's history—the conspiracy of Catiline—and nothing more was required to gain the good-will of that great though vain man. Archias came to Rome in the consulship of Marius and Lutatius Catulus, B.C. 102, and lost no time in recommending himself to these leading persons by a poem in celebration of their victories over the Cimbri. He was, in fact, the poet-laureate of those days: he was the intimate friend of Lucullus, and we find him chanting the praises of that luxurious Roman in a poem on the Mithridatic war. It was chiefly through the influence of Lucullus that he was admitted to the freedom of Heraclea, one of the most powerful Greek cities in the south of Italy, and one whose citizens were entitled to all the privileges of Romans. It was thus that Archias became a naturalized citizen of Rome. Why a certain Gratius should have contested this right, we have no means of discovering; but as the public archives of Heraclea had been destroyed by fire, Archias was unable to produce any legal document in proof of his claim. The result of the trial, which took place at least after the consulship of Cicero, B.C. 63, is unknown, but it is not probable that the jury resisted the eloquent harangue of the orator and the influence of the leading men of Rome. If we could be certain that the epigrams published under his name, in the *Anthologia Græca*, were his productions, we should feel satisfied that we had justly appreciated his character. They are in general below mediocrity, but as there were several of the same name as the poet, we cannot decide to whom they really belong. These epigrams have been published separately by Ilgen, *Animadvers. Histor. et Critic. in Cic. Orat. pro Archia*, Erfurt, 1797; and by Hülsemann, in his edition of *Cicero's Oration for Archias*, Lemgo, 1800, 8vo. We may observe, that lately an attempt has been made to prove that this oration of Cicero in defence of Archias is not genuine: but we think that the discovery by Angelo Mai, in the Ambrosian library at Milan, of a commentary on the oration by Asconius Pedianus, who flourished A.D. 30, puts the matter beyond any reasonable doubt. (See the work to which we allude by Schroëter, *Oratio quæ vulgo fertur pro Archia rec. suasque Observationes adjecit*, Lips. 1818; and the opposite view of the question by Platz, in the *Krit. Bibliothek von Seebode*, 1820.)

ARCHIATER (in Greek ἀρχίατρος), an honorary distinction conferred on physicians in the times of the Roman emperors, and still employed in some of the continental countries. Physicians generally occupied a very subordinate station in Rome during the republican period: in fact, no well-educated medical men existed among the Romans at that time; and the Greek physicians who went to Rome were not at first favourably received. Julius Cæsar at length bestowed the rights of Roman citizenship on the foreign physicians practising at Rome; and the Emperor Augustus, after his recovery from a dangerous illness, not only conferred on his own physician, Antonius Musa, the honours of knighthood, but is said to have exempted all physicians from the payment of taxes and other public burdens. The Emperor Nero first gave the title Archiater (*chief of the physicians*) to his medical attendant, Andromachus the elder, well known as the inventor of a celebrated compound preparation called Theriaca. It is probable that the Emperor only intended to express, by this title, the consideration in which he held his own physician; but it appears that, soon afterwards, the Archiatri were charged with some kind of superintendence over the medical profession. Thus Galen says of Andromachus: "It appears to me that he was appointed by the emperor at that time to reign over us;" and we also find that the word *Archiater* was translated into Latin by the words *superpositus medicorum*, 'superintendent of the physicians.' At a later period, however, the rank or office of the Archiatri seems to have undergone some change; and we find two classes of them distinguished, viz., the Archiatri of cities, and those of the court. The first law regarding the Archiatri of cities (*Archiatri populares*) was given by Antoninus Pius. He ordered each smaller town to have five, the larger seven, and the largest cities to have ten physicians, distinguished by the above name, and wholly exempted from the payment of taxes and public burdens: thus it appears that the exemption of all

practitioners, if it ever existed, was found too extensive a privilege. At Rome, there were fourteen Archiatri appointed for the different districts of the city, besides one for the vestal virgins, and another for the gymnasia: they were elected by the citizens and proprietors, and approved by their colleagues. In later times, the Archiatri of a higher rank appear to have had the sanction of the emperor; and it is not improbable that some sort of examination was also requisite for their admission. Besides enjoying the privileges alluded to, the Archiatri derived from the towns certain remunerations in kind (*annonaria commoda*), as well as salaries. It was their business to treat poor patients gratuitously, but in treating other persons they were authorized to take fees like their professional brethren. They formed medical committees or colleges in each city, and superintended the public health, and the state of the medical profession, and they also taught the principles and practice of medicine. Thus a decree of Constantine the Great says, "We order rewards and salaries to be given to them, that they may the more readily imbue many pupils with liberal studies and the said arts." There is a variety of laws relative to the Archiatri, shewing that the Romans regarded the members of the medical profession as deserving and requiring the attention and protecting care of government. The physicians attached to the imperial court took the title of Archiatri of the palace, and also formed a corporation, with certain rights, privileges, and distinctions of rank, which became more important during the reigns of the later emperors, when strict rules of precedency were established for all persons connected with the court and government. The *Count of the Archiatri* was a "*vir spectabilis*," and equal in rank to the dukes and to the vicars of the emperor.

In modern times, the name of Archiater has, in imitation of the ancient fashion, sometimes been assumed by physicians holding public appointments in cities, but more frequently by the physicians of kings and princes. In Sweden and Denmark, however, the dignity of Archiater still exists, as the highest honour conferred on medical men: in Sweden there are only two Archiatri, who act as physicians to the king.

ARCHIDAMUS. Five kings of Sparta are known to us by this name. They were of the royal line of the Proclidae, and were not the least distinguished of their family. The first lived before the historical age of Sparta, and his name, mentioned by Herodotus (viii. 131), is the only memorial left of his existence.

ARCHIDAMUS II., son of Zeuxidamus, succeeded to the throne when his grandfather, Leotychides, was banished from Sparta for allowing his military proceedings in Thessaly to be influenced by a bribe from his opponents. Archidamus reigned from B.C. 469 to 427; and his character, as drawn by Thucydides and Diodorus, exhibits all the peculiar features of the Doric race. Power and foresight, steadiness of purpose, and gravity of deportment, are the more prominent qualities which he displays. It was in the fourth year of his reign (B.C. 464) that Sparta was nearly annihilated by the violence of an earthquake, an opportunity which the Messenians did not fail joyfully to seize, with the hope of regaining their independence. The presence of mind displayed by Archidamus on this occasion saved what remained of the city from the hands of an exasperated foe; but it was not till ten years had elapsed, that this Third Messenian War, as it is called, was brought to a close, when the Messenians evacuated their citadel, Ithome. (Diod. Sic. xi. 64. Thucyd. i. 103.) On the part which Archidamus took in the affairs of his country, history is silent for a long succession of years: nor does his name again appear till we find him pleading the cause of peace in the important council held by the Lacedæmonians before they resolved on the Peloponnesian war. His voice was not listened to by his countrymen, and a declaration of war was the result of their deliberation (B.C. 431). So much confidence, how ver, had they that he would perform his duty, that they placed him at the head of the troops to be led against the Athenians. He was their general also in their second (B.C. 430) and third expeditions (B.C. 428); but it is unnecessary to notice his proceedings in the war, as they had little effect in deciding the contest. He was succeeded by his son Agis II., probably in B.C. 427. (Thucyd. i. 79, ii. 10-20, 71, iii. 1.)

ARCHIDAMUS III., the son of the celebrated Agesilaus, succeeded his father B.C. 361, and died B.C. 338. We find him in command of the Spartan troops during his

father's lifetime, B.C. 367, and gaining a battle against the Arcadians and Argeians, which is known in history as *the tearless victory* (τὴν ἀδάκρυον μάχην). Not one of the Spartans fell, while a very large number of the enemy were cut to pieces. (Xenoph. *Hell.* vii. 1. 28-32.) In the sacred war, which broke out B.C. 356, in consequence of the seizure of the temple of Delphi by the Phocians, it would appear that Archidamus gave at least secret support to Philomelus, the general of that people; but when the Lacedæmonians at last took an active part in the war, the name of Archidamus does not appear. There is, indeed, no other fact mentioned respecting him, except that he was sent (B.C. 338) to Italy to assist the inhabitants of Tarentum, then engaged in war with their neighbours the Lucanians. He fell fighting bravely at the head of his troops; and a statue was erected to his honour, at Olympia, by his countrymen. He was succeeded by his son Agis III. (Diod. Sic. xvi. 24, 63; Strabo, vi. 280; Paus. iii. 10.)

ARCHIDAMUS IV., the son of Eudamidas, is not mentioned, except by Plutarch, who states that he was defeated (B.C. 296) by Demetrius Poliorcetes; and Archidamus V., son of another Eudamidas, was put to death by his royal colleague, Cleomenes III., somewhere between B.C. 236-220. In him ended the line of the Proclidae, for though he left five sons, they were passed over, and Lycurgus, not of the royal family, was raised to the throne. (Polyb. iv. 2, v. 37.)

ARCHIGENES of Apamea, a medical author and practitioner, who enjoyed a great reputation at Rome in the commencement of the second century, during the reign of the Emperor Trajan. He must have held a very distinguished rank among his contemporaries, as appears from several passages in the *Satires of Juvenal* (vi. 236, xiii. 98, xiv. 259), in which his name is employed to denote a great physician generally. Archigenes followed the principles of the pneumatic sect, founded by Athenæus of Attalia, and is known to have written a considerable number of treatises on pathology, the practice of medicine and surgery. His works were thought very highly of in antiquity, although the author is accused of the same obscurity of style which the pneumatic physicians in general had adopted from the stoic philosophers, from whom they also derived some of their principal doctrines. The writings of Archigenes seem to have existed till the sixth century; but the only remains which we now possess are fragments contained in the works of Galen, Ætius, and Oribasius. Galen generally quotes Archigenes in order to criticise his opinions; Ætius and Oribasius give more copious extracts from him. Some of the surgical fragments have been collected by Cocchii, *Græcorum Chir. libr.* pp. 117, 118, 155. The passages contained in Oribasius have been published by De Matthiæ (xxi. *Med. Opusc. ex Oribasii Cod. Mosquæ*, 1808, 4to.)

ARCHIL (also called **ORCHIL**, in Chambers's *Dict. of Arts and Sciences*), *litmus*, or *turnsole*, is a blue dye procured from the *rocella tinctoria* and *cranora tartarea*, which are lichens growing abundantly in the Canary and Cape Verde Islands. The colouring matter of these plants appears to be a peculiar vegetable principle which has been called *erythrine*: it may be extracted either by means of alcohol or ammonia, but the latter is employed by those who manufacture the colour, which is generally sold in small flat pieces, and known by the name of litmus.

The blue colour of litmus is soluble in water and in alcohol: a strong infusion, when looked at in mass, is purple, but a diluted one is of a pure blue colour by day-light, and red by candle-light. Acids redden the colour of litmus, and this effect is produced even by the weakest of them, as carbonic acid and sulphuretted hydrogen: when mixed with the latter, and kept for some days in a well-stopped bottle, the colour is destroyed, but by exposure to the air, or by boiling, the colour is restored. Sulphureous acid and the hyposulphites also bleach litmus. These effects appear to be the result of deoxidization, for the blue colour is restored by the absorption of oxygen.

Archil is employed by chemists to ascertain the presence of acids in solution: for this purpose, the infusion or spirituous tincture is sometimes used; generally, however, paper which has been dyed and dried is preferred, and is well known by the name of *litmus paper*. This test is extremely sensible: according to Mr. Watt (*Phil. Trans.* 1781), it is capable of detecting one grain of sulphuric acid when mixed with 100,000 of water. It may also be used, when it has been

reddened by a weak acid, as a test of the presence of the alkalis: these restore the blue colour of the litmus by saturating the acid which reddened it. Archil is never used alone as a dye, on account of its want of permanence. It is, however, employed for the purpose of deepening and improving the tints of other dyes, and it imparts a bloom which it is difficult to obtain from other substances.

ARCHILOCHUS, one of the most celebrated lyric poets of Greece, who lived at too remote an age to allow any very satisfactory account of his private history to reach us. Yet every traditional fragment respecting him concurs to make us believe that he was one of the most extraordinary men of his time, whose hand was raised against every one, and whom all naturally feared and shunned. He was son of Telesicles by a slave Enipo, and he was born in Paros, an island of the Ægean Sea. The exact period at which he flourished does not appear to have been known to ancient writers, if we may judge from the different epochs in which they place him. By Herodotus (i. 12) and Tatian he is made contemporary with Gyges, King of Lydia, Olympiad 23, or about B.C. 688; by Cicero he is said to have lived in the reign of Romulus; and by Corn. Nepos in the reign of Tullus Hostilius. It is most probable that he lived at the period assigned to him by the father of history: and it is not impossible that Cicero and Nepos intend to refer to the same epoch, though they denote it by two different Roman kings. He was more formidable with his pen than with his sword: like Alæus and Horace, he thought life preferable to honour, and did not hesitate to turn his back on an enemy. This event in the life of Archilochus took place, according to the old scholiast on Aristophanes, in an expedition against a people called Sai (Σάοι), in Thrace. Archilochus, it would appear, defended himself by boldly declaring that it was better to lose one's shield than life, and Plutarch, in his account of the Spartan republic, states that Archilochus was banished from Sparta for such a remarkable opinion. Others tell us that his verses were of so impure a character, that the Spartans wisely interdicted the perusal of them by their youth. We have no difficulty in forming an opinion respecting his style of poetry, from the concurrent testimony of the antients: it was full of energy, terse in its language, and vivid in its images. Of his satirical powers no doubt can be entertained, if we credit the story of Lycambes. He had promised his daughter in marriage to Archilochus, but having changed his intention, the poet directed such a fearful satire against the offending Lycambes, that he found no other way of escape but by hanging himself, and some say his three daughters followed his example. On account of his powers of ridicule, over which he does not appear to have had sufficient control, he was driven from his country, and his character seems to have been so well known, that he was always an unwelcome visitor wherever he went. He died in a single combat with one Corax, whom he had probably provoked by his powers of satire, and the oracle of Delphi compelled the murderer to appease the manes of Archilochus by certain expiatory sacrifices. (Plut. *de Sera*, *Nun. Vind.* c. 17.) It was in Iambic verse that the poet chiefly excelled: he is said, indeed, to have been the inventor of it, and was one of the three poets whom Aristarchus esteemed most highly in this species of poetry (Vell. Patere. i. 5; Quintil. x. 1). It is also remarked by Vell. Patereulus (i. 5), that Homer and Archilochus are the only poets who both invented a peculiar style of poetry and carried it to perfection. Some specimens of Archilochus, translated with much spirit, may be seen in Merivale's *Anthology*, London, 1832. Some fragments are found in the *Analecta Vet. Poet. Græc.* of Brunck, Argent. 1785, and they are published separately by Liebel, *Reliquiæ Archilochi*, Vienna, 1819, 8vo.; also in Gaisford's *Minor Greek Poets*, vol. i.; and in Boissonnade's *Collection*, vol. xv. For his merits as a writer the reader may consult Huch, *Versuch über die Verdienste des Archilochus um die Satyre*, Wittenbach, 1767; *Memoires de l'Acad. des Inscript.*, tom. x.

ARCHIMANDRITE, the title of a dignitary in the monastic orders of the Greek church, answering to that of Father Provincial among the monks and friars of the Roman Catholic church. The archimandrite is a superior abbot, having under his jurisdiction several convents of the same district or province. The Russian church, which is a branch of the Greek, has its archimandrites, as well as the Greek church in Hungary and other parts of the Austrian empire.

ARCHIMEDES, the most celebrated of the Greek geometers, and one of the few men whose writings form a standard epoch in the history of the progress of knowledge, was born in Sicily, in the Corinthian colony of Syracuse, in the year 287 B.C. : he was killed when that town was taken by the Romans under Marcellus, B.C. 212, aged seventy-five years. Euclid died about the time of the birth of Archimedes, and Apollonius of Perga was about forty years his junior. Eratosthenes was born about ten years before him.

The life of Archimedes was written, according to Eutocius, his commentator, by Heraclides, but the work is not come down to us, and all that is known of him has been collected from various authors, of whom the principal are Polybius his contemporary, Livy, Plutarch, and Cicero. We, once for all, acknowledge our obligations to the life of Archimedes in Rivault's edition of his works, Paris, 1615; and also to that in M. Peyrard's translation, Paris, 1801.

Archimedes was related to Hieron, the second prince of that name, who came to the throne of Syracuse when Archimedes was a very young man. The reign of this prince, including the time that his son Gelon also bore the royal title, lasted about fifty-five years, during the greater part of which Archimedes remained at Syracuse under their patronage. All that we know of his life during this period, independently of the results of his studies, of which we shall presently speak, is contained in the following incidents. The well known story of Hieron's crown (or Gelon's crown, according to some) is as follows:—Hieron, or Gelon, had delivered a certain weight of gold to a workman, to be made into a votive crown. The latter brought back a crown of the proper weight, which was afterwards suspected to have been alloyed with silver. The king asked Archimedes how he might detect the cheat: the difficulty being to measure the bulk of the crown without melting it into a regular figure. For silver being, weight for weight, of greater bulk than gold, any alloy of the former, in place of an equal weight of the latter, would necessarily increase the bulk of the crown. While thinking on this matter, Archimedes went to bathe, and on stepping into the bath, which was full, observed the very simple fact, that a quantity of water, *of the same bulk as his body*, must flow over before he could immerse himself. It immediately struck him that by immersing a weight of real gold, equal to that which the crown ought to have contained, in a vessel full of water, and observing how much water was left when the weight was taken out again, and by afterwards doing the same thing with the crown itself, he could ascertain whether the latter exceeded the former in bulk. In the words of Vitruvius, 'As soon as he had hit upon this method of detection, he did not wait a moment, but jumped joyfully out of the bath, and running naked towards his own house, called out with a loud voice that he had found what he sought. For as he ran he called out in Greek, *εὕρηκα, εὕρηκα*, (I have found it, I have found it). According to Proclus, Hieron declared that from that moment he could never refuse to believe anything that Archimedes told him. For the method of detecting the exact quantity of silver alloy, see **GRAVITY, SPECIFIC**.

The apophthegm attributed to him, that if he had a point to stand upon, he could move the world, arose from his knowledge of the possible effects of machinery, and, however it might astonish a Greek of his day, would now be readily admitted to be as theoretically possible as it is practically impossible. He is reported to have astonished the court of Hiero by moving a large ship, more than usually loaded, with a pulley, or collection of pulleys, and it is said that on this occasion the king pressed him to exert himself in contriving machines for the defence of the city.

He is said to have travelled into Egypt, and while there, observing the necessity of raising the water of the Nile to points which the river did not reach, to have invented the screw which bears his name (see **SCREW OF ARCHIMEDES**). Athenæus, in mentioning this screw, says it was employed to drain the holds of ships. Diodorus (i. 34) expressly asserts that this machine, which he calls *κοχλίας*, was his invention. It is certain, from the preface to the *Quadrature of the Parabola*, that Conon of Alexandria was well known to Archimedes, which is some presumption in favour of his having been in Egypt.

After the death of Hieron, the misconduct of his successor Hieronymus, the son of Gelon, provoked a rebellion, in which he was killed. The successful party sided with the Carthaginians, and the Romans accordingly dispatched a

land and naval armament against Syracuse under Appian and Marcellus. Among all the extraordinary stories which have been told of the siege, so much seems clear:—that it lasted three years in spite of the utmost efforts of the besiegers—that this successful resistance was principally owing to the machines constructed by Archimedes—and that the city, after the siege had been some time converted into a blockade, was finally taken by surprise, owing to the carelessness of the besieged during the festival of Diana. Polybius states that catapults and balistæ of various sizes were successfully used against the enemy; that in their nearer approach they were galled by arrows shot not only from the top of the walls, but through port-holes constructed in numerous places; that machines, which threw masses of stone or lead of a weight not less than ten talents, discharged their contents upon the Roman engines, which had been previously caught by ropes; that iron *hands* (or hooks) attached to chains, were thrown so as to catch the prows of the vessels, which were then overturned by the besieged; and that the same machines were used to catch the assailants on the land side, and throw them to the ground. Livy and Plutarch give much the same account: but the curious story of setting the Roman ships on fire by mirrors is first mentioned by John Tzetzes and Zonaras, writers of the twelfth century, who cite Diodorus and others for the fact. But Galen, in the second century, though he mentions that Archimedes set the enemy's ships on fire, says it was done with *πύρα*, which may refer to any machine or contrivance throwing lighted materials. Lucian also, who lived in the second century, mentions the burning of the ships, but without saying how it was effected. Montucla is of opinion that this report arose from the joining together of two others, namely, that Archimedes wrote a treatise on burning mirrors, and that he did burn the Roman ships: both very credible stories. But their junction must, in our opinion, rank with the many curious things said of Archimedes in later ages. It is difficult to say at what period after his death discoveries respecting an illustrious man will stop: thus Rivault, in 1615, was informed by a very learned Greek, who had translated from that language the lives of the Sicilian martyrs, that one of them, a lady named Lucia, was a descendant of Archimedes, and an ancestress of the Bourbons.

After the storming of Syracuse, Archimedes was killed by a Roman soldier, who did not know who he was; Marcellus, it is said, had given strict orders to preserve him alive. According to Valerius Maximus, when the soldier asked who he was, Archimedes, being intent upon a problem, begged that his diagram might not be disturbed; upon which the soldier put him to death. According to another account, he was in the act of carrying his instruments to Marcellus, when he was killed by some soldiers who suspected he was concealing treasure. At his own request, expressed during his life, a sphere inscribed in a cylinder was engraved on his tomb, in memory of his discovery that the solid content of a sphere is exactly two-thirds of that of the circumscribing cylinder. By this mark it was afterwards found, covered with weeds, by Cicero, when he was residing in Sicily as quaestor.

The fame of Archimedes rests upon the extraordinary advances which he made, considering the time in which he lived, in pure geometry, in the theory of equilibrium, and in numerical approximation. In the first, by an axiom already mentioned [see **ARC**], and a similar one with respect to curved surfaces, and by the method of **EXHAUSTIONS** (which see), he made as near an approach to the fluxional or differential calculus as can possibly be done without the aid of algebraic transformations. In the theory of mechanics, he was not only the first but the last of the ancients who reduced anything to demonstration from evident first principles; indeed, up to the time of Stevinus and Galileo, no further advance was made. We proceed to notice his writings, stating very briefly the most important of *his own discoveries only*. The works which have come down to us, of which the first seven are in Greek, are,—

1. *Two Books on the Sphere and Cylinder*.—Here he finds the surface of a right cylinder, a right cone, and a sphere—that a hemisphere is double of a cone of the same base and altitude, and two-thirds of the cylinder of the same base and altitude—that the surface of the circumscribing cylinder (the bases included) is half as great again as the surface of the sphere, and consequently that the surface of the cylinder (not including the bases) is exactly

equal to that of the sphere—he also finds the surface of any spherical segment, and the solidity of a spherical sector. In the second book, he shows how to find a sphere equal to a given cone or cylinder; to cut it into segments having a given ratio; to make a segment equal, either in surface or solidity, to one, and similar to another, segment. Also he shows how to cut off a segment which shall have a given ratio to its inscribed cone.

2. *On the Measurement of the Circle.*—It is here shown that the area of a circle is equal to that of a triangle which has the circumference for its base and the radius for its altitude, and also that the circumference of a circle exceeds three times the diameter by a line which is less than 10 parts out of 70, and greater than 10 parts out of 71, of the diameter. This is the celebrated approximation of Archimedes, and amounts to saying that the ratio of the circumference to the diameter lies between $3 \cdot 1428$ and $3 \cdot 1408$. It is now known to be $3 \cdot 1416$ very nearly.

3. *On Conoids and Spheroids.*—By a *conoid* is meant the solid formed by the revolution of a parabola or hyperbola about its axis. *Spheroid* has the usual meaning. Archimedes here shows that a segment (or part cut off by a plane) of a parabolic conoid is half as much again as its inscribed cone, whether the base be perpendicular to the axis or not, the axis of the conoid being the parallel to the principal axis which passes through the centre of the base; that all segments of the same conoid, having equal axes, are equal; or, more generally, that different segments of the same conoid are as the squares of their axes; how to find the ratio of the segment of an hyperbolic conoid to its inscribed cone; that any spheroidal segment, having the centre of the spheroid in its base, is double of its inscribed cone; and generally, how to compare any spheroidal segment with its inscribed cone. In this treatise is also shown, probably for the first time, how to find the area of an ellipse, by means of that of a circle.

4. *On Spirals.*—The spiral of Archimedes, the method of forming which appears to have been suggested by his friend Conon, is thus made:—a point moves uniformly along a straight line, which straight line itself revolves uniformly about a given point in it. Archimedes shows how to compare the areas described by the moving point in its various revolutions, and various other properties, which the little importance of the subject will excuse us from noticing. As an effort of geometry, it is, however, not inferior to the preceding, and it is one of the most difficult of his works.

5. *Two Books on the Equilibrium and Centre of Gravity of Plane Surfaces.*—The axiom on which Archimedes sets out is, that equal weights suspended at equal distances on opposite sides of a pivot are in equilibrium. He then shows the well-known property of the lever:—given the centre of gravity of a whole plane, and of one of its parts, how to find the centre of gravity of the remainder—how to find the centre of gravity of a parallelogram, triangle, and trapezium. In the second book he shows how to find the centre of gravity of a parabolic segment, or the difference between two segments of the same parabola, having different bases.

6. *Psammites*, better known by its Latin name *Arenarius*.—This is a mathematical toy, but abounds in curious information. It appears from it that Archimedes had written a system of numeration, in a work addressed to one Zeuxippus, resembling that of modern times in having units of different orders carried to a great extent that he approved of the system which he attributes to Aristarchus, which places the sun immovably in the centre of the universe, instead of the earth—that he was aware of some attempts having been made to measure the earth, which, from their result, as stated by him, could hardly have been those of Eratosthenes—that no instrumental means then existed by which the apparent diameter of the sun could be measured within $4'$ —and that plane trigonometry was totally unknown at that time. The object of the work is to oppose those who held that the grains of sand on the sea-shore are either infinite in number, or at least cannot be reckoned. By approximately measuring the apparent diameter of the sun, and making arbitrary suppositions as to how many times the real diameter is contained in the earth's distance, and this again in the sphere of the fixed stars, he comes at last to the conclusion that no one will assert the diameter of the sphere of the fixed stars to be greater than 10,000,000,000 of stadia. Then supposing a stadium to be 10,000 finger-breadths, and a sphere, which is

only the 40th part of a finger-breadth, to contain as many as 64,000 grains, Archimedes shows that the number of grains contained at the same rate in the whole sphere of the fixed stars can be expressed, in his system of numeration, by a number which in our system is less than 1 followed by 63 ciphers.

7. *On the Quadrature of the Parabola.*—Archimedes here shows that any segment of a parabola is four-thirds of a triangle, having the same base and the same altitude.

8. *Two Books on Bodies floating in a Fluid.*—This work does not exist in Greek, but was translated by Tartaglia from a mutilated Greek manuscript: the first book was published in 1543, and both together in 1545. That Archimedes did write such a work is certain, from the testimony of Strabo (Casaubon, p. 54). These two books contain the conditions of equilibrium of a floating body in general, applied to determine the positions of a spherical segment and of a conoid. It is less necessary to describe this book particularly than any other, because, the use of algebra excepted, it contains all the conditions of a modern work on the same subject.

There is also a book of *Lemmas* attributed to Archimedes, translated from the Arabic in 1659, and republished by Borelli in 1661. Both Archimedes and his commentator Eutocius refer to some such work; but the very common character of the contents of the *Lemmas* has led some to doubt if this was the work in question.

The works of Archimedes are written in Doric Greek, the prevailing dialect in Sicily. The text is for the most part in tolerably good preservation; the style is clear, and has been considered better than that of any of the other Greek geometers. His books are mostly addressed to a friend named Dositheus. The demonstrations are long, but rigorous; and M. Peyrard, in calling Archimedes the Homer of geometry, has made a simile which is perfectly admissible as to the strength of praise it conveys, if in no other point. The commentaries of Eutocius which have come down to us, are those on the *Sphere and Cylinder*, the *Measurement of the Circle*, and the *Equilibrium of Planes*.

We can only briefly touch upon several remaining points. It is known from Ptolemy that Archimedes observed or calculated several solstices, for the determination of the length of the year. He is said to have been the first who constructed a machine for representing the motions of the sun, moon, stars, and perhaps of the planets. The doubt is from Delambre, who does not, however, appear to have remembered that Cicero (*Tusc. Quæst.*) says that Archimedes '*lunc, solis, quinque errantium, motus in sphaeram illigavit.*' Pappus cites a treatise of Archimedes on the construction of this sphere, as also does Proclus. A large number of works which have not come down to us is attributed to him, a list of which may be found in Fabricius; particularly a treatise on *Burning Mirrors*, and a treatise on the *Parabola*, published at Louvain in 1518. There is no great evidence in favour of the genuineness of either. The ancients attributed to him more than forty mechanical inventions; among which are the endless screw; the combination of pulleys; an hydraulic organ, according to Tertullian; a machine called the *helix*, or screw, for launching ships, according to Athenæus; and a machine called *loculus*, which appears to have consisted of forty pieces, by the putting together of which various objects could be framed, and which was used by boys as a sort of artificial memory. It is impossible to understand what is meant by such a description. This constant tendency to attribute inventions to Archimedes, sufficiently shows the impression which his name left on posterity.

Among the principal editions of the works of Archimedes we must notice the partial edition of Tartaglia, Venice, 1513; the first complete edition, reviewed by Regiomontanus, accompanied by the commentary of Eutocius; the whole Greek and Latin, Basle, 1544. This last edition does not contain the treatise on *Floating Bodies*, nor the *Lemmas*. Vossius states that the manuscript which had been brought from Constantinople at the fall of that place, was carried into Germany by Regiomontanus. There is also an edition by Commandine, Venice, 1558, containing only part of his works; by Rivault, Paris, 1615, containing the Greek of Archimedes in the preliminary addresses and enunciations only, the demonstrations being the Latin of Rivault, except in the *Arenarius*, which is complete; this edition has been much censured by several more modern editors, but Mon-

tucta and Vossius unite in speaking well of it; by Torelli, Oxford, 1792, the best, perhaps, of all. The last-mentioned edition was purchased by the University of Oxford after the death of the editor, and is the only one which contains the various readings. We have also the Latin translation of Borelli, 1661; the paraphrase of Maurolico, 1570, the whole edition of which was lost by shipwreck except one or two copies, and which was reprinted in 1681; the abridgment of Barrow, in 1675; and finally, the French translation of Peyrard, Paris, 1809, undertaken at the request of the Institute, and revised by Delambre, being, for public use, by much the most convenient version which has yet appeared. A German translation of all the works of Archimedes, by Ernst Nizzo, appeared at Stralsund in 1824, in 4to.

Montucla cites the following lives of Archimedes: Mazuchelli, *Notizie Historiche alla Vita, &c., d'Archimede*, 4to., 1735; and an unfinished work of M. Melot, *Mém. de l'Acad. des Belles Lettres*, vol. xv.

ARCHIPELAGO is the common term given to many clusters of islands: the group generally known by this name, when not qualified by some word prefixed, contains those islands which lie between the shores of Greece and Asia Minor. There are, however, other groups so called in our charts, the principal of which are the Aleutian, Chagos, Sooleo, Dangerous, Queen Adelaide's, Corean, Louisiade and Solomon's, the two last forming part of Polynesia. The origin of the term Archipelago appears rather doubtful: the second part of the term certainly is *pelagus*, the sea, a Greek and Latin word; and the first part is possibly a corruption of *Ægeum*. [See **ÆGEAN SEA**.]

ARCHIPELAGO, ALEUTIAN, or Fox Islands, an extensive group on the N.W. coast of America. [See **ALUTIAN ISLANDS**.]

ARCHIPELAGO, CHAGOS, in the Indian Ocean, extends from the south end of Diego Garcia (or Chagos) Island, in $7^{\circ} 29'$ S. lat., to the north end of Speaker's Bank, in $4^{\circ} 40'$ S. lat., and from the meridian of 71° to 77° E. It is composed entirely of coral islets, of which Diego Garcia is the largest: they have all very deep water close to them, and are covered with tall cocoa-nut trees. These islands abound in land-crabs, green turtle, and have a plentiful variety of fish; fresh water may be had by digging eight or ten feet deep. There is a port in Diego Garcia, which, however, is difficult of access. The tide rises from six to seven feet, and the current generally sets through the group to the N.W.

ARCHIPELAGO, DANGEROUS. This appellation has with good reason been given to a group of half-formed islets in the South Pacific Ocean, lying eastward of the Society Islands, and between the parallels of 14° and 26° south. They are exceedingly numerous, and probably many yet remain undiscovered; they are nearly all of coral formation, and consist of narrow ribands of coral rock, generally describing a circular figure, and inclosing a lagoon, in many instances of great depth. These ribands rarely exceed an elevation of ten feet above the sea, and half a mile in breadth; they all have the pandanus, and some the cocoa-nut tree on them. The eastern side is universally the better formed, and covered with vegetation: this is owing to the westerly current caused by the trade-wind, which deposits all floating substances, among which are the seeds of trees, on the eastern side of the island.

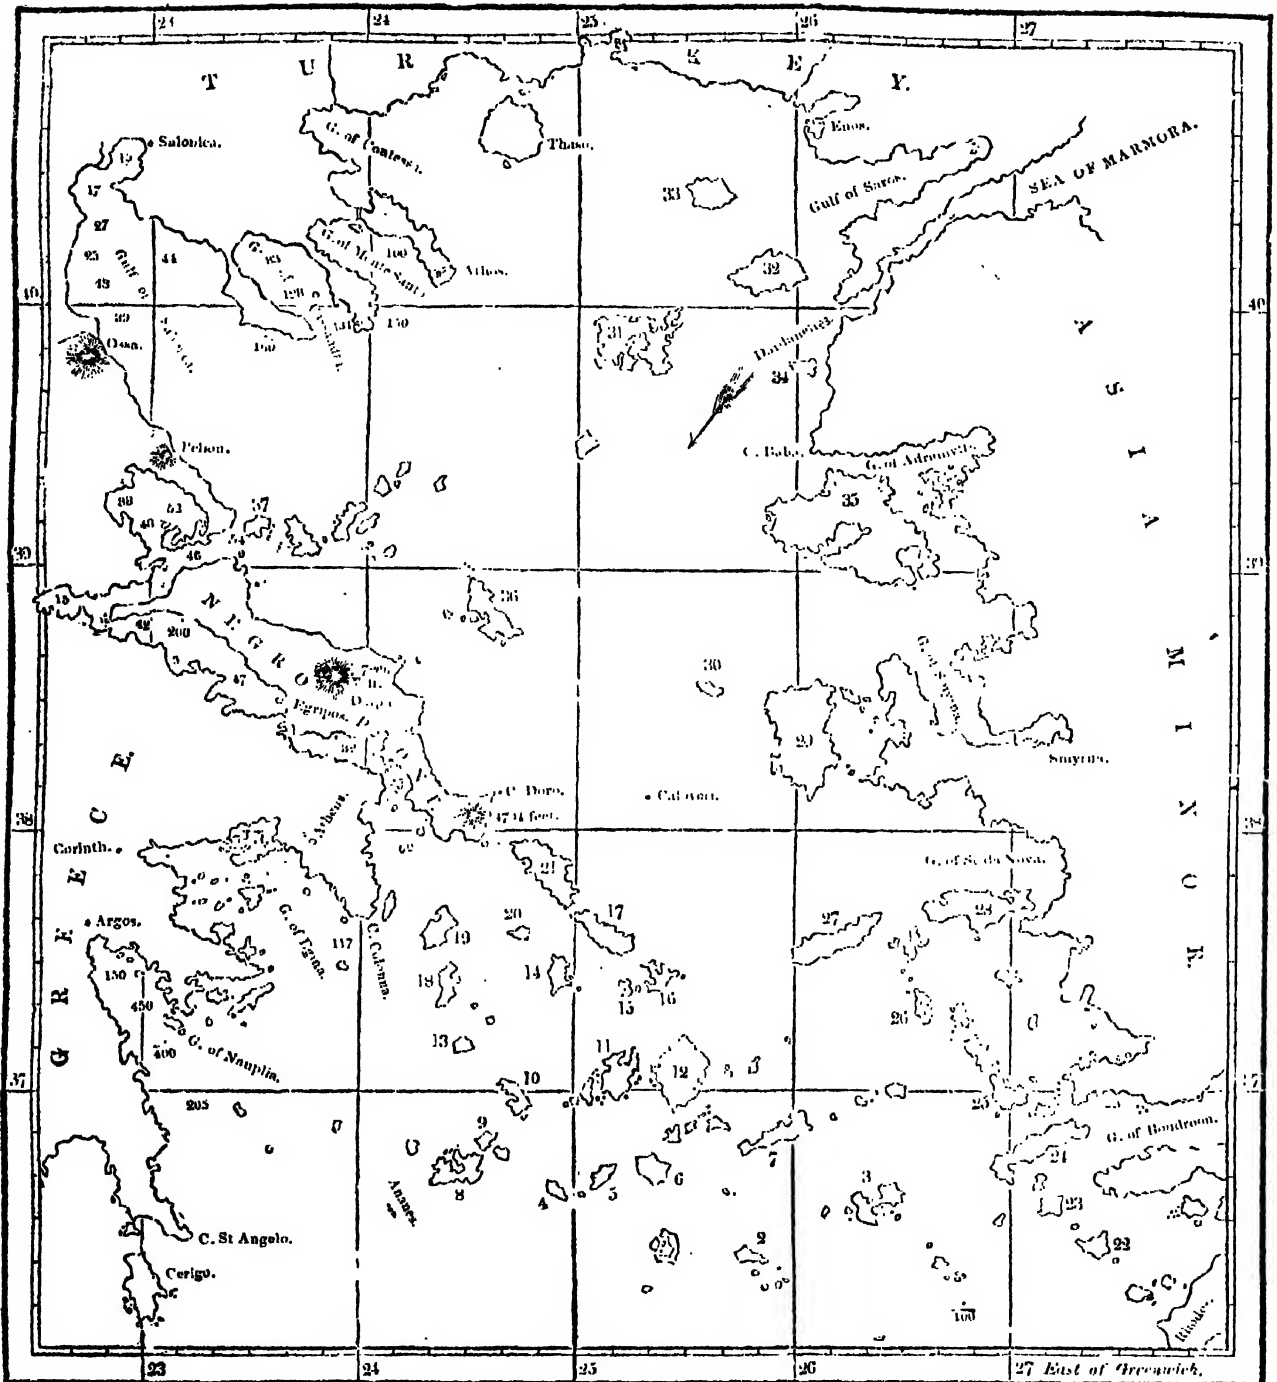

Salas Rock, Pitcairn Island, and Gambier's Group, are volcanic; and it may be presumed that the same convulsions of nature have given the little zoophyte a foundation on which to erect his stupendous structure. One island (Elizabeth) has attained a height of seventy or eighty feet, is formed of compact coral, and well covered with such stunted vegetation as may be expected from the absence of good soil. It has no lagoon; occasionally instances occurring of small islands without one, though rarely. The surf, which breaks violently over them on all sides, is the best safeguard for ships; in the night it may be heard from six to eight miles off, and is frequently seen by day before the island itself, unless the island is well covered with trees. Half a mile from the reef the sea is fathomless. The western sides are, as we have remarked, always less perfect, and some admit of a passage for ships into the lagoons, which become safe harbours. They all lie within the range of the S.E. trade-wind, which however prevails nearly east, but in the winter months there are frequent and heavy gales from the westward. Fresh-water may be obtained by digging in the sandy beach. Many are inhabited, though evidently not by the

same race. Canoes driven off the Society Islands have been the means of peopling some. There is a tide-rise of from three to three and a half feet, but the surf prevents the direction of the tide from being ascertained. Plovers, ringdoves, curlews, and sandlings, terns, tropical birds, and gannets are found among them; and the specimens of shells are various and beautiful.

ARCHIPELAGO, GRECIAN, includes all the islands situated in the north-eastern quarter of the Mediterranean sea; they are bounded by the shores of Roumelia (a province of Turkey in Europe, partly corresponding to the ancient Thrace) on the north, Asia Minor on the east, and the Negropont and Greece on the west, comprising a portion of sea which lies in the direction of N. by W. true, with a length of 380 (statute) miles from Candia to the coast of Roumelia, and a breadth, from the Negropont to the Asiatic shore, of 100 miles.

This sea was called by the Greeks and Romans the *Ægean Sea*, and the islands were distributed into two chief groups: those to the westward, now considered as part of Europe, were called Cyclades, from their being supposed to lie in a somewhat circular form; the smaller and more southern islands along the Asiatic coast obtained the name of Sporades, or 'scattered islands.' Of the Cyclades the principal are Santorin (1), Anaphi (2), Stenalia (3), Meliandro (4), Sikino (5), Nio (6), Amorgo (7), Milo (8), Argentiera (9), Siphno (10), Paros (11) with the small island of Antiparos near it, Naxia (12), Scyrho (13), Syra (14), Rhenea (15), Miconi (16), Tino (17), Thermia (18), Zea (19), Jura (20), and Andros (21). Of the Sporades the principal are—Piscopi (22), Nisari (23), Cos (24), Calymna (25), Putmo (26), Nicaria (27). There are also on the Asiatic coast the large islands of Samos (28), Scio (29), and Psara (30). Farther to the northward are Lemnos (31), Imbros (32), Samothraci (33), Tenedos (34), Mitilin (35), Skyro (36), and the Skiathos (37) group off the Trikiri Channel. Many of these islands are of volcanic formation; others are composed almost entirely of a pure white marble, of which the Parian, from Paros, where it was formerly most worked, is often mentioned by ancient writers. They exist almost in countless numbers; some are beautifully fertile and picturesque, though all the smaller islands are mere masses of rock, almost entirely destitute of vegetation. The productions of the islands are wine, oil, gum-mastic, raisins, figs, silk, honey, wax, olives, and various fruits, especially the lemon and orange: cotton is grown in small quantities at Milo and other islands, and might be cultivated to a great extent. It is remarkable for its brilliant white hue. Some of the larger islands contain sulphur, alum, iron, and other minerals. An extensive sponge fishery has also long been established among the Sporades, which are noted for their fine sponges. The arts and manufactures are at so low an ebb, that commerce is confined chiefly to the interchange of articles of daily consumption, and is carried on principally in small kaïks, in which the inhabitants push across from one island to another, certain of always being able to reach a port in the event of being overtaken by bad weather. These kaïks are open boats, sharp at each end, and carrying one large spritsail, part of which is always dragging in the water.

All the islands are thinly peopled, and some indeed may scarcely be considered inhabited. As their religion imposes on the people four lents a year, when meat may not be eaten, fish becomes more a necessar, than a luxury, in consequence of which a large portion of the men are employed as fishermen. There are, however, no regularly established fisheries; the supplies are obtained by any who think they can make a livelihood by fishing in their small boats; nets are most commonly used, and the fish caught are chiefly bream and mullet, both red and grey, which are large and well flavoured. The men are a fine, hardy, and athletic race, and as their insular position renders them necessarily habituated to the sea, they are justly considered good sailors. Their dress consists of a short jacket and waistcoat, without a collar, very full breeches, with a red sash round the waist, a small red cap fitting close to the crown of the head, and shoes resembling our slippers; the legs and throat are generally bare: they wear moustachios, but never beards, and though they do not shave the fore part of the head, like the Albanians, yet the hair is made to lie back, and falls down the neck to a great length. The women are generally considered beautiful; in no part of Greece does the character and expression observable in the face of the

[The figures attached to the islands refer to the list in p. 279: the numbers which stand alone denote depths in fathoms; and 400, for instance, denotes no bottom with 400 fathoms.]

antient statues so decidedly show itself, and especially among the Cyclades. The women's dress is very simple; the only peculiarity being a long jacket, generally trimmed with fur, and a red cap. When not employed in their household occupations, which are laborious, their time is taken up with spinning cotton, and knitting, or weaving.

Their religion, like that of their countrymen on the mainland, is of the established Greek church; and as they are very superstitious, almost every point of their islands has its little chapel dedicated to some saint, where the boatmen can offer up their prayers or thanksgivings. In many of the islands, however, Catholics are numerous. The difference of faith provokes much jealousy and hatred, and it is notorious that during the late war for independence, the Roman Catholic portion of the islanders inclined rather to the Turks, than to their own countrymen of the Greek church. This was more particularly the case at Tino and Miconi.

The mode of threshing is still that mentioned in Scripture—treading out the corn by oxen yoked together and driven round a circular enclosure.

All the islands are high: the mountains have an average

elevation of 1500 to 1800 feet, but Mount Elias of Milo rises to the height of 2036 feet above the sea. Many of the islands exhibit, in the remains of antiquity yet visible, traces of their former prosperity and importance.

The climate is more equal and temperate than that of the surrounding continents, the heats of summer being tempered by cool refreshing sea-breezes and prevailing northerly winds; even in the more northern islands the winter is never felt with such severity as on the neighbouring mainland. The N.E. or Etesian winds, called by the fishermen 'Meltem,' a corruption probably of *mal tempo*, blow with great fury, especially about the equinoxes; the general period of their duration is three days. The true scirocco, with its oppressive state of atmosphere, does not blow in the Archipelago; and it is curious to observe the sea-breeze taking the direction of the various gulfs and inlets, though differing several points in bearing. In winter the navigation of these seas is, to say the least, an anxious task, on account of the numerous islands and rocks, which occasion sudden flaws and eddies of winds, and a short, high, confused sea. A remarkable feature is the very great depth

of water: at the distance of less than a mile from the shore there is generally no bottom with 150 to 200 fathoms of line. The Ananes rocks, 10 miles south-west of Milo, and the Caloyeri, 30 miles west of the south point of Scio, rise up almost perpendicularly, like the coral reefs of the Southern Ocean. Throughout the Cyclades more especially, the Dardanelles current is felt, and sets strong through the narrow channels between them; but to the north, along the coast of Roumelia, a kind of back current sets to the eastward.

The rivers that empty themselves into the Archipelago are more deserving of notice from their classical associations than from their magnitude or commercial importance; indeed the south-western shores offer no river navigable even for small boats. On the coasts of Thessaly, Macedonia, and Thrace, however, the Peneus, the Axios, the Strymon, and the Hebrus, admit the larger class of kuks, though in all of them the mouths are much obstructed by shoals and deltas of low islands. On the Asiatic shore, the Hermeus and Mæander are the chief rivers. The coasts around the Ægean are deeply indented with gulfs of considerable length, the principal of which are Nauplia, Egina, Egripos, Trikiri Channel (leading to Zeitouni and Tallanda), Salonica, Cassandra, Monte Santo, Contessa, Saros, Adramytti, Smyrna, Scala Nova, Hassan Kalessi, and Boodroon (or Cos). Some of these are separated from each other by remarkable peninsulas, especially those of Pallene, Sithonia, and Athos, which last is perhaps the boldest promontory in the world: the steep and almost inaccessible sides of the mountain descend abruptly into an unfathomable sea. [See *ATHOS*.] Among the chief mountains in or near the Ægean may be noticed Delphi in Eubœa, the mountains bordering on the coast of Thessaly, Athos, and Elias in the island Milo.

On the division of the Roman empire the islands formed a portion of the eastern dominion, and continued so till the year 1185, when the Venetians captured Andros, Lesbos, Samos, and Scio, in revenge for an attempted aggression of the Emperor Alexis on the territories of the republic. In 1207 an edict was issued at Venice, authorizing the nobles to equip armaments for the reduction of portions of the empire. Several of the islands were thus taken possession of as private estates by the victorious adventurers; the most celebrated among whom was Marco Sanuto, who in the same year made himself master of the island of Naxos, with the title of Duke of Naxos. Having added to his conquest the islands of Paros, Antiparos, Santorin, Anaphi, Argentieri, Milo, Siphno, and Policandro, he asserted his independence of Venice, and assumed the more comprehensive title of Duke of the Archipelago.

Some of the other islands were occasionally recaptured by the Greeks, but this dynasty continued uninterruptedly in the same family for a period of nearly three centuries, till Naxos fell into the hands of Barbarossa, who, after sacking the island, allowed John Crispo, the then reigning duke, to retain his dominions on condition of becoming a vassal to the Porte. Barbarossa plundered the other islands which still remained appanages of Venetian noblemen. In 1566, James, the twenty-first and last duke, having become a prisoner in the Seven Towers, a governor was appointed by the sultan, and all the islands then became united under the dominion of Solymán. It is singular that no one institution worth recording, and no monument of art, remain to preserve the remembrance of the long period of the ducal government.

In 1686, Morosini again laid some of the islands under temporary contribution to Venice, though they were never again detached from the Ottoman dominions. The islands were, however, entirely freed from the Turkish presence by the expeditions of the Knights of Malta, who, making frequent descents, carried away into slavery all the Mussulman residents, so that the Porte withdrew its governor and officers, leaving them in a manner independent, and masters of the land, subject only to a tribute levied as land and capitation taxes. For this purpose the captain pasha, to whose pashalik most of the islands belonged, used to make an annual tour with the fleet in such force as to keep the knights in awe, and enforce the speedy collection of the taxes.

The government taxes of Candia, Cyprus, Cos, Imbros, Lemnos, Mitilin, Tenedos, and Thasos, were set apart for members of the imperial family; Nicaria and Samos, for the mufti; Andros, Tino, Scio, and Syra, for other officers of the divan. In 1770, the Russians became masters of some of the

Cyclades, which they evacuated by treaty four years afterwards. They remained tributary to the Porte till the breaking out of the revolution in 1821, shortly after which most of them eagerly embraced the cause of liberty, and contributed as much as lay in their power, both by men and ships, to the squadrons fitted out at Hydra and Spezzia. Their intrepid behaviour in their small vessels against the Turkish fleet became the admiration of Europe, and contributed greatly towards the establishment of their national independence.

All the Cyclades are now a portion of the Greek kingdom, but most of the other islands still remain under the Turks. In many of the islands they build vessels, and in Syra, more particularly, there is a large establishment for ship-building; their fir plank is imported chiefly from Trieste. Their models are beautiful, but being hurriedly and slightly put together, often with unseasoned wood, their vessels do not last long. The polacca rig is universal.

ARCHIPELAGO, CARIBBEAN. [See *ANTILLES*.]
ARCHIPELAGO, COREAN, an extensive cluster of islands on the western coast of Corea, discovered by the Alceste in 1816. They are all high, rising like mountains from the sea, and are well wooded to the summits. None of them appear to exceed three or four miles in length, but all are in some degree cultivated; the fields are divided by stone walls. From the tops of one of the highest 135 islands were counted, forming a chain of excellent harbours communicating with each other. They appeared to be all inhabited, and the natives resembled those of the mainland of Corea; they cultivate corn and feed cattle for their own consumption, but subsist chiefly on fish; no weapons were observed among them. The rise and fall of tide is considerable, but among so many islands the direction most of course be various. They extend from 34° to 36° 45' N. lat., and from 125° to 127° W. long. (Hall and McCleod.) [See *COREA*.]

Besides these there are many groups of islands to which the term Archipelago is applied by some geographers: thus all the islands to the north and east of Madagascar, from Bourbon to the Seychelles, and from Rodriguez to the main, have been classed under the denomination of the Ethiopian Archipelago. On the N.W. coast of America are small clusters, called George Third's, Prince of Wales's, and Pitt's Archipelagos [see *COOK*, *VANCOUVER*, *PEROUSS*], and on the western coast of the Birmese empire, near the Andamans, are two chains of small barren islands, called the Mergui and Tanasserim Archipelagos. The term has also been applied to the Philippines and many other groups. A list of twenty-six groups called Archipelagos is given in the *Encyclopédie Méthodique (Géographie Physique)*, most of which, such as the Azores, Canaries, &c., are as properly called Archipelagos as those here noticed; but as they are generally known by other special names, and not by that of Archipelago, we prefer describing each group under its ordinary appellation.

ARCHIPELAGO, GREAT CYCLADES, a group of large islands in the south Pacific, so called by the French navigator Bougainville; they received from Cook the name of New Hebrides, by which they are now generally known. [See *NEW HEBRIDES*.]

ARCHIPELAGO, LACCADIVE, a group of low islands, opposite the Malabar coast, and separated from it by a channel 135 miles wide. They are surrounded by and interspersed with coral reefs, which are steep, with no soundings between them. Some of the islands are well inhabited and afford good fresh water; they abound in turtle, and are so low, that at a small distance the trees only appear visible above the water. There is a rise of tide of about six feet, but the tides are not regular, and the currents are very strong; the largest island is about six miles long and one broad. To the northward of the group is an extensive coral bank of twenty-five to thirty fathoms, also steep. It lies nearly N. and S., about sixty-five miles in length and very narrow. The extent of the chain is from 10° to 12° 20' S. lat., and 72° 0' to 74° 20' E. long. (Horsburgh.) [See *LACCADIVES*.]

ARCHIPELAGO, LOUISIADE, a range of islands to the S.E. of New Guinea, about 400 miles in length, and 160 at its greatest breadth. The largest islands do not exceed thirty miles in length; they are very high and are covered with wood from the summit to the shore. They are surrounded by and interspersed with coral reefs and islets, which are covered with cocoa-nut trees; these reefs are steep, like all others of the same formation. The current sets through the channels to the N.W. at the rate of about half a mile an

hour. Some of the islands are populous and fertile, but the natives are warlike and treacherous, and are supposed to be cannibals: they are of middling stature, of a copper colour, with woolly hair: they tattoo, and go nearly naked, but are fond of personal ornaments. The islands appear to abound in aromatic plants, as most of the articles obtained from the natives were highly scented. Their canoes, some of which are fifty feet long, have their stems and sternposts prolonged to a great height; they carry outriggers and sails, and have two rudders. In battle the natives use slings chiefly, but also darts and tomahawks, and a wooden shield for defence. The group is contained between $9^{\circ} 45'$ and 12° south lat., and $148^{\circ} 50'$ and $154^{\circ} 40'$ east long. (Bougainville, Cook, &c.)

ARCHIPELAGO, MALDIVE, in the Indian ocean, to the S.W. of Ceylon, a chain of innumerable low islands and rocks, extending about 470 miles nearly on a meridian line. The large islands abound in cocoa-nut trees, and are generally inhabited by a race of Hindoos, but most of the other islands are mere barren rocks and sand banks. The greatest breadth of the range is about twenty leagues; it is formed of large groups or clusters, called by the natives Atolls. An Atoll is a bank rising from an unfathomable depth on which islands and rocks are situated; these prevail generally round the margin of the bank, though many exist within the area thus formed, that is, the islands themselves do not rise from the great depth, but are based on the sand-bank, which affords anchorage within the area. There are thirteen large Atolls from five to ten leagues in diameter, with several other detached islands and rocks in the channels that separate them: some of the channels are wide and safe; having no soundings till close to the reef, but within the reefs there is a moderate depth of water fit for anchorage. The currents set strong through the channels with the prevailing monsoon. The native boats, taking advantage of the monsoon, trade to Bengal in coir, cowries, &c., and return with rice, sugar, and piece goods. The geographical position is from lat. $7^{\circ} 6' N.$ to $10^{\circ} 40' S.$, long. $72^{\circ} 48'$ to $73^{\circ} 48' E.$ (Horsburgh). [See MALDIVES.]

ARCHIPELAGO, QUEEN ADELAIDE'S, on the S.W. coast of Patagonia, lies between Lord Nelson's Strait and the northern entrance to the Strait of Magalhaens on the western side. These islands are separated from the main land by an intricate channel, varying from two to five miles in breadth, called Smyth's Channel. They consist of numerous elevated islands with sharp rugged peaks and serrated ridges, separated by narrow and deep passages. Sir John Narborough touched here in 1670, and the S.W. island of the group still bears his name. This Archipelago is at present under examination: it is contained between $51^{\circ} 50'$ and $52^{\circ} 42' S.$ lat., and $74^{\circ} 07'$ and $75^{\circ} 10' W.$ long.

ARCHIPELAGO, RECHERCHE DE L', a very scattered and intricate labyrinth of reefs and islands on the south coast of New Holland. The largest island does not exceed four miles in length: they are all barren and arid, producing little vegetation, and nothing esculent. They have attained some elevation from the accumulation of sand, like the opposite coast, the approach to which is thus rendered dangerous. Wood and water, both in small quantities, may be procured on some of the islands: penguins, seals, and sharks are very numerous: the only quadruped seen by those who have visited the spot is the kangaroo. This group was so named by D'Entrecasteaux in 1792, when in search of La Perouse: the largest and the western portion of the islands lies off the bay of Espérance: the rest lie scattered to the eastward. The whole are included between the parallels of $33^{\circ} 45'$ to $34^{\circ} 0'$ south, and meridians of $121^{\circ} 35'$ to $124^{\circ} 4' E.$ (*Australian Memoir: D'Entrecasteaux's Voyage.*)

ARCHIPELAGO, SOLOMON'S, a chain of large islands, east of New Guinea, some of which are sixty miles in length: they are very high, and thickly wooded from the summit to the beach; they appear to be but thinly inhabited by different races, some very black and others copper-coloured; the former have soft woolly hair, the latter long and black; most of them cut it short round the crown. The men tattoo their bodies, and both sexes paint their faces; the ears are pierced and the orifices distended by rings of different kinds, and an ornament is also worn through the septum of the nose. Both sexes go entirely naked, except a scanty girdle round the waist. In war they use bows and arrows, spears and clubs; shields made of wicker-work are also used as a defence. Their canoes are skilfully constructed of pieces

neatly joined together: the head and stern are high, and in general ornamented with mother-of-pearl; some of them are between fifty and sixty feet in length, and about four wide. The inhabitants are treacherous, and said to be constantly at war with the neighbouring islands; they are supposed to be cannibals.

The group was first discovered by Alvaro de Mendana in 1567, and was again visited by M. de Surville 200 years after, but, like the greater part of Polynesia, they have never undergone a survey, though frequently touched at by vessels during the last fifty years. Nothing is therefore known of their government, religion, or customs; the wild boar appears common, with loories, cockatoos, and aquatic birds: there are also large snakes and a peculiarly large ant. Their geographical position is from lat. 5° to $11' S.$, long. $154^{\circ} 40'$ to $162^{\circ} 20' E.$ They lie parallel to the Louisiades in a N.N.W. direction, and are about 210 miles distant from that Archipelago. (D'Entrecasteaux.)

ARCHIPELAGO, SOOLOO, a group of islands, about sixty in number, lying between the S.W. point of Mindanao, and the N.E. point of Borneo, and consisting of some large islands, especially Sooloo, Beca, and Basseelan, with many smaller ones, and coral reefs so numerous as to render the navigation of the group very dangerous. All the islands are subject to a rajah, who resides at Sooloo town in the island of that name, which is thirty miles long, twelve broad, and contains about 60,000 inhabitants. The islands are generally high, and there are several good harbours; bullocks, poultry, and other live stock, with fruit and vegetables, may be had in abundance; but the natives are treacherous, and small vessels should be on their guard against attacks. The group is comprised between lat. $4^{\circ} 30'$ and $7^{\circ} 0' N.$, and long. $118^{\circ} 30'$ and $122^{\circ} 30' E.$ See Sooloo (Horsburgh).

ARCHITECTURE is sometimes defined to be 'the art of building.' We shall presently examine in what sense this definition ought to be explained, and how it ought to be limited.

The Greek term for architect is ἀρχιτεκτων (*architectōn*), which we find employed by Herodotus (iii. 60.) in the same sense as the word *architect* now is: he informs us, that Rhœceus, a Samian, was the *architectōn* or architect of the great temple of Samos. We thus learn from positive testimony, that before the great buildings of Athens were erected, the term architect and the profession of an architect were distinctly recognized among the Greeks. But Herodotus also uses the word *architectōn* in the passage just referred to in another sense: he applies it to a person who made a tunnel by which the city of Samos was supplied with water; and this is an instance in which *building*, or *construction*, properly speaking, can hardly be said to have been employed. The great increase in works of this class in modern times has led to new designations, such as that of civil engineer, which we apply to those who construct artificial ports, roads, railways, tunnels, &c.; and though the engineer may often have occasion to *build*, and may also with propriety *decorate*, common usage has placed a determinate boundary between civil engineering and architecture.

In ascertaining the present meaning of terms, it is sometimes useful and often necessary to ascend to their primary signification, and to trace their historical progress. The Greek word *archi-technō* signifies the chief *fabricator* or *maker*; and the word *technō* itself (*τεκνω*) appears to mean, originally, a *worker in wood*, a *carpenter*, a *house-builder*, a *ship-builder*, &c. (See *Iliad*, xv. 411; xxiii. 712; *Od.* xvii. 384.) It is not, however, limited to those who were skilful in the working of wooden materials, but when coupled with a qualifying term (as in *Il.* iv. 110; *Hymn to Venus*, l. 12) it had a more extensive signification. We believe that a fair examination of the earliest uses of this word will lead to an opinion that it signified *primarily* 'a worker in wood'; and consequently the Greek term *architectōn*, and the Roman *architectus* (which is a borrowed word with a Latin ending), would properly signify the *chief-carpenter*. It seems to be a fair inference, that this primary signification of the Greek word should have reference to the *materials* first employed in construction; and it appears to confirm the opinion, which is established by other independent considerations, that the *architecture* of the Greeks derived its origin from a construction in wood.

It is impossible to assign an exact meaning to the term *architecture* by any short definition. Architecture is not merely the 'art of building,' or of working materials of

earth, timber, or stone, into the form of mounds, huts, caves, and walls. Thus we do not admit such mounds of earth as that of Alyattes [see *ALYATTES*], or of Silbury Hill near Marlborough, to possess an architectural character. Neither are the kraals of the Hottentot, nor the rude huts of nations, entitled to this name, though such habitations undoubtedly have in each nation a particular and a tolerably uniform style of construction.

An excavation in a rock is not an architectural work, unless it possess a certain symmetry and certain ornaments which characterize other similar works, so as to enable us to refer it to some class or kind of construction. Where such instances of excavations occur, the ornamental or architectural part is obviously only the copy of models in wood or stone previously erected on the earth. Such is the character of the rock temples of Elephanta, and the rock-cut tombs or temples in Nubia. The rude Pelagic or Cycloplan walls of Tiryns in the Peloponnus, and other similar structures in Italy, possess a distinctive character, which is seen in a more advanced and improved state in the military fortifications of Mycenæ, where we find also the oldest instance, as far as we know, now existing in Europe, of a construction in stone combined with the sister art of sculpture. We refer to the sculptured figures in high relief, commonly called lions, which stand over the great gateway. But neither are these buildings included in the term architecture, as we shall proceed to show.

The existing monuments in Great Britain which are supposed to be anterior to the Roman invasion of this island, are classed, whether correctly or not we shall not here inquire, under the general term of Druidical or Celtic. The most remarkable of these monuments, both for preservation and arrangement, is Stonehenge on Salisbury Plain in Wiltshire. Here we find stones, some of very large dimensions, placed upright in the ground, and forming series of concentric circles. They are not merely rude masses, like those of Avebury near Silbury Hill, but they have evidently undergone some shaping and rubbing down so as to form tolerably regular parallelopipeds. We here observe also two stones placed upright, like posts or pillars, and another large stone placed over them like an architrave or lintel: the lintel is also secured by means of mortises and tenons: all this indicates certainly a regular principle of construction. But, with the exception of a few inquirers who are, perhaps, disposed to over-value Celtic remains, can any careful antiquarian trace the forms of our oldest churches and other ancient edifices, to the rude masses of the British monuments in this island? It is an historical fact, that the Romans introduced into England their own principles of building; and it is equally demonstrable that, with the exception, probably, of the arch, Roman architecture, as it is known to us, both from existing specimens and written books, is a modification and adaptation of Grecian architecture; it was probably introduced among the Romans by Greeks, and certainly generally practised by them even under the emperors. [See *APOLLODORUS*.] If we then trace the progress of architectural construction from the Greeks, through the Romans, to its introduction into western Europe, we may fairly assert that the term *architecture*, in its strictest sense, implies the adaptation of Grecian models to the buildings of our own times.

A building may be well arranged for all purposes of mere convenience, but in this case it is not an architectural construction. The progress which the arts have made in modern times has taught us to combine internal convenience and fitness with beauty of external form, and with durability. If the external arrangement of a building should be compounded of those of several nations, such as Hindoo, Egyptian, and Greek, we should not admit this to be an architectural construction, even if the external form gave pleasure, which, however, is hardly a possible result; for it is essential to the character of an architectural structure, that the general arrangement and ornaments should have a unity of character and be referable to some one model.

We have endeavoured briefly to show, what we believe to be strictly demonstrable, that the term architecture, *historically* explained, is the mode of constructing edifices which we have received from the Romans and the Greeks. But with the establishment of Christianity, and its diffusion over western Europe, a gradual modification was made in the forms of buildings devoted to religious worship: for it must be observed that it is principally in the religious edifices of a nation that we find the essential principles of its architecture

exhibited and preserved. This remark applies with equal truth to all nations that have left behind them examples of some definite style of building. The great ecclesiastical structures of western Europe now exhibit a character in appearance very different indeed from the models of Greek and Roman buildings. They gradually deviated from the heavy and rounded Norman arch, the type of which is undoubtedly the Roman arch, to the pointed and light constructions generally denominated the Gothic. That foreign ornaments of a barbarous or at least incongruous style, were occasionally mingled with them by the numerous architects of the middle ages, cannot be denied; but still in the early ecclesiastical and also in many of the civil structures of Germany, France, Flanders, and England, a distinct and new character of architecture may be seen.

This distinction became again so marked in the several countries of Europe, that a very competent judge (Rickman) is of opinion that the Gothic or pointed styles of England, and various continental countries, have each a separate character, though they may all have had a common origin. The observation of Mr. Rickman has accordingly led him to assign to English architecture a distinct character and history. As England, then, possesses an architecture of her own in the numerous ancient structures that adorn the country, and as the principles of Greek and Roman architecture have, especially within the last twenty years, been more carefully studied, and their general character and details more extensively diffused, we may reasonably expect that all our new public structures will not only be constructed with reference to their use, but that in their external design and the ornamental parts we shall adhere to some one of the great models.

The architecture of a people is an important part of their history. It is the external and enduring form of their public life; it is an index of the state of knowledge and social progress. Some speculators, indeed, would regard the noble monuments which decorate our own country, only as the marks of slavish submission to a hierarchy. But it may safely be asserted that the progress which man has made in the arts is mainly due to the influence of religious systems; and that the great improvements which have thus been gradually effected have at last descended to the humblest dwellings.

We have considered that the architecture of a country is inseparable from its history; and it is for this reason, among others, that we propose the subdivision, which the reader will see at the end of this article. A few remarks, however, may not be inappropriate on the supposed origin of the forms of architecture, and here we speak with reference to that of the Greeks. Whatever connexion, or rather resemblance, there may be between Greek and Egyptian, and between Egyptian and Hindoo architecture, will be most appropriately discussed under those separate heads. It is difficult to conceive that a Greek temple is any thing else than the improved and decorated form of a wooden construction. That wood would be used for the ordinary construction of dwellings, before baked clay or stone, seems natural, because it is more easily worked and more readily adapted to any required form. A rude cabin with its upright posts, its horizontal cross timbers, and its roof of wood, presents enough as a basis. A rectangular chamber for the inmates, a portico to screen them from the sun, posts to support it, with sloping roofs to carry off the rain, present all the essential elements of a Greek temple. Such an edifice, probably, was the ancient wooden temple of Neptune, in Arendia, which tradition attributed to Agamemnon and Trophonius. This venerable monument of antiquity was preserved by the care of the emperor Hadrian, who ordered it to be eased with a new edifice. (Pausan. *Arcad.* 10, 2.) In the *agora* or public place of Elis, the same traveller saw a curious structure in the shape of a temple, but without walls; the roof was supported by columns of oak. An old man told Pausanias that it was the tomb of Oxylus. (6, 24.)

In opposition to this hypothesis, for it is not a matter which admits of proof, it is alleged, that we do not find barbarous nations, who use wood or sticks for their huts, adopting a construction such as we have described, and that in none of them do we trace these supposed elements of Greek architecture. The wonder would be if we did find a barbarous nation possessing these elements of knowledge, for a nation that had them would soon cease to be barbarous. But *all* nations have not an architecture of their own, nor have *all* nations a style of sculpture of their own, nor do *all*

[Temple of Neptune at Paestum]

nations possess the power of forming geometrical figures and reasoning on their properties: and yet all these are the essential elements of architecture. For reasons which we cannot understand, the same faculties are not given to all the children of men: to some races is given the power to invent, to others a capacity to receive the inventions of others; but to some is denied the power of even receiving and adapting what others have invented.

Though we conceive, then, that Grecian architecture arose from the rude fabric of a wooden dwelling, we do not conceive that the edifice of stone attained either the beauty of proportion or the richness of ornament, till it called in the aid of sculpture. *Building*, that is, the putting together of timber frame-work, may be older than sculpture, but sculpture combined with building produced architecture. From the Homeric poems we deduce only very vague ideas as to the structure of temples and palaces; we find no distinct indication of the arrangement of columns, which are the very essence of Greek architecture. But the arts of design, and even the arts of working in metal, had attained some excellence. (See in the *Iliad*, book 18, the description of the shield of Achilles.) We find epithets derived from metal applied to the house of Alcinoos and other buildings, from which we infer that they were structures of wood, and that the decorations were of metal: but we find no trace of columnar arrangement, or of an edifice of stone. (*Odys.* vii. 84, &c.; iv. 45, &c.) Even in the time of Pausanias (x. 5. 11) there still existed at Lacedæmon the temple of Minerva, called the 'house of copper,' from which it would appear, that this and other ancient temples were mainly of wood, and ornamented with metal.

That the oldest material of sculpture was wood, is a fact in itself probable enough, and attested by the authority of Pausanias (viii. 17). Many of these wooden statues of high antiquity remained after the wooden temple itself had been exchanged for a more substantial edifice of stone.

We believe, then, that Grecian architecture was only the improved and decorated wooden edifice, and that the ornamental parts of the stone structure, even in their simplest form, were derived from the art of the sculptor. The sculptor and the architect, in fact, were often united in the same person; and even when it became usual to separate these arts into two distinct branches, we can have no doubt that the skill of the architect, and the taste, at least, of the sculptor, were generally combined in the same individual. We believe this was the case also with the old cathedral architects of England, who frequently not only adapted the exterior forms of their edifices for the reception and display of sculpture, but had good taste enough to take care that

these ornaments were in harmony with the whole design, and worthy of the edifice which was to receive them. Specimens of sculpture of great excellence may be observed on the exterior of many of our cathedrals: for instance, on the west end of Salisbury cathedral.

In attempting to discover what was the model of the wooden construction which we have assumed to be the parent of the architectural edifice, we meet with a variety of theories which are unsatisfactory. But it seems to have escaped the observation of many writers, that the nation to which Europe is indebted for the elements of its architecture is also the nation to which we are indebted for our knowledge of geometry. That law of the mind which gave birth to the simple forms of the triangle, the circle, and the square, gave to man the elements of all his works of art. We are not aware of any nation that has had a system of architecture which has not also had a style of sculpture; nor do we know of any nation that has carried architecture to perfection, or even to a degree of excellence in its kind, that has not also had a system of geometry and arithmetic.

Without such an extension of these general remarks as would interfere with the details belonging to the separate heads into which the various styles of architecture are divided, we could not attempt to bring down the history of the art to our own days, and trace its various stages of application in the public and private edifices of our own and other countries. We have therefore only to mention that the terms of architecture must be sought under their respective heads, as ARCH, ARCHITRAVE, &c.; that the general principles of construction will be found under BUILDING, and of architecture, as a fine art, under PROPORTION; and that the more important styles and æras of architecture will be thus distributed:-

BABYLONIAN ARCHITECTURE	ITALIAN ARCHITECTURE
CELTIC	MEXICAN
CHINESE	MOORISH
EGYPTIAN	NORMAN
ENGLISH	PELASGIAN
ETRUSCAN	PERSEPOLITAN
GOthic	PERUVIAN
GREEK	ROMAN
HINDOO	

The principles of military architecture will be treated of under CASTLE, and FORTIFICATION; those of naval architecture under SHIP; and the most approved principles of domestic architecture under HOUSE.

ARCHITRAVE, from a Greek word and a Latin one, meaning, when put together, *the principal beam*, is the lower

[Part of the west front of St. Paul's Cathedral.]

part of any structure supported by pillars, or the lower beam which rests upon the columns and joins them together, on which the whole entablature (or ornamental part which comes immediately above the columns) rests. It was also called by the Greeks and Romans *epistylon*, or that which is on the columns. Thus, when pillars support an arch, the voussoirs (see ARCH) supply the place of an architrave, by which name they are sometimes called. In the same way the flat beam, or row of stones coming immediately above a door or window, is called the architrave. The architrave may have only one face or two, that is, may appear as one beam, resting on and joining the contiguous columns (see the temple of Paestum), or as two beams, the upper of which projects a little in front of the lower, as at *a* in the preceding cut. The proportions, &c., will be described under the heads of **GRECIAN** and **ROMAN ARCHITECTURE**.

ARCHIVE, or **ARCHIVES**, a chamber or apartment where the public papers or records of a state or community are deposited: sometimes, by a common figure, applied to the papers themselves.

By some the word archive is supposed to have been derived from the Greek *Ἀρχία* (*Archeia*), a term used by Josephus in the sense of public registers, and considered to have been transmitted to us through the Latin of the middle age. The Greek word *archeion* seems, in its primary signification, to mean 'a council-house or state-house,' or 'a body of public functionaries,' as the Ephori at Sparta. (See *Aristot. Politic.* book ii.; and *Pausan.* iii. 11.) Others derive it from *arca*, 'a chest'; such being, in early times, a usual depository for records. So *Isidorus, Orig.* lib. xx. c. 9 — 'Archa dicta, quod arceat visum atque prohibeat. Hinc et archivum, hinc et arcanum, id est secretum, unde ceteri arcentur.' 'It is called Archa, because it does not allow (*arc-eat*) us to see what is in it. Hence also Archivum and Arcanum, that is, a thing kept secret, from which people are excluded, (*arc-entur*).'

The Temple of Saturn, built in the time of the Republic, was the chief repository of the archives as well as of the public treasure of ancient Rome. In England the archives of the Court of Chancery are kept partly (*i. e.* to the year 1483) at the Tower of London, and partly in the Rolls Chapel, Chancery-lane. The national archives of France are preserved in the Hôtel Soubise at Paris; those of the Courts of Justice, in La Sainte Chapelle at the Palais de Justice.

ARCHIVOLT, or **ARCHIVAULT**, means, literally, the principal turning, or arch, and is applied to any orna-

mented band or moulding which runs round the lower part of all the voussoirs of an arch.

ARCH-LUTE, a large lute, or double-stringed theorbe (see *THEORBO*), formerly used by the Italians for the base parts, and for accompanying the voice, the form of which is given by Mersenne and Kircher in the next cut. In the early

editions of Corelli's *Sonatas*, the principal base staff is assigned to the violone (double-base), or *arcileuto*. According to Kircher (*Musurgia*, lib. vi.), this instrument had fourteen notes, the highest whereof was *A*, the fifth line in the base, the lowest the double *G* below; and possessed considerable power. It was about five feet in extreme length, and proportionally large in the body. As Luscinius does not notice the arch-lute in his *Musurgia*, printed in 1536, it is to be inferred that it was invented subsequently to that time. At the commencement of the last century this instrument was much in use; Handel employed it in many of his early operas. The office of *Lutenist* still continues as part of the establishment of the Chapel-royal, though the place has been a sinecure for nearly a century.

ARCHON, a Greek word written in Roman characters, signified originally one who had rule or command, either civil or military. In modern usage it is known only as the title of certain magistrates of the Athenians, of whom we propose to give some account in this article.

On the abolition of regal government at Athens (see *CODRUS*), the chief power was still intrusted to a single magistrate, or archon, without the title of king (*βασιλεύς*), which was more directly associated with the idea of arbitrary rule. The new office was hereditary; at least it is said to have been enjoyed successively by lineal descendants of Medon, the first archon, who was himself a son of Codrus, the last king. The Athenians were fond of attributing to Theseus the origin of their democracy; by which probably they meant, that many of his regulations had a popular tendency, and that his general reformation of the state, which was favourable to that part of the population which had possessed no political rights, was accompanied by a permanent relaxation of regal authority. (*Plut. Vit. These.* c. 25.) The prerogative of the archon was still further limited; for he was made responsible to his fellow citizens for the acts of his government. (*Paus.* iv. 5. 10.) Tradition told of thirteen hereditary archons, after whom the chief magistrate was appointed to his office for ten years, but was still taken from the Medontidae, or de-

scendants of Medon. We have the name of Charops and of five others after him as decennial archons. (Vell. Patere. 1, 8.) Another revolution, which is placed by Newton B. C. 607, limited the duration of the office to a single year, at the same time dividing the charge of administration between the chief magistrate and eight others, thus forming a council of state, which consisted of nine magistrates or archons. Hence they are sometimes mentioned by the Greek writers under the general designation of The Nine. These officers had their distinguishing titles and duties, of which we shall presently speak, when we have carried a little farther the general history of this new constitution. We have seen that the first archon was, like his royal predecessor, the head of the government. The decennial archons had, doubtless, the same place and character, and the annual magistrates for a time exercised collectively the political power before vested in a single ruler. Their names and number, and in great measure the particular civil duties assigned to them, remained unaltered whilst Athens continued to possess an independent government; but the course of events wrought a most important change as to their position in the state. This change, to which in earlier times there was a gradual approximation, was effected mainly by the increased activity of the ecclesia, or popular assembly, which received its first impulse from the regulations of Cleisthenes, and was confirmed by the consequences of the Persian war, by which the *thetes*, or lowest class of citizens, which supplied the naval strength of Athens, were taught to know their power. (Aristot. *Polit.* 2, 9, 1.) From time that the ecclesia interfered habitually and directly with the government of the republic, the actual minister of state was the person who enjoyed the confidence of the people, which neither the office of archon nor any other office could procure. The inevitable consequence was, that the archons sunk from ministers of state into municipal officers of high rank. We have thought it worth while to point attention to this fact, from having had occasion to observe that young students of Athenian history are sometimes perplexed by the apparent inconsistency of the accounts given them of the first appointment of archons with the little notice bestowed upon these magistrates in the general history of the republic. They read of important public measures, and of the persons who originated and executed them, whilst the name of archon seldom occurs in Grecian history, except as marking the year in which certain events took place. (See Thueyd. ii. 2.) Pericles, without the office of archon, to which it was not his chance ever to attain, enjoyed a degree of power which was not possessed during the freedom of the republic by any other citizen. Perhaps no one who read with the least attention would find the difficulty, if he were not in some measure led to it by popular works on Grecian antiquities, which too commonly present an accumulation of facts and authorities without sufficiently discriminating the times to which the different statements refer.

The annual archons, from their first appointment down to the time of Solon, were taken from the eupatridæ, or nobles, to which class all political power seems to have been confined. This is rather assumed from what we know of the progress of civil and political society at Athens, than asserted on any authority of much weight. The establishment by Solon of a timocracy, or government in which political power was distributed with reference to property, put an end to the claims of noble blood; but since the archons were by this regulation taken from the wealthiest class of citizens (*οἱ πεντακοσιμέδωνοι*), the noblest families probably still continued chiefly to supply the archons for each year, till the celebrated law of Aristides, enacted about B. C. 479, threw open the offices of state to the whole body of the people. (Plut. *Vit. Arist.* c. 1. and c. 22.) From this time no qualification was requisite in an Athenian citizen for the office of archon but fair fame and freedom from bodily defect.

The mode of appointment presents some difficulties, from the want of precise information. It appears that the archons were originally elected by suffrage, and the elective franchise was probably confined to the noble class from which they were taken. By Solon, eligibility to the office, and perhaps the right of suffrage, were enlarged, but the mode of appointment remained the same. In after times, and even as early as the first Persian invasion of Greece, the appointment was by lot. The case of Aristides seems to have been an exception to the general rule, and may be attributed, per-

haps, to his high character and eminent services. (Aristot. *Polit.* 2, 9, 2; Herod. 6, 109, Plut. *Vit. Arist.* c. i. p. 481, ed. Reisk, compared with p. 479.) We have no information which enables us to fix the time when the change was effected. It has been attributed, with some probability, to Cleisthenes, but we know only with certainty that they were at one time elected, and at some subsequent period appointed by lot. It must not be supposed that all the citizens were eager to avail themselves of the double opportunity offered by the new mode of appointment and the law of Aristides. It seems that the poorest of them declined the hazard of the lot, which might throw upon them a burdensome honour. (Xen. *Rep. Athen.* 1, 3.)

Of the nine archons, one, usually termed the archon, was chief, and had the title of *eponymus* (*ἐπώνυμος*), or name-giver, because the year in which he served the office was called by his name, as among the Romans the year was distinguished by the names of their consuls. Thus his name appears at the head of all public decrees (see Dem. *De Cor.* Thueyd. 5, 19), and generally in all solemn records of state. Of the remaining eight, one was called the king (*βασιλεύς*), another the *polemarch*, and the last six had the general title of *thesmothetæ*. Before admission to their office they were subjected, like other public officers, to the examination, called *dokimasia* (that is, *trial* or *examination*), for the purpose of ascertaining that they were Athenians of pure blood, whole of limb, and without blemish in their characters. With reference to the last point, they were asked if they had treated their parents kindly. When once invested with their office and adorned with the chaplet, the distinguishing mark of it (Æsch. *contra Tim.* p. 3, 33), they were especially protected by the laws from all insult and outrage, and were exempted even from those public burdens which were not included in the general exemption granted to their most favoured citizens, the descendants of Harmodius and Aristogiton. (Dem. *contra Lept.* p. 462, 20; and p. 465, 17.) There is reason to believe that they were members of the council of Areopagus by virtue of their office. (See *AREOPAGUS*.) It is certain that they passed from their annual magistracy to a permanent seat in that council.

Their public duties had reference for the most part to the administration of justice. In some courts, and in certain causes, they were the presiding judges. On some occasions they had the execution only of the sentence pronounced by other judges; but it seems to have formed a large if not the most considerable part of their legal duties to bring causes into court (*ιστάμεν*, Dem. *contra Lacr.* p. 940, 5-20) to be tried before the proper tribunal, not in the character of public prosecutors, but on application from the plaintiff or accuser, in which case their province was somewhat similar to that of an English grand jury in finding and ignoring bills. Sometimes, perhaps, the application to the archon was a form of little more importance as to the responsibility of the archon, than that in English law of suing out a writ. To each of the first three archons, and collectively to the six *thesmothetæ*, a distinct province and peculiar duties were assigned. Incidental notices of these are to be found scattered over the Greek classics, especially in the Attic orators; more systematic accounts occur in the earlier lexicographers and antiquarians, among whom Julius Pollux may be particularly distinguished, whose authority would have more weight if we were better acquainted with the sources from which their information was derived and the times to which their accounts refer. Copious collections have been made from them by modern compilers, of whom, perhaps, the most popular in our language is that of Archbishop Potter. We shall present our readers with only a brief outline, sufficient to convey a general view of the separate jurisdiction of these magistrates in the later times of the Athenian republic.

It seems to have been the duty of the chief archon, or *eponymus*, to throw his official protection around those whose interests were most liable to be overlooked in the ordinary execution of the law. Hence he was the appointed guardian of orphans and minors. He was also charged with a more general superintendence in matters which concerned the safety and good order of the state than was committed to his colleagues.

The king archon was more especially concerned with religious matters. He was required to preside at the performance of the most solemn sacrifices. He had a certain control over the ministers of religion, and either himself tried offenders, or originated trials, in cases of impiety. It

is hardly necessary to observe that in the early periods of regal government, kings were almost universally the chief ministers of religion. It is commonly supposed that the title of this archon was intended to denote the transfer of an important part of the king's prerogative to the magistrate who, in the department of religion, supplied his place.

The office of the polemarch was doubtless in its first institution that which the name implies, to command in war; and even as late as the battle of Marathon, we find the polemarch Callimachus acting an important part in the council of war which preceded it, and commanding in virtue of his office the right wing of the Athenians in the engagement: but, in later times, when the generals of the republic were immediately chosen by the people, the polemarch was confined to the discharge of civil duties, and particularly had cognizance of matters which concerned the strangers and *metics* (resident aliens) at Athens, exercising a jurisdiction, in this respect, not unlike that of the prætor peregrinus at Rome.

The thesmothetæ should, according to the meaning of their title, have been legislators, or propounders of laws. It was not, however, their office to introduce laws, but rather to watch over the conduct of those who put themselves forward as legislators, and also annually to examine the existing laws for the purpose of removing contradictory and superfluous enactments—to keep, as it were, the statute-book in a pure and consistent state. (Dem. *contra Lacc.* p. 940, 10, and 12; *contra Zenoth.* p. 890, 10; Lys. *contra Andoc.* p. 104, 15; Herod. 6, 109, 111; Lys. *contra Pancl.* p. 166, 32, and 40.) It appears that the whole college of archons was sometimes assembled in council (Dem. *contra Meid.* p. 542, 2); but we have no information respecting the authority which they collectively exercised.

For further information on the various and important duties assigned to the different archons, in addition to this brief and general notice, the reader is referred to the authorities mentioned above; but we would remind the young student, in his inquiries, that the reliance to be placed on the accuracy of even a credible and well-informed author must depend in some measure on the circumstances under which his information is given; and this should especially be kept in mind when, as in the subject of the present article, all our information, so far as it is supplied by the Greek classics, is obtained, not from regular essays, but from incidental notices. Our meaning in this caution will be best explained by an instance. The subject of inquiry may be the manner in which certain officers were appointed; and this, as in the case of the archons, may have varied at different times. The mode of appointment may, according to a common practice with the Athenians, be implied by an epithet familiarly joined with the title of the office. Now, it is possible that an author, who when writing professedly on the subject would have given minutely accurate information, may use this epithet, familiar to him, inaccurately with reference to the times of which he is speaking, if the circumstance indicated by it is of no importance to the subject immediately before him. Evidence drawn from a casual expression must often be taken into account, but then it should be carefully rated at its proper value.

ARCHYTAS, a native of the Greek city Tarentum in Italy; of whose life we can give only a very unsatisfactory account. His father's name is variously given as Hestæus, Mnesarchus, or Mnesagoras; but however that may be, all ancient accounts concur in considering him a man of extraordinary talents, uniting the merits of a philosopher, mathematician, statesman, and general. Even the period at which he lived is disputed; but if the *οἱ περὶ Ἀρχύταν μαθηματικοί* signify Archytas, he must have been contemporary with the younger Dionysius (Plut. *Dion.* 26.) and with Plato. Archytas belonged to the Pythagorean school, and was himself probably the founder of a sect. He is distinguished more particularly for his knowledge of mathematics,

*Te maris et terræ numeroque carentis arenæ
Monsorem.*—(Horat. l. 23.)

The poor gift of a little dust confines,
And near unto the Mantine shore enshrines,
Thou now (Archytas), who could'st measure well
The sea, the earth, and sands which none can tell.

Odes of Horace, by Hawkins, London, 1635.

and for his discoveries in practical mechanics. In what way he contrived to communicate the power of flying to his wooden pigeon, we are by no means able to state, but it seems to have been a great source of wonder to the ancients. (Aul.

Gell. x. 12.) Probably this Archytas is the person recorded in Aristotle (*Politie.* book 8) as the inventor of that useful toy, a child's clappers or rattle (*παραγῆ*). Many works ascribed to him, and we have still several small pieces under his name, but there seems good reason to doubt whether they are the genuine productions of Archytas. Archytas is said to have been drowned, as Horace intimates in the Ode quoted above. There is a *Treatise on the Ten Categories*, or *on the Nature of The All*, published in Greek by Camerarius (Lips. 1564. Venet. 1571), and a fragment on Mathematics, edited, with some other opuscula, by Stephens (Paris, 1557), reprinted at Copenhagen, 1707. The fragments of the works attributed to Archytas are chiefly known from the quotations of Stobæus. (See Schmidt, *Diss. de Archyta Tarentino*, Jena, 1683; Navarro, *Tentamen de Archyte Tarentini Vita atque Operibus*, Hafn. (Copenhag.) 1819; Montucla, *Histoire des Mathém.* vol. i. p. 143; Bardi, *De Archyta Tur. in Nor. Act. Soc. Lit. Jenens.* vol. i. p. 1.)

ARCIS-SUR-AUBE, a town in France, in the department of Aube, and the capital of an arrondissement to which it gives name. It is ninety-three miles E.S.E. of Paris, and sixteen miles N. of Troyes, the capital of the department. It is on the S. or left bank of the Aube, which begins to be navigable here, and by means of this river it carries on a considerable trade with Paris in corn, wine, wool, iron, and mill-stones. There are manufactories of cotton hose here; and a tribunal *de première instance*, or subordinate court of justice, under the jurisdiction of the assize court of Paris. The population in 1826 was about 3000.

Arcis was injured by the allies in 1814, but has since been much enlarged and improved: 48° 32' N. lat., 4° 3' E. long. from Greenwich.

The arrondissement of Arcis comprehends ninety communes, and has a population of about 33,000 persons.

ARCKENHOLZ, JOHN, a Swede, was born in Finland in 1695. He studied at Up-sal, after which he travelled over Europe, and resided at Paris a long time. There he wrote, in French, *Considerations Politiques sur la France par rapport à la Suède*, in which he spoke unfavourably of the former country, and censured the administration of Cardinal Fleury. Having communicated his MS. to several persons, he was arrested on his return to his own country and obliged to apologize to the cardinal minister. King Frederic I., of the house of Hesse Cassel, appointed him, in 1746, librarian and keeper of the cabinet of medals at Cassel, where he remained for twenty years. He wrote, in French, the *Mémoires de Christine, Reine de Suède*, 4 vols. quarto, Amsterdam, 1751, also *Lettres sur les Japonais et les Finnois*, 8vo. Frankfurt, 1756, and *Recueil des Sentimens et des Propos de Gustave Adolphe*, Stockholm, 1769. From Arckenholz's MS. account of that prince, joined to other Memoirs, a history of Gustavus Adolphus was compiled by M. Mauvillon, and published in French at Amsterdam in 1761, and afterwards translated into German under the title of *Geschichte Gustav. Adolphi*, 2 vols. 8vo. Breslau, 1775. Arckenholz's manuscript on France and Sweden was published in Büsching's *Historical Magazine*. Arckenholz had been commissioned by the states of Sweden to write the history of Frederic I., but he never completed it, his mental faculties having grown weak; he died in 1777, at the age of eighty-two.

ARCOLE, a village in the Venetian States, about fifteen miles S.S.E. of Verona, lies in the midst of a low marshy country, through which the Adige flows, a torrent which comes from the mountains near Vicenza, and empties itself into the Adige about three miles below Arcole. It is situated on the left or eastern bank of the Adige, farthest from Verona. The ground between the left bank of the Adige and the right bank of the Adige is one impervious marsh, intersected by two or three causeways, one of which leads to a narrow bridge over the Adige, and to the village of Arcole beyond it. It was along this causeway that the French, under Bonaparte, having crossed the Adige at the village of Ronco, advanced on the morning of the 15th November, 1796, with the view of surprising the rear of the Austrian army under General Alvinzi, which was then posted on the heights of Caldiero near Verona. Two battalions of Croats and Hungarians were posted at Arcole, with some artillery, and they stoutly defended the bridge. Three times the French column attempted to storm it, amidst a shower of grape-shot and musketry, and three times it was repulsed with great loss. Bonaparte himself was thrown from the causeway into the marsh, and was near

being taken. At last General Gueux, with 2000 men, having crossed the Adige further down, at the ferry of Albaredo, below the confluence of the Alpone, marched by the left bank of the latter stream, where the ground is firmer, and took possession of Arcole. General Alvinzi, however, having sent reinforcements in the evening, retook the village. Next day (16th) the battle became general between the two armies, and the village of Arcole was again the main point of the contest. The French attempted repeatedly to carry the fatal bridge, and were again repulsed with tremendous loss. Almost all their superior officers were killed or wounded. Thus passed the 16th, the Austrians retaining possession of Arcole for that night. On the 17th, Bonaparte, having thrown a bridge over the Alpone just above its confluence, directed Augereau to march with a column by the left bank, whilst another column advanced by the famous causeway. The latter was repulsed as before; but Augereau, after a sharp contest, succeeded in gaining possession of the village. General Alvinzi then made his retreat upon Montebello and Vicenza. This was the hardest fought battle in Bonaparte's first Italian campaigns, and one in which he showed great personal courage. The Austrians lost about 4000 killed, and as many were taken prisoners. The French loss in killed and wounded was not made known, but it must necessarily have been very great. Bonaparte's obstinacy in attempting so many times to carry the bridge in front, instead of turning it, as he was obliged to do at last, has been strongly censured. [See BONAPARTE, NAPOLEON.]

ARÇON, JEAN CLAUDE D', a native of Pontarlier in Franche Comté, in 1733, showed an early inclination for the military profession. He became an expert engineer, and wrote several treatises, among which may be enumerated, *Correspondance sur l'Art de la Guerre*, and *Réflexions d'un Ingénieur en réponse d'un Taciticien*, duodecimo, Amsterdam, 1773. In 1780, the war of France and Spain against England gave him an opportunity of displaying his talents on a larger scale. The Spaniards were besieging Gibraltar without success, when D'Arçon devised a plan of attack, by means of floating batteries, which were to be incombustible and not liable to sink. His scheme being approved by the Spanish government, ten ships of from 600 to 1400 tons were cut down, each forming a battery of from nine to twenty-one guns, and manned by crews of from 250 to 760 men. The front of the batteries was covered with thick layers of squared timber, a sloping roof protected them from shells, and the exterior of the floating machine was lined with cordage and hides. In order to prevent combustion from red-hot balls, a reservoir was placed in each battery from which the water raised by pumps could be distributed by certain channels through every part of the fabric, so as to keep the wood constantly wet. Each floating battery was set in motion by a single sail. The ten batteries were to form a close line at 400 yards distance from the wall of the fortress, and the attack was to be supported by the land-batteries, by bomb-vessels and gun-boats, and by ten Spanish ships of the line. The equipment of this vast armament was made in the port of Algesiras, and 40,000 men, French and Spaniards, were assembled for the expedition, of which the Duke of Crillon, the conqueror of Minorca, had the chief command. The Spanish admiral, Moreno, commanded the fleet. The first nobility of Spain repaired to the spot to witness the attack, and the Count d'Artois (since Charles X.) and the Duke of Bourbon went from Paris for the same purpose. The attack was, however, precipitated through fear of the approaching stormy season, and the expected arrival of a British squadron. When the vast machinery was set in motion, it was found that the pumps occasioned such a flow of water into the interior of the vessels that the commanders became apprehensive lest their powder should be spoiled, and they therefore contented themselves with keeping the outer surface wet. On the morning of the 13th of September, 1782, the floating batteries moved forward, but were unable to gain the positions assigned to them; the wind, the roughness of the sea, and perhaps want of skill, entirely disconcerted the plan. The two largest, the Talla Piedra and the Pastora, anchored in advance, the rest some distance behind. The cannonade began soon after ten o'clock; and 100 pieces of heavy artillery were playing at once from both sides. General Elliot fired on the floating batteries with red-hot balls, which seemed to have no effect, till seven o'clock in the evening, when the Talla Piedra, in which D'Arçon

was embarked, was discovered to be on fire. 'A red-hot ball,' says D'Arçon, 'had lodged in the side, and could not be extinguished. The fire of the enemy frustrated all our efforts to arrest the progress of the flames. An order was precipitately given to wet the powder, and this caused a total cessation of our cannonade. As we were no longer concealed by the clouds of smoke, we became too much exposed, and it was found impossible to extinguish the flames. The smoke proceeded at first from the outside, and afterwards through the interior joints of the machine. This hidden conflagration, which could easily have been stopped by moving to a distance from the constant fire of the garrison, continued in a smoking state for six hours, and did not become unmanageable till after midnight.' D'Arçon had proposed to send out a warp anchor, by which the vessel might be removed from its dangerous situation. 'The officer charged with this commission could not collect a sufficient number of sailors for the purpose.' In fact, panic and confusion had seized them when they found that the batteries were not incombustible. D'Arçon repaired at midnight to the admiral's ship, but he was referred to the general-in-chief, who was absent; he was, however, informed that orders had been given to abandon and destroy the whole of the batteries. Only the two foremost, the Talla Piedra and the Pastora, seem, at this time, to have caught fire, so that the other eight might probably have been saved. Such is D'Arçon's account in his *Mémoire pour servir à l'histoire du Siège de Gibraltar*, which he published at Cadiz, in 1783, and it explains pretty clearly how the catastrophe occurred, without attributing it, as some French biographers have done, to porfidity and jealousy on the part of the Spaniards. There was mismanagement, no doubt, both by the French and Spanish commanders, and D'Arçon himself was evidently mistaken with regard to the security of his batteries against red-hot balls. D'Arçon afterwards served in the French army at the time of the revolution, and assisted in the conquest of Holland. In 1795 he published *Considérations Militaires et Politiques sur les Fortifications*, in which he condensed all that he had previously written on the subject. He was made a senator in 1799, and died the following year at his estate near Auteuil. (See the account of the siege of Gibraltar in Cox's *Memoirs of the Kings of Spain of the House of Bourbon*; and Captain Drinkwater's *Account of the late Siege of Gibraltar*, &c., Lond. 1785.)

ARCOT, a considerable district of Hindostan, forming part of the Carnatic (see CARNATIC). The territory thus named is subdivided into the two districts of northern and southern Arcot; both of which are under the government of the Madras presidency. They are situated between the 11th and 14th parallels of north lat., and the 78th and 80th degrees of east long. Northern Arcot is bounded on the north by Cuddapah and Nellore; on the east by the district of Chingleput and the sea; on the south by southern Arcot; and on the west by the Balaghaut, the high central tableland of Cuddapah. Southern Arcot is bounded on the north by the northern division of Arcot; on the east by the sea and the Chingleput district; on the south by Tanjore and Trichinopoly; and its western boundary is formed by the district of Salem and the Balaghaut region. This district comprehended Pondicherry, during the time in which that settlement was in the hands of the English. Chingleput, the Jaghire, or tract obtained by the East India Company in 1750 and 1763 by grants from the nabob of Arcot, in return for services rendered to his father and himself, was also formerly included within the limits of Arcot.

It was doubtless owing to the frequent wars of which these districts were the seat, and which raged for so long a time during the infancy of the British empire in the Carnatic, that the condition of the country and its inhabitants became so deplorable. The agriculture of Arcot depends for its prosperity upon irrigation; but it appeared, upon a survey made in 1810, that of 2698 large tanks 451 were then out of repair, and of 1222 smaller tanks the still greater proportion of 510 were useless, while the water-courses from rivers, springs, and wells, were scarcely in a better condition. The peace of the country being restored, and an improved system of management having been adopted by the Company's government about the time just mentioned, the prosperity of the district has been to a great degree restored. At that time (1810) the northern district contained 3699, and the southern district 3988 villages; the gross collection of the public revenue amounted, in 1817, to 1,369,279 pagodas, about 550,000l.

not see the sun, and the rotation round the axis, *Pp*, brings every part of the earth under *OV* when its night begins. *MN* and *mn* are the arctic and antarctic circles. By cutting out a semicircle equal to *OV*, and placing it in different positions on the second figure, the following will appear, on a little consideration:—

1. At the summer solstice (when *V* is at *U*) all circles above *MN* will be in light for twenty four hours, and all below *mn* in darkness—and *vice versa* at the winter solstice.

2. At the equinoxes (*V* is at *A*) every circle will be in light for twelve hours, and the same time in darkness.

3. During the passage from the equinox to the summer solstice (*V* moves from *A* to *U*), at every moment some circle above *MN* emerges entirely into light, and an opposite circle below *mn* begins to be entirely covered by darkness; and both states remain until the return of the circle *OV* in the next quarter of the year. And *vice versa* for the passage from the equinox to the winter solstice (when *V* moves from *A* to *W*).

4. No circle lying between *MN* and *mn* is ever entirely in light or entirely in darkness.

Hence, to find the duration of light at any place above the arctic circle, that is, to find during what part of the year the sun performs his daily rotation entirely above the horizon, look in an almanac for the times before and after the summer solstice, at which the declination of the sun is equal to the polar distance (or latitude subtracted from 90°) of the place. Between those two times there is perpetual light. For example, the north point of Nova Zembla (latitude 75° , polar distance 15°) has perpetual light between May 1 and August 12, 1834. For the time of perpetual darkness do the same with the winter solstice; thus there is perpetual darkness at the above mentioned place from November 3, 1834, to February 9, 1835.

The north polar distance of the arctic circle is equal to the angle *HOB*, the greatest declination of the sun, or the obliquity of the ecliptic. The south polar distance of the antarctic circle is the same. This quantity changes very slightly from year to year. It is as follows:—

January 1, 1834, $23^\circ 27' 39'' \cdot 26$

January 1, 1835, $23^\circ 27' 38'' \cdot 81$

decreasing at present by about half a second yearly.

The arctic and antarctic circles are the boundaries which separate the frigid from the temperate zones, as they are called. The part of the earth included within each of the two is about $\frac{1}{10}$ per cent. of the whole surface of the globe. The best known points through or near which the arctic circle passes are Cape North in Iceland, the Maelstrom whirlpool, the mouth of the Ob, Behring's Straits, and the south of Melville Island. For discoveries of land within the antarctic circle, see ANTARCTIC OCEAN.

The arctic and antarctic circles of the heavens occupy positions with respect to the celestial poles similar to those occupied by the same circles on the earth. Thus a traveller going round the arctic circle would always have some point of the celestial arctic circle directly over head, or in his zenith. But the term is hardly ever employed by astronomers.

In all that precedes we have taken no notice of REFRACTION, the effect of which is to raise the sun a little towards the nearest pole at every point of the globe, thus lengthening the day and diminishing the night. In some latitudes the effect would be very considerable, and would increase the duration of light by as much as a day.

ARCTIC FOX, in zoology, a small species of fox (*Canis lagopus*), celebrated for the beauty and fineness of its fur, which has long been considered a valuable article of commerce. The colour of the fur, as is the case with all animals which inhabit very high latitudes, varies according to the season, being slaty blue in summer, and pure white in winter. It is in the latter state that the fur is most esteemed, not only on account of its colour, but likewise because it is of a closer and finer quality than at any other time. The soles of the feet also are at all seasons covered with a thick coat of fur, like those of the common hare, which defends them from the severity of the snow, and is a character likewise common to most other northern animals. For a more detailed account of the form, habits, and uses of the Arctic fox, see the articles FOX and FUR TRADE.

ARCTOMYS. [See MARMOT.]

ARCTOSTAPHYLOS, or bear-berry, is a genus of plants till lately considered the same as *arbutus*, from which it is essentially distinguished by its berries containing only from one to five, instead of a great many seeds. The common

bear-berry, *A. uva ursi*, is found wild in the mountainous parts of England and Scotland, and generally over the whole of the north of Europe. It is a trailing shrubby plant, with leathery dark green entire leaves, which are broadest at their upper end. The flowers are white, tinged with pink, small, and in clusters. The berries are small, and red like those of the hawthorn. The whole plant is so astringent that it has been employed by the tanner with success, and also in dyeing a greyish black colour; it is no doubt the same property which has made it celebrated for its efficacy in gravelly complaints, and in diseases of the urinary organs. When cultivated it requires to be grown in peat earth.

ARCTURUS, or α Bootis, a star of the first magnitude in the constellation Bootes. It derives its name from two Greek words, signifying the tail of the bear, and, though not in the latter constellation, it is very nearly in a right line drawn through the two hinder stars of the tail (ϵ and η). It rises N.E. by E. at Greenwich, and is on the meridian in about $7\frac{1}{2}$ hours after rising; which takes place at half past seven A.M., on the 1st of January, and about two hours later for the first of every succeeding month. Its mean places are as follows:

	Right Ascension. h m s.	Declination.
January 1, 1834, 14 8 56		$20^\circ 3' 1'' \cdot 5$ N.
January 1, 1835, 14 8 83		$20^\circ 2' 42'' \cdot 57$

Its annual increase of right ascension is $2'' \cdot 734$: its annual decrease of declination $18'' \cdot 96$. This is not all owing to precession and nutation, as the star has a PROPER MOTION, (or change of place relatively to surrounding stars,) which (*Mem. Roy. Astron. Soc.*, vol. x., p. 165) caused a decrease both in right ascension and declination, as follows:

	Average yearly decrease of R. A.	Decl.
1755—1800	$1'' \cdot 21$	$1'' \cdot 94$
1800—1830	$1'' \cdot 14$	$1'' \cdot 99$

Formerly the conclusion was sometimes drawn that Arcturus was the nearest star to our system, from its being a brilliant star with so decided a proper motion. This, which was but a faint presumption at the time, is now overturned by the known fact that there are much smaller stars (μ Cassiopeiæ, for example) which have much larger proper motions.

ARCY, GROTTTO OF, a singular excavation in the mass of a hill which stretches into the valley of the little river Cure, a feeder of the Yonne in France. It is in the department of the Yonne, about a league south of the little town of Vermenton. A narrow path over a hill covered with wood conducts to the entrance of the grotto, which contains a number of apartments, some of which are more than 1500 or 1800 feet long; but they rarely rise to the height of 20 feet. In the first two apartments are found large blocks or masses of stone lying in greater or less profusion on the ground; and in the second apartment is also a small pool about 120 feet in diameter, the depth of which is not known. Its waters are clear and fit for drinking. The apartments farther in are distinguished by the number and variety of the crystallizations which either hang from the roof (stalactites), or rise column-like from the ground (stalagmites); they are formed by the water which filters through the over arching rock, and forms a deposit about the orifice from which it issues, as well as on that part of the ground on which it drops. As the crystallizations rising from below are thus exactly under those depending from the roof, they frequently unite and form pillars which appear to support the roof of the vaults. Many of these crystallizations are capable of receiving a polish.

In the *Dictionnaire Universel de la France* (Paris, 1804-5), these caverns are described as abandoned stone-quarries, in which time has obliterated the traces of human labour; but the writer of the article in the *Encyc. Méthodique* ascribes them to the effect of the waters of the Cure, (one channel of which, entering the hill a little above the entrance of the grotto, undermines and traverses it, emerging on the other side, and having sufficient stream to turn a mill,) and to other subterraneous waters. It is acknowledged, however, that the stone with which the cathedral of Auxerre is built was taken from this place; and if so, the caves, to whatever their origin may be ascribed, have been at least enlarged in some parts by the hand of man. (*Encyc. Méthodique: Dict. Univ. de la France*; Malte Brun.)

ARD, LOCH. [See FORTH.]

ARDAGH, now a decayed village in the county of

Longford, in Ireland, about five miles S.E. of the town of that name, was once a place of considerable importance: as it gives name to a barony, one of the six into which the county is divided, and to a bishopric now united with the archbishopric of Tuam. The parish, a rectory in the diocese of Ardagh, had a population in 1821 of 4942 persons. There is a church, and some remains of the ancient cathedral, which appears to have been a small building, though of very great antiquity, as it is supposed to have been erected not long after the conversion of the natives. There is also a free school for fifty children (thirty-two boys and eighteen girls), twenty of whom are educated at the expense of the dean of Ardagh. There are two fairs, viz., April 5, and August 26.

The see of Ardagh has undergone great changes. It was founded in the middle of the fifth century; united in 1658 to the see of Kilmore; separated in 1692, but reunited in the same year; again detached in 1741, and united with the see of Tuam, though it is in the ecclesiastical province of Armagh.

It is a small diocese, containing only twenty-five benefices, which comprehend thirty-seven parishes; but it extends into six counties. It is separated from the diocese of Tuam by that of Elphin. It has a dean and archdeacon, but no chapter. The temporalities are destined, upon the first vacancy of the see, to form part of the fund for defraying the expenses hitherto raised by the vestry cess. Ardagh is in $53^{\circ} 38' \text{ N. lat.}, 7^{\circ} 39' \text{ W. long.}$

ARDEA (*Vieillot*), the heron, a genus of birds under which Linnaeus comprehended the cranes and several other divisions now formed into distinct genera by modern naturalists. M. Vieillot followed Buffon in making four divisions of the herons; but Temminck, who has paid peculiar attention to these birds, arranges them under one genus and two sections. We prefer, however, on account of its distinctness, the arrangement of M. Vieillot, which has been partly followed by Lesson, Drapiez, and Baron Cuvier. The genus *Ardea*, as limited by Vieillot, is thus characterised:

Bill strong, straight, or slightly curved, compressed, acuminate, sharp, in most species finely toothed; the upper mandible somewhat channelled, and usually notched towards the tip; nostrils on the side, almost at the base, slit lengthwise in the groove, and half shut by a membrane; eyes with a naked circle around them extending to the bill; legs long, slender, and either half-naked or feathered down to the shank (*tarsus*); the middle fore-toe united to the outer one by a short membrane; the back toe articulated interiorly, and upon the same level as the others; the second and third quill feathers of the wings the longest.

Among the genera separated from *Ardea*, are *Anthropoides*, *Balearica*, *Grus*, *Carinaria*, *Nycticorax*, and *Ciconia*; but considerable difference of opinion seems to exist with respect to these and a few other allied genera which have been proposed. The bitterns, however, though popularly distinguished from the herons, cannot, we think, with much propriety be separated from *Ardea*.

ARDEBIL, one of the principal towns of Azerbaijan, is situated, according to Jaubert, in $38^{\circ} 11' \text{ N. lat.}$ and about $48^{\circ} 19' \text{ E. lon.}$ from Greenwich, in a fertile plain encompassed by hills, at a distance of thirty hours' march from Tauriz (or Tebriz), and about seven and a half from the western border of the Caspian Sea. Monteith gives the lat. at $38^{\circ} 10' 20''$; Olearius at $38^{\circ} 5'$. A chain of hills, which separates Azerbaijan from Ghilan, keeps off the noxious winds that prevail in the sultry lowland of the latter province: it is probably in allusion to this circumstance, and to its advantageous situation generally, that Ardebil has been surnamed *Abadan-i Firuz*, 'the abode of happiness.' But still it is not a very healthy place, being exposed to great changes of temperature. The trees about Ardebil do not begin to bud before the end of April, which shows that the temperature of the place is much affected by its position near the mountains. The town is of importance as an emporium in the caravan trade of Tiflis, Derbend, and Baku, with Ispahan and Teheran. In history, Ardebil is remarkable as having given birth to the dynasty of the Sufi or Safawi rulers of Persia: two of the ancestors of this family of kings, Sheikh Safieddin and Sheikh Heider, are buried here; and their tombs are held in high veneration, as the sepulchres of saints, among the Mohammedans of the Shiite sect. Ardebil contained a fine library, which was sent to Russia when the place surrendered to Count Soukhataline. This library is described by Olearius (ii. 638, Amster-

dam ed.). A small river, the Balulukh, runs through the town, which is subject to inundations when the snow on the surrounding hills begins to melt. The great mountain of Sevelan, next to Ararat, perhaps the highest in this country, is about twenty-four miles west of Ardebil: its height is roughly computed at about 13,000 feet. In the neighbourhood of Ardebil, there are several hot and mineral springs.

ARDECHE, a departement in France, including nearly the whole of the former district of Vivarais (so called from the town of Viviers): the remaining part of the Vivarais, which is of small extent, is included in the department of Haute Loire. Ardèche is bounded on the north and north-west by the departments of Loire and Haute Loire, from which it is separated by the range of the Cévennes. On the west it has the department of Lozère, and on the south that of Gard. The eastern boundary along the whole length of the department is formed by the Rhone, which separates it from the department of Drôme. Its greatest length is about 80 miles from N. by E. to S. by W., and its breadth about 42 or 43 miles. The superficial extent is about 2116 English square miles, and the population about 328,000, or about 155 to a square mile.

The geology of this district is of a very interesting character from the abundance of volcanic phenomena which it presents. (See VELAY and VIVARAIS, and CÉVENNES.) The principal heights are along the western boundary of the department in the chain of the Cévennes. Mezen, which is just on the boundary, is 5820 feet in height, and Gerbier de Jones, from which the Loire rises, is 5125 feet. (See *Orographie de l'Europe*; and *Comp. to the Almanac for 1853*.) Indeed, the western part of the department is equal in elevation to almost any in central France. From these high lands descend the streams which by their union form the Cance, the Doux, the Erioux, and the Ardèche, which fall into the Rhone in the order (from north to south) in which their names occur. Of these the Ardèche alone appears to be navigable. The northern and western parts of the department abound in granite and sandstone, and yield rich iron ore, coal, clay for earthenware, and the finest kind for porcelain. Near Tournon, on the banks of the Rhone, are several lead mines, and indications of copper have been observed near St. Laurent les Bains, in the western part of the department.

The lower grounds along the bank of the Rhone, and in the southern districts near Aubenas, produce the mulberry and the vine; the more mountainous parts yield the chestnut and the walnut, and afford pasturage to herds of cattle. The wines of St. Peray and Cornas are much esteemed. On the loftiest summits the snow lies eight months in the year: the department, from its unequal elevation, has a great variety of climate.

The capital of the department is Privas (population 1000), on the river Onysse, an insignificant stream which flows into the Rhone. L'Argentière (population near 3000) and Tournon (population 3500) are sub-prefectures or capitals of arrondissemens. But these towns, which derive much of their importance from their political rank, are inferior in population to Annonay in the north, and Aubenas and Le Bourg St. Andeol in the south of the department. These have respectively 8000, 5000, and between 1000 and 5000 inhabitants. Aubenas is the great mart for the wine and chestnuts of Ardèche. It has two well attended fairs in the year for the sale of silk, which their mulberry trees enable the inhabitants to produce. The cotton manufacture is carried on here: and in the neighbourhood are dye-houses, tan-yards, corn and oil mills, and silk manufactories. Near Le Bourg St. Andeol are the remains of an ancient temple of the Gauls, among which are some nearly defaced bas-reliefs. For other of the places above-mentioned, see PRIVAS, ARGENTIERE L', TOURNON, and ANNONAY. This department is in the bishopric of Viviers, a small town on the Rhone, a little north of the Bourg St. Andeol already noticed. It is within the jurisdiction of the *Cour Royale* (Assize Court) of Nismes; and sends three members to the Chamber of Deputies. The inhabitants are said to be ignorant and superstitious. (Malte Brun; Balbi; *Diet. Géog. de la France*; *Encyc. Méthodique*.)

ARDECHE, a river of France, which rises in the Cévennes, and flows first to the E. then to the S. or S. by W., and then turning S.E. empties itself into the Rhone a little above Pont St. Esprit (D. of Gard), forming, in the lower part of its course, the boundary of the department of Ar-

dèche. This stream is perhaps about sixty miles long, but is not navigable for more than about ten miles. The river passes under the natural bridge of Arc, about eighteen or twenty miles above its outfall. This natural bridge consists of a very hard greyish limestone rock, forming an arch through which the river flows.

It has been used as a passage over the river ever since the Roman conquest. The road way is elevated nearly 200 French, or 212 English feet above the surface of the water. The arch has an elevation of ninety French, or between ninety-five and ninety-six English feet, and the breadth near the base is about 163 French, or 173 English feet. The length of this tunnel or arch is not given by our authorities.

Geographers have spoken of it as originally a work of nature, but perfected by the hand of man. The writer of the article *Ardeche* in the *Encyclopédie Méthodique (Géog. Physique)*, is of opinion that the river has worn this passage through the rocks round which it once took its course; having first effected a small opening, and gradually enlarged it. On the other hand, Malte Brun (*Géographie Universelle*) affirms that the arch does not exhibit any marks of the rock having been worn away by the stream; and denies, not only that the river originally formed, but even that it has at all enlarged the opening. He considers it a natural cavern formed by the decay of the rock on the bank of the river; and observes, that a tendency to decay is one of the characteristics of the kind of limestone which composes the mass. (*Encyc. Méthodique*; Malte Brun.)

ARDEE (or ATHERDEE), a market town, in the barony of Ardee, county of Louth, Ireland, forty three miles N. by W. of Dublin, on the Lafford and Derry road. It is pleasantly situated on the river Dee, which is a small stream uniting its waters with those of the Lagan, and flowing into the Irish sea. The town had in 1821 a population of 3588 persons, and the rest of the parish contained 1773. The living is a vicarage, which has been united from time immemorial with those of Shenlis, Smernmore, and Stackallen, and from a later period with the rectory and vicarage of Killydrenock. The united parishes are in the diocese and province of Armagh. There are in the town two schools on Erasmus Smith's foundation, one containing eighty-four boys, and the other eighty girls, on the Lancasterian system: there is also a dispensary.

Ardee returned two members to the Irish Parliament, but lost its franchise with the Union; it has four fairs in the year. It gives the title of baron to the Brabazon family, earls of Meath.

Ardee was antiently a walled town, and defended also by a strong castle, erected by Roger de Pippard, lord of Atherdee, about the close of the twelfth or the beginning of the thirteenth century. There were two monastic establishments here; an hospital for Crouched Friars, following the rule of St. Augustin, founded in 1207 by the above-mentioned Roger de Pippard, and a Carmelite friary, the church of which, filled with men, women, and children, was burned by the Scots and Irish under Edward Bruce in 1313. Near the town is a remarkable mound called Castle Guard, of ninety feet perpendicular height, 600 feet in circuit at the base, and 140 feet at the summit. It is tastefully planted, and is surrounded by a deep and wide trench, or, according to other accounts, a double ditch and vallum (*i. e.* embankment). The remains of two structures, one seemingly a castle or tower, and the other a kind of parapet, are on the summit. These mounds, which the Irish call *raths*, and attribute to the Danes, are more numerous in the county of Louth than in any other county. (Carlsle's *Top. Dict. of Ireland*; *Traveller's New Guide through Ireland*, &c.; Beaufort's *Mem. of a Map of Ireland*, &c.) 53° 50' N. lat., 6° 30' W. long. from Greenwich.

ARDEN, the woodland district of the county of Warwick. This name, which, from its occurrence in the northern part of France and elsewhere [see ARDENNES], we may suppose was a common Celtic designation for a forest, was given to this most extensive of the antient British forests. It is said to have reached from the banks of the Avon to the Trent on the north, and to the Severn on the west; and to have been bounded on the east by an imaginary line from Burton upon Trent to High Cross, the point of intersection of Watling Street and the Fosse-way on the border of Warwickshire and Leicestershire. Drayton, in his 'Poly-olbion,' (the 13th song.) says,

That mighty Arden held, even in her height of pride;
Her one hand touching Trent, the other Severn's side.

Upon the division of England into shires, this immenso wild was divided between different counties, and only that part which was included in Warwickshire retained its name: though perhaps 'Dean,' the name of a forest on the borders of Gloucestershire and Monmouthshire, may be a relic of it.

Although there is no longer a continuous forest in this district, yet it is still the best wooded part of the county, affording plenty of timber, consisting of almost all kinds of forest trees, but especially oaks.

Several places preserve the name, as Henley in Arden Hampton in Arden, &c. (Drayton's *Poly-olbion*, with Sclden's illustrations; *Beauties of England and Wales*; Marshal's *Review of the Agricultural Reports of the Midland Counties*.)

ARDENNES, a mountainous, or rather hilly region on the northern frontier of France, between the rivers Meuse and Moselle, situated partly in France, in the Grand Duchy of Luxembourg, in the Rhenish provinces of Prussia, and in Belgium. The name of the region is antient: the *Ardenna Silva* is mentioned by Julius Cæsar (*Bell. Gall.* l. v. vi.) by Strabo (*Geogr.* l. iv.), and by Tacitus (*Ann.* l. iii. 42). Ardennes is the name of one of the northern departments in the modern subdivision of France, and is a part of the antient provinces of Picardy and Champagne. The Ardennes, or, as the region is sometimes called, the Forest of Ardennes, extends from the hills of Thierache in Picardy, on the left of the Meuse, to those of the Hautes Fagnes and the banks of the river Roer, in the form of a half moon; and the hilly parts of the Duchy of Luxembourg, as well as the mountainous district called the Eifel, which extends to the Rhine, and contains numerous extinct volcanoes, belong to the same system. The mean elevation of the Ardennes, according to Dumont (*Mémoire sur la Constitution Physique de la Province de Liège*, Bruxelles, 1832), is about 470 metres, or 1540 English feet, above the level of the sea; its highest point, La Baraque Michel, is 680 metres, or 2230 feet. The mountain Schneifel, in the environs of Prum, according to Steininger, is 2132 feet. Omalius d'Halloy, in his *Mémoires Géologiques*, observes, that the Ardennes afford a proof that the direction of streams is not always a sure indication of the general slope of a country: that the table-land of Langres, in the department of the Haute Marne, which forms the watershed of rivers which flow into the North Sea, the Atlantic, and the Mediterranean, has, on that account, been considered as one of the most elevated parts of France, and that it has been supposed that, from that point, there is a slope to the north, west, and south; that the table land of Langres is only 1495 feet above the level of the sea, whereas the river Meuse, which rises at the foot of it, traverses, between Mezières and Givet, 136 miles to the north, a table-land which has an elevation of more than 1640 feet. The Ardennes, although a high region, cannot be called mountainous: there are extensive tracts where only very low hills or gentle undulations are observed. But in those parts which are traversed by the more considerable rivers, such as the Meuse, the Semoy, the Ourte, the Sure, the Warge, and the Roer, the surface is broken into a multitude of valleys, and extremely deep and often very narrow gorges, with steep sloping or precipitous sides, 650 feet high. These great water courses form, as it were, principal trunks from which a number of secondary valleys branch off, furrowing the whole surface of the neighbouring country. Thus the Ardennes contain both hilly and flat districts: but these last are lofty table-lands, having the same general elevation above the sea, and being composed of the same materials.

The prevailing rocks of the Ardennes are clay-slate, grauwaacke-slate, grauwaacke, conglomerate, quartz-rock, and quartzose sandstones in various modifications of colour and internal structure, with now and then, but very rarely, some thin beds of limestone and of calcareous conglomerates. These rocks are in strata generally bearing N.E. and S.W., often highly inclined, sometimes vertical, but seldom, if ever, horizontal. They maintain a considerable uniformity both of composition and stratification throughout large tracts. The slaty rocks are abundant, and afford, in some places, excellent roofing slates; there are extensive quarries of these along the banks of the Meuse, and they are carried to great distances from the facility of the river-navigation. Excellent whetstones, both for coarse and fine cutlery, are largely exported. The Ardennes have hitherto proved but poor in metallic substances except iron; but the lead-mines of Longvilly and the antimony-mines of Guesdorf were productive. Near Liernaux, an oxide of manganese is worked

in a mine open to the day. On the borders of the region towards the west there are some rich iron mines. The celebrated mineral waters of Spa issue from these slaty rocks.

The country of the Ardennes is in general sterile; and even in the best part of it, which constitutes the French department of Ardennes, there is only about a third of the land in cultivation. There are vast heaths and extensive marshes which can only be approached in the three driest months of the year. These heaths are called Fagnes, and the most elevated part of the region on the south-east is called Les Hautes Fagnes. There are extensive forests of oak and beech; more rarely, of alder, ash, and birch. Pines and firs occur but seldom. The people of Belgium, living on the borders of the Ardennes, call them the *Neur-Paî*, that is, *Noir-Pays*, 'black country,' because it contains no limestone, and because the only grains cultivated are rye and dwarf oats. Around the villages there are patches of land which have been brought into cultivation by means of a process of paring and burning, called *essartage*: it consists in taking off the turf and burning it on the ground, and by this process the soil is rendered capable of yielding three successive crops: the first year, rye, generally of a very good quality; the second year, oats; and the third year, potatoes; but after these crops have been got off the land, it must lie fallow for six, twelve, or even twenty years. Meadows and regularly cultivated lands occur only in the valleys. The rearing of cattle, sheep, and horses, is carried on to a great extent. The mutton is celebrated for its excellence, but the wool is not in such high repute. A great deal of ewe-milk cheese is made. The oxen, sheep, and horses are of a small breed. The hardy and valuable Ardennes ponies and little horses appear to be indigenous. They were as highly esteemed in ancient times as they are in the present day; for at the time of the invasion of Gaul by the Romans, the cavalry of the Treviri, in which this particular breed was employed, was esteemed the best in Gaul.

ARDENNES, a department in the north of France, on the frontier. It is bounded on the N. and N.E. by the kingdom of Belgium, E. by the department of Meuse, W. by that of Aisne, and S. by that of Maine. Its length is about sixty-five miles N. and S., and its breadth sixty miles from E. to W. Its superficial extent is 1955 English square miles, and the population about 282,000, being about 144 to a square mile.

This department is traversed by ridges which may be regarded as remote branches of the Vosges, and which separate the waters of the basin of the Meuse from those of the Seine. The streams which flow from the N.E. slopes of these ridges fall into the Meuse; the Bar (which is navigable for several miles) just below Donchery, the Vence, and the Sornonne, near Mézières, and the Faux and the Viroin, a considerable way farther down. The Meuse itself traverses the department in a direction S.E. and N.W., nearly parallel to and not very far from the Belgian frontier; it then turns more towards the N., and waters a portion of the French territory which projects into the kingdom of Belgium. It receives the abovementioned streams on its left bank: on the right it receives the Semoy, which has the greater part of its course in the Belgian territory. The Aisne forms an are in the southern part of the department, flowing in a direction which may be described as, on the whole, E.S.E. and W.N.W.; it receives the Vaux on its left bank from the range of heights above alluded to; and falling into the Oise, far beyond the limits of the department, ultimately joins the Seine. Its navigation begins at Château Portien, a little before it leaves this department. Some of the other feeders of the Oise rise just on the eastern border of Ardennes.

The elevations in this department appear from their steep declivities and rugged summits to be more lofty than they really are. They afford excellent slates, equal in quality to those of Angers, though not so deep in colour. (*Euryc. Méthod.; Géog. Physique*, Art. ARDOIRS.) Slate and stone are quarried to a considerable extent. Coal, iron, and some lead, are also worked: the great quantity of wood which the department produces, furnishes fuel for considerable iron works.

These heights were once covered with an immense forest. Cæsar (*Comment. de B. G. lib. v.*) describes it as spreading 'in vast extent through the middle of the country of the Treviri (people of the diocese of Trèves, now included in the Prussian Grand Duchy of the Lower Rhine), from the river Rhine to the beginning of the territory of the Remi (the

people about the present town of Rheims). In another place (*Comment. de B. G. lib. vi.*), he speaks of it as 'the largest forest in all Gallia,' and says, 'that it stretches from the banks of the Rhine and the country of the Treviri, to the lands of the Nervii' (who dwelt in the present country of Flanders), 'and extends above 500 miles in length*.' But this measure is so great that some error in the text has been suspected. In some documents of the German empire of the dates 1001, 1003, A.D., the name Arduenna is applied to a canton of Westphalia bordering on the diocese of Paderborn. If the word signified a forest [see ARDEN], it accounts for the fact that the Roman goddess of forests, Diana, appears sometimes with the epithet Arduenna: and Montfaucon shows that a superstitious belief in this goddess existed in the Ardennes till the thirteenth century.

Strabo speaks of it as a large forest, consisting of not very lofty trees. (*Géog. lib. iv.*) Though now much reduced, it renders the department which bears its name one of the best wooded in France. It occupies a considerable extent on the banks of the Meuse below Charleville, and encompasses the plain in which the town of Rocroy stands. The timber which it furnishes, besides supplying the forges or manufactories, forms one of the chief articles of commerce. The agricultural produce of the department is not sufficient to supply the wants of the inhabitants. Their timber, slates, metals, and woven fabrics are exchanged for the corn and wine of more fertile districts. The southern parts contain the most pasturage and corn land.

The chief manufactures carried on in this department are of cloth and woollen stuffs, at Sedan and Rethel; cutlery, hardwares, nails, and fire-arms, at Charleville; leather, which is in good repute; hosiery, hats, serges, &c.

The chief towns are Mézières, the capital (population 4000), Rethel (population 6000), Rocroy (population 3560 or 4000), Sedan (population 13,000), and Vouziers (population under 2000): all which are seats of sub-prefects; Charleville (population 8000), which is separated from Mézières only by the Meuse; and Charlemont, with Givet, Notre Dame, and Givet St. Hilaire, which form one town with a population of about 1000. Several of these being on the frontier are fortified.—Mézières, Rocroy, Sedan, and Charlemont with the Givets. For a further account of these towns, see CHARLEVILLE, CHARLEMONT, MÉZIERES, RETHEL, ROCROY, SEDAN.

This department is included in the archbishopric of Rheims, and is under the jurisdiction of the *Cour Royale* (Assize Court) of Metz. It sends three members to the Chamber of Deputies. (Malte Brun; Balbi; *Euryc. Méthodique; Diction. Géog. de la France*, &c.)

ARDESHIR. [See SASSANIDE.]

ARDFERT, called antiently ARDART, ARDFEART-BRENN, or ARDBREINN, a decayed city of Ireland, in the barony of Clannaurice, county of Kerry; 184 English miles S.W. by W. from Dublin, and about four N.N.W. of Tralee. Although now much reduced, its former importance and its episcopal rank entitle it to notice. The see of Ardfert was erected in the fifth century, and was so early united with that of Aghadoc that they now form but one diocese, comprehending the county of Kerry and part of Cork, and containing eighty-eight parishes, and forty-nine benefices. In 1663, the united sees were added to that of Limerick, but without incorporation. The chapter of Ardfert consists of five dignitaries, viz., dean, precentor, chancellor, treasurer, and archdeacon, but no prebendaries; only the archdeacon of Aghadoc has a stall. The five dignitaries above mentioned have the cure of souls in the parish of Ardfert, and contribute each one-fifth to the curate's salary. The parish church serves as the cathedral, and is the relic of a very extensive edifice, the rest of which was demolished in the wars of 1641.

The ruins of the nave and choir are twenty-six yards long and ten broad. There are the remains of an aisle on the south side, and there was probably one on the north side, which was rebuilt not long before the demolition of the church in 1641. Towards the west end of the cathedral, there are two detached chapels, said to have belonged to the dignitaries of the cathedral, one of them bearing marks of remote antiquity. Opposite the west door was formerly one of the an-

* As the Roman mile was about $\frac{11}{12}$ ths of our mile, the distance will be about 454 English miles—which is impossible; for it is little more than 300 Roman miles from the Rhine at Strasburg to the coast of Flanders. And Strabo expressly says, the forest was not of the extent which some writers assign to it, mentioning 4000 stadia as the exaggerated dimensions, which are equal to Cæsar's measurement. Eight stadia are equivalent to one Roman mile.

tient round towers (see *ANTRIM tower*) nearly a hundred feet high, and built mostly of a dark kind of marble; but this fell in the year 1770 or 1771. The area of the cathedral is crowded with tombs, on one of which is the effigy of a bishop rudely sculptured in relief.

Ardfert was once the capital of Kerry, and had a university of high repute. The bishops were antiently called bishops of Kerry. St. Brendan, or Brandon, to whom the cathedral was dedicated, erected a sumptuous abbey here in the sixth century, but it was burned, as well as the town, in 1089. The town suffered a similar fate again in 1151 and 1179, on which last occasion the abbey was entirely destroyed.

Within the demesne formerly belonging to the earls of Glandore and barons of Ardfert (titles now extinct) are the remains of an antient monastery, forming a most picturesque addition to the grounds. These remains, according to Sir R. C. Hoare, who visited them in July, 1806, consist of the tower, nave, and a great part of the cloisters, which are in tolerable preservation. The architecture of the building does not bespeak a very antient date. There is some difference of opinion as to its origin; Smith (*Nat. and Civ. Hist. of Kerry*) ascribes its foundation to Thomas, Lord of Kerry, in 1253, in which he is followed by Archde. (*Monast. Hibern.*); others ascribe it to a baron of Kerry, in 1389. It is thought to occupy the site of the former monastery founded by St. Brendan, and was destroyed when the town was burnt in the years 1089 and 1179.

There are three fairs in the year. The population amounted, in 1821, to 629 in the town, or 2181 in the whole parish. It was a parliamentary borough before the Union, and sent two members to the Irish House of Commons; it is still governed by a portreeve and twelve burgesses. In 1821, there was an Hibernian Society school of forty boys and twenty-one girls. 52° 19' N. lat., long. 9° 39' W. from Greenwich.

Ardfert is so near the sea, that single trees, or even rows, are destroyed by the wind; yet there are fine plantations in the grounds of the late Earl of Glandore.

ARDGLASS, a town in Ireland, in the barony of Lecale, county of Down, a short distance E. by N. of the town of Killough, which is 100 miles N. by E. of Dublin. It lies upon the east side of the tongue of land which separates the bay of Killough from that of Ardglass: the road between the two towns leads round the head of the first-named of these bays, a distance of about five miles, but this may be very much shortened by crossing the sands when the tide permits.

Ardglass lies on a small rocky bay or creek about 150 fathoms wide, and extending, at high water, 500 fathoms inland, with three or four sandy coves along its shores, divided from each other by rocky ledges. The outer of these ledges on the west side has been built up so as to form a kind of pier, at the extremity of which is a light house; and as there are always three or four fathoms water at the entrance, it may be run for at night, even at low water. The harbour is, however, far from secure when the south-east wind, the most violent on this coast, sets in. (*Report of the Commissioners of Irish Fisheries for 1822.*) It is inhabited chiefly by fishermen. The population of the whole parish was only 976 in the year 1821, the inhabitants of the town not being discriminated. It is the centre of one of the districts or stations into which the Irish fisheries are divided. In the year ending the 5th of April, 1830, there were employed within the district 208 sailing and 300 row-boats; 2441 fishermen, and probably about 300 other persons, as fish-curers, net makers, coopers, sail-makers, and other artificers connected with the fisheries, and depending on them for support. In 1822 there were two packets to the Isle of Man. The harbour has been within a very few years substantially repaired by W. Ogilvy, Esq., and government have lately made a grant towards the erection of a pier. There is in the town a school on the foundation of Erasmus Smith, the school-house for which was built by Mr. Ogilvy: it contained in 1826 about 120 pupils, half of whom were boys and half girls.

Ardglass was once a corporate town of considerable importance, both as a seat of commerce and a military post. In the time of Queen Elizabeth it was, next to Newry and Down, the principal place in the county. Some authorities make it the second town for trade in all Ulster, Carrickfergus being the first. Several remains attest its former

and 20 broad in the clear—(250 feet long and 24 broad, according to Seward, *Topog. Hibern.*, which are probably the exterior dimensions.)—is situated close by the harbour, and washed by the sea on the north end and the east side. On that side there are only spike-holes; but on the west side, or front, are sixteen arched stone doors, alternating with fifteen square windows; there are also three towers, two connected with the building, the third, now a little detached, but which probably at first constituted one extremity, as the remaining two towers occupy the centre and the other end of the building. The whole building has been divided into small apartments in two ranges, one over the other, with a staircase in the centre. The lower rooms are about seven feet high; the upper, six and a half; there is a small water-closet in each of the latter, the drain running down through the wall into the sea. The towers have each three rooms, ten feet square, with broad-flagged floors supported without any timbers. The building is surmounted with a battlement, at least on the side next the sea.

This singular erection is termed by the inhabitants the 'new works,' although they have no tradition as to its use, which, however, its construction seems sufficiently to point out. It appears to have been intended for the secure deposit and sale of the goods of some merchants who came from beyond sea. About ten feet from the south tower of this building is a square tower, forty feet by thirty, (we know not whether these are the inside or the outside dimensions, but we believe them to be the latter), consisting of two stories, and called Horn Tower, from the quantity of horns of oxen and deer found about it. It is thought to have been the merchants' dining-hall and kitchen, from the fire-places and other marks about it. There are at Ardglass three castles, called King's Castle, Cowd (or Coud) Castle, and Jordan's Castle. The last, though not so large as King's Castle, is a finer building than any of the rest. In the great rebellion of Tyrone (in the reign of Elizabeth) it was defended by Simon Jordan, the owner, for three years, until the garrison was relieved by the Lord Deputy, Mountjoy.

The parish of Ardglass is in the union (*i.e.* united parishes) of Ballyphilip, in the diocese of Down, and ecclesiastical province of Armagh; but it has been erected into a perpetual curacy, and a new church built. The old church of Ardhol was the parish church, but was desecrated by the dreadful massacre of the whole congregation at the Christmas midnight mass by the sept (clans) of the McCartans. (*Antient and Present State of the County of Down*; Seward's *Topogr. Hibernica*; *Parliamentary Papers*.)

ARDNAMURCHAN. [See ARGYLSHIRE.]

ARDOCH, a village in Scotland, in the district of Strathallan, county of Perth, where there are the remains of a permanent Roman station, supposed to be in the most perfect preservation of any in the island, and the traces of three temporary Roman camps. The station is on the right of the great military road from Stirling through Crieff to the north Highlands, and close upon the little river Knaick or Knaig, a feeder of the Allan, which falls into the Forth.

This station is supposed, by General Roy, to be the Lindum of Richard of Cirencester*; and to have been founded by Agricola in one of his northern campaigns, perhaps in the fourth. It was on a road carried by the Romans from the wall erected by them between the Firths of Forth and Clyde into Strathmore beyond the Tay, and which crosses the river Knaig immediately below the station. The accompanying plan, from General Roy's *Military Antiquities of the Romans in Britain*, will show the great pains taken to strengthen it. Its form, according to the general practice of the Romans, is rectangular; its dimensions are about 500 feet by 430 within the entrenchments; and its four sides nearly face the four cardinal points. On the north and east sides, where the works are most perfect, there are five ditches and six ramparts. From the nature of the ground the direction of the outer rampart varies, but the aggregate breadth of the works on the east side, where intersected by the line A B, is about 180 feet, and that of the works on the north side, where intersected by the line C D, is more than 270 feet. The prætorium, or general's quarter, is near the centre, but not in it; it is a rectangle, and almost a square, having its greater side about 70 feet, but its sides are not parallel to those of the station. On the south side of the latter the works have been much defaced by the process of cultivation, and

* A monk of Westminster, author of a History and Map of Roman Britain, written about A. D. 1294. Also MS. of a history of the same island, in the same library.

Plan and Sections of the Roman Station Lindum, at Ardoch, in Strathallan.

on the west by the modern military road from Stirling towards Inverness. Three of the gates remain. The entrance at the prætorian gate crosses the entrenchments, not at right angles, but obliquely. There is a road out of the camp on the south side; but whether it coincides with the remaining (*decuman*) gate is not clear from the plans. The Roman stations and camps had usually four gates: the Prætorian, in front of the prætorium or general's quarters; the Decuman, at the back of the same; and the right and left principal gates. From an inscription on a sepulchral stone dug up at this place, it appears that a body of Spanish auxiliary troops lay in garrison here.

The west side of the camp is protected by the river Knaig, the banks of which, as the section shows, are very steep. The level of the camp is sixty feet above the river. The prætorium, which has from time immemorial been called Chapel Hill, has been at some time enclosed with a stone wall, and has the foundations of a house ten yards by seven. The whole station has been of late years enclosed with a high stone wall in order to preserve it.

There is said to be on one side of the prætorium a subterraneous passage, supposed to extend under the bed of the

river, but the entrance having been closed about 1720, to prevent hares, when pursued, from taking refuge there, it is not known where the passage is. Search has been made for it, but in vain. Previous to its being closed, a man who had been condemned in the baron court of some neighbouring lord, consented, upon condition of pardon, to explore it; but after bringing out some Roman spears, helmets, and bits of bridles and other things, he descended again and was killed by the foul air. The articles brought out were carried off by the duke of Argyle's soldiers after the battle of Sheriffmuir in 1715, and were never recovered.

The camps are a little way north of the station on the way to Crieff, and are of different magnitudes. The largest of them has a mean length of 2800 feet, and a mean breadth of 1950, and was calculated to hold between 25,000 and 26,000 men. The military road enters the camp by the south gate, and has levelled half of the small work which covered it, leaving the other half of it standing. On the east rampart of this camp is a small redoubt, on a gentle eminence; the only thing of the kind in the temporary camps of Agricola in these parts. The area of this camp is marshy, and some parts of it appear to have been always so.

The second camp is smaller, and its ramparts obliquely intersect those of the last. The north end and part of the east and west sides remain entire. Its length is 1910 feet, and its breadth 1310, and it would contain about 14,000 men, according to the Roman method of encamping. The area is drier than that of the great camp. These camps Roy supposes to have been formed and occupied by Agricola in his sixth campaign; the smaller one after the larger, when he had divided his forces. The part of the rampart of the first included within the second was not levelled. The lower parts of both, where they approach the river Knaig, are now demolished.

The third camp is immediately adjacent to the station, and was probably an addition to it. Its mean length is 1060 feet, and its mean breadth 900, so that it would contain about 4000 men. It was stronger than the great camp, and was formed subsequently to it, the works of the great camp having been defaced by its rampart, and the part included within it has been levelled either by the Romans or others since their time.

In this part of Scotland are the remains of two other Roman stations, but neither of them are so perfect as that at Ardoch. One of them, at Strageath or Strathgeth, on the river Earn, about six miles and a half N.N.E. of Ardoch, is thought to be the *Hierna* of Richard of Cirencester; and between this and Ardoch, about two miles and a half from the latter, is a small post called Kair's Castle, supposed to have been a look-out for both stations, the remains of which are very perfect.

The other station, of which only slight vestiges remain, is in the neighbourhood of West Dealgin Ross, near the junction of the rivers Ruagh Huil and Earn, about eight miles and a quarter N.N.W. from Ardoch, and eight and a half W.N.W. from Strageath. Near it are the remains of a small temporary camp, whereof great part of the intrenchments and the four gates (which are covered in a manner singularly curious) remain entire. This station General Roy supposes to be the *Victoria* of Richard of Cirencester, and the camp that of the ninth legion, which was attacked by the Caledonians in the sixth campaign of Agricola. About half a mile S.W. of Ardoch, at the Grinnan Hill of Keir, is a circular Roman work. (Roy's *Military Antiquities of the Romans in North Britain*; Sir John Sinclair's *Statistical Account of Scotland*.)

About a mile west of Ardoch was a cairn of extraordinary dimensions, viz., 182 feet in length, 30 feet in sloping height, and 45 feet in breadth at the base. (Gordon's *Itinerarium Septentrionale*.) The stones have been now mostly carried away to form enclosures for the neighbouring farms; but a large stone coffin, in which was a skeleton seven feet long, has been preserved, together with a few large stones around it. (Sir John Sinclair's *Statistical Account of Scotland*.)

ARDROSSAN, a sea-port and parish in the district of Cunningham, the most northern division of Ayrshire in Scotland. The harbour of Ardrossan was begun in 1806. The port had previously considerable natural advantages, being sheltered by a large island (Horse Island) off the coast. The works were carried on under the auspices of the late earl of Eglinton, who bestowed upon them much trouble and expense. The harbour was to form one outlet of a canal intended to connect the Clyde with this part of the coast, and the projectors seem to have hoped to render Ardrossan the port of Glasgow. The harbour has been for many years in a state to receive shipping, and is considered as one of the safest and most capacious and accessible on the west coast of Scotland. A circular pier of 900 yards* was finished in 1811; but the progress of the wet dock and other works was suspended by Lord Eglinton's death in 1820. The canal (begun in 1807) has never been finished. It has been carried from Glasgow past Paisley to the village of Johnston, a distance of eleven miles, at an expense of 90,000*l*. A rail-road has been commenced from Ardrossan to the canal, which will thus complete the communication, though not in the manner first designed. Baths have been constructed at Ardrossan, which render it somewhat attractive as a watering place.

There are some ruins of an old castle, the remains of which indicate it to have been of considerable extent. It was in a great degree demolished by Cromwell, who used the stones of it for the erection of the fort of Ayr.

The parish has a medium length of six miles. Its greatest breadth is about five miles, and its least not more than three. The kirk is close to the town of Saltcoats, part of which is in this parish. [See SALTCOATS.] The population in 1831 was 3494. Ardrossan is in the presbytery of Irvine, and the synod of Glasgow and Ayr. It gives the title of baron to the family of Montgomery, earls of Eglinton. (Sinclair's *Statistical Account of Scotland*, &c.)

ARDSTRAW, an extensive parish in Ireland, in the county of Tyrone. [See NEWTON STEWART.]

ARE, the modern French measure of surface, forming part of the new decimal system adopted in that country after the revolution: it is obtained as follows:—the metre or measure of length, being the forty-millionth part of the whole meridian, as determined by the survey, is 32809167 English feet; and the *are* is a square, the side of which is 10 metres long. The following denominations are also used:—

Decare	is	10 ares.
Hectare	"	100 "
Chilare	"	1000 "
Myriare	"	10,000 "
Déciare	"	$\frac{1}{10}$ of an are.
Centiare	"	$\frac{1}{100}$ "
Milliare	"	$\frac{1}{1000}$ "
The are is		100 square metres,
or		947.8175 French sq. feet,
or		1076.4141 English sq. feet.

The hectare is generally used in describing a quantity of land. It is 2.4711695 English acres, or 10.43 hectares make 1000 acres, which disagrees with the first result by less than 1 part out of 50,000.

AREA. This term is a Latin word, and means the same thing as *superficies* or *quantity of surface*, but is applied exclusively to plane figures. Thus we say, 'the *surface* of a sphere, the *area* of a triangle,' and 'the *surface* of a cube is six times the *area* of one of its faces.' The word is also applied to signify any large open space, or the ground upon which a building is erected; whence, in modern built houses, the portion of the site which is not built upon is commonly called the *area*.

Returning to the mathematical meaning of the term, the measuring unit of every area is the square described upon the measuring unit of length: thus, we talk of the square inches, square feet, square yards, or square miles, which an area contains. And two figures which are *similar*, as it is called in geometry, that is, which are perfect copies one of the other on different scales, have their areas proportional to the *squares* of their linear dimensions. That is, suppose a plan of the front of a house to be drawn so that a length of 500 feet would be represented in the picture by one of 3 feet. Then the area in the real front is to the area of the front in the picture in the proportion of 500 times 500 to 3 times 3, or of 250,000 to 9. Similarly, if the real height were 20 times as great as the height in the picture, or in the proportion of 20 to 1, the real area would be to that of the picture as 20 times 20 to once one, or as 400 to 1, that is, the first would be 400 times as great as the second.

Any figure which is entirely bounded by straight lines may be divided into triangles, as in the adjoining diagram.

The area of every triangle may be measured separately by either of the following rules; in which the word in italics may mean inches, yards, miles, or any other unit, provided only that it stands for the same throughout. 1. Measure a side, *AB*, of the triangle *ABC*, and the perpendicular *CD* which is let fall upon it from the opposite vertex, both in *units*. Half the product of *AB* and *CD* is the number of square *units* in the triangle *ABC*. Thus, if *AB* be 30 yards, and *CD* 16 yards, the triangle contains 240 square yards. 2. Measure the three sides, *AC*, *CB*, *BA*, in *units*; take the half sum of the three, from it subtract each of the sides, multiply the four results together, and extract the square

* This is the statement in the *Ency. Britannica*, last edition; but we suspect some error. Two statements of the plans of Mr. Telford, the engineer, give 600 yards as the intended length of this pier.

root of the product; this gives the number of square units in the triangle. For instance, let the three sides be 5, 6, and 7 inches; the half sum is 9: which, diminished by the three sides respectively, gives 4, 3, and 2: 9, 4, 3, 2, multiplied together, give 216, the square root of which is 14.7, 14 $\frac{7}{10}$ very nearly. The triangle, therefore, contains about 14 $\frac{7}{10}$ square inches.

The following rules may be applied in the following cases—for a parallelogram, multiply AB , a side, by CD , its perpendicular distance from the opposite side—for a rectangle, multiply together adjoining sides, PQ and PR —for a four-sided figure, in which RT and SV are parallel, but TV and RS converge; multiply RS , one of the converging sides, by YZ , its perpendicular distance from the middle point of the other. When RT and SV are perpendicular to RS , then YZ is half the sum of RT and SV .

To find the area of a circle, multiply the radius OA by itself and the result by 355; then divide by 113. To find the area of the sector $OADB$, see *ANGLE*. To find the area of the portion ABD , find those of the sector $OADB$, and the triangle OAB separately, and subtract the second from the first.

In all these cases, the result is in

the square units corresponding to the linear units in which the measurements were made.

The area of a curvilinear figure can only be strictly found by mathematical processes too difficult to be here described, but the following method will give an idea of the principles

employed. Let $ACDB$ be a curvilinear figure bounded by the curve CD and the lines CA , AB , BD , of which the first and third are perpendicular to the second. Divide AB into any number of equal parts (eight is here supposed) by the points 1, 2, 3, &c. and construct the accompanying obvious figure by making Ap , $1q$, &c. parallelograms. It is plain that the area sought, $ACDB$, is

greater than the sum of the inscribed rectangles, denoted by the letters or numbers at opposite corners,

$1C$, $2p$, $3q$, $4r$, $5s$, $6t$, $7u$, Bv ;

and that it is less than the sum of the circumscribing rectangles

Ap , $1q$, $2r$, $3s$, $4t$, $5u$, $6v$, $7D$.

Therefore the area sought does not differ from either of these sums by so much as they differ from one another; but the sums differ from one another by the sum of the rectangles

Cp , pq , qr , rs , st , tu , uv , vD ,

which, placed under one another, give the rectangle DE , which is less than $D7$: consequently neither sum differs from the area sought by so much as $D7$. But by carrying the division of AB , with which we set out, to a sufficient degree, the area of $D7$ might have been reduced to any extent which might have been thought necessary; that is, name any fraction of a square inch, however small, and AB can be divided into such a number of equal parts that $D7$ shall be smaller than that fraction of a square inch. Hence the sum of the inscribed or circumscribed parallelograms may, by dividing the line AB sufficiently, be made as nearly equal to the area as any practical purpose can require.

The accuracy of the preceding process will be increased by summing, not the parallelograms, but the figures

$ACp1$, $1pq2$, $2qr3$, &c.

considering Cp , pq , qr , &c. as straight lines. This will be equivalent to adding half the rectangle, DE , to the sum of the rectangles aforesaid. The practical rule is:—Add all the intermediate ordinates, $1p$, $2q$, &c. to the half sum of the extreme ordinates AC and BD : multiply the total by the common value of $A1$, or 12 , &c. This approximation is the first step of the method of *QUADRATURES*, which see.

The mathematical process of finding the area carries the preceding approximation one step further, and finds what is the limit to which the sum of the inscribed parallelograms approaches nearer and nearer, as the number of divisions of AB is increased. This limit, it is easy to show, is an exact expression for the area required. If x represent one of the lines $A1$, $A2$, &c., and y the corresponding line $1p$, $2q$, &c., the area of the curve is found by the process of the integral calculus thus represented:

$$\int y dx$$

or, in the language of fluxions,

fluent of $y \dot{x}$

A process similar to the preceding is employed by surveyors in measuring a field whose boundaries are curvilinear. [See *SURVEYING*, *OFFSET*.]

The investigation of the area of a curve was formerly called the *quadrature* of the curve (*quadratum*, a square), because, before the application of arithmetic to geometry, the most convenient method of representing an area was by giving the square to which it is equal.

For some practical purposes the following experimental method of finding the above area might suffice. Cut out the figure $ABCD$ in pasteboard (heavy wood or metal would be better). Out of the same pasteboard cut a square inch or other unit; and weigh both the pieces thus cut out accurately. Then the weight of the first piece divided by that of the second will give the number of square units in the area required, if the pasteboard, or other material, be of Archimedes (see his *Life*) might easily be devised.

ARECA, a genus of palms containing two species, both remarkable for the purposes to which they are applied. Botanically, areca is distinguished by a double membranous sheath in which its bunches of flowers are contained, by its female corollas containing the rudiments of stamens, its calyx being divided into three parts or leaves, and its fruit

[*Areca catechu*]

being a berry or drupe, with a fibrous rind inclosing one seed only. The leaves of all the species are pinnated, with their stalks rolled up cylindrically at the base.

Areca catechu is described by Dr. Roxburgh as being the most beautiful palm in India, with a remarkably straight trunk, often from forty to fifty feet high, and in general about twenty inches in circumference, equally thick in every part, and smooth. The leaflets are from three to three feet and a half long, and widest at the point, where they also are ragged. It is cultivated all over India for the sake of its nuts, which are about the size of a hen's egg, of a reddish-yellow when ripe, and with a firm fibrous rind about half an inch thick. It is this nut, which, under the name of pinang or betel nut, is so universally chewed in the East Indies. It has an austere and astringent flavour, and is not eatable alone; but mixed with lime, which no doubt destroys its acidity, and with the leaf of the betel pepper, it becomes milder and pleasant. The mixture is, however, after all, so hot and acrid as to be unfit for the use of any but persons accustomed to it: it is said to be aromatic and stomachic, and also to produce intoxication in beginners, but it is very doubtful whether all these qualities are not rather to be ascribed to the betel pepper leaf than to the nut of the palm. It, or rather the mixture of the three substances, stains the saliva and teeth of a deep red colour. It is to the stems of *Areca catechu* that the common black pepper vine is usually trained on the coast of Malabar. (Roxb.) The astringent substance called catechu was once supposed to be produced by it, but this was an error, as has been already explained. [See ACACIA CATECHU.]

Areca cleracea, or the cabbage palm, is the only other species that it is necessary for us to notice. This plant must be familiar to most persons in consequence of the allusions to it in the tale of *Paul and Virginia*, and from the often repeated fact that a tree of the growth of half a century is sometimes cut down for the sake of the single bud which terminates it, and which is called the cabbage.

The species is found in great abundance in the mountainous parts of Jamaica and other West India islands, growing to the height of from one to two hundred feet, with a trunk not more than six or seven inches in diameter. This gives it an extremely graceful appearance, especially as the leaves grow from the top only, in a kind of tuft or plume, to the length of fifteen feet; these leaves are divided in a pinnated manner, and their divisions are deep green, and several feet long. The unexpanded leaves are arranged so closely one over the other as to obstruct all access of light, which causes them to be of a very tender and delicate nature. It is this which forms the cabbage, which is considered a great delicacy, either raw or boiled. The nuts, which are about the size of a filbert and covered with a yellowish skin, are produced in great abundance upon a very long and branched spadix: the kernel is white and sweet.

Independently of the use of this palm as an article of food, its trunk when felled and exposed to the air quickly rots in the centre, and becomes a natural hollow cylinder, which, on account of the hardness of its outside, forms a very durable water-pipe, often as much as a hundred feet long, and is said to become, when buried, almost as hard as iron. (See Sloane's *Jamaica*, vol. ii. p. 116.)

AREMBERG is a considerable duchy close upon the Dutch frontier: it consists of the sovereignty of Meppen, which formerly belonged to the Westphalian bishopric of Münster, but is at present within the Hanoverian dominions; of Recklinghausen; of another sovereign domain in the circle of Münster, within the Westphalian dominions of Prussia; and of extensive possessions in the Netherlands. The ancestors of the present duke were created counts of the Roman empire in 1549; they were advanced to the rank of princes in 1576; and were ultimately created sovereign-dukes by the emperor Ferdinand III. in 1644. As a compensation for the loss of a considerable part of the duchy on the Upper Rhine and in the Netherlands under the stipulations of the treaty of Lunéville, the then duke received Meppen and Recklinghausen, which are six times greater in extent, and produce double the revenue of the lost territory. The dukes of Arenberg, besides being grandees of Spain of the first class, are subject to the crown of Prussia as holding Recklinghausen, and to the Hanoverian crown as holders of Meppen. The late duke was created duke of Arenberg-Meppen by George IV. in 1826. His ancestor, Prince Leopold, who died in 1754, was a Field-Marshal in the Austrian service, and took a distinguished part in the

Italian and German campaigns, which arose out of the contest for the succession to the empire, in the days of the empress Maria Theresa.

The present extent of this duchy, independently of the Belgian domains, is 920 geographical square miles; the amount of its German population above 85,000; and the yearly income from its possessions both in Germany and Belgium is estimated at nearly 70,000*l*. Meppen, which fell to the house of Arenberg in 1803, and became part of the French empire in 1810, being afterwards made over to Prussia, was relinquished by that power in favour of the king of Hanover in 1815, when it was erected into a duchy, with a seat in the Upper Chamber of the Hanoverian states. The 690 miles over which it spreads are the most cheerless, sterile tract in the whole kingdom; in fact, it is an extensive plain, in which heath alternates with morass; the inhabited parts exhibit the appearance of so many islands, and are almost as inaccessible as the Oases in the African desert. The heart of the land, which is denominated the 'Humling,' is an immense moor of sand, above twenty miles in circumference, the whole surface of which presents a wide covert of heath, interspersed with sandstones, and surrounded at every point by impenetrable morasses. This inhospitable region is traversed by the Ems in the west, and the Hase, which flows into the former, in the south; it is also watered by the north and south Ratte, the first running into the Ems, and the second into the Hase. Its climate is temperate, but moist, gloomy, and variable. The districts where rye and buckwheat are grown do not produce enough by one-half for the wants of the inhabitants; the growth of flax also is much less than adequate to their consumption; but the principal and the richest source of profit is the breeding of horned-cattle, sheep, and bees. Wood or charcoal is unknown to them; but they have turf in sufficient quantity both for fuel and as an article of exportation. There is scarcely a mechanic among them, unless the domestic weaver and knitter deserve the name; for their shirts, stockings, and garments are all made at home. In short, Meppen is so poor that the greater part of the inhabitants make their way into Holland for the sake of finding better bread in the summer season, and returning home with the surplus produce of their labour before winter sets in. The present number of its inhabitants, who are wholly Catholics, is about 43,000; and its revenue amounts to between 26,000*l*. and 27,000*l*. a-year. The chief town, which lies at the confluence of the Hase and Ems, and 10 or 11 miles north of Lingen, in the bailiwick of Osnaburg, bears the same name as the duchy; it has a gymnasium or grammar-school, soap and sucery manufactures, two churches, a hospital, bleaching-grounds, and some external trade. Its population is 2300: 52° 41' N. lat., 7° 17' E. long. Haselüne, on the Hase, is the seat of the ducal court of justice, and manufactures agricultural implements; it has a convent, and about 1700 inhabitants.

The earldom of Rocklinghausen, which constitutes the remaining portion of the duchy of Arenberg, so far as respects Germany, belonged to the electorate of Cologne until the year 1803, formed part of the grand-duchy of Berg in 1811, and was transferred to the Prussian crown in 1815. It is situated in the circle of Münster, in the Prussian province of Westphalia, and is bounded on the south by the circle of Arnsberg and Düsseldorf, and on the west by Cleves. Its superficial extent is 294 square miles, and the number of its inhabitants at the close of the year 1831 was 42,214. The face of the country is a plain, intersected with gentle eminences; the Lippe traverses it, and its western districts are watered by the Emster. The soil is strong and fertile; the people depend chiefly upon agriculture and the breeding of cattle, though they are also employed very generally in making yarn and linen. It produces iron, freestone, turf, and coals. The inhabitants are all of the Catholic faith, and divided into seventeen parishes. The revenue which the duke of Arenberg derives from it is computed at nearly 16,000*l*. Recklinghausen, the chief town, which lies at the foot of the Hard, the highest spot in the earldom, is about 50 miles N.E. of Cologne, on the Lippe. It has a ducal residence, two churches, an asylum for females of noble birth, some linen manufactures, and a steel-work; and, in 1831, had a population of 2466 souls; 51° 57' N. lat., 7° 12' E. long. The other towns of note in this earldom are Dorsten, population 2295; and Boer, which, with its dependencies, contains above 4000 inhabitants. The latter

includes the iron-works of St. Antonie, which are among the most considerable in Westphalia, and have sometimes produced 600 tons per annum.

ARENARIUS, literally, *relating to the sands*, a work of Archimedes. [See **ARCHIMIDES**.]

ARENG is the botanical name of one of the palms that produce sago, and from which palm-wine is obtained. The only species, *Areng saccharifera*, is described as a plant of an ugly appearance, having a trunk twenty or thirty feet high, covered almost entirely with coarse black fibres, resembling horse-hair. The leaves are from fifteen to twenty-

[*Areng saccharifera*.]

five feet long, and pinnated; their leaflets, which are from three to five feet long, widen gradually to the point, where they are ragged and prickly, in consequence of the projection of their hard veins beyond the margin; above they are of a deep shining green, but on their under surface they are firmly coated with ash-coloured mealy matter. The stalks of these leaves have intermixed with their coarse hair stiff bristles as thick as porcupine's quills. Each bunch of flowers is from six to ten feet long, and, when covered with fruit, is as much as a man can carry. The berries are of a yellowish brown colour, about the size of a medlar, and extremely acid; each contains three seeds.

This palm is found in all the islands of the Indian Archipelago, in moist and shady ravines through which rivulets find a course; it is much used for the sake of its sap, which flows in great abundance from the wounded branches of the inflorescence about the time when the fruit is forming. A bamboo bottle is tied to the extremity of an amputated branch, and removed twice a day, morning and evening. A single tree will yield a large quantity of this fluid, which, when first drawn from the tree, is transparent, with the taste and colour of new wine: after a short time it becomes turbid and milky, and acquires a slight degree of acidity. When fit for drinking it is of a yellowish colour, with a powerful odour and a good deal of astringency; strangers do not, for some time, become accustomed to it. It is exceedingly intoxicating; but, if drunk in moderation, is said to be stomachic and wholesome.

Besides yielding wine, the coarse fibres of the stem and leaf-stalks are manufactured into powerful cables, and the trunk contains a great quantity of a nutritious meal like sago; Dr. Roxburgh mentions that 150 lbs. of that substance were obtained from one tree felled in the botanic garden at Calcutta. (See Roxburgh's *Flora Indica*, vol. iii. p. 627; and Rumphius' *Herbarium Amboinense*, vol. i. The former calls this palm *Saguerus Rumphii*.)

ARENSBURG, the capital of a circle in the large island of Oesel, or, as the natives call it, *Kure-Saar* or *Saare-Ma*, at the entrance of the Gulf of Riga, and within the limits of the Russian government of Livonia, is situated in about

51° 24' N. lat., and 8° 1' E. long. It lies on the Peddus, a small river on the S.E. side of the island, and has a harbour, too shallow for loaded vessels of any size, which are therefore compelled to anchor about five miles below the town. Its present site was formerly the abode of a colony of pagans from Esthonia. Valdemar, the Danish sovereign, built a fort of wood on the spot in 1205, but this fort having been destroyed by fire, another was rebuilt in 1221, at the time when Arensburg was erected into the seat of a bishopric; and it was converted into a regular and strongly-fortified castle by Hermann, bishop of Osnaburg, in 1331. Charles XII. afterwards added greatly to its strength and embellishment; but part of the works were destroyed in the course of the operations which preceded its capture by the Russians in September, 1710. It is a fine specimen of solid masonry, and constructed in a style of magnificence which reflects credit on the memory of its founder, and the talent of the age in which he lived. The town itself contains a Russian and a Lutheran church, a town-hall, public school, and hospital, and about 1400 inhabitants, nearly the whole of whom are Germans. They load twenty vessels a year with the produce of their industry and fisheries. Two fairs are annually held in the town.

AREOPAGUS, or more correctly **AREIOPAGUS**, the Hill of Ares, is an eminence at a short distance west of the Athenian Acropolis. It was here that Xerxes posted his troops for the attack of that fortress (Herod. viii. 52). The circumstances which connected the place with the God are variously told. It was the hill of Ares, according to some, because the Amazons, who in their invasion of Attica pitched their camp on it, were descendants of Ares, or rather, according to Æschylus (*Eumen.* v. 692, ed. Stan.), because they performed sacrifice to the God in that place; according to others, because Ares himself was there tried for adultery; or lastly, to follow the more popular story (Paus. i. 2, 8), because it was on this hill that the God was brought to trial by Poseidon (Neptune) for the murder of his son Halirrothius. In short, the place was called Areopagus, and, in process of time, these legends were invented or employed to supply the want of further information.

AREOPAGUS, COUNCIL OF, a celebrated council, so called from the hill of that name, on which its sessions were held. It was also called the council above (*ἡ ἀνω βουλὴ*), to distinguish it from the council of five hundred, whose place of meeting was in a lower part of the city, known by the name of the Ceramicus (Paus. i. 3, 4). Its high antiquity may be inferred from the well-known legends respecting the causes brought before it in the mythical age of Greece, among which that of Orestes, who was tried for the murder of his mother, has obtained especial celebrity (Æschyl. *Eumen.*); but its authentic history commences with the age of Solon. There is, indeed, as early as the first Messenian war, something like historical notice of its great fame, in the shape of a tradition preserved by Pausanias (iv. 51), that the Messenians were willing to commit the decision of a dispute between them and the Lacedæmonians, involving a case of murder, to this council of Areopagus. We are told that it was not mentioned by name in the laws of Dracon, though its existence in his time, as a court of justice, can be distinctly proved (Plut. *Vit. Sol.* c. 19). It seems that the name of the Areopagus was lost in that of the Ephetae, who were then the appointed judges of all cases of homicide, as well in the court of Areopagus, as in the other criminal courts. (See Müller, *History of the Dorians*, vol. i. p. 352, English translation.) Solon, however, so completely reformed its constitution, that he received from many, or, as Plutarch says, from most authors, the title of its founder. It is, therefore, of the council of Areopagus, as constituted by Solon, that we shall first speak; and the subject possesses some interest from the light which it throws on the views and character of Solon as a legislator. It was composed of the archons of the year (see **ARCHON**), and of those who had borne the office of archon. The latter became members for life; but before their admission, they were subjected, at the expiration of their annual magistracy, to a rigid scrutiny (*dokimasia*) into their conduct in office, and their morals in private life. Proof of criminal or unbecoming conduct was sufficient to exclude them in the first instance, and to expel them after admission. Various accounts are given of the number to which the Areopagites were limited. If there was any fixed number, it is plain that admission to the council was not a necessary consequence of honourable discharge from the

dokimasia. But it is more probable that the accounts which limit the number are applicable only to an earlier period of its existence. (See the anonymous argument to the oration of Demosthenes against Androtion.) It may be proper to observe, that modern histories of this council do not commonly give the actual archons a seat in it. They are, however, placed there by Lysias the orator (*Areop.* p. 110, 16-20), and there is no reason to think that in this respect any change had been made in its constitution after the time of Solon. To the council thus constituted Solon entrusted a mixed jurisdiction and authority of great extent, judicial, political, and censorial. As a court of justice, it had direct cognizance of the more serious crimes, such as murder and arson. It exercised a certain control over the ordinary courts, and was the guardian generally of the laws and religion. It interfered, at least on some occasions, with the immediate administration of the government, and at all times inspected the conduct of the public functionaries. But, in the exercise of its duties as public censor for the preservation of order and decency, it was armed with inquisitorial powers to an almost unlimited extent.

It should be observed, that in the time of Solon, and by his regulations, the archons were chosen from the highest of the four classes into which he had divided the citizens. Of the archons so chosen, the council of Areopagus was formed. Here, then, was a permanent body, which possessed a great and general control over the state, composed necessarily of men of the highest rank, and doubtless in considerable proportion of eupatridæ, or nobles by blood. The strength of the democracy lay in the *ecclesia* or popular assembly, and in the ordinary courts of justice, of which the *dikasts*, or jurors, were taken indiscriminately from the general body of the citizens; and the council of Areopagus exercised authority directly or indirectly over both. The tendency of this institution to be a check on the popular part of that mixed government given by Solon to the Athenians, is noticed by Aristotle (*Polit.* ii. 9, and v. 3, ed. Schneid.) He speaks, indeed, of the council as being one of those institutions which Solon found and suffered to remain; but he can hardly mean to deny what all authority proves, that in the shape in which it existed from the time of the legislator, it was his institution.

The council, from its restoration by Solon to the time of Pericles, seems to have remained untouched by any direct interference with its constitution. But during that interval two important changes were introduced in the general constitution of the state, which must have had some influence on the composition of the council, though we may not be able to trace their effects. The election of the chief magistrates by suffrage was exchanged for appointment by lot, and the highest offices of state were thrown open to the whole body of the people (see ARCHON). But about the year B.C. 459, Pericles attacked the council itself, which never recovered from the blow which he inflicted upon it. All ancient authors agree in saying that a man called Ephialtes was his instrument in proposing the law by which his purpose was effected, but unfortunately we have no detailed account of his proceedings. Aristotle and Diodorus state generally that he abridged the authority of the council, and broke its power (Aristot. *Polit.* ii. 9; Diodor. Sic. xi. 77). Plutarch, who has told us more than others (*Vit. Cim.* c. 15; *Vit. Pericl.* c. 7), says only that he removed from its cognizance the greater part of those causes which had previously come before it in its judicial character, and that, by transferring the control over the ordinary courts of law immediately to the people, he subjected the state to an un-mixed democracy. Little more than this can now be told, save from conjecture, in which modern compilers have rather liberally indulged. Among the causes withdrawn from its cognizance, those of murder (*ποικιλὸν δίκαι*) were not included; for Demosthenes has assured us (*Contr. Aristocr.* p. 641-2), that none of the many revolutions which had occurred before his day had ventured to touch this part of its criminal jurisdiction. There is no reason to believe that it ever possessed, in matters of religion, such extensive authority as some have attributed to it, and there is at least no evidence that it lost at this time any portion of that which it had previously exercised. Lysias observes (*Areop.* p. 110, 46), that it was in his time charged especially with the preservation of the sacred olive-trees; and we are told elsewhere that it was the scourge of impiety. It possessed, also, long after the time of Pericles, in some measure at

least, the powers of the censorship. (Athenæus 4, 64, ed. Dindorf.)

Pericles was struggling for power by the favour of the people, and it was his policy to relieve the democracy from the pressure of an adverse influence. By increasing the business of the popular courts, he at once conciliated his friends, and strengthened their hands. The council possessed originally some authority in matters of finance, and the appropriation of the revenue; though Mr. Mitford and others, in saying that it controlled all issues from the public treasury, say perhaps more than they can prove. In later times, the popular assembly reserved the full control of the revenue exclusively to itself, and the administration of it was committed to the popular council, the senate of five hundred. It seems that, at first, the Areopagites were invested with an irresponsible authority. Afterwards they were obliged, with all other public functionaries, to render an account of their administration to the people (*Æsch. Contr. Ctes.* p. 56, 30). Both these changes may, with some probability, be attributed to Pericles. After all, the council was allowed to retain a large portion of its former dignity and very extensive powers. The change operated by Pericles seems to have consisted principally in this: that, from having exercised independent and paramount authority, it was made subordinate to the *ecclesia*. The power which it continued to possess was delegated by the people, but it was bestowed in ample measure. Whatever may have been the effect of this change on the fortunes of the republic, it is probable that too much importance has been commonly attached to the agency of Pericles. He seems only to have accelerated what the irresistible course of things must soon have accomplished. It may be true that the unsteady course of the popular assembly required some check, which the democracy in its unmitigated form could not supply, but the existence of an independent body in the state, such as the council of Areopagus as constituted by Solon, seems hardly to be consistent with the secure enjoyment of popular rights and public liberty; which the Athenian people, by their naval services in the Persian war, and the consequences of their success, had earned the right to possess, and the power to obtain. It ought not, however, to be concluded, that institutions unsuitable to an altered state of things were unskillfully framed by Solon, or that he surrounded the infancy of a free constitution with more restrictions than were necessary for its security. He may still deserve the reputation which he has gained of having laid the foundation of popular government at Athens.

With respect to the censorship, we can show, by a few instances of the mode in which it acted, that it could have been effectually operative only in a state of society from which the Athenians were fast emerging before the time of Pericles. The Areopagites paid domiciliary visits, for the purpose of checking extravagant housekeeping (Athenæus 6, 46). They called on any citizen at their discretion to account for the employment of his time (Plut. *Vit. Sol.* c. 23). They summoned before their awful tribunal a little boy for the offence of poking out the eyes of a quail (Quintil. 5, 9, 13). They fixed a mark of disgrace on a man who had dined in a tavern (Athenæus 13, 21). Athens, in the prosperity which she enjoyed during the last fifty years before the Peloponnesian war, might have tolerated the existence, but certainly not the general activity, of such an inquisition.

It appears from the language of contemporary writers, that, while there were any remains of public spirit and virtue in Athens, the council was regarded with respect, appealed to with deference, and employed on the most important occasions (Lys. *Contr. Theomnest.*, p. 117, 12; *De Evand.*, p. 176, 17; *Andoc.*, p. 11, 32; *Dem. Contr. Aristocr.*, p. 641-2). In the time of Isocrates, when the *dokimasia* had ceased, or become a dead letter, and profligacy of life was no bar to admission into the council, its moral influence was still such as to be an effectual restraint on the conduct of its own members (Isocr. *Areop.*, p. 147). In the corruption of manners and utter degradation of character which prevailed at Athens, after it fell under the domination of Macedonia, we are not surprised to find that the council partook of the character of the times, and that an Areopagite might be a mark for the finger of scorn (Athenæus 4, 64). Under the Romans it retained at least some formal authority, and Cicero applied for and obtained a decree of the council, requesting Cræpus, the philosopher, to sojourn at Athens, and instruct the youth (Plut. *Vit.*

Cic., c. 24). It long after remained in existence, somewhat superior in dignity, and perhaps equal in power, to a modern court of aldermen in a municipal corporation. The old qualifications for admission were neglected in the days of its degeneracy, nor is it easy to say what were substituted for them. Later times find even a stranger to Athens among the Areopagites.

We shall conclude this article with a few words on the forms observed by the council in its proceedings as a court of justice in criminal cases. The court was held in an uninclosed space on the Areopagus, and in the open air; which custom, indeed, it had in common with all other courts in cases of murder, if we may trust the oration (*De Cæde Herodis*, p. 130) attributed to Antiphon. The Areopagites were in later times, according to Vitruvius, accommodated with the shelter of a roof. The prosecutor and defendant stood on two separate rude blocks of stone (Paus. 1, 28), and, before the pleadings commenced, were required each to take an oath with circumstances of peculiar solemnity; the former, that he charged the accused party justly; the defendant, that he was innocent of the charge. At a certain stage of the proceedings, the latter was allowed to withdraw his plea, with the penalty of banishment from his country (Dem. *Contr. Aristocr.*, p. 642-3). In their speeches both parties were restricted to a simple statement, and dry argument on the merits of the case, to the exclusion of all irrelevant matter, and of those various contrivances known under the general name of *paraskeue* (*παράσκευη*), to affect the passions of the judges, so shamelessly allowed and practised in the other courts (Or. Lyeurg., p. 149, 12-25; Lucian. *Gymn.*, c. 19). Of the existence of the rule in question in this court, we have a remarkable proof in an apology of Lysias for an artful violation of it in his Areopagitic oration (p. 112, 5). Advocates were allowed, at least in later times, to both parties. Many commentators on the New Testament have placed St. Paul as a defendant at the bar of the Areopagus, on the strength of a passage in the Acts of the Apostles (xvii. 19). The apostle was indeed taken by the inquisitive Athenians to the hill, and there required to expound and defend his new doctrines for the entertainment of his auditors; but, in the narrative of Luke, there is no hint of an arraignment and trial.

Some of our readers may perhaps be surprised that we have made no mention of a practice so often quoted as peculiar to the Areopagites, that of holding their sessions in the darkness of night. The truth is, that we are not persuaded of the fact. It is, indeed, noticed more than once by Lucian, and perhaps by some other of the later writers; but it is not supported, we believe, by any sufficient authority, whilst there is strong presumptive evidence against the common opinion. It was, as it should seem, no unusual pastime with the Athenians to attend the trials on the Areopagus as spectators (Lys. *Contr. Theomn.*, p. 117, 10). We suspect that few of this light-hearted people would have gone at an unseasonable hour in the dark to hear such speeches as were there delivered, and see nothing. Perhaps there may be no better foundation for the story, than there is for the notion, till lately so generally entertained, that the same gloomy custom was in favour with the celebrated Yehmic tribunal of Westphalia.

AREQUIPA, a department of the republic of Peru, bordered to the north by that of Lima. It is 185 leagues long, and 30 wide; the temperature is mild, and the soil fertile; the aspect of the country is that of a perpetual spring. It is watered by the Lona, the Arequipa, the Tambo, and the Chile, and has a considerable commerce in wine with the adjacent provinces; cochineal is also produced, and there are gold and silver mines, particularly those of Calloma. It has excellent pastures for vast herds of cattle, and produces wheat, maize, and sugar. It is backed by the Andes, offsets from which come down to the sea coast, and form a succession of delightful valleys.

AREQUIPA, one of the largest and finest cities of Peru, second only to Lima, is situated in the beautiful valley of Quilca, about thirty-five miles from the coast. It was originally founded by Francisco Pizarro in 1539, but not on its present site; its inland situation having secured it from the attacks of pirates who infested the coast, it has continued in a flourishing condition, though repeatedly desolated by earthquakes. Its inhabitants have acted altogether on a different system from the people in most other parts of this country, who build slightly, that there may be the less danger in the overthrow of their edifices, and less ex-

pense in restoring them. On the other hand, the houses of Arequipa are built of stone, very substantial, low, and vaulted, with the view of their being able to withstand the shock. The town is populous, the inhabitants being estimated at 40,000; it is a bishop's see, with a cathedral, under the archbishopric of Lima, is divided into three parishes, has two Franciscan convents, one Dominican, and one Augustine, a college of Jesuits, and a hospital of S. Juan de Dios. A handsome bridge is thrown over the Chile, which runs through the city, and, being let off in sluices, irrigates the country; it is also conducted through the streets by canals, which contribute to cleanliness, and to the health of the inhabitants. An elegant bronze fountain adorns the Plaza, or great square. The climate is delightful; in winter a slight frost is perceptible, and the summer heats are not excessive. Gold and silver, cloths, woollens, and cottons, are manufactured at Arequipa, which carries on a great trade with Buenos Ayres, exporting brandies, wines, flour, cotton, and sugar; and importing cattle, dried flesh, tallow, corn, &c. The great commercial road passes through the city from Lima to the southern provinces. (Ulloa).

Mollendo, the port of Arequipa, consists of about fifty huts built of reed-mats, and covered with flat cane roofs, without windows and chimneys. The whole has the appearance of a wicker-work cage. The anchorage is open, but, like other ports on the coast, is safe, from the general absence of storms. The site of this village was chosen for the advantage of a sandy beach to land on in the balsam. (Hall.)

ARES (*Ἄρης*), the God of War among the Greeks, generally considered as corresponding to the Roman Mars. Homer makes him a native of Thrace, and others consider him the father of several Thracian rivers and races. It is therefore highly probable that he was the god particularly worshipped by some northern people, though nearly all other traces of this circumstance have disappeared. The Scythian deity known to Herodotus as the God of War, whom he calls by the Greek term *Ares* (iv. 62), was worshipped under the form of an iron scimitar, to which horses and other quadrupeds were annually offered; and also every hundredth man of captives taken in war. In the later genealogy of the gods he was considered the son of Jupiter and Juno, and, as such, took part in the war against the giants, and slew Mimas and Pelorus. In the contest with Typhon he fled with the other gods into Egypt, and was changed into a fish. He was not more successful in his engagement with Otus and Ephialtes, the children of Aloeus, by whom he was imprisoned for thirteen months. To a still later period we must refer the murder of Halirrhoetus, and his trial before the court of Areopagus, as well as his combat with Hercules.

It is a curious circumstance that the Greeks, though constantly engaged in war, should have paid little attention to the worship of Ares. There were few temples erected to his honour in Greece. Geronthron, a village of Laconia, had a temple and grove where a yearly festival was celebrated, to which no female was admitted (Paus. iii. 22): there was another on the road from Amyclæ to Therapne in Laconia (iii. 19), and a third at Athens (i. 8). Though, as we have remarked, Ares seems to be a Thracian god, yet the element of the word Ares is an integral part of the Greek language, and the word which denoted best and bravest, *aristos* (*ἄριστος*), is the superlative of *arses*. The Sanscrit *ari*, nom. *aris*, signifies an enemy. In early times human sacrifices were offered to him by the Lacedæmonians, dogs by the Carians, and asses by the Scythians (Apollod. *Fragm.* p. 394, ed. Heyne).

It is difficult to say what distinctive character ancient artists wished to give to this god, because no Greek state honoured him as their principal deity. We have no distinct account of his statues by Alcamenes and Scopas in the temple at Athens, but we can collect, from some that have been preserved, and also from heads of the god on gems, that the following is the general character under which he is represented. The expression is stern and thoughtful; firm nervous muscles, a strong fleshy neck, and short bristly hair; the mouth is small, the lips full, and the eyes deep-set. It is only in later times that he appears with a strong beard as the Roman Marspiter. When not naked, his dress is a chlamys (*sagum*). See a beautiful head on a gem (Millin, *P. Gr.* 20); a standing figure on a basso-relievo (Pio Clem. iv. 7); head on the coins of the Mamertini (Magnani, iv. 31, 32); on the Denarii of Fonteius Capito

(Patin. p. 114). See this subject fully treated by Hirt, *Bildende Kunst*, 1833; Müller, *Archæologie der Kunst*, p. 492. (For the Italian God of War, see MARS.)

ARETEUS, surnamed CAPPADOX, or the CAPPADOCIAN, one of the most valuable medical writers of antiquity, is supposed to have lived in the latter part of the first and the beginning of the second century after Christ. There are no positive accounts as to the time and circumstances of his life: the above supposition, therefore, rests solely on the fact of the medicinal preparations of Andromachus, physician to the Emperor Nero, and the medical dignity of the Archiatri, being mentioned in his works; whilst, on the other hand, the name of Aretæus occurs in the *Euporista* of Dioscorides, which appears to have been written during the reign of Vespasian. Hence it is concluded, that Aretæus wrote shortly after the time of Nero. He takes notice of the wine of Falernum, and other Italian wines, which has led critics to believe that his residence must have been in Italy. The learned have found some difficulty in fixing upon the sect, or school of medicine, to which Aretæus belonged. P. Petit considered him as a follower of the dogmatic sect, who founded their explanations of life and disease on the four elementary qualities. But his frequent allusions to the *pneuma*, or spirit, have led others to regard him as one of the pneumatic school founded by Athenæus, which embraced a considerable proportion of the medical men of eminence at the period when Aretæus is supposed to have lived. It seems to be a peculiar merit of this physician, however, to have remained free from the predominant influence of any one of the prevailing theoretical schools, and to have preserved a praiseworthy independence in the observation and treatment of diseases. Aretæus was an original observer; his writings bear no traces of compilation: and if a part of the information which he affords belongs to the age in which he lived, there is another very considerable part for which we seem to be indebted to his own personal experience.

Aretæus regarded a knowledge of the structure and functions of the body as a necessary step towards the study of disease: his anatomical remarks, however, betray sufficiently the imperfect state of this science in his time. He concurred with the pneumatic physicians and the Stoic philosophers, in believing the heart to be 'the principle of life and strength,' and the seat of the soul. He gave a full account of the distribution of the *vena portarum*, and regarded all veins as having their origin in the liver; he also was aware of the numerous communications which exist in various parts of the venous system, which led him to refute the notion that particular veins in the arm are connected with particular internal organs, and the consequences which were drawn from this notion as to bloodletting. Aretæus looked upon the liver as the organ destined to prepare the blood, and the spleen as fitted to purify that fluid. He regarded both the stomach and colon as organs of digestion, and bestowed much attention on the morbid affections of the latter organ. He knew that the kidneys had a glandular structure. He stated the nerves to be the organs of sensation and motion. The fact that injuries of the head are apt to produce paralytic affections on the opposite side did not escape his observation, and, in order to account for it, he stated that the nervous fibres in the brain form a decussation in the shape of the Greek letter X, whilst the nerves arising from the spinal marrow proceed directly to the organ for which they are designed. Notwithstanding these curious remarks on the functions of the nervous system, Aretæus evidently did not make any clear distinction between the nervous and tendinous parts; the latter are undoubtedly alluded to, when he says that, besides the nerves proceeding from the brain, there are others which pass from one bone to another, and are the principal sources of motion?

The descriptions which Aretæus has given of the diseases to which the human economy is subject are accurate delineations, evidently taken from nature, and distinguished by a peculiar liveliness, elegance, and conciseness of diction. He is thought to have excelled all ancient authors, not even excepting Hippocrates, in the art of describing diseases, and may still be regarded as a model in this species of literature. His account of epilepsy, tetanus, acute and chronic headaches, hæmoptysis and *causæ*, or burning fever, are peculiarly happy specimens of his manner of writing.

In the treatment of diseases, Aretæus regarded experience as the best guide (*ἀγαθὴ ἐμπειρία ἢ πείρα*), and he

repeatedly refers to the necessity of following the hints which nature gives to the physician. His methods of treatment seem to have been energetic where it appeared necessary, but always simple; and he was averse to that sarrago of medicines to the use of which some of his contemporaries were addicted.

He frequently employed emetics, purgatives, and clysters; and he was aware that emetics not only evacuate the contents of the stomach and intestines, but derive a great part of their efficacy from the shock which the act of vomiting produces in those parts. He was fond of bloodletting in chronic as well as acute diseases, but cautious with regard to the quantity of blood which he took away: he advises the blood to be stopped before fainting supervenes, and recommends not to take away too much blood at one bleeding in apoplexy. He also mentions the practice of opening a vein on the back of the hand, and he practised the operation of arteriotomy. He employed cupping-glasses and leeches, and he is the first author who mentions blistering with cantharides: as he recommends this practice as preferable to other rubefacients, without mentioning it as having been formerly in use, it appears probable that we are indebted to him for this most important remedy; nor had the tendency which it sometimes has to injure the functions of the urinary organs escaped his observation; he enjoins, therefore, milk to be drank in large quantities before the blister is applied.

Scarcely any internal medicines were employed by Aretæus in the treatment of acute diseases; but he paid strict attention to diet and regimen: among his dietetical prescriptions, those on the use of the different kinds of milk deserve to be mentioned. In treating chronic diseases he more frequently had recourse to the aid of medicines; we find him prescribing diuretics, sudorifics, and several of the compound stimulating preparations which were in vogue in his time. One of the substances he most frequently resorted to is castoreum, which he regarded as very efficacious in various affections of the nervous system.

Of the writings of Aretæus, only four books on the causes and symptoms, and as many on the treatment, of acute and chronic diseases are extant; nor have they been preserved in a perfect form: chap. i.—iv. and part of chap. v. of the first book on the causes, and several passages in the books on the treatment, of diseases are lost. In this work the author alludes to his treatises on surgery, on pharmacy, on fevers, and on the diseases of women, of all which works not a single fragment now remains. Had they been handed down to our times, they would have formed most important additions to medical literature. Aretæus wrote in the Ionic dialect of the Greek language, which at his period had nearly ceased to be employed in writing; but he was, probably, induced to adopt it by the example of the older medical authors, Hippocrates and his contemporaries and successors, who wrote in this dialect, which was also used in the ancient sentences of the school of Cos.

The eight books of Aretæus were first edited from the Parisian MSS. by J. Goupyl, and published at Paris, 1554, 8vo. The standard edition is that of Mr. John Wigan, student of Christ Church, Oxford: it was undertaken by the advice and with the assistance of Dr. Froind, and printed at the Clarendon Press, 1723, folio. Wigan gave a very good Latin translation, notes, and a valuable dissertation *de Aretæi ætate, secta, in rebus anatomicis scientia, et curandi ratione*. This edition is scarce, only 300 copies having been struck off. Another edition was published under the superintendence of Boerhaave, Leid. 1731, folio: the greater part of it had been printed as early as 1719, before the publication of the Oxford edition; and the text, as well as the Latin translation, are such as they had been before Wigan's labours. Boerhaave added, however, the valuable critical commentaries of Peter Petit, a Parisian physician, which had remained in MS. for nearly seventy years. Aretæus also forms the 24th volume of Kühn's edition of the Greek medical authors. This volume (Lips. 1828, 8vo.) contains the Greek text and Latin translation, Wigan's preface, notes, and dissertation, Boerhaave's preface, Petit's commentaries, Trillor's conjectures and emendations, and a copious Greek index by Michael Mattaire. An English translation of Aretæus, by John Moffat, was published at London, 1785, 8vo.

ARETHUSA, a celebrated fountain in the island Ortygia, one of the five divisions of ancient and the site of modern Syracuse. For the story of the nymph Arethusa

the manner of her change into a fountain, and the pursuit of her by the river-god Alpheus from Eleia below the sea to Sicily, see ALPHEIUS, and Ovid, *Met.* v. 572. Pausanias tells rather a different story; he says that Arethusa passed over into Ortygia, and there was changed into a fountain (v. 7). Diodorus says, that the nymphs produced the fountain Arethusa to gratify Diana, after one of whose names the island was called Ortygia, and to whom it was consecrated. He calls it 'a very large fountain,' and adds, that it abounded in large fish, which were held sacred, and never caught; and that if any persons were impious enough to eat them (as had been done in time of siege), they incurred the anger of the deity and fell into great misfortunes (v. 3). Cicero speaks of it as a 'fountain of sweet water of incredible size and abounding in fish, which would be covered by the sea but for a stone bulwark.' (*Verr. Act.* ii. iv. 53.) That beauty and abundance of water which attracted the admiration of the poets, has disappeared. Swinburne speaks of the rock as riven by earthquakes, and of the spring as sometimes failing in the volcanic convulsions which from time to time desolate that region. Wilkins thus describes its appearance at the beginning of this century: 'The fountain now springs from the earth under a natural arch in the rock, within a few paces of the sea, and is only separated from it by the city wall, through an aperture in which it is discharged into the harbour. It is a considerable spring of brackish water, although of little depth; and is resorted to by the poor female inhabitants of Syracuse, who, after the Sicilian manner of washing, perform the operation standing up to their knees in the stream. Over the arch is a rude image of the Madonna, which the Syracusans pretend to be a statue of the nymph Arethusa.' (*Magna Græcia.*)

It was commonly said that things thrown into the Alpheus would reappear in this fountain. Strabo asserts that a cup did so. Seneca quotes it as an article of popular belief, that when the Olympian festival was celebrated on the banks of the Alpheus, the sweepings of the temple reappeared in the Sicilian fountain. (*Nat. Quest.* iii. 26.) Moschus intimates a similar belief in his seventh Idyll. In the middle ages the story reappeared with a change of form adapted to the change in religion, and the fountain was said to cast up leaves not known to grow except on the river Jordan. (Maritiotti, *Cron. Antiche di Calabria*, ap. Wilkins.) A strong spring bubbles up under water near the place where the stream from the fountain runs into the sea; and this has been said to come from the waters of the Alpheus. It is now called *L'Occhio della Zilica*. The Syracusan poets, Theocritus and Moschus, make frequent mention of this favourite stream. There was another Arethusa in Samos, and another in Eubœa. (*Schol. in Theoc.* i. 117.)

ARETINO, PIETRO, an Italian writer of the sixteenth century. He was born at Arezzo in 1492, and was the natural son of Antonio Bacci, a patrician of that city. He left his native place very young, and went to Perugia, where he found employment as a bookbinder. Here he had an opportunity of reading the books which were entrusted to him, and of thus acquiring some information. His regular education had been very limited, and indeed he remained all his life ignorant of Latin and Greek; but he had much quickness of parts, a fervid imagination, and great fluency of expression. After some years he set off from Perugia on foot; and with nothing but the clothes he had on, went to Rome in quest of better fortune. He first met with a patron in a wealthy merchant, Agostino Chigi, the same for whom Raphael painted the palace called La Farnesina, who lodged him in his house. His next step was an introduction to Pope Leo X., and to Cardinal Giulio de' Medici, afterwards Clement VII., whose service it appears that he remained seven years, but in what capacity is not known. A circumstance which strongly shows the profligacy of those times drove him away from Rome about 1524. The celebrated painter, Giulio Romano, sketched a series of most obscene drawings, Marc' Antonio Raimondi engraved them, and Aretino illustrated them by sonnets. The court of Rome, being informed of this scandal, ordered the arrest of the offenders. Giulio Romano escaped to Mantua, Aretino also ran away, but Raimondi was seized, and would have been severely punished, had he not succeeded in escaping from prison. Aretino now found a friend in Giovanni de' Medici, the famous captain of the Florentine republic, and in Francis I. of France. Giovanni took a particular liking to him, and introduced him to the king, who made him presents in

return for the praises which Aretino lavished on him. The death of Giovanni de' Medici having deprived Aretino of a generous patron, he went to live at Venice, where he depended on his writings for subsistence. He wrote both prose and verse, obscene dialogues, satirical *capitoli in terza rima*, heroic cantos, sonnets, and comedies, besides a multitude of letters which he addressed to all the princes and great men and ladies of his time, sometimes flattering them, sometimes praising himself, and generally asking money or some other favour in exchange for his praise, or for the dedication of some of his works; and sometimes threatening them with the lash of his satire if his demands were not complied with. It is a curious fact, that by these means he received considerable sums of money, which enabled him to lead a dissolute life, and also to satisfy his taste for prodigality, which he mistook for generosity. His house was open indiscriminately to the destitute poor, the adventurer, and the profligate of either sex. He dressed in costly garments; and spent nearly a thousand scudi, or crowns, a year, a large sum in his time. He was often embarrassed, and ever craving for money, though he received presents from most Italian princes, as well as from Francis I., Charles V., Henry VIII. of England, and even, it is said, from Solymán, Sultan of the Turks.

Owing to the virulence both of his speech and pen, he narrowly escaped from several attempts to assassinate him. Twice at Rome, in the time of Leo X., he nearly lost his life, but was saved by a friend. Piero Strozzi, a celebrated captain of his time, who was serving in the French armies in Italy, being incensed at some satire of Aretino, sent him a message, that if he continued to slander him, he would have him killed in his bed; the threat so frightened the poet, that he shut himself up in his house, and would not trust any one within as long as Strozzi remained in the Venetian territory.

Aretino still cast a longing eye towards Rome, in expectation of dignities and emoluments. For this purpose he wrote several compositions on sacred subjects, such as the *Lives of Christ*, the *Virgin Mary*, *St. Catherine*, *Thomas Aquinas*, *A Commentary on the Book of Genesis*, and *A Paraphrase of the Seven Penitential Psalms*. These works met with no success, being, with the exception perhaps of the last, utterly contemptible both in their conception and style. The language of Aretino is generally turgid, affected, full of metaphors and hyperbole, resembling that which became prevalent in Italy a century later, and which is known by the name of *del seicento*. He wrote with great facility, but at the same time with carelessness, and his taste was coarse and trivial. The Duke of Urbino applied in his favour to Pope Paul III., and even proposed that Aretino should be made a cardinal. Luckily for the credit of the Roman hierarchy, the pope would not listen to such a suggestion; and it was perhaps in resentment of this, that Aretino unmercifully lashed the pope's grandson, Pier Luigi Farnese, Duke of Parma. After Paul's death, Julius III., who was a native of Arezzo, was addressed by Aretino in a letter of congratulation, accompanied by a sonnet characterized by the most fulsome praise of the new pontiff. Julius, being at the same time importuned by several persons around him in favour of Aretino, made the poet a present of 1000 scudi, and sent him the bull or diploma of Knight of St. Peter, an inferior order, to which a small income was attached. Aretino still expecting more, went to Rome with the Duke of Urbino in 1553, was kindly received by the pope, but meeting with no further encouragement, he again left that city in disappointment a few months after, and returned to Venice, where he remained till his death in 1557. He was buried in the church of S. Luca, at Venice, where a monument was raised to him, which Sansovino mentions in his *Venezia Illustrata*; it was afterwards removed in the reparations which that church underwent. The witty epitaph which has been reported by many biographers and travellers, and by Misson among the rest, was never placed on his tomb. Pietro Aretino must not be confounded with the historian Leonardo Bruni, also called 'L'Aretino'; nor with the poet Bernardo Accolti, who was styled 'L'Unico Aretino.' Some travellers, seeing the monument of Leonardo Bruni in the celebrated church of Santa Croce, at Florence, by the side of the tombs of Galileo, Michel Angelo, and Machiavelli, have mistaken it for that of Pietro, and have indulged in unequalled moral reflections on the subject. Pietro Aretino was never married, but he left several natural daughters. His works, and the most obnoxious of them in

particular, have been re-published separately at different times, notwithstanding the censure of the Inquisition, and have been translated into several languages. His *Capitoli* are the best specimens of his poetry: they are partly satirical and partly laudatory of several conspicuous characters of his age—Charles V., Catherine of Medici, Pope Julius, and the Duke of Urbino. He wrote *L'Orazia*, an historical tragedy in blank verse, one of the earliest Italian tragedies. His five comedies in prose,—*Il Filosofo*, *La Cortigiana*, *Il Mariscalco*, *L'Ipocrito*, and *La Talanta*,—are not without some merit in the invention, but, like most of the old Italian comedies, they are deficient in dramatic plot, and objectionable in their language. His *Letters* were published at Venice at different epochs during his lifetime, and form six volumes, octavo, besides two volumes of letters written to Aretino by his numerous correspondents. Amidst a multitude of unmeaning or egotistical phrases, much of the life and character of Aretino, as well as of the character of his times, may be gathered from these letters. He was either the flatterer or the enemy of almost every Italian writer of his age; and it was one that abounded in writers. He bestowed freely the epithet of 'divine' on Cardinal Bembo, Fracastoro, Giovio, Alamanni, Tolommei, Lolho, and even upon Molza and Dolee, and they in gratitude returned the compliment with interest. Ariosto has not disdained to call himself 'Il divin Pietro Aretino.' Berni, on the contrary, was never his friend, and wrote a most bitter invective against him. Franco, another poet, nearly as immoral as Aretino himself, bandied satire with him. Aretino directed his enmity chiefly against the prelates of Rome: Clemens VII., Cardinal Caraffa, afterwards Paul IV., and the estimable and learned Cardinal Sadoletto, were all the objects of his low and vulgar abuse. At last they paid so little attention to it at Rome, that it was considered rather an honour to be satirized by the cynic poet. Aretino boasted of his impudence, styling himself 'by divine grace a free man,' and 'the scourge of princes.' He is indeed one of those instances of successful shamelessness which occasionally appear to astonish the world, and make us wonder that such nuisances are so long endured. But the heaviest guilt of Aretino lies in his licentious writings. He was the most offensive writer of a most immoral age, an age abounding in impure works, which might rival in obscenity those of ancient Rome, and are only surpassed in infamy by some of the worst productions of the French erotic press of the eighteenth century. (Count Mazzuchelli's *Vita di Pietro Aretino*.)

ARETINUS (Musician). [See GUIDO.]

AREZZO, a very ancient and still considerable town of Tuscany, thirty-four miles S.E. of Florence. The citadel of Arezzo is in 43° 27' 52" N. lat. and 11° 52' 35" E. long. Arretium was one of the wealthiest and most populous among the twelve cities of ancient Etruria, was repeatedly at war with Rome, and afterwards became its ally, and supplied money and arms towards Scipio's expedition to Africa about the end of the second Punic war. Its government was then partly popular and similar to that of Rome, having its senate, and its patricians and plebeians. Arretium, having joined the Marsi and other Italian nations in the social war against Rome, was devastated by Sulla, its inhabitants were dispersed, and a Roman colony was sent into the country. It is a matter of doubt whether the colony did settle at old Arretium, as we find in the Roman geographers two colonies mentioned, one about eight miles to the north of it, called Arretium Julium, and another the same distance to the south, called Arretium Fidens, both distinguished from Arretium Vetus, which last, however, survived them both, having been restored by the care and liberality of Mæcenæ, who was said to be descended from the old kings or rather nobles of that part of Etruria. The pottery of Arretium was in great repute. After the fall of Rome, Arretium, or Aritium, as it is sometimes called, was ravaged by the Goths under Totila, but was restored under Justinian. It then passed under the dominion of the Longobards, and afterwards of Charlemagne and his successors. The bishops of Arezzo were made feudal counts, and as such governed the town and its county or district, in the name of the Emperor and King of Italy. In the eleventh century, however, Arezzo, like most Italian cities, threw off its allegiance to the empire, and adopted a republican form of government. It was subsequently distracted by the factions of Guelphs and Guibelines. The Guibelines at last prevailed in the

time of Frederic II.; and having at their head the Bishop Guglielmo Ubertini, drove the Guelphs out of the city. They next made war against Florence, and were defeated at the battle of Campaldino, in 1289, when the bishop was killed. In the following century, another bishop, Guido Tarlati of Pietramala, also a Guibeline, became Lord of Arezzo. He was a warrior and a statesman. He enlarged and fortified the city, made roads, conquered several neighbouring towns, fought against Florence, and maintained himself in his see although deposed by the pope, from whom he took Città di Castello, and other places. Under him Arezzo attained a high degree of power and splendour. He died in 1327, and his monument is in the cathedral of Arezzo. After his death there came fresh dissensions among the citizens, and new wars with the Florentines, until 1384, when the city was taken and plundered by Ingelram of Coucy, a famous Condottiere of the times, who sold Arezzo to the Florentines for 40,000 golden florins. After more than a century Arezzo revolted against Florence in 1502, was again taken, and treated with great severity. In 1529 it opened its gates to the army of Charles V., which was then besieging Florence. Arezzo was obliged, in 1531, to submit, as well as Florence, to the Medici, and has ever since made part of the duchy of Tuscany. But its inhabitants have always retained something of their former independent and warlike spirit. In 1799, they rose against the French who had occupied Tuscany: the following year, after the battle of Marengo, being attacked by a French division, they resolutely defended themselves; but the town being stormed on the 19th of October, 1800, a dreadful scene of violence and slaughter ensued.

Arezzo is situated on two hills, and in the middle of a fine plain, watered by the Arno and the Chiana, and surrounded by an amphitheatre of mountains. The citadel is on the summit of one of the hills. It lies on the high road from Florence to Perugia and Rome, and three miles from the left bank of the Arno. The walls of Arezzo are about three miles in circuit, and have four gates: the streets are tolerably wide and well paved. The only remains of antiquity are the ruins of an amphitheatre. The cathedral is a large Gothic building, besides which there are several other remarkable churches with fine paintings, and various handsome palaces belonging to the nobility. But the handsomest structure in Arezzo is that called *Le Logge*, by the side of the town-house on the principal square, which has a fine portico nearly 400 feet long. It contains a theatre and the custom-house. It was built by Vasari, who was a native of this place. Arezzo has produced many other distinguished men—the monk Guido, the first restorer of modern music; Guittone, one of the earliest writers in Italian; the celebrated Petrarch, who was born here, though of Florentine parents; the historian Leonardi Bruni, Pietro Aretino, Pope Julius III., the naturalist and physician Cesalpini, the learned Redi, &c. Arezzo has about 10,000 inhabitants, and its community, or territory, 17,000 more in 1825, according to Professor Giuli's *Statistica della Val di Chiana*. But Arezzo is also the chief town of one of the five compartimenti, or provinces, into which Tuscany is now divided, which includes the large district called Val di Chiana, once a marsh, but now drained, and the towns of Cortona, Montepulciano, and others. The territory of Arezzo is fertile in corn, oil, wine, and fruits. The celebrated wine called *Allietico*, the finest in Tuscany, is made here. There are also manufactories of woollens and of pins. Arezzo is a bishop's see, which has an income of 3,000 scudi, or crowns, per annum.

ARGALI, in zoology, the name of a species of wild sheep (*Ovis ammon*) found on the mountains of Siberia and Kamtschatka. [See SHEEP.]

ARGAND LAMP, so called from the name of its inventor, who was a native of France. This lamp has been made of various forms, for the different purposes of reading and of diffusing general light. Fig. 1. exhibits the external appearance of the reading-lamp; A is the reservoir of oil, from which it descends gradually to the cistern B, and is thence conveyed through by the pipe C to the burner D, containing the wick, placed between two tubes and immersed in oil. The wick rises a little above the upper surface of D, at E; F is the glass-chimney, the lower part of which is enlarged, in order to increase the current of air upwards; the chimney rests in the gallery G, and is kept in its place by four wires, two of which are marked H, H. By turning the gallery G, the wick is either raised or low-

Fig. 1.

ered. The wick is hollow and cylindrical, and receives a current of air both internally and externally; the former enters through the open work at I, and the latter at the gallery G: this indeed constitutes the peculiar principle and merit of the lamp. K is a shade surrounding the light, so as to prevent its acting too powerfully on the eyes. L is a handle, which, when the lamp is burning, is depressed, to allow of a supply of oil to descend into B, and which is raised to cut it off when the lamp is not in use; M is a small cup screwed on to receive any drops of oil which may fall. The internal construction of the lamp may be seen by fig. 2.

Fig. 2.

The reservoir A terminates in a neck, which screws into the upper part of the oil cistern B; when it is unscrewed and

inverted, the oil is poured into the reservoir at the hole N; by moving the handle L, the short tube O is made to cover this hole and prevent the oil from running out, and the reservoir is then screwed into its place, and the handle depressed so as to uncover the hole and to allow the passage of the oil into the cistern B. Within the perpendicular tube P there is placed a smaller tube Q, and both are closed at bottom and open at the top; the space between these contains oil and the wick R, stretched over the short tube S, rising a little above the tubes at T. The outer surface of the tube Q has a spiral groove formed round it, and a tooth in the ring or gallery G entering this groove, when it is turned round, causes the tube and wick attached to it to ascend or descend, so as to regulate the flame. On account of the nature of the reservoir which contains the oil, a constant supply will be kept up at the level marked by the dotted line U, both in the cistern B and in the wick-tubes P and Q.

It has been mentioned that various forms are given to the Argand lamps. In those employed for the purpose of giving a general and diffused light, the reservoir of oil is circular, and surrounds the cistern and wick, and is nearly on a level with the latter; a ground-glass shade, which in the smaller lamps is frequently globular, and in larger ones rather flat, rests upon a groove.

The chemical Argand lamp is a very useful instrument, and is represented by fig. 3: a is the reservoir of oil: b the

Fig. 3.

opening at which the oil is poured into it; c is a short copper chimney; d is a pinion by which motion is given to the rack e, so as to raise or depress the wick; the apertures at f supply air; and the dish g, in which the lamp stands, serves to retain any oil which drops from the reservoir.

ARGEI, a name sometimes applied by Homer to the whole body of Greeks assembled at Troy; it is derived, probably, from the inhabitants of Argos, who had even in those early times raised their city to considerable celebrity. Homer, indeed, employs the word Argos not only to designate the name of a town, but also the whole Peloponnesus: Agamemnon is styled the sovereign of all Argos and the islands. (See Strabo, viii. 369.) The capital of Agamemnon's kingdom of Argos, which certainly did not comprise all the Peloponnesus, was Mycenae. Homer often qualifies it with some epithet, as Achaian (*Iliad*, ix. 141), when Argos of the Peloponnesus is meant, and Pelasgium when the Thessalian city or district of that name is intended. Strabo (viii. 372) tells us that in later times the word Argos in the Thessalian and Macedonian dialects signified a plain or field, and we may therefore perhaps consider it as having the same root with *ager* in the Latin language. What connexion this has with the several cities named Argos, the geographer does not think proper to inform us, though he may perhaps intend us to infer that they were so called from being situated in a plain. Pausanias (viii. 7) mentions a plain (called the *πεδον ἀργον*) close to the mountain Artemisium, but we doubt if this has any reference to the use of the word Argos, of which we are here speaking. The early inhabitants of the Peloponnesian Argos and of the district around it were, we have good reason to believe, Pelasgi. (Strabo, viii. 371; Eurip. *Orest.*, 931; Æschyl.

Suppl., 265.) The arrival of Danaïis from Egypt, according to tradition, caused their name to be changed to Danaï, a term that occurs in the *Iliad*, but the mass of the population no doubt still remained the same. Eighty years after the Trojan war, or B.C. 1104, the invasion of the Peloponnesus by the Heracleidæ took place, and Argos, like most of the other cities of southern Greece, was obliged to submit to the Dorians. Still this was only a change of dynasty, and all the older Achaean inhabitants were not compelled to leave their country. From this time the names Argos and Argæi lost their more extensive signification; but the city Argos itself continued an important place under this new name. [See ARGOLIS, ARGOS, and ACHÆI.]

ARGEMONE, the name of a small genus of the poppy tribe, of which three species are cultivated in this country as ornamental plants. They are all natives of Mexico, and are characterised by having six petals and three sepals, a very unusual number of parts in the natural order to which this genus belongs. Their leaves are prickly, and generally marked with whitish or pale bluish-green veins; the flowers are white or yellow. The commonest species is *A. Mexicana*, from the seeds of which the Mexicans obtain an oil very useful to painters: the handsomest is *A. grandiflora*, the flowers of which are pure white, and as much as three inches in diameter. They are all hardy, and will thrive in almost any soil or situation. Their seeds should be sown in a hot-bed, and the young plants treated as half-tender annuals.

ARGENS, MARQUIS D', JEAN BAPTISTE BOYER, a writer of the last century, more remarkable than illustrious for his opinions, adventures, and literary reputation, was born at Aix in Provence, on the 24th June 1701, and, as he says, was destined to the bar from his birth, because his father, who was Procurator General of the parliament of Aix, had resolved if possible to keep that office in his family. But the ardour of youth, and a restless disposition, led the marquis to frustrate the prudent designs of his parent, and to choose a profession which he thought more conducive to a life of pleasure. He therefore, by force of impetuosity, obtained his father's consent, and was placed in the army. Pleasure became his principal pursuit, and a course of illicit amours occupied a great portion of his time for several years. At last, interest was made to get him into the suite of Monsieur Andresel, in an embassy to Constantinople, which gave him an opportunity of visiting Algiers, Tunis, Tripoli, and some other places, and also of making a short tour in the Black Sea. In these voyages he had some curious adventures in the pursuit of his favourite pleasure, and was more than once in danger of experiencing the severity of Turkish retribution. He did not, however, neglect the opportunity of making many useful observations, and as he always attached himself as much as possible to the best informed and most respectable persons of the embassy, he was introduced by them into the best society. The remarks which he made upon the manners and customs of the people he conversed with, and his sketches of the characters and qualifications of those who were employed in the embassy, evince considerable ability for so young a man. Upon his return to France, he took seriously to the study of the law; and so far qualified himself as to be able to plead two remarkable causes, both of which he gained. Flattered by this success, and complimented upon the progress he had made and the fair prospect of future eminence thus opened to him, he began to think better of the bar. But, unfortunately relapsing into his former habits, his disgust for all professional studies returned. His intrigues becoming more troublesome, and the state of his finances more so, he left home, and found his way to Paris, where accidentally gaining a sum of money in his first and only adventure at a public gaming-table, he had the good sense to keep it and retire to Rome, to study music, for which he had great taste, and to perfect himself in the art of painting, in which he became very skilful. The same propensities that drove him from home compelled him to return, by exhausting his funds, and subjecting him to the danger of assassination. On his return to Aix, where he was received with more kindness than he had a right to expect, he again applied to the law, but only for the purpose of employing himself till he could find some other occupation more suitable to his inclinations. An event soon occurred that he contrived to turn to his own purposes. This was the famous trial of the Jesuit Girard before the Parliament of Aix, for seducing Mademoiselle La Cadière, his penitent. The decision of this case was un-

satisfactory to the people of Aix and its neighbourhood: a riot ensued, and the military were called in to protect the magistrates. The marquis made this a pretext for again quitting the legal profession, his dislike for which seems to have been confirmed by a consideration of its being so often involved in religious disputes in Roman Catholic countries.

He went to Paris, obtained a commission, and was slightly wounded at the siege of Philippsbourg. At the siege of Kehl he received an injury by the fall of his horse, which rendered him incapable of further service, and he quitted the army without having distinguished himself as a military man.

In the meantime he had been guilty of his usual imprudences, and his father, thinking him incorrigible, disinherited him, and reduced his pecuniary allowance to half its former amount. Being in some measure compelled by this circumstance to abandon the fashionable world, he retired to Holland, where he lived under an assumed name, and endeavoured to obtain a livelihood by his pen, which he could there use with more freedom than in his native country. His *Lettres Juives* attracted the attention of Frederic the Great, then Prince Royal of Prussia, who commenced a correspondence with him, offered him his friendship, and invited him to Berlin, 'to live and philosophize with him.' The marquis declined this invitation, for good reasons: the king, Frederic William, was not partial to literary men; he had interfered with Frederic's studies, and had hanged one of his best friends before his face.

When Frederic came to the throne, in 1740, the invitation was renewed, and accepted. The marquis was soon appointed one of his chamberlains, with a pension of 6000 francs; made a member of the Royal Academy of Belles Lettres, and Director of the Philological Class, with a salary of 800 francs, and other marks of royal favour. He had apartments in the palace, and the king built and furnished a country retreat for him. D'Argens was so disinterested as to refuse an addition to his emoluments, telling his majesty that he had many officers who had served him faithfully in his wars, who stood in greater need of his bounty.

There is evidence that his good sense influenced the king's conduct on some important occasions, which also show the extent of the confidence placed in him. His amours ended in a marriage with Mademoiselle Corhois, a dancer. When it took place is not known. His biographers choose to call it a sexagenarian adventure, but it is certain that this lady accompanied him to France in 1747. In the latter part of the marquis's life, his health and spirits appear to have failed together; he became unwilling to exert himself, and was too often absent from the royal supper parties under pretence of illness. He felt it was time to retire, and had reasons for wishing to end his days among his own relations. His brother, who had become president of the parliament of Aix, had honourably given him up a family estate, and built a house upon it for his reception. An agreement existed between D'Argens and the king that he should be allowed to retire when he had completed his sixtieth year, and he demanded the fulfilment of the bargain. It was, however, with great difficulty that he obtained only a leave of absence for six months, in 1769, under a solemn promise to return: this he meant to keep, and, though in bad health, he began his journey to Berlin, and reached Bourg en Bresse, where he was detained by a long and serious illness. Unfortunately, his wife neglected to write to Berlin, and a letter of admonition from a friend there missed him. The king, thinking he had broken his word and did not intend to return, hastily cashiered him, and the marquis, on hearing the news, as hastily returned to Aix, though not without grief and vexation. Before his departure from Berlin, he returned all the letters which he had at various times received from the king, telling him, in a well-written letter, that he thought it might not be right in the present state of his health to carry these marks of his majesty's confidence into a foreign country. The king returned the letters, with a reassurance of his confidence in the marquis. He died in 1771, while on a visit to his sister, near Toulon, leaving a daughter, who inherited his property.

It is stated by all his biographers that he maintained the character of a good husband and master, and that he was always firm in his friendship. The natural ardour of his mind led him to make considerable acquisitions; he understood several languages, knew something of chemistry and anatomy, was a great reader of the fathers and doctors of the church, and of all sorts of polite literature. His works are:—

1. *Mémoires de Monsieur le Marquis d'Argens, avec quelques Lettres sur divers sujets* (fourteen not in the collections of his works); Londres, 1736, 12mo. (certainly a foreign print—Hague); 1737, Londres, 12mo. 1807, Paris, 8vo.

2. *Mémoires du Marquis de Miremon, ou Le Philosophe Solitaire*; 1736, 12mo. An interesting work.

3. *Mentor Cavalier*; 1736, 12mo.

4. *Nouveaux Mémoires du Comte de Bonneval, publiés sous le nom de Miron* (perhaps the name he took in Holland); 1737, 4 vols. 12mo. The *Mémoires de Bonneval* is an inferior work by another writer.

5. *Mémoires du Comte de Vaxère, ou Le Faux Rabbín*; 1737, 12mo.

6. *La Philosophie du Bon Sens*; 1737, 12mo.—1763, with Nos. 8, 15, and 16; called his works in 24 vols. 12mo.

7. *Triomphe de la Vertu, ou Voyages sur Mer, et Aventures de la Comtesse de Bressol*; 1741, 3 vols. 12mo.

8. *Lettres Juives*; 1742, 6 vols. 8vo.—1754, 8 vols. 12mo.

9. *Lettres Philosophiques et Critiques, par Mad. Cochois; avec les Réponses de M. d'Argens*; 1744, 12mo.

10. *Mémoires Secrets de la République des Lettres*; 1744, 7 vols. 12mo. These *Mémoires* contain notices of the lives, acts, and peculiarities of numerous writers that can only be found elsewhere by consulting a great variety of authors. The *Lettres Juives et Chinoises* contain similar notices.

11. *Mémoires du Chevalier de * * **; 1745, 2 vols. 8vo.

12. *Songes Philosophiques*; 1746, 12mo.

13. *Nonnes Galantes, ou l'Amour Embéguiné*; 1749, 12mo.

14. *Réflexions Critiques sur les différentes Ecoles de Peinture*; 1750, 12mo. Much has been written upon this subject with great pretensions; but nobody has said so much as the marquis, so well, and in so few words, nor indeed anything more to the purpose. See also *Letters* in No. 1.

15. *Lettres Cabalistiques*; 1754, 7 vols. 12mo.—1769, 7 vols. 12mo.

16. *Lettres Chinoises*; 1755, 6 vols. 12mo.

17. *Ocellus Lucanus, Gr. et Fr.*; 1762, 8vo.

18. *Timée de Locres, Gr. et Fr.*; 1763, 8vo.

19. *Défense du Paganisme, par l'Empereur Julien, Gr. et Fr.*; 1764, 8vo.—1768, avec des Notes de M. de Voltaire. Ces trois traductions ont des Dissertations et Notes sur les principales Questions de la Métaphysique, de la Physique, et de la Morale, qui peuvent servir de suite à la Philosophie du Bon Sens. These translations are very good.

20. Certain pieces in the *Mémoires de l'Esprit et du Cœur* that bear his name; he had no part in the rest.

21. Letters printed in the Works of Frederic the Great. The editor of his *Mémoires* (Paris, 1807) has collected what was necessary to complete his life, and has reviewed some of his works with considerable fact and delicacy, and not without censure where it is due. But where he accuses the marquis of making insidious attacks on religion through its priests, he expressly alludes to the religion of the church of Rome, to which the word is exclusively applied by all its writers. Writers of other sects, and their errors, are also remarked upon with great levity by the marquis; but many ecclesiastics have attacked each other with infinitely more virulence, and without a due regard to the decency which their order should never lose sight of.

The marquis's name was again brought forward when, we are told, it was nearly forgotten in France, by the well meant zeal of certain declaimers against the licentious opinions which were promulgated during the revolution in the reign of Louis XVI. As all ranks and establishments were then thrown into confusion, so all names were confounded in searching for the authors of those calamities, and the Marquis d'Argens was associated with 'atheists and desolators of religion, morals, and government.' These words have been repeated by some who must be supposed to feel the very existence of the desolation they describe in the destruction of the old French government. More impartial writers have traced the causes of the French revolution to the accumulated grievances of many ages, and shown that it was not caused, though it may have been quickened, by the writers alluded to; if so, they may be classed together as instigators, but if their names are worth preserving, they are entitled to their just distinctions in biography. 'The marquis was not an atheist,' he says; 'he always thought it would be opposing his clearest notions not to believe in the existence of God;' he never abjured religion. After

his return to France, 'he manifested sentiments and exhibited acts of devotion that were not expected from him, considering his life and writings.' This only proves that those who did not expect such things were not acquainted with his habits—perhaps not with his writings, for he frequently asks, whether certain opinions and practices 'are consistent with true religion?' his objection to them being that he thinks they are not. The last of the sweeping accusations against him clearly indicates the temper of the person who first brought it forward, and of those who have copied it, whose thorough detestation of the Philosophy of Common Sense seems to have induced them to abandon the small portion of that valuable commodity which may have naturally fallen to their share. From their own biographical works it can be quoted that 'Frederic the Great was the best legislator of his day in Europe; that his people were the best governed; and that the Marquis d'Argens, a desolator of government, according to their ideas, was his confidential friend and adviser during the whole term of his literary life, lived under his special protection, died most sincerely regretted by him, and was, by his command, characterized on his monument as a lover of truth and an enemy of error.'

ARGE'NSOLA, BARTOLOME' LEONARDO DE, was a native of Barbastro in Aragon, and descended from a noble family, originally from Ravenna in Italy. He was born in 1566. He studied at the university of Huesca, and entered the ecclesiastical profession. Through the influence of his brother he was made a chaplain to the princess Maria of Austria, and rector of Villahermosa. He followed his brother to Naples, and remained in Italy three years after his death. In 1616, having first visited the principal cities in Italy, he returned to Spain, and was made a canon of Zaragoza, in which town he died, according to some authorities in 1633, and according to others in 1631.

Argensola left behind him a continuation of the *Annals of Aragon* by Zurita, a History of the Conquest of the Molucca Islands, some letters, satires, and other poetical effusions. The continuation of the history of Zurita, in point of style, exceeds the original, and the events are related with no less accuracy than freedom. The history of the Molucca islands, though it was written in his youth, is not inferior either in judgment or elegance to his later performances. As poets, both the brothers are, if not in point of originality, at least for their correctness and purity, among the first that Spain has produced. Their poetry is vigorous, abounds in wit and classic dignity of style, and above all, is marked by singular correctness of taste, on which account they have been styled the Horaces of Spain.

ARGENSOLA, LUPERCIO LEONARDO DE, brother of Bartolomé, was born in 1565, and began his studies at the university of Huesca. He afterwards went to Zaragoza, where he studied Greek, history, and rhetoric. Before he had attained his twenty-fifth year he went to Madrid, where his patroness, the princess Maria of Austria, had fixed her residence, and he was made her secretary. The archduke Albert of Austria made him his chamberlain, and Philip III. honoured his talents by appointing him historiographer of Aragon. The count of Lemos, having been appointed viceroy of Naples, took Argensola with him and made him his secretary of state, and also secretary for war. In 1613, he died at Naples. He left behind him three tragedies, some poems, and other works which are still unpublished.

(See Nicolao Antonio, *Bibliotheca Nova*; Fernandez, *Rimas de Lupericio y Bartolomé de Argensola*; Bouterwek, *History of Spanish Literature*, pp. 392-405.)

ARGENTAN, a town in France, in the department of Orne, 115 miles W. of Paris, twenty-five N. of Alençon, and thirty-four S. by E. of Caen: 49° 14' N. lat., 0° 1' E. long.

It is on the river Orne (which falls into the sea below Caen), and on an eminence in a very fertile plain. It is tolerably well built, with good broad streets and its fortifications have been converted into a pleasant promenade. Near it are the ruins of a strong castle. The trade of Argentan is considerable. Lace similar to that of Alençon is made here; and also leather, the waters of the Orne being considered excellent for tanning. The cottons manufactured in the town and in its vicinity are carried to Caen and sold there, where they bear a good price. A considerable quantity of poultry is reared about the town; and there is an iron mine at no great distance. The village of Rye, in the neighbourhood, was the birth-place of the historian Mezeray. The population of Argentan is about 6000.

Before the revolution, Argentan possessed a priory and three other convents.

It is the capital of an *arrondissement*, or sub-prefecture, containing 248 communes and above 115,000 inhabitants.

The form of this word and of the next (*Argenteuil*) may be compared with some Celtic names which occur in the map of Gallia: *Argentomagus* (Argenton), between Poitiers and Bruges, *Argentoratum* (Strasbourg), &c.

ARGENTEUIL, a town in France, in the department of Seine and Oise, on the right bank of the Seine below Paris, just where the river serves as boundary between the department above-mentioned and that of Seine: 48° 56' N. lat., 2° 14' E. long.

It stands in the middle of a district abounding in vineyards and gardens, the produce of which forms the chief trade of the town. There are also in the neighbourhood quarries of gypsum, which furnish an abundant supply. Some ruins still indicate the site of a monastery, founded in the seventh century, which has acquired celebrity as the retreat of Heloise. [See *ABELARD*.] The lordship of the town was in the prior of the Benedictine monks, who appear to have occupied the monastery which once sheltered Heloise. Two other religious houses existed before the revolution. Population 4700. (*Reichard's Guide des Voyageurs*.)

ARGENTEUS CODEx, or Silver Book, the name given to a very curious manuscript, or rather fragment of a manuscript, containing the greater part of the Four Gospels in the *Mæso-Gothic* language, preserved in the library at Upsala, in Sweden. It is believed to be a relic of the Gothic Bible, all or the greater part of which was translated by Ulphilas, bishop of those Goths who were settled in Moesia and Thrace, and who lived under the emperor Valens about A. D. 360. This curious fragment was discovered in the library of the abbey of Werden in Westphalia. The leaves are of vellum, some purple, but the greater part of a violet colour: all the letters being of silver, except the initials, which are of gold. These letters, which are all capitals, appear not to have been written with the pen, but stamped or imprinted on the vellum with hot metal types, in the same manner as book-binders at present letter the backs of books. This copy is judged to be nearly as ancient as the time of Ulphilas, or at least not later than a century or two after.

Michaelis and one or two other learned men have opposed the current opinion, that the Silver Book contains part of Ulphilas's Gothic version, and have offered arguments to prove, that it is rather a venerable fragment of some very ancient *Francic* Bible: but they have been confuted by Knittel and others. The letters used in the Gothic Gospels, being twenty-five in number, are formed, with slight variations, from the capitals of the Greek and Latin alphabets, and are believed to have been really the invention or application of Ulphilas. See the notes to Bishop Percy's *Translation of Mallet's Northern Antiquities*, vol. i. p. 366.

The Gothic Gospels of the Silver Book were first printed in types approaching to a fac simile, by Junius, in 1665; again in common type at Stockholm, in 1671; by Mr. Lye at Oxford, in 4to, 1750, with a Gothic Grammar prefixed; and lastly, by Zahn, 4to, Weissenfels, 1805.

Palimpsest fragments of this Gothic version of the Scriptures, though not in the silver character, have been since found in other places. Knittel printed a fragment, containing part of the Epistle to the Romans, which was discovered in the library at Wolfenbützel: it was reprinted in 1763, by Professor Ihre; and again in the Appendix to Lye's Saxon Dictionary. In 1819, some further fragments were published by Angelo Mai, and Car. Oct. Castiglione, in 4to., at Milan, containing small portions of Esdras and Nehemiah, parts of the 25th, 26th, and 27th chapters of St. Matthew, of St. Paul's Epistles to the Philippians, Titus, and Philemon, and of a homily and calendar; these were discovered in separate leaves in the Ambrosian library at Milan.

A *Dissertation on the Argenteus Codex*, by Ericus Solberg, printed at Stockholm, in 1752, contains two of its pages in fac-simile. Knittel and Mai have also engraved some of the palimpsest fragments which they respectively published.

ARGENTIE'RA, an island of the Grecian Archipelago, so called from its having been supposed to contain a vein of silver. It lies to the N.E. of Melos or Milo, from which it is separated by a narrow strait, only half a mile in breadth, which, though not free from dangers, may be passed through by ships of large size, the connecting ridge of the two islands having five fathoms water over it. The extreme length of

[Argenteira.]

the island is five miles, and breadth three miles and a half; it has no port, and but one small village, standing on an eminence at the S.E. side of the island, in 36° 48' N. lat., and 21° 35' E. long. It consists of only a few miserable huts; the whole population of the island does not exceed 800 souls. There are some hot springs in this island, like those in Milo, and the soil is also of the same volcanic nature, dry and barren, but producing in the valleys, with much care, a little cotton, corn, and fruit (chiefly figs and grapes). The only trade is the supply of a few *kaik*-loads of wine; for other articles the inhabitants visit Milo. The island generally is high: the hills rise to an elevation of 800 to 1000 feet. The ancient name was *Kimolos*, which is still always used by its present Greek inhabitants.

This island was noted in ancient times for an earth used in dyeing and bleaching cloths. (See Strabo, p. 484, and Plin. xxxv. 17, on the *Creta Cimolia*.)

ARGENTIERE, L', the capital of an *arrondissement*, in the department of Ardèche, in France. It is in the south of the department, in a deep valley, on the banks of the little river Ligne, one of the streams which run into the Ardèche: 44° 32' N. lat., 4° 17' E. long.

L'Argentiére derives its name from the mines of argenteriferous lead (*i. e.* lead combined with silver), which were formerly worked in its neighbourhood, but are now exhausted or neglected, as being of little value. Its chief trade is in silk, of which there are several manufactories. The population is nearly 3000.

The air of the town is pure, though it is situated in so deep a hollow that its eastern part does not enjoy the sun's rays till the afternoon. The western part, being more elevated, fares better in this respect. A public library of 4000 volumes was established in the town as far back as 1784.

The *arrondissement* of L'Argentiére contains 104 communes and 85,000 inhabitants. (*Dictionnaire Géograph. de la France*; Malte Brun, *Géographie de la France*.)

ARGENTINE REPUBLIC. [See *LA PLATA*.]

ARGENTON SUR CREUSE, a small town in the department of Indre, in France. [See *INDRE*.]

ARGIL. [See *ALUMINA*.]

ARGO, the ship, a southern constellation, the greater part of which, containing all the more important stars, is not visible in this country. It has one star of the first magnitude, *CAVORUS* (which see). The part of it which is visible in our latitude may be found in and above a line drawn through Orion's belt, and continued beyond Sirius. The star *Cor Hydræ* is just above the end of the mast, and the direction of the mast is that of a line passing through *Regulus* and *Cor Hydræ*. The latter comes on the meridian at six in the evening in the middle of May. For the mythological story connected with Argo, see *ARGONAUTS*.

The stars in Argo are as follows, in which, as before, the

simple number in the column marked Flamsteed, &c. is that of Flamsteed; () denotes Piazzi; C, Lacaille; and Fa, Fallows.

Owing to the extent of this constellation, it is usual to subdivide it into four, between the stars of which dotted lines are drawn in the preceding table. They are named as follows: Argo in Carina (in the keel), Argo in Puppis (in the stern), Argo in Velis (in the sails).

The stars to which a note of interrogation has been placed are those about which some mistake has arisen in the catalogues. Thus the star which, according to Flamsteed, is 13 Argus, is really in Canis Minor; and 3 Argus, to which Flamsteed has affixed the letter τ , Lacaille has affixed l ; while τ Argus, according to Lacaille, is No. 579 of his own catalogue. (See *Memoirs of the Astronomical Society*, vol. iv. p. 291.)

ARGOL is an acidulous concrete salt which is deposited by wine, and forms a crust on the sides of vessels in which that liquid is kept. This crust becomes hard, brilliant, and brittle: it is easily reduced to powder. The colour of argol depends upon that of the wine from which it is separated. That which is deposited by white wine contains fewer impurities than the other, but when refined, the produce of both is identical. Argol brought from Germany is the most esteemed, and it is understood that the excellence of its quality is owing to the successive additions of new wine which are made from time to time during a series of years to the contents of the same casks or vats, which are commonly of large dimensions.

Argol is largely used by dyers as a mordant, that is, as an intermediate substance, which, having a stronger affinity for both the cloth and the colouring matter employed than exists between the cloth and the colouring matter, becomes, as it were, a bond of union between the two. It is employed also by dyers with another object, in combination with alum, the sulphuric acid of which would injure the texture of cloth, if it were not neutralized by the potass which argol contains. At the same time the tartareous acid, which is the other component of argol, combines with the alumina of alum and forms tartrate of alumina, which is decomposed by the cloth more easily than alum.

A further use is made of argol in the same art, by combining it with nitro-muriate of tin dissolved in water. A double decomposition is thus effected. The nitro-muriatic acid combines with the potass of the argol, while the tartareous

acid of this substance dissolves the oxide of tin. The mordant thus produced is therefore a tartrate of tin. These few explanations will perhaps suffice to indicate the purposes to which this substance is applied in the important art of dyeing. The chemical properties and further uses of argol will be described under the head of TARTAR.

About 3000 casks and cases (nearly 1000 tons) of argol are annually imported into this kingdom. It comes to us from almost all wine-producing countries. It is admitted at the trifling duty of two shillings per hundred weight from foreign countries, and half that rate from British possessions. The best, after that from Germany, comes from Bologna and the Cape of Good Hope; that shipped from Florence and Leghorn ranks next. Its present price varies, according to quality, from 42s. to 58s. per hundred weight, including the duty.

ARGOLIS, one of the ancient divisions in the north-eastern part of the Peloponnesus: it is of a peninsular shape, being bounded on the south and north-east respectively by the Argolic and Saronic gulfs. On the west, it was separated from Arcadia by a range of mountains, which, shooting off from Cyllene, now Zyria, the highest mountain of the peninsula, not far from the frontiers of Achæa, run southwards, and were known by the appellations of Artemisium and Parthenium. Pausanias (viii. 6) mentions several passes from the plain of Argolis into Arcadia, two of which were respectively over the ranges of Parthenium and Artemisium. The territory of Corinth bounded it on the north, Argolis lies between 37° 12' and 37° 46' N. lat., and extended from 22° 32' to 23° 33' E. long. Its greatest length, measured in a straight line along its western frontier from Laconia to Corinthia, was nearly thirty-eight miles, and the peninsular part of it varied from twenty-five to eleven miles in breadth. Mr. Clinton calculates (*Fasti Hell.* i. 385) its area in English square miles at 1059.

Argolis is traversed by a ridge of mountains which run nearly in a continued line through the peninsula, from Cyllene on its western frontier eastward to Cape Seyllæum, now Skylo: these mountains are intersected by deep valleys, through which flow rivulets, generally dry during summer. Arachnæum is the ancient name of part of this range, which was crossed on the road from Argos to Epidaurus. The valleys are most numerous and of greatest breadth on the southern side of the ridge, but none of them are of any great extent. That in which Argos and Mycenæ were situated is the largest, and through it flowed the ancient Inachus, now Bânitzæ. The coast is of an irregular shape, with numerous indentations, and it is generally low. The only good harbour is Nauplia, now Napoli di Romania, at the head of the gulf of Napoli; which, however, is exposed to a southerly wind.

Argos, with a territory around it of about 521 English square miles, was situated in the south-west part of the province near Mycenæ. On the eastern coast were the three independent republics, Epidaurus, now Pidhævro; Trœzen, now Damala, and Hermione. In the mountains to the west was situated Phlius. The only other city of any importance in Argolis was Tiryns, the mythological birth-place of Hercules, and known for its Cyclopiæ walls. [See TIRYNS.] The district of Cynuria, which was long a subject of contention between Argos and Sparta, lay on the west side of the Argolic gulf, on the borders. (Thucyd. ii. 26. iv. 56, &c.) It was finally adjudged to the Argon by the Romans. [See ARGON and ARGOS; and Gell's *Argolis*.]

ARGONAUTA. [See NAUTICS.]

ARGONAUTS, a term signifying the crew of the Argo, or members of the Argonautic expedition. This is one of the most remarkable of those mythological tales in which, as in the legends of the Trojan war, and the war of the Seven against Thebes, there is reason to believe that a substratum of truth exists, though overlaid by a mass of fiction. Anterior to these events (it is placed by Newton B. C. 937, by Blair B. C. 1263), the Argonautic expedition has a larger share of what is purely fabulous: the license of the poet being of course curtailed in proportion as the events which he related came nearer to his own times. No story has been more frequently treated by Grecian writers. We shall give a brief outline, and then offer a few remarks upon it.

Jason, the son of Æson, king of Iolcos in Thessaly, having been defrauded of his father's kingdom by his father's brother Pelias, in hope of recovering his paternal inheritance, undertook to bring from Colchis the golden fleece of the ram

which carried Phrixus thither. Argus, the son of Phrixus, by the help of Athene (Minerva), built the ship Argo, of fifty oars, at Pagasæ, and it was manned by the most celebrated heroes of Greece, in number fifty. The lists differ, for every state in later times wished to include its own national hero among them; but by general consent the most distinguished warriors, as Heracles (Hercules), the Æacidae, the Dioscuri, Orpheus, Theseus, &c., were on board the vessel, which was steered by Tiphys, the son of Agnius. Embarking from Ioleos (or, some say, Aphettæ, *departure*), they steered first to Lemnos; thence to Mysia, where Hercules remained behind, seeking his favourite Hylas, who had been carried off by the Naiades, and drowned. (See Theoc. *Idyll.* 13.) They touched next at Bebrycia, where Amycus, king of the country, was slain by Polydeukes (Pollux), in boxing with the *cestus*, or weighted glove. (Theoc. *Idyll.* 22.) Apollonius next conducts them to the coast of Bithynia, where Zetes and Calais, the winged sons of Boreas, delivered the seer Phineus from certain winged monsters called Harpies, and in return he gave the Argonauts instructions for the conduct of their voyage. (Apoll. Rhod. ii. v. 178-125.) The entrance to the Euxine sea was fabled to be closed up by certain rocks, called *Symplegades*, *clashers*, or *Phaetia* (Od. xii. 61), or *Cypæan*, which floated on the water, and when any thing attempted to pass through, came together with such velocity that not even the birds could escape. Phineas advised them to let fly a pigeon, and to venture the passage if the bird got through safe. It passed, with only the loss of its tail; and the Argo, favoured by Juno, and impelled by the utmost efforts of its heroic crew, passed also, though so narrowly that the meeting rocks carried away part of her stern-works. Thenceforward they remained fixed. The expedition reached the river Phasis without any more adventures worthy of notice. Æetes, king of Colchis, hearing from the strangers the cause of their arrival, promised to give Jason the golden fleece, which was suspended on a tree in the sacred grove of Ares, on condition of his yoking two bulls with brazen feet, which breathed flames, ploughing a piece of land with them, and sowing part of the teeth of the serpent slain by Cadmus, which had the peculiar property of producing a crop of armed men. These difficult tasks he performed by the help of the celebrated sorceress Medea, daughter of Æetes, who fell in love with him, placed the fleece, which Æetes ultimately refused to surrender, in his possession, and became his partner in flight.

How the Argo got back to Greece, it is not easy to say; but somehow or other she found her way from Colchis, at the eastern end of the Euxine, to the western extremity of the Mediterranean. Here the Argonauts touched at Æea, the island of Crete (see Od. xii. 69), which by Homer is placed in the westernmost part of the Mediterranean, and by some later writers has been said to be the promontory of Circum, on the Latian coast. Hence they passed all the wonders of the western world described by Homer: the Sirens; Scylla and Charybdis; Thrinakia (Sicilia), the isle of the sun; and Phæacia, or Coreya. Near Anaphæ, one of the Sporades, they narrowly escaped shipwreck, but were saved by Phæbus. They touched at Crete, proceeded to Ægina, thence to Ioleos, where Jason delivered up the fleece to Pelias; after which he sailed to the Isthmus, and dedicated the Argo to Poseidon, or Neptune.

For a full account of the adventures of the Argonauts, see, besides the passages referred to, Pindar. *Pyth.* IV.; Apollonius Rhodius; the Orphic *Argonautica*; Diodorus, book iv. c. 10; see also Hesiod. *Theog.* 992; Ovid, and the Latin poem of Valerius Flaccus, entitled *Argonautica*.

The reader will readily understand that it was a difficult matter to get the Argo home from Colchis to Greece, by way of the Mediterranean. Besides numerous large streams, two very great rivers, the Ister and Tanais (Danube and Don), flowed into the Euxine sea, from the west and north-east respectively, in addition to the Phasis (Faz), which entered it on the east side, within the limits of Colchis. Of none of these did the early Greeks know either the rise or course; and this was convenient, for they could do as they liked with them. Pindar (*Pyth.* iv. 44 and 418) conducts the Argonauts into the 'Red Sea' (probably the Indian Ocean), and by the ocean to the coast of Libya, where they carried their ship over land for twelve days, and launching her into Lake Tritonis, entered the Mediterranean. According to the tradition preserved by He-

rodotus (iv. 179), Jason was driven off the south coast of the Peloponnesus into the shallows of the Lake Tritonis, while he was on his voyage (apparently before the commencement of the great expedition) to carry a hecatomb and a brazen tripod to the god of Delphi. He only got out of the difficulty by surrendering the tripod to Triton, the god of the lake, who on no other terms would consent to pilot him out. Hecateus of Miletus improved the story, by making them sail from the ocean down the Nile, into the Mediterranean. Pisander and Timagetes, followed by Apollonius Rhodius, carried them up the Ister, and down one of its branches, by which they perhaps meant the Rhone, into the Keltic or Tyrrhene sea. Timæus and others took them up the Tanais to its source, from which they dragged the Argo to an unnamed stream, which carried them to the ocean, and they sailed home by Gades (Cadiz), that is, the straits of Gibraltar. The poet who writes under the name of Orpheus took them up the Phasis, down another branch of it to the Palus Mæotis, at the head of which they entered a river, probably the Tanais, and crossed the Rhipæan mountains to the Cronian or Baltic sea. They passed by the land of the Cimmerians, and the isle Iernis (Ireland?), and home by the strait of Tartessus (Gibraltar) into the Mediterranean.

The gross geographical ignorance involved in each of these routes need not be pointed out. Why later writers should have laboured to solve such an impossible problem, it is hard to say, except that Homer brings the Argonauts into the Mediterranean (Od. xii. 70), and they may have thought themselves bound to follow him. Diodorus, however, takes them quickly home by the Euxine Sea.

The name of Minyans, which was given to the Argonauts, according to the mythologists, because most of them were descended from Minyas, son of Poseidon on the maternal side, has led Mr. Keightley (*Mythology*) to suggest that the expedition may have been in fact undertaken by the Minyans, an early race in Greece, probably a branch of the Æolian tribe, who inhabited the southern part of Thessaly, and whose port was Ioleos, and their dockyard Pagasæ, and who are conjectured to have been a wealthy and commercial race. (Müller's *Orchomenos*; and Buttmann's *Mythologus*, ap. Keightley.)

Mr. Keightley further suggests, that the voyage may in fact have been to the west, for the wool and gold of Spain, and that this explains the universal agreement of all writers in bringing the Argonauts home by the Mediterranean; while at the same time the commodities for which the voyage was undertaken might readily be mythologized into the legend of the golden fleece. We prefer, however, the simpler belief of Mitford and others, that the expedition was of a piratical nature, on a large scale: in which, according to the notions of honour of the age, a number of young men of the highest rank and spirit engaged under one celebrated leader. The notion of the expedition being a western one seems to be untenable: the bold attempt of exploring the Black Sea, with the mingled objects of plunder, curiosity, and traffic, appears to be a more natural story. (See Herod. i. 2.) As to the Argonauts being found in the western part of the Mediterranean on their return, this notion arose, as we have already intimated, from the ignorance of the later Greeks as to the true course and character of the great streams which enter the Euxine or Black Sea on the north. When the geographers of Strabo's time (Strabo, Casaub. p. 121.) could believe, in opposition to the earlier statement of Herodotus, that the Caspian lake was an inlet or bay of the ocean running southward into the land, we may easily conceive how the ignorance of a previous age connected the Euxine with the waters of the ocean. When the Euxine was explored, so as to leave no doubt of its true character, ignorance and credulity merely transferred the same hypothesis to the Caspian. The wanderings of Io, as given in the *Prometheus* of Æschylus, are a good sample of poetical geography, which may be compared with that of the Argonautic voyage.

Bryant, in his learned work on ancient mythology, considers this expedition of the Argonauts as one of those corrupt traditions in which the recollection of the Deluge, and the preservation of mankind in the ark, was long maintained. Jason, therefore, he believes to be the arkite deity, and the name of Argo to be connected with and derived from the ark itself. The reader will find this question discussed with great research and ingenuity in his *Ancient Mythology*; but the author's prejudices in behalf of one

favourite theory are so strong, that his arguments require to be examined with more than usual care.

ARGONNE, a woody district in France, on the frontier of the ancient provinces of Lorraine and Champagne, and extending into each of them. It is now included in the departments of Meuse, Marne, and Ardennes. It is about sixty miles in length, with a very unequal breadth. It may be described as a vast forest, in the intervals and void spaces of which, towns and villages have been built. The inhabitants of these cultivate the lands in their neighbourhood; but the badness of the soil, and the quantity of deer, and animals of that kind (*bêtes fauves*), render tillage an unprofitable pursuit, and lead the inhabitants to attend rather to rearing stock. The cattle and the wood, which is so abundant, furnish the chief articles of trade. St. Menchould was the capital of this country, and among the other towns which are situated in it, are Clermont, Varennes, Beaumont, and Grandpré. Some of these take from the district a distinctive addition to their name, as Clermont-en-Argonne, Beaumont-en-Argonne, &c.; just as in England we have Henley-in-Arden, &c. [See **ARDEEN**.]

Argonne was the great scene of operations in the Duke of Brunswick's invasion in 1792, when the enthusiasm of republican France enabled her new levies to triumph over the disciplined forces of Prussia and Austria, and expel them from her territory. (*Encyc. Méthod. Dictionnaire de la France*.)

ARGOS, called also **Argi** by Latin writers, the most ancient city of the Peloponnesus, the chief city of Argolis, is situated on a level plain at the foot of a hill called Larissa, on which was its citadel and a temple of Jupiter, and on the banks of the rivulet Inachus, now Banitza. We admit the fact of its high antiquity, but we do not venture to decide whether its foundation took place B.C. 1857, as Eusebius affirms, or B.C. 1986, which is the opinion of Larcher. Its earliest known inhabitants were Pelasgi. In the remains of the Acropolis on the hill Larissa, we see traces of walls approaching to the massive Tirynthian style (see **TIRYNS**), and others of the later polygonal kind, which is characterized by the absence of regular horizontal courses, and by the accurate fitting together of the stones. In the mythic age it was governed by kings, of whom Inachus was the first; or, according to other accounts, he was the river-god, and his son Phoroneus was the first king. (Paus. ii. 16.) Danaüs, from Egypt, afterwards founded a new dynasty by wresting the sovereign power from Gelanor, a descendant of Phoroneus. Herodotus, in his story of Io, whom he calls the daughter of Inachus (i. l.), a story in itself of no historical value, states the general belief as to the importance of Argos at this remote period, and indicates that it was known to the enterprising merchants of Phœnicia. According to Homer, the city Argos belonged to the kingdom of Diomedes, and not to that of Agamemnon, who however seems to have enjoyed a kind of sovereign power over the whole peninsula.

[Silver Coin of Argos. Brit. Mus.]

Under Pheidon, in the 8th Olympiad, the power of Argos appears, for a time at least, to have acquired a considerable extension. [See **PHIDON**.]

In the more certain historical age, Argos appears under a republican form of government, and becomes first known to us when engaged in war with the Spartans respecting the territory of Thyrea. This war was contemporaneous with the capture of Sardes by Cyrus. (Herod. i. 82.) Before this epoch, the possessions of Argos had extended to Cape Malea, and included Cythera and other islands. At a later period, B.C. 493, there was another contest between Argos and Sparta, in which Argos was unsuccessful, and so many of the citizens fell in battle, that the slaves, or more probably the Peræci, found no difficulty in seizing the government, and are said to have retained it till the sons of their masters had grown up, when they were again expelled from the city. (Herodot. vi. 83.) It was probably on this account that the Argæians took no part in the Persian war B.C. 480, though many much less creditable reasons for

their conduct were afloat in Greece at the time. It was, in fact, believed that they had been bribed by Xerxes; but Herodotus is evidently unwilling to credit the story. (vii. 148—152.) A few years afterwards, B.C. 468, we find them at war with the inhabitants of Mycenæ, who had refused to acknowledge the supremacy of Argos, and had been supported for many years in their independence by the Spartans. Mycenæ fell, and it never again rose from its ruins. (Diod. Sic. xi. 65.) [See **MYCENÆ**.]

Though Argos remained neutral during the earlier part of the Peloponnesian war, her feelings were at all times opposed to the Spartans, and she at last took an active part with the Athenians. The defeat, however, of the Argæians at Mantinea, B.C. 418, dissolved the confederacy, of which she was the head, and Argos was compelled to accept an aristocratical constitution. (Thucyd. v. 65—81.) She subsequently shook off the yoke, and we find her assisting the Thebans at the battle of Mantinea, B.C. 362; but her history becomes gradually less important; nor is there any fact worthy of being noticed, till the unsuccessful attempt made by Pyrrhus, B.C. 272, to take the city. It joined the Achaean league, and continued to form a part of this confederacy till its final dissolution by the Romans. (Strabo, viii. 377.) The great deity of Argos was Hera (Juno), and it seems probable that a great catalogue of the priestesses had been preserved, which may have served as the basis of the work ascribed to Hellanici on the succession of the priestesses. (See Herod. i. 31. Thucyd. ii. 2.)

Argos is still known by its ancient name, and at the beginning of this century contained 1200 families. Part of the plain around is cultivated, and where the moisture is sufficient, cotton and vines are grown; in the marshy parts towards the sea, some rice. The plain of Argos does not abound in water, for which Pausanias assigns a mythological reason (ii. 15; but compare Strabo, p. 371.) A ruined castle, of lower Greek construction, which now occupies the summit of Larissa, still preserves some remains of the famed Acropolis of Argos. For a detailed account of its ancient remains, see Leake's *Travels in the Morea*, London, 1830; and for its ancient history, Manner's *Geographie des Griechenlandes*, Leips. 1822. Pausan. ii. 19, &c.; Strabo, p. 368, &c.; Müller's *Dorians*.

ARGOS, in Amphiloehia, a town near the S. E. angle of the gulf of Arta. Its ruins are supposed by some to be those at the bottom of the gulf of Karavasara. (See *Lond. Geog. Journal*, vol. iii, p. 85, and the article **ARTA**.) This Argos was founded, according to tradition, by Amphiloehus of the Peloponnesian Argos, after his return from the war of Troy. (Thucyd. ii. 68.)

ARGOSIE, a ship of great burthen, whether for merchandise or war. Shakspeare, in his *Merchant of Venice* (Act i. Scene 1) says—

‘Your mind is tossing on the ocean,
There where your *Argosies* with pottly sail,
Like signion and rich bughten, on the flood,
Or as it were the pageants of the sea,
Do over-peer the petty traffickers.’

It is mentioned in the same sense by Chapman, Drayton, Beaumont and Fletcher, and other writers. In Rycant's *Maxims of Turkish Polity*, chap. xiv, it is said, ‘Those vast carracks called *Argosies*, which are so famed for the vastness of their burthen and bulk, were corruptly so denominated from Ragosies,’ i.e., ships of Ragusa, a city and territory on the Gulf of Venice, then tributary to the Porte. We have no proof, however, that the Ragusan vessels were particularly large; and it seems more likely that the *Argosie* derived its name from the classical ship *Argo*. Indeed Shakspeare himself has hinted as much in the play just quoted, when he makes Gratiano, in allusion to Antonio's *argosie*, say (Act iii. Scene 2)—

‘We are the *Jasons*; we have won the fleece.’

Sandys, in his *Travels*, p. 2, applies the term *argosie* to a ship of force. Describing the boldness of pirates in the Adriatic, he observes, that from the timorousness of others they ‘gather such courage that a little frigot will often not fear to venture on an *argosie*.’

ARGO'STOLI. [See **CEPHALONIA**.]

ARGUIN, or **ARGUIM**, one of a cluster of small islands in a bay of the same name, about fifty miles to the S.E. of Cape Blanco, on the western coast of Africa. It is only about two miles long, and would be unworthy of notice were it not for the variety of masters to whom it has been subject, and the loss of life incurred there. It was discovered in 1444, by Nunez Tristaõ, and in 1461 a fort was erected for

the protection of commerce, then consisting of gold and negroes, which were received in exchange for cloths, knives, glass-beads, bells, &c. The Portuguese remained in quiet possession till 1638, when they were driven out by the Dutch, who established a traffic with the Moors in gum Arabic, and claim the merit of being the first to introduce that article into Europe. The bay also abounded in stock-fish, which they cured with salt, obtained from the opposite shore and exported to Holland. In 1665, the fort was destroyed by an English squadron; but the Dutch, recapturing the island in the following year, strengthened it very much, entered into an alliance with the Moorish chiefs, and by giving a high price for the gums greatly injured the trade of the French Senegal Company. In consequence an expedition was sent, which drove the Dutch out, and the island was ceded to the French by the treaty of Nimègue. It appears that in 1690 the French exported hence a thousand tons of gum Arabic, with many chests of ostrich and herons' feathers, and a quantity of ambergris. The Dutch, however, still carried on their trade in spite of the French company; but in 1725 they were finally driven away, and the gum trade gradually merging into the establishments on the Senegal, Arguin has been abandoned, and subsequently to the treaty of Versailles in 1763 the forts have been demolished.

The opposite coast of the main land is only a barren tract of sand; but the country inland is described as being fertile, yielding corn and fruit in abundance. The country of the gold-mines, called Darha, is fifty leagues in the interior. The anchorage was good, and the bay afforded plenty of turtle and fish.

Arguin has been supposed by Major Rennell to be the Cerne of Hanno; and Bougainville asserts that the cisterns found there are of Carthaginian construction. The largest of these cisterns (evidently an artificial work) is 96 feet long, 60 wide, and of considerable depth: it is situated about 400 yards from the ruins of the fort. There is plenty of fresh water on the island.

An extensive and dangerous shoal, called the Arguin Bank, stretches thirty leagues along the land in a S.S.E. direction, from off Cape Blanco to Cape Mirik; it is composed of hard sand with broken shells: a strong current sets along its edge to the southward. This was the scene of the melancholy wreck of the French frigate *La Méduse*. Arguin is in $26^{\circ} 24' N.$ lat., $16^{\circ} 14' W.$ long.

ARGUMENT, in astronomical tables, is the angle on which the tabulated quantity depends, and with which, therefore, in technical language, the table must be *entered*. If, for example, a table of the sun's declination were formed, corresponding to every degree, &c. of longitude, so that the longitude being known, the declination might be found opposite to it in the table, then the longitude would be made the *argument* of the declination.

ARGYLE, or **ARGYLL**, a shire in the west of Scotland, comprehending an extensive district on the main land, and several of the Hebrides, or Western Isles. The name is said to be derived from *Earra Ghaidheal*, the West Gaël's country. It is bounded on the N. by Inverness-shire; on the E. by Perth, Dumbarton, and Renfrew shires; from the last two it is separated by Loch Long and the Firth of Clyde. On other sides it is washed by the sea; but the islands of Bute and Arran, which form the shire of Bute, lie close to it to the S.E. The line of the coast is very irregular. Deep indentations of the sea penetrate far inland. The principal of these, beginning from the N., are Loch Moidart and Loch Shiel (communicating with Loch Moidart by a narrow passage), which separate Argyleshire from Inverness-shire; Loch Sunart, which runs into the land in an eastern direction; Linnhe Loch, which runs nearly N.E., and the extremities of which are Loch Eil (which runs first N.E., and then W. by N. till it approaches Loch Shiel), and Loch Leven; Loch Creran and Loch Etive are inlets of Linnhe Loch, on the right as you enter. From Linnhe Loch, the coast runs in a direction about S. by W. for a distance of between 80 and 90 miles (broken successively by the Lochs Feochan, Melfort, Craignish, Crinan, Swin, Killisport, and West Tarbet), to the Moyle or Mull of Cantire. From this headland, the coast, after running eastward a short distance, returns N. by E. for about 35 miles to Skipnish Point, forming the long narrow peninsula of Cantire. From Skipnish, Loch Fine runs inland first N. by W., then N.E., and has a subordinate inlet; Loch Gilp,

• Loch is a lake, and also an inlet of the sea,

Lochs Riden and Straven also run N. by W., or N.; and the Firth of Clyde, with its terminating lochs, Long and Goyie, completes the circuit of the Argyleshire coast, the extent of which is estimated at more than 600 miles.

Authorities differ considerably as to the dimensions of Argyleshire: we give the following from measurement on the Map of Scotland published by the Society for diffusing Useful Knowledge.

Length from the northern extremity of the county in the territory of Lochail to the Mull of Cantire, 115 miles.

Length from the point of Airdnamurchan to the Mull of Cantire, 101 miles.

[Statement in Dr. Smith's Survey of the Agriculture, &c., of the County (1798), 115 miles.]

Breadth from the point of Airdnamurchan to the border of Perthshire, near the source of the river Uchay, 66 miles.

[The breadth is given by Dr. Smith at 68 miles.]

There is equal diversity of statement as to the superficial contents: Dr. Smith's calculation is as follows:—

	Sq. miles.
Mainland, exclusive of Cantire	2475
Peninsula of Cantire	260
Islands	1063
	3798

But the Doctor gives this statement as conjectural, in the absence of good authority; and as he appears to have over-estimated the length and breadth of the county, it seems better to take the statement in the *Gen. Report of Scotland*, drawn up under the direction of Sir John Sinclair, Appendix, vol. i. pp. 49, 53 (1814):—

	Sq. miles.	Eng. acres.
Land on the main	2200	or 1,408,000
Lakes	60	—
Islands	929	or 594,560
	3189	or 2,002,560, more

than one-tenth of the whole surface of Scotland and its islands.

Of the land, the quantity in cultivation is—

	Eng. acres.
On the main land	163,970
Islands	107,020

270,990, about

13.5 parts in 100, or between one-seventh and one eighth of the surface of the county; and between one-eighteenth and one-nineteenth of the cultivated land in Scotland.

The islands attached to Argyleshire are as follows. The length and breadth are given from measurement on the Society's map: the proportion of land in cultivation is from the *General Report of Scotland*; the population from the census of 1831:—

Canna: greatest length, $4\frac{1}{2}$ miles, E.N.E. to W.S.W.; greatest breadth, 1 mile; proportion of land cultivated in Canna and its dependency, Sandy Island, 45 parts in 100; population, 261.

Rum: greatest length, 8 miles, N. to S.; greatest breadth, $7\frac{1}{2}$ miles; proportion of land cultivated, 6 parts in 100; population, 134.

Rum is the most mountainous and rugged of all the Hebrides.

Muck, Muick, or Monk: greatest length, 2 miles, E. to W.; greatest breadth, $1\frac{1}{2}$ mile; population, 155.

Muck contains good pasturage and excellent corn land. The above islands, with the isle of Eig or Egg, lying between Rum and Muck, but included in Inverness-shire, make up the parish of Small Isles, one of the most laborious ministerial charges in Scotland. The population here has been rapidly decreasing, as appears by the statement below:

	Population in		Diminution.
	1821.	1831	
Canna	436	261	172
Rum	394	134	260
Muck	321	155	166
	1151	553	598

Coll: greatest length, 12 miles N.E. to S.W.; greatest breadth, $3\frac{1}{2}$ miles; proportion of land cultivated, about one-third; population, 1316.

Tirree, or Tir-y, or Tyree: greatest length, 13 miles, N.E. to S.W.; greatest breadth, $6\frac{1}{2}$ or 7 miles; proportion of land cultivated, 30 parts in 100; population, 4453. The dimensions of this island, which is not included in the So-

ciety's Map, are given from Langlands and Son's Map of Argyleshire, 1801.

Mull: greatest length, 29 miles, from Duart Castle, N.E., to the point opposite to Holmfin Island, S.W.; greatest breadth, 28 miles; proportion of land cultivated, 8 parts in 100. The following islands are dependencies of Mull:—**Gometray**: greatest length, 2 miles, E. to W.; greatest breadth, $1\frac{1}{2}$ mile. **Ulva**: greatest length, 5 miles, E. to W.; greatest breadth, $1\frac{1}{2}$ mile. **Staffa**: dimensions under a mile. **I-calm-kill**, or **Iona**, antiently called **Sodor**: greatest length, $3\frac{1}{2}$ miles, N.E. to S.W.; greatest breadth, 1 mile; all arable or good pasturage; and several smaller islands. Population of Mull and its dependencies 10,538.

Lismore: greatest length, $10\frac{1}{2}$ miles, N.E. to S.W.; greatest breadth, $1\frac{1}{2}$ mile; one-half cultivated, very fertile; population, 1790.

The Islands of **Lorn**: 35 parts in 100 cultivated; the population cannot be given, as it is included in that of the parishes on the main land to which they belong.

Kerrefra, or **Kervera**: greatest length, $4\frac{1}{2}$ miles, N. by E. to S. by W.; greatest breadth, 2 miles.

Seil: greatest length, 4 miles, N. by E. to S. by W.; greatest breadth, 2 miles.

Easdale, or **Eysdill**: dimensions under a mile: famous for its slate quarries.

Luing: greatest length, 7 miles, N. to S.; greatest breadth, $1\frac{1}{2}$ mile.

Shuna: greatest length, $2\frac{1}{2}$ miles, N. to S.; greatest breadth, 1 mile*.

Lunga: dimensions about or under a mile.

Scarba: greatest length, 3 miles, N.E. to S.W.; greatest breadth, $2\frac{1}{2}$ miles.

Jura: greatest length, 25 miles, N.N.E. to S.S.W.; greatest breadth, 8 miles; proportion of land cultivated, 7 parts in 100; population, 1312.

Colonsa and **Oronsa**: greatest length, 10 miles, N.N.E. to S.S.W.; greatest breadth, 3 miles; proportion of land cultivated, two-fifths; population, 893.

These are counted as one island, and their united dimensions given, as the channel between them is dry at low water.

Isla or **Hay**: greatest length, 26 miles, N. by E. to S. by W.; greatest breadth, 21 miles; one-fourth cultivated or in woods or pastures; population, 14,992.

Gigha: greatest length, 5 miles, N.E. to S.W.; greatest breadth, 2 miles; proportion of land in cultivation, 30 parts in 100; population, 534.

Sanda (a small island near the southern point, or Mull of Cantire): greatest length, nearly 2 miles N.E. to S.W.; greatest breadth, about a mile.

Several of these islands deserve further notice for their magnitude, productions, or other circumstances. [See **IONA**, **ISLA**, **JURA**, **MULL**, and **STAFFA**.]

The population of the islands, as given above, amounts to 35,065; that of the whole shire, at the same period, amounted to 101,400, leaving 66,335 for the main land.

Argyle is mountainous; and presents an appearance more pleasing to the lover of the picturesque than to the agriculturist. The barrenness of the soil and the want of cultivation are shown by the scanty population, which amounts only to about 32 for every square mile of land in the shire, or 1 for every $2\frac{1}{2}$ acres under cultivation.

The northern and eastern parts, where it borders on the Grampians, are the most rugged: along the coast the ground is in general lower and more level, yet particular mountains near the sea rise to a great height, and are indeed among the loftiest in the shire. We subjoin a table of the principal—

Cruachan Ben , between Loch Etive and Loch Awe	Feet. 3669
Benmore , in the Isle of Mull	3168
Cruach Lussa , to the E. of Loch Swin	(S) 3000
Bedan na bean , or Bedan ambran , N. of the termination of Lake Etive	(L) 2720
Paps of Jura , on the Isle of Jura	2580
Buchael Etive , or Buachaille , N.E. of the extremity of Loch Etive	(L) 2537
Ben na hua , on the N. side of Linnhe Loch	2515
Ben Ima , Ben Arthur , or the Cobler , at the extremity of Loch Long	(S) 2389
Ben More , in Rum	2310

* There is another Shuna off this coast, N.E. of Lismore, and a Shona in Loch Moidart, between Argyre and Inverness shires.

Ben na Tan , S. of Loch Sunart	2306
Slia Gaoil , between Loch Killisport and Loch Fyne (S)	2228
Crook Moy , in Cantire	(L) 2036
Oreval , in the Isle of Rum	1800
Ben Tuirek , in Cantire	1515
Ben Varn , in Isla	1500
Isle of Scarba	1500
Ben Ronastill , in Isla	1050
Isle of Canna	810
Ben Tartevil , in Isla	762
Cliffs near the Mull of Oe , in Isla	750
Isle of Muck	600
Ben Oe , in Isla	516
Isle of Sanda , near Mull of Cantire	300

The above, where they have no distinctive mark, are from the *Map of Scotland* published by the Society for diffusing Useful Knowledge: those marked (S) are from the Appendix to the *General Report of Scotland*, drawn up under the direction of Sir John Sinclair (1814); and those marked (L) from a table of heights given with *Langlands' Map of Argyleshire* (1801).

The chief rivers in the county are, the **Urchay**, which rises in the Grampians and flows into Loch Awe, an inland lake lying in a direction nearly parallel to Loch Fyne; and the **Awe**, which serves to connect Loch Awe with Loch Etive, and through it with the sea. The basin of these streams is estimated at 250 square miles. Streams of smaller importance are numerous, as the nature of the country would lead us to expect. There are no large inland lakes except Loch Awe just mentioned, which is about 21 miles long from N.E. to S.W., and from half a mile to two miles and a half broad. It is thickly studded with small green islets, and surrounded with picturesque scenery of woods and mountains.

Argyleshire is divided into six districts: 1. **Mull**, including the island of that name, and its dependent isles, with **Canna**, **Rum**, **Muck**, **Coll**, **Tiree**, and **Airdnamurchan**, **Sunart**, **Ardgover** and **Morvern**, N.W. of the **Linnhe Loch**, which separates these divisions from the rest of Argyleshire: 2. **Lorn**, a large division, comprehending the subordinate districts of **Appin**, **Benederaloch**, and **Muchairn**; with **Glen Urchay** or **Glenorchy**, **Glen Etive**, and **Glen Co**; the island of **Lismore** and those grouped together, as the islands of **Lorn**: 3. **Argyle** proper, or **Inverary**: separated from Lorn by **Loch Melfort**, **Loch Avich** (which is united by a channel with **Loch Awe**), and **Loch Awe**, and by a line drawn S.E. from the last mentioned lake to the eastern frontier of the county: 4. **Cowal**, including the district S.E. of Loch Fyne: 5. **Cantire** or **Kintyre** (including **Killslate**), a long peninsula, formed by **Loch Killisport**, the ocean, the Sound of **Kilbrannan** (which is the strait between the Isle of Arran and the mainland), and **Loch Fyne**; the Island of **Gigha** is joined to and forms part of Cantire: 6. **Isla** or **Hay**, including the islands of **Isla**, **Jura**, **Colonsa**, and **Oronsa**, with a small part of the continent between Argyle and Cantire. **Knapdale** is divided between districts 5 and 6.

With respect to the geology of Argyleshire, granite forms the principal constituent of the mountain masses which stretch from the river Awe, N.E. into Perth and Inverness shires; it also extends along the N.W. shore of the Linnhe Loch in the districts of Morvern and Sunart. Micaceous slate predominates in nearly every other part of the mainland, together with the islands of **Isla**, **Jura**, **Colonsa**, **Oronsa**, **Coll**, **Tiree**, and the south part of **Mull**. It constitutes the mass of the Grampians (which form the E. border of the county) and of the mountains of Cantire. **Flötz** trap prevails in **Canna**, **Rum**, and the north side of **Mull**: in some districts, of no great extent, along the coast of **Airdnamurchan** and **Morvern**; and in the neighbourhood of **Campbeltown** in Cantire. A small extent in the last mentioned neighbourhood is occupied by the coal formation and the rocks connected with it, being perhaps part of the great coal-field of Scotland, and serving as a link between that and the coal formation of the North of Ireland. The columnar basalt will be noticed under the head of **STAFFA**.

The minerals which are turned to economical purposes are numerous. There are lead-mines in several places, as at **Strontian** near the extremity of **Loch Sunart**; at **Tyndrum** on the border of Argyle and Perth shires; and in the islands **Isla** and **Coll**. Copper was obtained from a mine in **Kilmartin** in the district of Argyle, but the mine is no longer worked. A vein is, however, worked in the island of **Isla**. Coal is obtained in the neighbourhood of **Campbeltown**. There are seams of coal also in **Mull**,

but not sufficient to defray the expense of working them: peat is the common fuel, except at Inverary and Campbeltown, and at gentlemen's houses on the coast. The slate-quarries of Easdale island have been among the most considerable in Britain; and there are quarries at Balaclulish or Balahulish in Appin in Lorn. In the Appendix to the *General Report of Scotland* (1814), the yearly produce of the quarries in Easdale and the other islands of Argyshire is stated at 5,000,000 slates; and the produce of those at Balaclulish and other parts of the mainland of the same county, at 3,000,000. Marble is procured in several places, of various quality and colour; among the most beautiful specimens is that of the island of Tirree, which is very hard, and takes a good polish. Limestone is abundant in most parts of the county. The granite quarried near Inverary takes as fine a polish as marble; and the *lapid ollaris* (a kind of micaceous slate), with which the Duke of Argyll's castle at that place is built, is one of the handsomest of the building-stones found within the borders. The earth strontian takes its name from the place so called near Loch Smart, where it was found and first analysed. In Glenorchy in Lorn, specimens of cobalt are found; and the coasts of Cantire towards the south end, and of the isle of Colonsa, abound with coral.

Argyshire has a very variable and moist climate, but from its situation on the coast, and from the numerous inlets of the sea by which it is so deeply indented, the temperature is mild. Frost seldom continues long on the sea-coast, and snow rarely lies more than two or three days at a time. Mildew, blight, and hoar-frost seldom do much injury to the husbandman. The north-eastern parts, bordering on the Grampians, have a colder climate: though even there the valleys, sheltered by the surrounding heights, are neither so cold nor so uncomfortable as might be expected.

The farmers of this county direct their attention chiefly to the breeding of stock and the feeding of sheep, for which the rough and mountainous character of the surface is better adapted than for tillage. There is, indeed, a considerable quantity of arable and improvable ground in the vales interspersed among the mountains, and along the margin of the streams which wind through them, but the chief proportion of arable land is on the coast. The soil varies materially: by the rivers and by the sea there is a light loam, mixed with sand or gravel, on a clay or gravelly bottom, while on the sides of the hills there is a light gravelly soil. Sometimes the soil of the lower grounds has a mixture of clay, and sometimes of moss. The pasture grounds differ much, and the difference is manifested by the produce; in one place there is sweet fine grass; in another, coarse grass and rushes. Moss and heath occupy a part of the flat grounds; and heath covers a large portion both of the hills and flats. The tops of the highest hills are usually quite barren.

The farmers (with the exception of the tacksmen, a kind of intermediate class between the land-owners and the great body of the farmers), owing to the small size of their farms, the short terms of their leases, and their want of capital, are in a dependent and even depressed state. They excel in rearing live stock, and in the knowledge of the diseases of their cattle; but are regarded as deficient in general industry and skill, wedded to old customs, and unwilling and unable to promote improvements. The principal kinds of grain raised are oats, and bear or big, a species of barley much used in distilling. Wheat and rye are cultivated in Cantire, though to a small extent. Peas and beans are grown, but not to any large amount; and flax is raised for family use. Potatoes are cultivated extensively, and serve as a staple article of food for a considerable part of the population. Turnips, cabbages, kail, and the artificial grasses, are little attended to, except in Cantire, and there not to any considerable extent. As late as the commencement of the present century, the old custom of ploughing with four horses abreast, the driver walking before them backwards, was kept up in many parts; but as it was then yielding to improved methods, it is probably now nearly or quite done away. The rotation of crops is not well understood; grain crops are raised with little interruption, on the same ground, till it is exhausted. (Smith's *General View of the Agriculture of Argyll*, 1798.) Although there is a considerable extent of meadow-land, the quantity of hay made is not great. It is usually cut in August: the artificial grasses in July. The bear harvest begins in general in the middle of August, and is followed by the harvests of oats (middle

of September), beans, peas, and potatoes, in succession. The inhabitants, even the poorest, have usually gardens attached to their houses, but they are neither well cultivated, nor is their produce much varied. The general food of the people is oatmeal and potatoes. Of oatmeal a considerable quantity is imported.

The extent of wood land in Argyshire has been very differently estimated. Dr. Smith (*General View of the Agriculture of Argyll*) gives 30,000 acres for the natural woods; and the plantations of the Duke of Argyll and others are estimated at about 4000 more; to which 2000 acres may be added for the wood of the islands. The scarcity of wood is severely felt in many places. In former ages a great part of the country was covered with it.

The cattle of this district constitute one of the chief articles of export. They are of the west Highland breed, and are reared for the southern market, where they are preferred to almost any others. Being of small size, and of hardy constitution, they can bear to be driven to distant markets, which is an important consideration. Their milk is rich, but small in quantity. In Cantire, the dairy is the chief object of attention; and both butter and cheese are made beyond the wants of the district. The sheep occupy, in many places, the high grounds, where they have been substituted with great advantage for black cattle. They are chiefly of the Linton or black-faced kind, having in a great measure driven out the small white-faced breed, which is supposed to have been the earliest introduced into Scotland, and which many have thought capable of being so far improved as to become a very suitable stock. The horses are of various, but on the whole of inferior, breeds. Since the introduction of sheep, less attention has been paid to rearing them. Swine were formerly few in number, the Highlanders having a prejudice against them; but they are increasing. Goats are few; poultry and pigeons not numerous. In the islands, black cattle are reared more than sheep. From Isla horses are exported to Ireland.

Wild animals are numerous in the rugged districts to the N.E. Roes and red deer are abundant in several parts; also grouse, ptarmigans, and black cocks. The eagle occupies the bare rugged summit of the rocks. Rabbits and a few hares are found in some of the islands.

The manufactures of this county are unimportant. The woollen manufacture was established at Inverary, and carried on for many years under the patronage of the Duke of Argyll, but it does not seem to have flourished, and has been given up for some time. The cotton manufacture has gained but little ground; whatever is carried on is about Campbeltown. A more important branch of industry is the herring, cod, and lug fishery, though these might be prosecuted with greater diligence and spirit. In the years 1829-30, at the two stations, Inverary and Campbeltown, 266 vessels and 798 men were engaged in this branch of industry, besides various workmen as curers, coopers, labourers, &c., who made up the total number of 1220. The quantity of fish on the coast and around the islands is very great, and the herrings of Loch Fyne are well known. The salmon of Loch Awe are remarkably good, and the trout perhaps unrivalled, being of all sizes, up to 20 lbs. weight. The quantity of kelp made on the coast and on the islands was considerable; but the reduction of the duty on foreign barilla has much diminished the demand for it.

Large sums of public money have been applied to making roads in this county, together with other sums raised by county assessments. The main road from the Lowlands enters the county by Glenorchy and Cairndhu, at the head of Loch Fyne; that from Perthshire, by Dalnally, near the N.E. end of Loch Awe, and that from the north Highlands crosses Loch Loven at Balaclulish, or Balahulish ferry, and Loch Eil at Carron ferry. Two canals, the Caledonian Canal (running through the great valley of Scotland from Murray Frith to Linnhe Loch), and the Crinan Canal (from Loch Crinan to Loch Fyne), belong to Argyshire; the former partially and in a small degree, the latter entirely; but the traffic on these canals, though much increased by the introduction of steam-navigation, is not commensurate with the outlay. Nothing, however, has given a greater impulse to agriculture and industry in Argyshire than the extension of steam-navigation of late years. By means of it, the most distant parts of the county are brought into communication with one another, and with Glasgow, to which they can now send their stock and produce, with the certainty of finding a good market.

Argyleshire contains few towns. Inverary, on Loch Fyne, in Argyle proper (population in 1831, 1117), is the county town, and a royal burgh; Campbeltown, in Cantire (population 1869), is also a royal burgh. [See INVERARY and CAMPBELTOWN.] Oban, perhaps the next place in importance, is on the coast of Lorn, nearly opposite the island of Kerrera. There are no weekly markets in the shire; but eighteen fairs for the sale of horses, cows, coarse cloths, yarn, &c. are held during the year at various places (Smith's *Survey*, &c.) The population of the whole county was, in 1831, 101,400, as already stated. It has increased in the last twenty years, notwithstanding the partial depopulation from the consolidation of smaller holdings into large sheep farms.

The county returns one member to the House of Commons; and the burghs of Inverary, Oban, and Campbeltown, unite with Ayr and Irvine (Ayrshire) to return another.

The chief landed proprietor is the Duke of Argyle, whose domains and influence were formerly such that he could bring 3000 to 4000 men into the field; and the name of Campbell, that of the ducal family, is by far the most prevalent. The marquises of Tweeddale and Breckinridge have also property in the county. The latter is a branch of the Campbell family.

The population returns of 1831 contain the names of fifty parishes in the mainland and isles, but we have no information of the number of benefices. The great extent of some of the parishes has led to the erection of new churches and manse (parsonage houses) by the 'commissioners for building churches in the Highlands of Scotland.' Eleven churches have been built, all except one, with a manse; and three manse erected where churches were previous in existence, or have been built by private individuals. Of these eleven churches, six are in the islands of Mull, Isla, Ulva, and Iona. Argyle gives name to a synod, which has jurisdiction over all the parishes of the county, except one, and over the shire of Bute. In the territory thus subject to the synod there were, in 1811, five presbyteries, and thirty-nine ecclesiastical parishes, with forty-one clergymen; but the number of the latter is now of course much increased. There are some catholics in the islands.

Argyleshire contains many antiquities. The ecclesiastical ruins in Iona will be mentioned in our notice of that island. There are in Oronsa the remains of a Cistercian priory, one of the finest religious antiquities of the Hebrides, after those of Iona. Of ancient castles, may be mentioned Dunstaffnage, at the entrance of Loch Eive, a square building in a ruinous state, with round towers at three of the corners, having an old chapel of elegant workmanship near it; Ardtermish or Ardnornish, on the sound of Mull; Skipnish in Cantire, Kilchurn at the east end of Loch Awe, and others; Inverary castle will be mentioned in the article INVERARY. There are in different places of the coast old 'Duns' or Danish forts. Drumhead circles, more or less complete, and cairns, are to be seen in different parts. Of natural curiosities, besides Staffa with its basaltic columns and cave [see STAFFA], may be noticed some singular caverns in the parishes of Loch-Goyle-head and Strachur, both in Cowal.

After undergoing a variety of political changes, we find, in the middle ages, the territory of Argyle subject to thames, powerful and in fact independent. The lordship of Argyle, with Mull and the islands north of it, were subject to the M'Dougals of Lorn: Isla, Cantire, and the southern islands to the M'Donalds, known by the style of 'Lords of the Isles,' or 'Earls of Ross.' The nominal allegiance of these last to the kings of Scotland was unsteady; but their power was broken in the reign of James III., towards the latter part of the fifteenth century. The acquisition of Lorn by the Stuart family, by marriage, and the erection of the earldom of Argyle in favour of the Campbells of Loch Awe, weakened their sway still further, and produced the diminution, and at last the annihilation of it. In 1611 the M'Donalds rose in insurrection to oppose the grant of Cantire to the Earl of Argyle and his relations, but the power of the Campbells prevailed. In 1718 all heritable jurisdictions were abolished by act of parliament, and civilization has subsequently made great advances.

The Gaelic language still predominates in Argyle; but in Inverary, though in the Highlands, English is as much spoken as Gaelic. (Smith's *General View of the Agriculture of Argyle*, 1798; *General Report of Scotland*, drawn

up under the direction of Sir John Sinclair, 1811; *Parliamentary Papers*; Pennant's *Tour in Scotland*, 1774; and *Voyage to the Hebrides*.)

ARGYLE, a subdivision of the county so called. [See ARGYLE, SHIRE OF.]

ARGYLE, DUKES AND MARQUIS OF. [See CAMPBELL.]

ARGYRO (or ARGHIRO) CASTRO, an important town in the inland part of Albania, in European Turkey. It is in the fertile valley or district of Deropul, a name which appears to be sometimes applied to the town itself, and to the river which waters the valley.

Argyro Castro is built upon the declivity of the mountains which enclose the valley on the south-west side, and is not far from the river already mentioned, to which it gives name, and which is a branch of the Vouissæ, or Bojessa. [See ALBANIA.] Several deep ravines approach each other at this spot, and the houses crown the summits of the steep and narrow ridges which separate them. Upon three of these ridges the greatest part of the town is placed. The central ridge is surmounted by the castle built by Ali Pasha, which is of great extent, and, with reference to Turkish warfare, strong. The included area of the castle, owing to the form of the ridge on which it stands, is very long and narrow, and the walls, though thick, were built in too great haste. The ground on which it stands is high and steep, but appears to be commanded by some of the neighbouring heights on which parts of the town are situated. Ali erected a seraglio, or palace, within this castle, and there are also a mosque, barracks for 5000 troops, and subterranean magazines of ammunition and provisions. Water is brought to the town generally, and also to the castle, a distance of six miles, by an aqueduct.

The situation of the town renders the streets so steep, that horsemen must dismount in order to proceed with safety, but it gives an air of magnificence to the place, which is increased by the size of some of the Turkish houses. The sides of the chasms, or ravines, are lined with houses intermingled with trees, shrubs, and gardens; but the mountain torrents, which, after the melting of the snow, sweep through these ravines, sometimes occasion fearful devastation.

The houses were estimated, when Dr. Holland visited the town in 1813, at 1000, and the inhabitants at 20,000, which agrees with the estimate of Sir John Hobhouse, who travelled in the country, though he did not visit the town itself, about three years and a half before. Mr. Hughes, who visited Argyro Castro about the same time as Dr. Holland, says, the inhabitants were computed at about 15,000. The trade of the town, which, before its reduction by Ali Pasha, was the principal depot for the internal commerce of the district, appears to have been considerably less. M. Balbi states the population very vaguely at 4000 to 9000.

The distance of this town from Joannina is computed at fifty miles by Dr. Holland, and by Mr. Hughes at twenty hours' journey N. W. Mr. Hughes states, that it is not on the site of the ancient town, which had successively the names of Phanote, Hadrianopolis, or Justinianopolis.

Previous to the winter of 1811-1812, Argyro Castro appears to have enjoyed a considerable degree of independence. The chief power had been divided, as in many towns in Albania, among the principal families. Ali Pasha attacked it in vain, till the time above mentioned. About that period, he contrived to inveigle away the bravest and most warlike of the inhabitants, and seized many of the merchants who were scattered about the country. The chiefs of this and some neighbouring parts assembled their forces to oppose him, but were defeated near Delvina, another Albanian town some miles to the south. Argyro Castro soon afterwards surrendered, and Ali built the fortress noticed above. When he was attacked by the forces of the Grand Seignor, this strong hold was given up to the Turks by his son Mouetar, who deserted him in his hour of need.

Most of the people of Argyro Castro are Turks or Albanians, who profess the Mohammedan religion. The number of Greek families is very small: they have a bishop, and are remarkable for their courtesy and agreeable manner to strangers. (Hobhouse's, Holland's, and Hughes's *Travels*; Leake's *Researches in Greece*.)

ARIA, the name of a province of the ancient Persian empire. It formed part of the country of Ariana, or Iran.

• From this name Deropul seems to be a derivation. See Leake's *Researches*

and bordered in the north upon the Tapuri, Margiana, and Bactriana, in the east upon the Paropamisadæ, and in the south and west upon Drangiana, Karmania, and Parthia. Its situation corresponds to that of the modern Sejestan and the southern part of Khorasan. Strabo (xi. c. 10) calls Aria and Margiana the best provinces of this part of the earth. They are, he says, watered by the rivers Arius and Margos. The former of these, called also Arias, Arcios, or Arrianos, is described by Arrian (iv. c. 6) as a river not less than the Peneios of Thessalia, yet losing itself in the ground. This account answers to the present Heri-Rud. The Margos is supposed to be the modern Murghab.

The remark of Strabo, that Aria is 2000 stadia in length and 300 in breadth, can be understood only as applying to the principal part of the province, probably the valley of the river Arius, which seems to have been early celebrated for its fertility.

Herodotus does not mention the country of Aria, but he enumerates the Aarii (*Ἀαριοί*) as constituting, together with the Parthi, the Chorasmii, and the Sogdi, the sixteenth of the twenty satrapies into which Darius divided the Persian empire. (Herod. iii. c. 93.) The ancient name of the Medi was Aarii (*Ἀαριοί*). (Herod. vii. 62.) Lassen (*Indische Bibliothek*, vol. iii. p. 71) supposes the name of the Aarii to be etymologically identical with the word *Arya*, by which the followers of the Brahmanic religion are designated in Sanscrit.

The importance of Aria, and the advantages which its situation affords to commerce, could not be attested by higher authority than that of Alexander the Great, who here founded a town, named Alexandria Ariôn (Alexandria of the Aarii). The situation of this town it is difficult to determine, in consequence of the discrepant statements concerning it found in ancient authors. Ptolemy (*Geogr.* vi. 17) places Alexandria near the lake Arius, and conformably to this information D'Anville fixed its position at a place now named Corra, on the western side of the lake Zerrah. Pliny (*Hist. Nat.* vi. 23) says, that Alexandria Ariôn was washed by the river Arius; and if we take this Arius to be the present Heri-Rud, the position of Alexandria will answer that of the present Herat. Besides the popular belief now prevalent in the East, which is in favour of this opinion, it is also supported by Eratosthenes' statement of the distance of Alexandria Ariôn from Baktra = 3870 stadia, and from the Caspiæ Pylæ = 6400 stadia (Strabo, xi. c. 8), which it would be impossible to reconcile with the assumption that Alexandria was near the lake Zerrah. (See St. Croix, *Examen Critique des Historiens d'Alexandre*, p. 822, &c.) Mannert, who takes the river Arius to be the present Ferrah-Rud, supposes the present village of Pulki, at the south-eastern turn of the river Hirmend, to answer the situation of Alexandria.

The capital of the Aarii, at the time of the Macedonian conquest, was Arctoana: thus the name is written in the best (the Florentine) MS. of Arrian: others have Artacoana; Mannert prefers Artacuan, or Artacabane, from Pliny and Isidor. It must have been situated considerably to the north, as Alexander was able to reach it within two days from his march against Baktra (Arrian, iii. 25). Ptolemy places it at no great distance from Alexandria; and Mannert, assuming the southern position of the latter town, seems inclined to think that the extensive ruins of an ancient town, discovered by Christie, at Dushak, near the river Hirmend, are those of Arctoana. [See ARIANA.]

A'RIA, in music (Ital. *air*). [See AIR.]

ARIA'NA is the general appellation given by ancient authors, subsequent to the age of Alexander the Great, to the eastern portion of those countries which form the high-land of Persia. According to Eratosthenes (quoted by Strabo, p. 723, Casaub.: tom. iii. p. 310, edit. Tauchn.), Ariana was bounded on the north by the Paropamisus mountains and their western continuation as far as the Caspiæ Pylæ; on the south by the Great Sea (the Indian Ocean); on the east by the river Indus, and on the west by the chain of hills which separate Parthylene from Media, and Karmania from Parthakene and Persis. Its shape is by Strabo (l. c., p. 304, 305) compared to that of a parallelogram, the dimensions of which, reckoned from the mouths of the Indus to the Paropamisus, he estimates at 12,000 or 13,000 stadia; and in a straight line from the upper Indus to the Caspiæ Pylæ, on the authority of Eratosthenes, at 14,000 stadia (Strabo, i. c. 4, tom. i. p. 101, edit. Tauchn.); the length of the southern sea-coast from the mouths of the Indus to the entrance of the Persian Gulf is stated at 12,900 stadia.

(Strabo, xv. c. 2, tom. iii. p. 305). The total of the distances on a road from the Caspiæ Pylæ by way of Hekatompylos, Alexandria in Aria, Prophthasia, Arachoti (the town), and Ortospana, to the confines of India, is in one passage of Strabo (xi. c. 8, tom. ii. p. 434, 435) reported, on the authority of Eratosthenes, to be 15,500 stadia, in another passage (xv. c. 2, tom. iii. p. 310), on the same authority, only 15,300: the latter appears more correct, as it approaches nearer to the sum of the single distances enumerated which amounts to no more than 15,210 stadia.

Strabo observes (p. 724: l. iii. p. 311), that the name Ariana is sometimes used so as to extend beyond the limits above assigned to it, and to comprehend part of the Persæ and Medi, and, towards the north, part of the Bactrii and Sogdiani; 'for these,' says he, 'have very nearly the same language (as that spoken in Ariana).'

The countries properly belonging to Ariana are, according to Strabo, in the east, the Paropamisadæ, the Arachoti, and Gedroseni along the Indus, proceeding from north to south; the Drangæ towards the west of the Arachoti and Gedroseni; the Aarii towards the west of the Paropamisadæ, but extending considerably to the west and south, so as nearly to encompass the Drangæ; the Parthyæi west of the Aarii, towards the Caspiæ Pylæ; and Karmania to the south of the Parthyæi. It is observed by Mannert, *Geographie der Griechen und Römer*, vol. v. part ii. p. 3, 4, that ancient authors sometimes confound Ariana with Aria, saying of the province what can only be understood as applying to the entire country.

The original form of the name Ariana in the Zend or ancient Persian language is *Airyâne*. From this seems to be derived the modern Persian name Iran, by which oriental writers designate the country between the Tigris, the Persian Gulf, the Oxus or Gihon, and the Indus. M. Eugène Burnouf (*Commentaire sur le Yagna*, vol. i. notes, p. 62) thinks that, in some passages of the Zend-Avesta, the word *Airya*, properly the name of the province Aria, must be taken as synonymous with *Airyâne* or Ariana. He observes that the countries not belonging to Airyâne are, in the Zend-Avesta, called *Anairyânô Danhâvô* (pronounce Dang-hâvô) i. e. Non-Arian provinces: a name regularly formed from *Airya* by means of the prefixed negative *a* (*an*), which is also used in Greek and Sanscrit. An expression of analogous form and import had long since been read by De Sacy (*Mémoires sur diverses Antiquités de la Perse*, p. 54, &c.) in one of the Greek inscriptions of Naksbi Rustam copied by Niebuhr, where the Sassanide king, Sapor, son of Arde-hir, is called the king of the Arians and Non-Arians (*APIANON KAI ANAPIANON*).

ARIA'NO, a town in the province of Principato Ultra in the kingdom of Naples, and a bishop's see. It is situated on a very steep hill on the main road from Naples to Puglia, and in the highest point of the pass leading over the Apennine ridge into the plains of the latter country. From Ariano the road descends rapidly, following the course of the Cervaro, here a mountain stream, which flows eastwards, and enters the flats of Puglia a little beyond Ponte di Bovino. Ariano is forty-four miles E.N.E. of Naples, and thirty-two miles S.W. of the town of Foggia, in 41° 8' N. lat. and 15° 1' E. long. The road distance from Naples to Foggia, through Ariano, is about ninety English miles. It was built by the Greek governors of Apulia under the lower empire, as well as the neighbouring town of Troja, and was reckoned important during the subsequent vicissitudes of the country on account of its situation, which enabled it to command the pass from the eastern into the western provinces. It was made a feudal county by the Normans. Ruggiero I., king of Sicily and Duke of Apulia, held at Ariano a parliament of the barons of the kingdom in 1140, in which he fixed the new coin of the realm. Ariano had a castle, which was considered strong in those times, and was repeatedly taken and retaken during the wars of the Norman, Suabian, Angevin, and Aragonese dynasties. In the reign of Joanna II. the famous Sforza Attendolo bore the title of Count of Ariano. The fief subsequently reverted to the crown, and Ariano became a royal town. It has long since declined from its former importance. It has suffered greatly from earthquakes, especially that of 1732. Its population in the last century amounted to 14,000, but is now under 10,000. A recent visitor informs us that the population now can hardly exceed 7000.

Close to Ariano, and between that town and the head of the valley of Bovino, there is a village occupied by an Al-

banian colony, a remarkably handsome race. They retain the use of their own language among themselves, but they can also speak that of the country. (Vitale, *Storia della Città d'Ariano*.)

ARIANS, a name applied in common to all who entertain opinions concerning the relation between Jesus Christ and the Father similar to those entertained by Arius, although they have not always derived their notions from him. According to the second oration of Athanasius against the Arians (§ 24), Eusebius of Nicomedia, Asterius, and Arius, agreed in the following opinion: God being willing to create the universe, and seeing that it could not be subject to the working of his almighty hand, made first a single being whom he called Son, or Logos, to be a link between God and the world, by whom the whole universe was created. (Compare Athanas. *c. Arian*, i. § 5.) The Arians formed a more exalted idea of Christ than the Socinians and the modern Neologians, or Rationalists, in Germany. According to the Rationalists, Jesus was a sort of Socrates among the Jews, and Socrates was a Grecian Jesus. But the Arians did not deny that Christ, in the New Testament, was called God, and they ascribed to him a sort of divine dignity: but asserted that he had this dignity, not by his own essence, but merely by the grace of God the Father. (Athanas. *Orat. c. Arian*, i. § 6.) The Arians fully admitted the incomprehensibility of God, and that Christians ought to pay divine worship to Jesus Christ. This they proved from Christ's saying, 'That all men should honour the Son, even as they honour the Father. He that honoureth not the Son, honoureth not the Father who hath sent him.' (St. John, v. 23.) Hence the Arians were accused by Athanasius of idolatry, because, according to their own notions, they offered to a creature that tribute which belonged to the Creator alone. The Arians distinguished the Logos in God from the Logos improperly so called.

These were the characteristic doctrines of the strict Arians. But in the western part of the Roman empire, all adversaries of the doctrine of Athanasius, that the Son was *homoousios*, or of the same essence with the Father, were called Arians; although some of these opponents taught a doctrine which had already been propagated in the school of Origen, namely, that the Son was *homoiousios*, or of similar essence. These, afterwards called semi-Arians, were first compelled, by the opposition of the Homoousia-sts, to join the Arians, but, owing to the persecutions which they suffered from the strict Arians (who asserted the Son to be *ἀνόμοιος κατ' οὐσίαν*, dissimilar in essence), they were driven back into the orthodox church. The party of Aëtius, and of his pupil, Eunomius, went a step farther than Arius, by asserting the comprehensibility of the divine essence, and by considering the precision of doctrine (*κοινωνία ἀκριβείας*) of chief importance in Christianity. The Antiochene church, under the Arian bishop Eudoxius, afforded an asylum to the ultra-Arian followers of Eunomius. The difference between Arians and semi-Arians became more evident from these extreme opinions, and contributed to the gradual assimilation of the latter to the orthodox church. This assimilation was easily effected, because the semi-Arians had constantly used an orthodox phraseology, which was taken by the people in an orthodox sense. According to Hilarius Pictaviensis *contra Aurentium* (§ 6), the ears of the people were holier than the hearts of their priests. At Constantinople, however, a dogmatizing spirit pervaded all ranks of society. Of this we have a graphic description in the *Oratio de Deitate Filii et Spiritus Sancti*, by Gregorius of Nyssa (Opp. t. iii. p. 466). 'The town is full of those who dogmatize concerning incomprehensible matters,—they are in the streets and markets, among the clothiers, money-changers, and victuallers. If you ask any one how much you have to pay, they dogmatize about being begotten and not being begotten. If you ask the price of bread, the reply is, "The Father is greater than the Son, and the Son is subordinate to the Father." If you ask, "Is the bath ready?" the answer is, "The Son is created from nothing." (Compare Neander's *Kirchengeschichte*, b. ii. pp. 767-904.) [See ARIUS, ATHANASIUS, EUNOMIUS, GREGORIUS of Nazianzen, GREGORIUS of Nyssa, BASILIUS.]

ARIARA'THES. [See CAPPADOCIA.]

ARIAS MONTANUS (BENEDICTUS), in Spanish BENITO ARIAS MONTAÑO, was a celebrated catholic divine and orientalist, who possessed vast erudition in Jewish antiquities, and chiefly distinguished himself as editor and interpreter of the sacred Scriptures. He was born, in 1527,

of noble, but poor parents, in a village called Frexenal de la Sierra, which is situated in the province of Estremadura, near the Andalusian border, in a mountainous district; and hence his surname Montano. He also used to style himself Hispalensis, because at Sevilla (Hispalis) he laid the foundation of his future eminence as a scholar. During his stay at Sevilla he was supported by the magistrates of the city and other kind patrons: subsequently he took up his residence at Alcala de Henares (Complutum), and there obtained the degree of Doctor of Divinity. He specially devoted himself to the study of Scripture in the original languages, and in general to that circle of philosophy which is connected with these tongues. He acquired a knowledge of the Arabic, the Syriac, and the Chaldaic, which, for that age, was truly surprising: at a later period, while journeying through France, England, Italy, Germany, and the Netherlands, he acquired the knowledge of several modern tongues. He himself, as well as several of his contemporaries, seems to have considered it a wonderful accomplishment, as no doubt it was in that age, to know ten languages. On account of his great scholarship, the bishop of Segovia, Martin Perez Ayala, took him for his companion to the Council of Trent, where he had his share in some of the most important transactions. After his return to his own country he determined to live in seclusion and devote his time to literature, and for this purpose chose a small place in the mountains of Andalusia, near Aracena, as his residence. But he made no long stay in this retreat, being invited by Philip II. to superintend the splendid and expensive edition of the *Polyglott Bible*, which, at the suggestion of a most diligent and enlightened printer, Christopher Plantin, was to be executed at Antwerp. Arias accordingly set out for Antwerp, in 1568, provided with the most honourable recommendations to the governor of the Netherlands, the Duke Ferdinand of Alba, so disadvantageously known for his cruelty and tyrannical administration. Arias devoted four years to this undertaking, and had the pleasure of presenting the finished work to Pope Gregory XIII. in 1572. During his sojourn in the Netherlands, he was also president of the committee, which, by the Duke of Alba's order, prepared the *Index Expurgatorius*. The edition of the Polyglott Bible which Arias gave to the world, in every respect justified the high expectation which had been formed of it; but in an unfortunate voyage from the Netherlands to Spain nearly all the copies were lost. The king, however, remunerated Arias's labours very splendidly, giving him a yearly pension of two thousand ducats, besides other honorary rewards and lucrative offices. Arias was an upright, sincerely orthodox catholic, but he was a declared enemy of the Jesuits, and that ambitious order omitted no opportunity to take revenge on so dangerous a foe—the more powerful, because his orthodoxy had never been questioned, and was supported by uncommon erudition. His *Antwerp Polyglott* had received the approbation and praise of the pope, and even that of the most eminent catholic universities; yet because he had edited the Chaldaic paraphrase in the Polyglott, and expressed certain opinions in his commentaries, he was accused of a leaning towards Judaism, and, in fact, of heresy in general. He was even in danger of falling into the hands of the Inquisition, and was obliged several times to go to Rome in order to defend himself. Having cleared himself of these accusations, he devoted the remaining years of his life to literature, sometimes residing at Sevilla, sometimes at Aracena; he died at Sevilla, in the year 1598, as prior of the convent of St. Iago being then seventy-one years of age. His library, which was extensive, was incorporated in that of the Escorial, where, Schröckh says, some of his MSS. are still to be found. In respect to moral character, he enjoyed a high reputation for candour and blameless integrity.

Among Arias's numerous and extensive literary works, which chiefly belong to theological, but partly also to classical literature, his Polyglott certainly holds the principal place: it is generally called the *Antwerp Polyglott*; or, from the patronage bestowed on it by Philip II., *Biblia Regia* (the Royal Bible), and sometimes also after the printer, *Biblia Plantiniana*: a fuller notice respecting this great work, in eight folio volumes, will be found in the articles *BIBLE* and *POLYGLOTTS*.

Of Arias's other works the following are the most remarkable:

1. *Antiquitates Judaice*. Lugd. Batav., 1593, quarto.
2. *Liber Generationis et Regenerationis Adam, s. de His*

loria Generis Humani, operis magni pars prima, i.e. Anima. Antv., 1573, quarto. This is only a part of a Biblical Encyclopedia which Arias intended to write; another part of this work appeared after his death under the following title: 3. *Natura Historia, prima in magni operis corpore pars, Benedicto Aria Montano Descriptore.* Antv., 1601, quarto. 4. *Hyperi et Secula.* Antv., 1593, 16mo. (being a translation of the Psalms of David and the Ecclesiastes). 5. *Monumento Humane Salutis.* Antv., 1571, quarto. 6. *Speculum Vitæ et Passionis Christi.* Antv., 1573, octavo. 7. *David, Viridatis Eccreditissime probatum a Deo Spectaculum.* Francof., 1597, quarto. 8. *Dicatum Christianum, sive Auctus de Christi Vita et Doctrina Lobellus.* Antv., 1775, octavo. 9. *Aforismos sacros de la Historia de P. Cornelio Tacito, i.e. Aphorisms collected from Tacitus's History.* Barcelona, 1614, octavo.

He wrote, about the year 1569, an hexameter poem on rhetoric in four books; and he also edited the *Tour of the Jew Benjamin of Tudela*.

Sources for the biography of Arias Montanus are:

Nicolas Antonio, *Bibliotheca Hispanica*, tom. i. p. 162. 164. Nicéron, *Mémoires*, &c., à l'Histoire des Hommes illustres, tom. xxviii., p. 104. 118. J. Matth. Schröckh's *Lebensbeschreibungen berühmter Gelehrten*, one volume, p. 291-304 in the Leipz. edit. of 1790;—and Moreri's *Dictionnaire*, article *Arias*, where the Spanish translation of this great work is, as might be expected in the biography of a Spaniard, preferable to the French original.

ARICA, a district in the department of Arequipa, and the republic of Peru. The valley, which extends about eighteen miles from the coast into the lower chain of the Andes, is irrigated by a small stream of good clear water, about half a mile on each side of which the soil is fertile and the aspect verdant, but beyond this, as far as the eye can reach, is a complete desert of sand to the foot of the mountains, except a small space around the town. The valley is famous for Guinea pepper, which is principally cultivated with manure of 'guano,' or cormorants' dung, a singular but considerable branch of commerce, ten or twelve small vessels being employed in collecting it from the small islands along the coast. Cotton, olives, and castor oil are produced; fruit and vegetables are plentiful, and oxen and sheep may be procured; *aguardiente* (pirits) and a small white wine are manufactured, and rock salt is dug out of the adjacent mountains. The people of the valley are subject to a sort of ague called *tercena*, and the district is generally unhealthy; the heat is excessive by day, but the nights are very chilly.

Close to the beach, in a small bay formed by a projecting bluff, stands the town of Arica, once flourishing and populous; it was sacked by Sir Francis Drake in 1579, and, in common with other places in Peru, has suffered much from earthquakes, more particularly in November, 1607. It appears, however, successfully to have resisted the attacks of the Buccaneers, who twice attempted to reduce it. During the war of independence it was entirely desolated. It now consists of a few huts, the better sort built of sun-dried bricks, and plastered with mud, but mostly formed of canes or reeds set upright and bound together; these being only covered in with matting, the place appears at a little distance to be a heap of ruins. There is a custom-house, a convent of Franciscan friars, also one of the order of San Juan de Dios, and a parish church dedicated to St. Mark. The population does not exceed 500, the greater part of whom are Indians. The town is defended by two small forts of six guns each, and garrisoned by about fifty soldiers; it belongs to the see of Arequipa.

The bay is small, and safe, principally from the rare occurrence of storms; ships lie close to the shore in deep water; it is exposed to southerly and westerly winds, which seldom blow strong; but in winter time the north winds are violent. In the summer time the land and sea-breezes are very regular. There are no regular tides, but a rise and fall of about three feet, occasioned by the winds. The surf rolls so heavy on the beach, that ships' boats cannot land, and the only means of shipping or landing cargoes is on a *balza*, a float formed of two inflated seals' skins fastened together, and in this manner bars of silver, bags of gold and silver, and all goods, are conveyed to vessels in the bay.

Arica is the sea-port of Taena, distant thirty miles to the N.N.E.; most of the silver from the mines of Potosi was formerly shipped off hence to Lima, and much bullion is still exported.

Near the small bay of Chacota, south of Arica, a number of sepulchres of the ancient Peruvian inhabitants have been discovered, whence the bodies have been dug in a very perfect state, but almost reduced to skeletons, covered with a tough, dark, brown skin. Latitude of the town $18^{\circ} 28' S.$, longitude $70^{\circ} 13' W.$ Distant 185 leagues S.E. of Lima. (Basil Hall: *Orig. MS. of Captain Bauza*, Spanish navy.)

ARIES (constellation), the Ram, is the first constellation of the ancient zodiac. The sign of the zodiac, so called, including the first thirty degrees of the ecliptic, reckoning from the vernal equinox, owing to the precession of the equinoxes, now begins in the constellation Pices.

The Greek mythology makes Aries to be the commemoration of the golden fleece, in quest of which the Argonautic expedition was undertaken. [See ARGONAUTS.] Owing to the difficulty of separating any account of discussions relating to the origin of this constellation in particular, from the general description of the ZODIAC, we refer to the latter term for farther mythological elucidation.

This constellation is surrounded by Cetus, Taurus, Perseus, Andromeda, and Pices, the first of which is directly below it. In the horns are two stars, α and β , the only two of any note, which are near together, and may be found by continuing the line drawn from Procyon through Aldebaran; or, by continuing the line drawn through the pole star, and Cassiopeia, the nearest to the Great Bear of the five. These stars (α and β Aries) are on the meridian at midnight in the middle of October.

The principal stars are as follows. As before, a number without brackets is that of Flamsteed; in () that of Biazzi; in [] that of Bradley.

ARIES, in ancient military science, is the Latin name for the BAITING RAM.

ARIETTA, in music (the diminutive of the Italian word *aria*), a short air.

ARILLUS, in botany, is a fleshy expansion either of the umbilical cord by which seeds are attached to the placenta, or of the placenta itself. It is never formed till after the fertilization of the seed, and is only met with in a few plants; its use is entirely unknown. The most remarkable instance of the arillus among species of common occurrence is in the spindle tree, *Euonymus Europæus*, in which it is the fleshy red covering of the seed that renders that plant so ornamental in the autumn and beginning of winter. Another familiar case is the *mace* of the nutmeg; this substance is, when fresh, a crimson lacerated covering of the nut, which acquires its pale brown colour in consequence of the preparation it undergoes in being dried and prepared for market. Before the term was thus accurately defined, it was applied to a variety of parts of exceedingly different natures.

ARIMA'NES and AREIMA'NIOS are Greek corrup-

tions of the Persian name Ahriman or Aheriman, which, according to the ancient doctrine of Zoroaster, is the appellation of the author of evil, and the opponent of Ormuzd, who is the author of good. The genuine form of the word, as it occurs in the original text of the Zend-Avesta, is Anro-Mainyus (pronounce Angro-Mainyus), a compound term, the meaning of which might be expressed by perhaps an etymological equivalent in the Greek ἀποπερθε, 'hostile, of evil disposition.' The Zend original of the word Ormuzd is Ahuro-Mazdâ, coming near the forms Oromazes and Oromasdes, under which the name occurs in Greek authors (e. g., Plutarch, *de Iside et Osir.* p. 660, ed. Steph.) In the Sanscrit paraphrase of a portion of the Zend-Avesta by Neriassengh, the name Ahuro-Mazdâ is interpreted 'the king of great wisdom.' This interpretation is adopted by M. Eugène Burnouf, *Commentaire sur le Yagna*, vol. i. p. 72, &c.

The two individual beings Ormuzd and Ahriman were, according to the Zend-Avesta, the offspring of Zernane-Akerene, the indefinite and impersonal divine substance and cause of all existence. Both were primarily equal in intellect and power: but Ormuzd was, from the beginning, pure, good, and luminous; while Ahriman was dark and wicked, and bent on destruction and mischief. Ormuzd is represented as the creator of the world: Ahriman constantly counteracts the designs of his goodness. Ormuzd created the six Amshaspands, or ministering angels of good: Ahriman, in opposition, created the six Dairys to be subservient to his evil purposes. 'I produced,' says Ormuzd, 'a place of delight, Airyine-Vaejo, finer than the entire existing world. I acted first: then this evil one acted, whose soul is not mortal. The first place similar to paradise which I made, I who am Ormuzd, was Airyine Vaejo, created pure. Then this Paityare-Ahriman, full of death, produced in the river (which watered that country) the great snake of winter,' &c. (Anquetil du Perron's *Zend-Avesta*, vol. i. part 2, page 263, &c.) Thus Ormuzd is always taking the lead by pure and good productions, and Ahriman follows, sowing the seeds of natural and moral evil in the new creations. The struggle of the two deities will, according to the doctrine of Zoroaster, continue during 12,000 years, after the lapse of which Ormuzd will defeat his opponent, Ahriman himself will then become a convert to truth and goodness, and a new world, happier and better than the present, will be created.

We abstain from entering into further detail concerning the dogma of the contest between Ormuzd and Ahriman, as the original documents in the Zend language, from which alone authentic information on the subject can be derived, have but just begun to be critically examined, and much is still wanted to a full understanding of them. The translation by Anquetil du Perron, though of invaluable service to those who wish to follow up the inquiry, has been found too loose, and in some instances too incorrect to allow inferences on many subtle points of the ancient Persian faith to be drawn from it.

The Persian doctrine of the two opposite principles was known to Aristotle, who, according to Diogenes Laertius, (*De Vit. Philox. Proem.* 2), distinguished them as ἀγαθὸν *Capoor* and κακὸν *Capoor*.

The most ancient foreign authors that have given some interesting details regarding the doctrine of Zoroaster are the Armenian chroniclers of the fifth century, especially Elisæus and Esnæ. See Elisæus's *History of Vartan*, &c., translated by C. F. Neumann, London, 1830, 1to., and an extract from the Chronicle of Esnæ, in the appendix to P. Aucher's *Grammar, Armenian and English*, Venice, 1819, 8vo. p. 198, &c.

ARINS (or ARINNES), are the remains of a Siberian people who inhabit the banks of the Yenisei. They have been reduced to their present limited numbers by the successive cruelties of the Tartars, by consequent emigration to the regions inhabited by the Kirgishes, and by intermarriage with the Cutchin-Tartars and Otiaks. They reside in an *umak* or single district, under the superintendence of a *bachlik* or elder, by whom the tribute, fixed by the Russian government in 1733, is regularly paid. When Müller, the traveller, visited the spot, he found but one single individual amongst them who was capable of speaking the native dialect, which has some affinity to the Otiak: the rest of his brethren had adopted the Cutchin-Tartar tongue.

ARIOBARZANES. [See CARPADOCEIA.]

ARION, a native of Lesbos, the inventor of the dithy-

rambus, and a great musician, was contemporary with Pericles of Corinth, and with Alyattes, king of Lydia (c. 600-571). He travelled as far as Taras (Tarento) in Southern Italy, and acquired considerable wealth by his professional skill. (See his history, Herod. i. 23; and also *Elian. Hist. Anim.* vii. 15.)

ARIO'SO, in music (an Italian adjective, *adry*) used adverbially—in the manner of an air, as contradistinguished from recitative. When applied to instrumental music, it denotes a sustained, a vocal style. It is sometimes most improperly used substantively, and may be mentioned among the numerous instances of the misapplication of Italian words by English and German musicians.

ARIOSTO, LODOVICO, was born at Reggio, near Modena, September 8, 1474. He was the son of Niccolò Ario to di Ferrara, a military officer in the service of Duke Hercules I. d'Este, and governor of the citadel of Reggio: his mother, Daria Malaguzzi, was of a noble family of Reggio. Lodovico was the eldest born of a family of five brothers and five sisters. He early showed a disposition for poetry, and wrote in his boyhood a drama on the subject of Pyramus and Thisbe, which he and his brothers rehearsed before their parents. Lodovico, being designed for the profession of the law, was sent to Padua, where he spent five years, much again thus with in the study of that science: and his father, at last convinced of his distaste for this pursuit, recalled him home and allowed him to follow his own inclination. Lodovico was then past twenty, and being

From a bronze bust in the British Museum.

yet but little acquainted with the ancient writers, he put himself under the tuition of Gregorio da Spadeti, a learned scholar of the time, by whom it is stated he made great progress in Latin. He was proceeding to study Greek when his father was called away to Milan to be preceptor to the young Duke Stefano. Ariosto, however, studied Greek later in life. On the death of his father, about the year 1506, he found himself charged with the guardianship of his younger brothers and sisters, and the management of a very moderate patrimony—a task which he entered on with brotherly affliction, and which he fulfilled with integrity. In the midst of these cares he found time to write several lyric compositions, both in Italian and in Latin, by which he attracted the notice of Cardinal Ippolito d'Este, younger son of Hercules I. and brother to Alfonso, the heir to the ducal crown. The cardinal, in 1503, appointed Ariosto one of the gentlemen of his retinue, and soon discovering that his abilities were not confined to poetry, he employed him in important affairs and missions both for himself and for his brother Alfonso, after the latter became Duke of Ferrara, by the death of his father in 1505. Alfonso having joined, in 1509, the famous league of Cambray against the Venetian republic, Cardinal Ippolito took the command of his brother's troops, and Ariosto was present at the campaign of that year on the banks of the lower Po, the atrocities of which, perpetrated chiefly by the Slavonian mercenaries in the service of Venice, he feelingly describes at the beginning of the thirty-sixth canto of his great poem. In December of the same year, he was sent by the duke on a mission to Rome to request the assistance of Julius II. against the Venetians, but the pope, who had been the first mover in the league, had already changed his mind and become jealous of his French and German allies. Cardinal Ippolito, however, in the meantime defeated the Venetians and destroyed their flotilla on the Po, and the object of Ariosto's mission of course ceased.

The following year, 1510, Pope Julius, having openly

joined the Venetians against his former allies, excommunicated the Duke of Ferrara for refusing to follow his example, and assembled an army in the Romagna to attack Alfonso's territories. Ariosto was now sent again to deprecate the wrath of the pontiff; but not succeeding, he was obliged to make a hasty escape from Rome, as the pope had threatened to have him thrown into the Tiber, a threat which he was not unlikely to have carried into effect. The war continued, between the Duke of Ferrara and the French on one side, and the Venetians, the pope, and the Swiss on the other, till the death of Julius, in the beginning of 1513, delivered Alfonso from his bitterest enemy. Cardinal Giovanni de' Medici being raised to the pontifical throne, by the name of Leo X., Ariosto went to Rome, to congratulate the new pope, whom he had familiarly known at Florence and at Urbino. Leo received him most graciously. 'He stooped from his pontifical chair, took him by the hand, and saluted him on both cheeks' (Ariosto, *Satira* iv). Ariosto thought his fortune made; but he had not enough of courtly patience and perseverance. He soon grew tired of waiting for more substantial demonstrations of favour, left Rome in disgust, and returned to Ferrara to resume his studies. He had long before this begun a poem, in *ottava rima*, on the fabulous adventures of the knights and paladins, Moors and Christians, of Charlemagne's age, an inexhaustible theme, which had occupied the pens of many Spanish, French, and Italian ballad and romance writers.

In Italy, Pulci, Bojardo, and Bello had each written a poem on the wars between Charlemagne and the Saracens, which tradition had confounded with the previous wars of Charles Martel and Pepin, and in which Orlando, or Roland, appeared as a prominent character, and the champion of the Christians. Bojardo took Orlando for the hero of his poem, and made him fall in love with Angelica, an infidel princess, of exquisite beauty and of consummate coquetry, who had come all the way from Asia for the purpose of sowing dissension among the Christian knights. Bojardo introduced numerous episodes into his narrative, in the midst of which he broke off the story of Angelica, in the fiftieth canto of his *Orlando Innamorato*, and never resumed it, although he had carried his poem to the sixty-ninth canto at the time of his death. Ariosto took up the thread of Angelica's story where Bojardo had left it, and making the jilt fall in love herself with Medoro, an obscure youthful squire, he represents Orlando as driven mad by jealousy and indignation: he continues in this state during the greater part of the poem, committing a thousand absurdities, until he is restored to reason by Astolfo, who brings back his wits in a phial from the moon. Orlando's madness, however, is rather terrific and lamentable than ludicrous; for the poet, often jovial and humorous in his episodes, never loses sight of the dignity of his narrative, nor descends to the low burlesque. But the madness of Orlando is not the principal subject of the poem, although it has furnished the name for it: the war between Charlemagne and the Saracens is continued throughout the narrative, of which it forms a most important and consecutive action, ending with the expulsion of the Moors from France, and the subsequent death of their king Agramante and their other chiefs. The poet has interwoven with these a third subject, which some critics, who are determined to find a unity of action in a poem which is not an epic, have assumed to be the principal one, namely, the loves of Ruggiero, a young Saracen knight born of Christian parents, and Bradamante, a Christian amazon, and Rinaldo's sister. These two characters had been already introduced by Bojardo in his *Innamorato*, and Ariosto followed up the story of their mutual attachment; after numerous adventures, crosses, and narrow escapes, he makes them marry in the last or forty-sixth canto of the poem, and from their union he derives the genealogy of the house of Este.

Intermixed with these three subjects or tales are numerous and some long episodes of knights and damsels, of their fights and loves, of their strange adventures, some heroic, some ludicrous, and others pathetic; there are magicians and giants, enchanted palaces and gardens, flying horses and harpies, and other monsters: and the reader finds himself in the midst of a new world, created as it were by the wand of an enchanter. The poet has the art of sketching and particularizing every creature of his fancy with features and attributes so apparently appropriate and consistent with their supposed nature as to remove the feeling of

their improbability. He appears himself deeply interested in his fantastic creation, and at times so entangled in his own labyrinth, that he loses himself, as he ingenuously confesses, and is obliged to break off in the midst of a most interesting story, to run after some other personages, whom he left in a desert island, or on a dangerous voyage, or on the eve of a mortal combat, and to bring them again to the view of his readers. Yet he contrives to wind off all his threads at last with admirable skill. It is not always an easy thing to follow such a guide; but we wander along from tale to tale, from description to description, delighted with the present, and unconscious of the ultimate object of our journey. Such is the *Orlando Furioso* (as far as an idea of it can be given in a few words), the first of all the poems of chivalry and romance. A knowledge of Bojardo's *Innamorato* is, however, required for the proper understanding of the *Furioso*. In both poems there are licentious passages, which render them unfit for the perusal of youth.

Ariosto, after spending ten years in writing his poem, published it in one volume quarto, at Ferrara, in April, 1516, in forty cantos, which he afterwards increased to forty-six. He sold 100 copies of it to the bookseller Gigli of Ferrara, for 28 scudi: about 15 pence per copy. He dedicated it to Cardinal Ippolito, who, after perusing it, is said to have asked 'where he had picked up so many absurdities?' Whether this be true or not, it is certain that Ariosto gained no favour with his patron by his work, in which he had introduced his praises and those of his family in so many places. But the Cardinal had no taste for poetry; he was a busy man of the world, and he told Ariosto that 'he would have felt better satisfied if, instead of praising him in idle verse, he had been more assiduous in his service.' (Ariosto, *Satira* ii.)

In 1517, the Cardinal, being about to set off for Gran in Hungary, of which he was archbishop, asked Ariosto to follow him there, but the poet excused himself on the plea of his health, which was very delicate. His brother Alessandro, however, accompanied the Cardinal. The consequence of Ariosto's refusal was, that his patron was offended, and some time after his departure a small pension which he had allowed him was stopped. After the Cardinal's death, in 1520, Ariosto was called by the Duke Alfonso to his own service, in which he always experienced the kindest treatment. It ought to be observed, in justice to Cardinal d'Este, that, although he showed no sympathy for the poetical merits of Ariosto, it was he, nevertheless, who first patronised and brought him into notice, and introduced him to his brother, to the Medici, and other great men of his time; and that, had it not been for Cardinal Ippolito, Ariosto probably would not have had the leisure, the spirit, or the means of writing and printing his poem, at a time when the patronage of the great was a necessary encouragement to an author. The trifling pension of twenty-five scudi every four months, which Ariosto mentions as being stopped, was not the only remuneration which he had from the Cardinal: through his interest he enjoyed certain ecclesiastical perquisites, such as one-third of the profits of the archiepiscopal chancellor of Milan (about 100 scudi yearly), although he was not ordained priest nor even subdeacon, but, had only taken the minor orders which are not attended by binding vows, and wore the clerical dress. (Ariosto, *Satira* ii. and iii., and also Mazzuchelli, *Scrittori d'Italia*, Biography of Ariosto.) Ariosto had also the reversion of the rectorship of Sant'Agata, in Romagna, the incumbent, an old maternal relative, having made it over to him. We ought not to judge of Ariosto's permanent feelings towards his patrons from the fits of poetical querulousness in which he occasionally indulges in his satires, for in the very midst of them we can perceive much grateful regard and affection for both the Cardinal and the Duke. The Duke indeed, by Ariosto's own acknowledgment, behaved liberally to him. Through his munificence the poet was enabled to build himself a house surrounded by a pleasant garden, opposite the church of S. Benedetto, at Ferrara. In February, 1521, Ariosto published a second edition of his poems with many corrections; but still in forty cantos only; this edition is now extremely rare, even more so than the first.

In 1522, having applied to the Duke for some more active and lucrative employment, he was sent as governor to the mountain district of Garfagnana, a dependency of Modena, situated on the western slope of the Apennines, and bordering upon Lucca. This country had just returned to the allegiance of the House of Este, after having been occupied by the Pope and the Florentines. The people

were restless and quarrelsome, and the mountains were infested with outlaws. Ariosto humorously describes the troubles of his government in his fifth Satire. He remained nearly three years at Castelfnuovo, the chief town of the district, during which he seems to have conciliated the minds of that rude population, and to have restored order among them. Being once stopped in the mountains by a band of robbers, his name and reputation proved his protection; the outlaws, on learning who he was, showed him much respect, and offered to escort him wherever he chose. In 1523 the Duke proposed to send him as ambassador to Clement VII., who had just been elected Pope: but Ariosto declined the mission, having been disappointed with Rome and the Medici once before (*Satira vii*). In 1524, he returned from his government to Ferrara, where it appears he remained ever after, nominally in the Duke's service, but enjoying leisure for his studies. He now wrote his comedies, which were performed with great splendour before the court, in a theatre which the Duke built for the purpose. In October, 1532, Ariosto, after correcting and revising his poem for sixteen years, published the third edition in forty-six cantos, which, in spite of some misprints of which Ariosto bitterly complains, remains the legitimate text of the *Orlando Furioso*. The six entire cantos which he added, are the 33rd, 37th, 39th, 42nd, 44th, and 45th, besides several stanzas here and there added to the other cantos. Some stanzas he wrote in twenty different ways before he fixed upon the present text. The apparent ease of Ariosto's verse is the result of much labour. Scarcely had Ariosto completed his third edition, when he found himself grievously ill with a painful internal complaint, which brought on a decline, and at last, death. It was remarked, that on the night preceding the last day of the year, on which his illness first assumed a serious character, a fire broke out in a wing of the ducal palace, and burnt the great hall and the theatre which had been constructed for the performance of his plays. After lingering several months, Ariosto died on the 6th of June, 1533, in his 59th year. He was buried without any pomp in the old church of San Benedetto, attended by the monks, who volunteered to do honour to his remains. Forty years later, after the church had been rebuilt, Agostino Mosti, of Ferrara, who had studied in his youth under Ariosto, raised a handsome monument to him in the chapel, which is to the right of the great altar, to which spot the poet's bones were transferred with great solemnity. In 1612, Lodovico Ariosto, grand nephew of the poet, raised another monument to his memory more magnificent than the first, in the other chapel to the left of the great altar, to which place Ariosto's remains were finally removed.

Besides the three Ferrara editions above mentioned, printed under Ariosto's superintendence, several reprints of his poem were published in various parts of Italy in his lifetime. Numerous editions followed after his death; all, however, more or less incorrect, and some of them purposely altered and mutilated. The Aldine edition, of 1545, is one of the best of that age; it is also the first that contains five additional cantos, which are the beginning of a new poem, and were left in MSS. by the author, and delivered by his son Virginio to Antonio Manuzio. G. A. Barotti edited all Ariosto's works, Venice, 1766, six volumes, duodecimo, with many corrections and illustrations, and a life of the poet. Baskerville's edition, 1773, four volumes, octavo, with plates by Bartolozzi, is also much esteemed. The edition of the *Classici Italiani*, five volumes octavo, Milano, 1812-14, is valuable for the *varianti* added to every canto, which the editor Reina has taken from the first two editions of 1516 and 1521. But the best modern edition of the *Orlando Furioso* is that of Milan, 1818, in quarto, in which the learned editor Morali has faithfully restored the original text of 1532. The *Orlando Furioso* has been translated into most European languages, though seldom successfully. Of the English translations, that by Harrington is spirited and much superior to Hoole's, but the recent one by Mr. S. Rose is considered the best, and is generally faithful.

Ariosto is considered one of the best Italian satirists. The tone of his satires resembles that of Horace rather than that of Juvenal. He introduces several of the principal occurrences of his life, and exhibits the manners and vices of his time and country. He speaks of popes, princes, and cardinals, with great freedom, but in language generally, though not always, decorous. His satires, seven in number, and addressed to his brothers and other friends, were first published in 1534, after his death, and have been

often reprinted, both separately and with the rest of his works. He wrote five comedies in blank verse, *La Casaria*, *I Suppositi*, *La Lena*, *Il Negromante*, and *La Scodasfina*. Cardinal Bibbiena, Ariosto, and Machiavelli, all three contemporaries, were the first writers of regular comedy in Italy. They adopted the manner of Plautus and Terence: they preserved the unities, and made their plots turn chiefly upon the intrigues and stratagems practised by dissipated and needy young men, assisted by worthless domestics, to deceive an old miser, a jealous husband or father, or a watchful guardian of some good-natured beauty. The language is often grossly indecent, and yet these plays were performed before the court and chivalry of those times. There are some other minor works of Ariosto, consisting of *canzoni*, *capitoli in terza rima*, sonnets, and a curious eclogue which has long remained inedited: it was composed in 1506, on the occasion of a conspiracy being discovered against the life of Duke Alfonso by his two brothers Ferrante and Giulio. There are also some short Latin poems on various subjects, and an epithalamium on Alfonso's marriage with the famous Lucrezia Borgia. They are all found in the Venice editions of Ariosto's works of 1741 and 1766, edited by Barotti.

Ariosto left two natural sons, Virginio, whom he had legitimated by public act in 1530, and who afterwards became a canon of the cathedral of Ferrara; and Giovanbattista, who was made a captain in the Duke's service. The number of commentators, critics, and biographers of Ariosto, is very great: some of the best have been mentioned in the course of this article. Baruffaldi junior has also written a life of Ariosto: Ferrara, 1807.

ARISH, or EL ARISH, a small town on a slight eminence about half a mile from the shore of the Mediterranean, and on the usual road from Egypt to Syria, 31° 5' N. lat.: 34° 48' E. long. There are some wells near it, and some clumps of palm-trees between the town and the sea. They not (*Voyage de Levant*, p. 360) describes the castle, in his time, as being well built of small stones; and he says there were so many fine ancient columns at Arish, that the inhabitants made their coffee-houses and their wells of them, and the cemeteries also were filled with such remains. There are still some Roman ruins, and several marble columns at Arish. (Mangles and Erby.) Arish is the site of the ancient Rhinocolura, which was often considered a kind of frontier town between Egypt and Syria; and, in connexion with Petra in the interior, was an entrepôt of some importance (Strabo, 781). It stands on a small inlet of the sea, and near a scanty stream of water. The French took possession of it in February, 1799, in their expedition to Egypt, and kept it for some time.

It was at Arish that Sir Sydney Smith concluded a convention with the French army, allowing them to return to France with their baggage and arms, which was subsequently disavowed by the British government.

ARISTÆNETUS, a Greek writer, a native of Nicæa, whose epoch is not capable of being accurately determined. It has been conjectured that the Aristænetus to whom are attributed the *Erotic or Love Letters* (*Ἐρωτικὰ ἱστορικά*) is the person to whom several of the letters of Libanius are addressed, and who lost his life in the earthquake at Nicomedia, A.D. 358: some are inclined to place him at a later epoch.

These Letters, of which there are two books, are a species of rhetorical exercise, and not real letters; they often exhibit very bad taste, but are of some value as presenting a picture of the manners, or at least of the literature, of the age. The latest and best edition is by Boissonade, Paris, 1822, 8vo. There is a German translation of Aristænetus by Herel, Altenburg, 1778, 8vo.: there are also several French translations.

ARISTEAS. [See SEPTUAGINT.]

ARISTARCHUS of Samos, an astronomer, lived about the same time as Archimedes, and some say survived him, though this is not likely. Archimedes died B.C. 212, but there is an observation of the solstices made by Aristarchus, and preserved by Ptolemy, of the date B.C. 280. (See Ptol. *Synlar.*, lib. c. 2, tom. i. p. 163, ed. Halma.) Some accounts (in modern books) place him much earlier, but these are necessarily incorrect. In Plutarch's treatise *On the Appearances in the Moon's Disc*, it is said that Cleanthes, the successor of Zeno in the Stoic school, asserted that Aristarchus deserved punishment for his opinions about the earth's motion. This treatise of Cleanthes is cited by Dio-

genes Laertius. Whether the charge was ironical or not (Montucla conjectures the former), it serves to corroborate the preceding date, since Cleanthes succeeded Zeno about B.C. 261. We know nothing further of the life or death of Aristarchus.

Archimedes (in the *Arenarius*) attributes to Aristarchus the opinion that the earth moves round the sun, which is supposed to have been previously held by Pythagoras and Philolaus. His words are, 'He (Aristarchus) says, that the fixed stars and sun remain without motion, but that the earth is carried round the sun in the circumference of a circle, the sun being in the centre, and that the sphere of the fixed stars, which has the same centre as the sun, is so great that the circle described by the earth bears no more proportion to the distance of the fixed stars, than the centre of a sphere does to its surface.' Archimedes then proceeds to combat the singular notion contained in the last words. The passage from Plutarch's treatise on the moon, above referred to, states that Aristarchus supposed the heavens to be fixed, and that the earth moved in an oblique circle (*ἀλλοιῶν κίκλον*), at the same time revolving round her own axis. We learn also from Archimedes, that Aristarchus supposed the apparent diameter of the sun to be the 720th part of the zodiac, that is, half a degree. This is about 2' too little.

One small work of Aristarchus has come down to us, 'On the Magnitudes and Distances of the Sun and Moon,' which makes no mention of the preceding hypothesis with regard to the earth's motion. The scope of it will be shown in the following translation of the introduction (from Wallis's edition). The brackets contain remarks, mostly from Delambre.

* 1. The moon receives light from the sun. [This was asserted before Aristarchus.]

* 2. The earth is a mere point or centre when compared with the sphere of the moon. [This is wrong, since the moon would then appear at the same point of the heavens from different parts of the earth, which is not the case.]

* 3. When the moon appears halved, the great circle separating the light and dark part of the moon passes through the eye of the spectator. [A very simple truth but a great step in astronomy, as giving rise to the first determination of the relative distances of the sun and moon, the principle of which was correct.]

* 4. In the preceding case, the angle between the sun and moon is less than a quadrant by its thirtieth part. [That is, the angle is 87° ; whereas $89^{\circ} 50'$ is nearer the truth.]

* 5. The apparent diameter of the earth's shadow [that is, the section through which the moon passes in an eclipse] is twice that of the moon. [This would give it $6\frac{1}{2}'$; it is nearer to $82'$.]

* 6. The moon subtends the fiftieth part of a sign. [This would make the apparent diameter 2° , which is four times too great.]

* Hence the distance of the sun from the earth is more than 18 times the distance of the moon, and less than 20 times; that is, when the moon appears halved. And the [real] diameter of the sun bears the same proportion to the [real] diameter of the moon. The diameter of the sun bears to that of the moon a greater proportion than 12 to 3, but a less proportion than 13 to 6, as appears from what has been found of the ratio of the distances, the shadow of the earth, and the moon's subtending the 15th part of a sign.*

The preceding deductions follow correctly from the principles laid down, and of course partake of their numerical inaccuracy. The manner in which they are proved shows that the Greeks of this period had no trigonometry whatever: not even a table of chords, and the limits given are not so close as those which might have been obtained from the same data by a ruler and compasses. There are several propositions on the relative bulks of the three bodies, deduced by common methods.

There is a commentary of Pappus upon the work of Aristarchus, which has been given (in part at least) by Wallis in his edition.

From an obscure passage in Plutarch (*Πλουτάρχου Ζητήματα*, 8), in which the report of Archimedes is corroborated, Delambre infers that Aristarchus attributed day and night to the rotation of the earth. It is hard to see how he could do otherwise, if he supposed the sun fixed.

There is another work attributed to Aristarchus, published by Roberval at Paris, in 1543, on the System of the World. But this appears to have been probably one of the *restora-*

tions of which we have spoken in APOLLONIUS, as Descartes and several others affirm that it was written by Roberval himself, and Wallis asserts that this fact was perfectly well understood by the French, both at the time of publication and in his time.

Vitruvius speaks highly of Aristarchus, as the inventor of many useful machines, and, in particular, of a dial which he terms *scaphæ*. This dial is described by Martianus Capella (cited by Weidler), from which, and partly from the name, we should infer that it was a part of a concave hemisphere, with a style ending in the centre, so that by drawing the equator, &c. inside the hemisphere, the sun's position might be found by marking the extremity of the shadow. Montucla describes one, dug out at Tusculum in 1711, which, since Cicero describes such an instrument, is conjectured to have belonged to him. (Mont. *Hist. Math.* i. 721: a drawing is given.)

The principal editions of Aristarchus are the Latin translation of Valla, Venice, 1498, containing the commentary of Pappus; and of Commandine, Pesaro, 1572: the Greek text of Wallis, Oxford, 1688, with a commentary and Commandine's version, which edition was also reprinted in the second volume of Wallis's works, Oxford, 1699. A new edition of the Greek text, with a Latin translation, appeared at Paris in 1810, 8vo. There is also a French translation by M. de Fortia D'Urban: Paris, Didot, 1823.

ARISTARCHUS, the critic, the son of Aristarchus, was born in the island of Samothrace; but he abandoned the narrow limits of his own country, in order to settle in the wealthy and populous city of Alexandria. The time of his birth is not exactly known; but he is stated to have flourished about B.C. 158. Ptolemy Philometor, king of Egypt, reigned from B.C. 181 to 145, and Aristarchus was the preceptor of his son, who was killed by his uncle Ptolemy Evergetes II. at the accession of the latter in 145 B.C. (Justin, xxxviii. 8.) Aristarchus was the disciple of Aristophanes of Byzantium, the celebrated grammarian, who laid the principles of philological criticism upon a sound and accurate basis; thus he was the first to inquire with precision into the genuineness of the early Greek writings, and into the grammatical analogy of the Greek language: he likewise introduced the use of the Greek accents, as they may now be seen in manuscripts and printed books (Wolf, *Proleg. ad Homer.* s. 41). Aristarchus succeeded his master Aristophanes (for whose opinions he is stated to have entertained great respect), as head of the grammatical and critical school of Alexandria; and obtained in that capacity, by his eminence as a teacher and by his various writings, a reputation greater than any other critic of antiquity. Forty grammarians are stated to have proceeded from his school (Suidas in *Ἀριστάρχου*), who doubtless contributed to spread his fame over Greece and the neighbouring countries. His name was highly celebrated among his contemporaries: thus Panætius the philosopher called him a *diviner*, from his facility in conjecturing the meaning of poets (*ποιητῶν*, Athenæus xiv. p. 631. C.); and after his death, his authority was so much esteemed, that Horace and Cicero used Aristarchus as a general name for a great critic (*De Arte Poet.* 450. *Epist. ad Att.* l. 14), and Sextus Empiricus mentions him with Plato and other such eminent names (*Adv. Mathem.* ix. s. 110): one of the scholiasts to Homer likewise expresses an opinion (which a modern critic has applied to other persons), that it is better to err with Aristarchus than to be right with Hermapias, a grammarian of little note (*ad Il.* 235).

The critical works of Aristarchus appear to have been very voluminous, but they are now all lost, and are only known from extracts and citations preserved in other writers. His chief work was his edition of the *Iliad* and *Odyssey*; in which, 1. he revised the text, partly by means of the comparison of MSS., and partly by conjecture; 2. he divided the two poems into twenty-four parts or books, each distinguished by a letter of the Greek alphabet, which in the Alexandrine age contained twenty-four letters (*Incertus de Hom. Poesi.* in Ernesti's *Homer.* vol. v. p. 152); and 3. he placed certain critical marks before certain lines, some denoting that the verses so marked contained something worthy of notice, and others that they were spurious: the last were merely straight lines thus —, in the form of a spit or *ὀβελός*, whence *ὀβελίζεω* in Greek and *obelototare* in Latin, 'to mark with an obelus,' meant to mark as spurious. The reasons for the changes which he made in the text, and for the marks

which he prefixed to the verses, and his explanations of doubtful passages, he appears to have given separately in some of his commentaries or *ὑποκρίματα*, of which he is stated to have written more than 800 books. (Suidas in v.) Probably these books were not longer than such divisions as we should now call chapters: these commentaries, however, included not only his labours on Homer, but also illustrations of Hesiod, Archilochus, Alcaeus, Anacreon, Æschylus, Sophocles, Pindar, Aristophanes, Aratus, and other poets. Of these latter productions of Aristarchus few remnants have been preserved: of his Homeric criticisms, however, a large part is extant in the Scholia to Homer, from which a tolerably complete notion of his mode of treating ancient Greek poets may be formed. One of the most remarkable features of his criticism is the boldness with which he condemned numerous verses as unworthy of Homer, and as manifest interpolations of a later age. Various opinions have been formed on these judgments of Aristarchus: some moderns having thought that his method was in the highest degree arbitrary and uncritical, while others have thought that he exercised a sound and modest discretion. There can be no doubt that Aristarchus in rejecting verses of Homer for the most part did not rely on the faith of ancient copies, but trusted merely to his own sagacity in discovering the traces of interpolation: 'as Aristarchus (says Cicero, to his correspondent) denies that Homer wrote the verses of which he does not approve, so do you suppose that whatever part of my letters may be wanting in clearness is not written by me?' (*Epist. ad Fam.* iii. 11, and see Clinton, *Fest. Hellen.* part iii. pp. 192-5.) Whatever theory may be adopted with regard to the composition of the Homeric poems, whether we suppose that the *Iliad* and *Odyssey* were both entirely written by one poet, or that each was the work of a separate poet; or that they were a series of rhapsodies composed by a number of early bards, whose scattered songs, being originally like the old Spanish and Scotch ballads, were afterwards collected and joined together: it is equally certain that every part must have received its proper form from its original author; and that verses and passages might have been improperly introduced at a later date by the rewriters of these poems. Now these interpolations, if any such existed, were doubtless made before the age when the *Iliad* and *Odyssey* were first reduced to writing: and therefore they could not be detected by the mere comparison of manuscripts. Consequently, Aristarchus ought not to be taxed with rashness for condemning verses of Homer which might be found in all the MSS., nor should it be said with Cicero that he rejected those verses of which he did not approve, simply *because* he did not approve of them: he rejected them because he thought them unworthy of Homer, and inconsistent with the general character of his poetry and language. If the existence of any additions to the Homeric poems, of considerably later date than the body of the poem (as the last book of the *Odyssey*), is ever susceptible of proof, it can only be established by such probable and indirect arguments as those employed by Aristarchus in justification of his objections.

The division of Homer into books was doubtless made by Aristarchus for the purposes of reference, which were important to critics such as himself; and it has been retained on that account ever since his time. The earlier Greek writers, as Herodotus, Plato, Aristotle, &c., in citing Homer, refer by description to the part of the poem which they mean, as the exploits of Diomedes, the descent into hell, the battle of the gods, &c.

Aristarchus did not confine his criticism to grammatical and metrical questions, but he also gave historical and geographical illustrations of the author's text. Thus we are told that he considered Homer to have been a native of Athens, and placed him at the time of the Ionic migration, sixty years after the return of the Heraclidae, or one hundred and forty years after the fall of Troy. (*Incertus de Hom. Poesi.* in Ernesti's *Homer*, vol. v. p. 151, comp. Wolf, *Proleg. Hom.* p. cclvi.) His notes on the mythology and geography of Homer, preserved in the scholia, are very numerous. (See *Lehrs. de Aristarchi Studiis Homericis*, pp. 167-256.)

Aristarchus published two editions of his recension of Homer, as appears from numerous passages in the scholia to Homer, where the differences between the readings of the first and second editions are noticed. (*Lehrs. ib.* p. 27.) His recension became the established text of the *Iliad* and *Odyssey*, not only among the grammarians of

Alexandria, and their disciples: but among the copyists from whose transcripts the modern versions of Homer have been derived since the invention of printing. In the scholia to the *Iliad*, moreover, a constant reference is made to the explanations and observations of Aristarchus, whose opinion is often stated without the addition of his name, as if he was pre-eminently the commentator of Homer. (Wolf, *Proleg. ad Hom.* s. 17.)

Besides his edition of Homer and his Commentaries, he wrote some short works addressed to individuals, as to Philotas and to Comanus, the chief cup-bearer of the king (*Proleg. ad Hesiod. Op. et Di.* 97); a treatise on the Paradox of Zeno, and another on the *Iliad* and *Odyssey*, are also mentioned. (*Lehrs. p.* 25.) These writings, which probably were occasional productions, were considered less accurate and elaborate than his Commentaries (see *Schol. II. ii.* 111; *Lehrs. pp.* 20-6). He wrote also in defence of analogy in matters of criticism, against Crates, the grammarian, who defended the principle of anomaly. (Wolf, *ib.* p. ccxxx.) He is likewise stated to have contended at Pergamus with Crates, who was a native of that town; and Zenodotus of Malbis (a different person from his more celebrated namesake of Ephesus), a disciple of Crates, wrote a book in defence of the verses in Homer rejected by Aristarchus. (Suidas in *Zenodotus*, comp. Clinton, *F. H.* part iii. p. 191.) Late in his life he appears to have retired from Alexandria to Cyprus, where, being afflicted with a dropsy, he died of voluntary starvation at the age of 72: leaving as his successor in the Alexandrine school his disciple Ammonius. (Suidas in *Ammonius*.) He had two sons, named Aristarchus and Aristigoras, who were both idiots: the former was sold as a slave (probably because he was a burden to his family), but having been brought by his master to Athens, he was redeemed by the Athenians, out of respect (as it appears) for his illustrious father. (Suidas in v.)

ARISTIDES (*Ἀριστίδης*), son of Lysimachus, a great Athenian statesman and general, who took a leading part in the delivery of Greece from the Persian invasion. He was of the tribe Antiochus, and born in Alpece, a demos of Attica. Some doubt exists concerning his endowments of wealth and birth: a question of so little importance that we shall not stop to discuss it. It is to be regretted that Plutarch, from whom our knowledge of his personal history is almost exclusively derived, has given us little information as to the steps by which he rose to eminence in the state. Several anecdotes illustrative of his probity are told by that amusing, but not very accurate author, which, according to this arrangement of his life, ought to have occurred before the Persian war; but the date of their occurrence is not fixed, and they contain no distinct mention of Aristides's public employments, except that he was twice chosen treasurer of the public revenue of Athens. Plutarch further states, that Themistocles and others, whose malpractices he had exposed, had influence enough to procure his condemnation on a charge of malversation: but that, by the exertions of the more virtuous citizens, the fine imposed on him was remitted, and he was again elected to the office of chief treasurer. It appears that he was early opposed in politics to Themistocles, whose ambitious and unscrupulous temper led him to promote both his own and his country's benefit by measures quite at variance with the integrity and straightforward temper of Aristides. But the first distinct notice which we possess of his public life is, that he was one of the ten commanders who directed the Athenian army, B.C. 490, upon the occasion of the Persian invasion under Datis and Artaphernes. This rests on the authority of Plutarch, who ascribes to Aristides the honour of having first yielded his turn of command to Miltiades, and by his example and authority having carried the dissentients with him. (For a fuller account of these circumstances, and the battle of Marathon, see MILTIADES, and *Historical Parallels*, vol. i. p. 267.) Plutarch adds, that when the Athenians marched back to their capital in haste, to prevent the flying Persians from making any attempt on it by sea, Aristides was left with the men of his own tribe to guard the valuable spoil of the Persian camp: being selected for that duty on account of his incorruptible honesty. But Herodotus, in his account of the battle (vi. 109), never even mentions Aristides's name. This proceeded from no unfriendly feeling: for the historian (viii. 79) bears testimony to him as the 'justest and best man in Athens.' This silence would lead us to doubt whether Aristides did really act so important a part in the action as his biographer would

have us believe. That he did distinguish himself is, however, rendered probable by his having been elected archon *epónimo* in the following year. (Plut. Arist. c. 5.)

Of the transactions of his magistracy we have no account. In the sixth year after it (B.C. 483), he was banished by the process called *ostracism*. A person less obnoxious to the spirit of jealousy which dictated that singular expedient, whether of jealousy or precaution, could hardly have been found; but the practices of Themistocles prevailed with the suspicious temper of the Athenians against the approved integrity of his rival, though so well recognized, according to a story told by Plutarch, as to have already acquired for him the appellation of 'the Just.' In the third year afterwards (B.C. 480), the eventful transactions of the Persian invasion under Xerxes took place. At the battle of Artemisium, Aristides was still in exile; but before the battle of Salamis he was recalled, with other exiles. In the night preceding that memorable battle, he passed from the island of Egina through the Persian fleet, bearing intelligence to his countrymen that they were surrounded, and that flight, which they were then meditating, was no longer possible. (Herod. viii. 79.) The details of the action do not belong to this place. (See *Historical Parallels*, p. 360, and SALAMIS.) We have only to state that Aristides, at the head of a body of Athenians, landed on the small island of Psyttaleia, near Salamis, and put to the sword the Persian troops stationed on that island. (Herod. viii. 95; Plut. c. 9.) With respect to the prosecution of the war, he combated Themistocles's advice to sail for the Hellespont, and destroy the bridge built by Xerxes; and recommended, on the contrary, that every facility for evacuating Greece should be given to the Persians.

Before the battle of Plataea, fought in September, B.C. 479, he was reinstated in all and more than his former favour with his countrymen. The answer returned to Mardonius's offer of peace and alliance with the Athenians is said by Plutarch to have been dictated by him: 'Tell Mardonius that the Athenians say, while the sun goes in the same course as he is now going, we will never make peace with Xerxes; but we will fight him, trusting in the gods, who fight with us, and the heroes, whose temples and statues he, making no account of them, has burnt.' (Herod. viii. 143.) Aristides was one of the ambassadors sent to remonstrate with the Spartans for their tardiness in sending succours to resist the threatened second invasion of Attica by Mardonius; and at the battle of Plataea, contrary to the general usage, he was appointed sole general (*ἀρχηγός ἀνεκράτειρος*) of the Athenian troops, and signalized his moderation in a dispute with the Tegeate concerning the right of occupying the left wing of the allied army, the second post in point of honour, the right wing being always held by the Lacedæmonians. 'We came here,' he said, 'not to talk, but to fight. Since, however, the Tegeate have advanced their claims to renown, both in old times and of late, it is necessary that we also should explain to you our claims to priority over the Arcadians.' Then, after enumerating the warlike glories of his countrymen, he added, 'But this is no time to wrangle about place. We are ready to obey you, Lacedæmonians, wherever, and against whomsoever, you choose to station us; and wherever we are, we will do our best. Command us, therefore, as men who will obey.' The Lacedæmonians answered by acclamation, that the Athenians were more worthy than the Tegeate to lead the left wing. (Herod. ix. 27.) It is to be observed here (as of the answer returned to Mardonius), that what Plutarch says of Aristides, Herodotus says of the Athenians generally. It may be presumed, however, that on both occasions the people acted under the guidance of their leader; and that the words so full of wisdom, spirit, and moderation, agreeing so well with the character of Aristides, were really prompted or delivered by him.

Not long after the restoration of Athens, which had been destroyed by Xerxes and Mardonius, an important change took place in the constitution: though opposed to the principles of those with whom Aristides generally acted, it was supported at least, if not brought forward by him. By Solon's laws, noble descent and a definite amount of property were required as qualifications in candidates for the higher offices. It was now thought, either that in the great exertions made for the existence of the state, all had merited alike, and all were therefore entitled to an equal share in the direction of public affairs; or that the more numerous class who were excluded by law from the administration, having arms in their hands, and proud

of their recent exertions and success, would scarcely be brought to acquiesce in their former political inferiority. Aristides, therefore, proposed an alteration in the law, by which all were rendered eligible to the archonship, without regard either to birth or wealth. [See ARCHON.]

Aristides was the colleague of Thucydides in an embassy to Sparta, when the Spartan government interfered to prevent the rebuilding of the walls of Athens, destroyed by the Persians. (Thucyd. i. 91.) Cicero relates a story (*Off. iii. 11*), told in a slightly different manner by Plutarch, that Themistocles, after the end of the war, announced to the assembly of the people, that he had a scheme to propose greatly advantageous to the state, but of such a nature that it could not safely be made public. Upon this he was desired to communicate it to Aristides, who reported that nothing could be more advantageous, or less honourable; and the proposal was dropped without further inquiry. The measure proposed, according to Cicero and Valerius Maximus (vi.), was to burn the Lacedæmonian fleet at Gythium; according to Plutarch, to burn the dock-yard of the Grecians (*κατασθῆναι τὸν ἑλμύριον*), by which we suppose the confederate fleet was meant. It is difficult to conceive how either measure could be reconciled with sound policy, any more than with justice. Diodorus (xi. 42) has a different version still of the same story, agreeing in the one point of the proposal of Themistocles being referred to Aristides.

B.C. 477, the unpopularity of the Lacedæmonians, especially of the commander-in-chief Pausanias, induced the Ionian Greeks to decline serving under him. They offered the command of the confederacy to Athens, whose ships at that time were under the command of Aristides; and to his moderation and probity, and to the favourable opinion entertained of the Athenian character, mainly through his virtues, that transfer of the command is chiefly to be ascribed, and the consequent establishment of what is called by historians the Athenian rule in Greece, which was overthrown seventy-two years afterwards, at the end of the Peloponnesian war. Under this new arrangement the Greeks of the west coast of Asia Minor, the islands, and Thrace, in conjunction with the Athenians, engaged to maintain a fleet sufficient to prosecute the war with Persia. Each state was assessed to furnish a certain sum of money, amounting in the aggregate to 460 talents; and the difficult task of making the assessment was executed by Aristides with such fairness, that, according to Diodorus (xi. 47), he obtained the highest praise for justice. Deputies from the states met in the sacred island of Delos, where the temple of Apollo was appointed for the common treasury, and officers called *Hellenotamiai*, 'treasurers of the Grecians,' of whom the chief was Aristides, were appointed to regulate the distribution of the common fund.

This is the last public office in which we know Aristides to have been engaged. The precise time of his death is not mentioned by the early Greek historians, or by Plutarch. Nepos says that it occurred in the fourth year after the ostracism of Themistocles, which fixes it to 467. Plutarch quotes a story from Craterus of his having been accused of taking bribes from the Ionians to reduce their annual contribution to the common fund, and being fined five minæ, which being unable to pay, he retired to Ionia, where he died. But the story is in itself highly improbable, and the silence of certain writers seems conclusive against it; and Plutarch himself argues against its credibility. He says also that the tomb of Aristides was in his own time to be seen at Phalerum, erected at the charge of the state, because the patriot died so poor that nothing was found in his house to pay for his burial. He left children—a son, Lysimachus, who is one of the speakers in Plato's dialogue of *Laches*, and two daughters (Plut. 27); all of whom were provided for by the state. Lysimachus had a pension and a grant of lands at Estia in Eubœa. (Demos. *Leptin*, cap. 21.) Aristides lived and died in poverty, after having borne the highest offices of Athens, and possessed the most tempting opportunities for peculation of any man in Greece; a voluntary poverty, for he is said to have refused large sums offered to him by private liberality, saying that 'he could better boast of his poverty than others of their riches, which many did use ill, and few well; and that it was a hard thing to find one man of a noble mind that could away with poverty, and that such only might be ashamed of poverty as were poor against their wills.' (North's *Plutarch*.)

The character of Aristides (so far as we can trust our

chief authority, Plutarch, who is supported by the more scanty testimony of Herodotus and Thucydides) is one of the finest in antiquity. To him belongs the rarest of all praises, that of observing justice, not only between man and man, but between nation and nation. He was truly a patriot, for he preferred the good of his country to the gratification of his own ambition. A candid enemy, an impartial friend, a just administrator of other men's money, an observer of national faith, it seems hardly worth while to add to this catalogue of virtues the more common merit of being a brave and successful general, except that this latter quality completed his character, and fitted it to the stormy times in which he lived, giving to it a lustre and importance in the eyes of the many, which his peaceful virtues unassisted might have failed to command.

In the Elgin collection of the British Museum, there is a sepulchral stele, which bears the name of Aristides, the son of Lysimachus, of Estæa. It is conjectured that this Aristides was the grandson of Aristides the Just. (See *Elgin Marbles*, vol. ii. 149: Herod.: Plutarch, Cornelius Nepos, *Lives of Aristides*; Mitford, &c.)

ARISTIDES, a native of Thebes, and one of the great Greek painters, is said by Pliny (xxxv. 10) to have been the contemporary of Apelles. His excellence consisted in giving character and expression to his figures, and in the strong delineation of the passions: his colouring was hard. One of his great pictures represented the capture of a city. Among the most striking figures was that of a mother just expiring from a wound: her infant still clings to her breast, and the dying mother seems only anxious that her child should not suck the blood that is streaming from her body. Alexander the Great had this picture removed to Pella in Macedonia. He also painted an engagement with the Persians: this picture contained one hundred figures, and was liberally paid for by Mnason, tyrant of Elatea. The works of Aristides were numerous, and many of them were transferred to Rome with the rest of the plunder of Greece. At the capture of Corinth by L. Mummius, Polybius, the Greek historian, who was present on the occasion, saw with indignation the barbarians of Italy playing at games of chance on the most costly pictures which they had spread on the ground. (Strabo, p. 381.) A Dionysus (Bacchus) by Aristides, and a Hercules struggling with the poisoned shirt of Deianira, by the same artist, were treated in this shameful way. Strabo himself saw the Bacchus, which, by chance, had been safely transferred to Rome, in the temple of Ceres, and he pronounces it a most beautiful work of art. Unfortunately the picture was shortly after destroyed, when the temple of Ceres was accidentally burnt: Pliny also mentions this picture. Another fine painting of Aristides in the temple of Apollo at Rome was spoiled by an artist, whom M. Junius the Prefor had commissioned to clean it preparatory to its exhibition at the Ludi Apollinares.

See a passage in Athenæus (xiii. 567) on other subjects painted by Aristides.

ARISTIDES, ÆLIUS, a distinguished rhetorician of the second century, was born at Hadriani in Bithynia, probably about A.D. 117: but, according to other opinions, A.D. 129. He studied at Smyrna under Polemo, and at Athens under Herodes Atticus, after which he travelled extensively in Asia and in Egypt: finally, he settled at Smyrna, where he obtained the priesthood of Æsculapius. He also opened a lecture room and gained such reputation by his rhetorical prelections, that by his contemporaries he was placed on a level with Demosthenes, the great Athenian orator. In A.D. 178, Smyrna was destroyed by an earthquake, and Aristides, by addressing a letter on the subject, which is still extant, to M. Aurelius, induced the emperor to restore the city. Owing to his services on this occasion, and the high reputation which he enjoyed as a rhetorician, statues were erected to his honour; one, now in the Vatican (see Winkelmann, ii. 475, French ed.), bears his name, and it is by no means improbable that the statue supposed by some to represent Aristides of Athens, really belongs to this Aristides, who affected to rival Isocrates and Demosthenes.

Of his fifty-five declamations, one entitled *Against Leptines*, is an imitation of the great oration of Demosthenes, which bears the same name; and another, the *Panathenæikos*, was intended to show that he could write in the style of Isocrates, and rival one of the most famous specimens of that master. Aristides wrote also panegyrics on many distinguished cities, such as Smyrna, Rome, &c.

It was the practice of Aristides and other rhetoricians of his age, often to choose their topics from the republican times of Greece, and particularly from the most striking events of Athenian history. But instead of throwing any light on the historical events which they made their text, it is more frequently the case that in the effort after rhetorical effect, the truth of history is sacrificed to what were then considered the graces of style. The poverty of ideas in their declamations, and the total absence of the old Attic vigour of language, render them of less value in the judgment of the present age, than in that of the contemporaries of Aristides.

The latest edition of the Declamations of Aristides, together with his two books on Rhetoric, is by W. Dindorf, Leipzig, 1829, 3 vols. 8vo.

The statue which we have here assigned to Ælius Aristides was found in the ruins of Herculaneum, and is now in the Museo Borbonico at Naples. The height is about 6½ feet. It is called the statue of Aristides the Just by G. Fennel, in the work entitled *Museo Borbonico*: but from comparing the head with that of Ælius Aristides in the Vatican, and from the somewhat affected attitude, and the general character of the figure, we are convinced it is not the old Aristides. It may be objected by some that this statue is superior, as a work of art, to the age to which we have assigned it. The objection may be a good one: and the only conclusion then must be, that we do not know whom it was intended to represent. A cast of this figure may be seen at Sart's, Dean Street, London.

ARISTIDES QUINTILIANUS, a Greek writer on music, whose age is uncertain, as he is not mentioned by any other ancient author. Some critics are of opinion that he was contemporary with Plutarch. His work on Music (*Ἠοὶ Μουσικῆς*), in three books, is printed in the Collection of Meibomius, and is considered one of the most valuable musical works of antiquity. For further remarks, see *GREEK MUSICAL WRITERS*.

ARISTIPPUS, the son of Aritades, was born at Cyrene, a Greek colony on the north coast of Africa, and came to Athens when a young man in order to profit by the lessons of Socrates: his curiosity to hear this philosopher having been excited by some accounts of his doctrines which he had received from Ischomachus of Athens, whom he met at Olympia, during the celebration of the Olympic games. (Plutarch, *de Curiosit.* c. 2: on Ischomachus, see Xenophon's *Economic*.) Aristippus was a hearer of Socrates for some time: and as he could not have been very young when he went from Cyrene to the Olympic festival, and was attracted from thence to Athens by a philosopher's fame, we may suppose that he was at least twenty-five years old at the death of Socrates, B.C. 399: which would make his birth as early as B.C. 424 or 425. Lais, the courtesan, with whom he was in habits of intimacy, was born B.C. 421. (Clinton, *Fest. Hellen.*, part ii. introd. p. lv.); which agrees

with this determination. We know further, from explicit testimony, that he was celebrated in B.C. 366 (Olymp. ciii. 3: Diodorus, xv. 76): so that, if he lived to the natural age of man, he probably died between B.C. 360 and 350.

Although Aristippus was a disciple of Socrates, his mode of life and his opinions were very different from those of his master. Instead of imitating the chaste, frugal, and temperate habits which distinguished Socrates, he was a lover of sensual pleasure; and we learn from a conversation between Aristippus and his master, reported in Xenophon's *Memorabilia*, that the former deliberately maintained in argument the superiority of his own habits of life and principles of conduct. In this discussion, being pressed by the interrogations of Socrates, he asserts that he does not wish to take any share in public affairs, that his object is to be neither a governor nor a slave, but a private citizen; and that he lives out of his own country in order to escape from all political duties. (Xen. *Mem.* ii. 1. 1-18.) He appears to have prided himself on his knowledge of the world, on the popularity and versatility of his manners, and the ease with which he could adapt himself to the company of all persons, and to all varieties of fortune: hence Plato is reported to have said of him, that he was the only man who could wear with equal grace both fine clothes and rags. He recommended to others, as he practised himself, the pursuit of sensual pleasure, saying that the disgrace consisted not in enjoying it, but in being overcome by it. He attempted to profit by circumstances in order to adapt them to his own wants, and to be the arbiter rather than the slave of fortune: whence Horace says: -

* Nunc in Aristippi fastum precepta relator,
Et nulla res, non meretibus, adhibere coram.*

His principles and conduct made him obnoxious to Xenophon, with whom he is stated to have been on bad terms, and to Antisthenes, the head of the Cynic school, whom he is reported to have constantly ridiculed for the austerity of his manners. (Diog. Laert. ii. 65; Suidas in *Antisthenes*.) Plato likewise aims a blow at him in the *Phaedo*, for passing his time in luxurious enjoyment at Egina, while his master Socrates was under sentence of death at Athens, at a distance of a few hours' sail. (Plato, *Phaedo*, p. 59, ed. Steph.: Demetrius Phalereus *de Eloquent.* § 288, ed. Schneider; see also Aristot. *Rhet.* ii. 23, for a saying of Aristippus against Plato.) But Aristippus, although on bad terms with Xenophon, Antisthenes, and Plato, entertained friendly relations with Eschines, another disciple of Socrates, and recommended him as a teacher of philosophy to Dionysius, the tyrant of Syracuse. (Diog. Laert. ii. 60, 82; Plutarch *De cohibenda ira*, i. p. 462.) He seems to have remained true to the principle expressed by him in his conversation with Socrates, of avoiding his native country, and to have travelled to various Greek states: thus he passed much time at the court of Dionysius of Syracuse, and he is stated to have been taken prisoner by a satrap of the Persian king in Asia Minor. (Diog. Laert. ii. 79.) He probably retired late in his life to Cyrene, where we find his family and his school after his death. (Diog. Laert. ii. 86.)

Aristippus differed from Socrates and the genuine Socratic philosophers, not only in his mode of life, but also in taking money for his instructions (Diog. Laert. ii. 65, comp. Xen. *Mem.* i. 2. 60): hence he is called by Aristotle a *sophist* (*Metaph.* ii. 3): a name which Aristotle never would have given to any person whom he considered a genuine philosopher. Aristippus, when blamed for teaching for money, defended himself (and it must be confessed with some reason), by saying that Socrates was provided for by the richest and greatest of the Athenians, whereas he had to provide for himself. (Diog. Laert. ii. 74.) Aristippus is reported *once* to have sent five minas to Socrates, who refused them, saying that his genius did not permit him to receive such a gift. (Diog. Laert. ii. 65.)

There can be no doubt that Aristippus was the founder of a philosophical school: but it is doubtful whether he inculcated his opinions in writing, or whether, like Socrates, he only imparted them orally to his disciples. A list of his works, chiefly dialogues, is given by Diogenes Laertius (ii. 85), on the authority of Panætius and Sotion; the latter of whom lived in B.C. 205, and wrote on the history and lives of the Greek philosophers. (Clinton, *Fast. Hellen.* part. iii. p. 526.) Sosicrates of Rhodes, however, who lived somewhat later, and wrote on the same subject, stated that Aristippus left nothing in writing. (Diog. Laert. ii. 84; Clinton, *ibid.* p. 565.) However this may be, it is certain that his doc-

trines were perpetuated after his death by his daughter Arete, and by another disciple named Antipater of Cyrene. Arete was the teacher of her son Aristippus, who, to distinguish him from his grandfather, was called *metrolaductos* (taught by his mother); and Theodorus the atheist, a philosopher of some note, is stated to have been a disciple of this Aristippus. Antipater, the other immediate successor of the elder Aristippus, is stated to have had disciples; but Hegesias and Anaxicris, who were about contemporary with Theodorus, are the only philosophers in his branch of the Cyrenaic school of whose opinions anything is known.

As no precise or detailed account of the doctrines of Aristippus has been preserved, it is difficult to avoid confounding his opinions with those of his successors in the Cyrenaic school. The later Cyrenaics appear to have approached nearly to the doctrines of Epicurus: Aristippus, however, though agreeing in substance with the moral system of Epicurus, yet differed from it in many important particulars. Aristippus is stated to have considered ethics as the only subject which deserved the attention of a philosopher: and to have especially despised mathematical and physical science, as not being concerned about the happiness of mankind. (Aristot. *Metaph.* ii. 2; Diog. Laert. ii. 92.) The ancient Cyrenaics, however, though they confined themselves to ethical philosophy, yet adhered to it only in name: for they divided ethics into five parts, *viz.* 1. on those things which ought to be pursued or avoided; 2. on the affections of the mind; 3. on moral actions; 4. on causes; and 5. on proofs: of which heads the first three alone belong to moral philosophy, while the fourth refers to physical, and the last to logical inquiries. Aristippus held that the happiness of man consists in pleasure, and his misery in pain: happiness being merely an aggregate of pleasures, and misery an aggregate of pains. That pleasure is the greatest good, he conceived to be proved by the fact, that the youngest children, and even brute animals, seek it, and avoid its contrary, pain. He did not, like Epicurus, consider the absence of pain to be pleasure, or the absence of pleasure to be pain: for he thought that pleasure and pain are accompanied with motion, whereas the absence of pain and pleasure is not accompanied with motion: the former of these two states being like sleep. He compared the three states of which the mind is susceptible, *viz.* pain, pleasure, or the absence of both, to the sea during a storm, during a gentle breeze, and during a perfect calm: but this analogy is not quite perfect, for the sea agitated by a gentle breeze is in a middle state between the storm and the calm; whereas the absence both of pleasure and pain, which is the middle state of the mind, is made to correspond to the calm, which is not the middle state of the sea. He further held, that all pleasures, whether sensual or intellectual, are equally good: one account even states that he considered the pleasures of the body as superior to those of the mind. Hence he taught, that however immoral an action might be, still the pleasure which it causes is a good, and desirable for its own sake. He did not, however, recommend an unrestrained pursuit of pleasure: true wisdom (he thought) consisted, not in abstaining from pleasure, but in seeking it without being carried away by the love of it. Thus when reproached with his visits to Laïs, he replied that there was nothing disgraceful in going to her: the disgrace consisted in not being able to leave her. He condemned all care for the past or the future, all regret and all forethought, as equally useless; and said that a person ought to think only of the passing day, and, if possible, only of the passing minute. He recommended calmness of mind and moderation of desires: and he particularly cautioned his daughter Arete against covetousness and love of money. He also thought that the wise man should be free from the passions of envy and love, from superstition, and from the fear of death. Such is a brief summary of the principal moral doctrines of Aristippus which have been recorded by ancient writers: in which there is less acuteness than is usually perceptible even in the most mistaken systems of the Greek philosophers. They do not indeed appear to have attracted much attention in his own time: for Aristotle, in his *Nicomachean Ethics*, when examining the different opinions of philosophers on the subject of pleasure, takes no notice of Aristippus. (See the *Life of Aristippus* by Diogenes Laertius, ii. 65-101, with Menage's notes; Suidas in *Ἀριστάρκος*; and Ritter's *Geschichte der Philosophie*, vol. ii. pp. 87-103.)

ARISTOBULUS accompanied Alexander the Great in his campaigns, of which he wrote an account after the

king's death. This work, now lost, is one of the chief authorities for Arrian's history of Alexander. (See Arrian's *Preface to his Anabasis*.)

ARISTOBULUS: several of this name belonged to the Asmonæan dynasty. [See *ASMONÆANS*.]

ARISTOCRACY, according to its etymology, means a government of the *best* or *most excellent* (*ἀριστος*). This name, which, like *optimates* in Latin, was applied to the educated and wealthy class in the state, soon lost its *moral* and obtained a purely political sense: so that aristocracy came to mean merely a government of a *few*, the rich being always the minority of a nation. When the sovereign power does not belong to one person, it is shared by a number of persons either greater or less than half the community: if this number is less than half, the government is called an *aristocracy*, if it is greater than half, the government is called a *democracy*. Since, however, women and children have in all ages and countries (except in cases of hereditary succession) been excluded from the exercise of the sovereign power, the number of persons enumerated in estimating the form of the government is confined to the adult males, and does not comprehend every individual of the society, like a census of population. Thus, if a nation contains 2,000,000 souls, of which 500,000 are adult males, if the sovereign power is lodged in a body consisting of 500 or 600 persons, the government is an aristocracy: if it is lodged in a body consisting of 100,000 persons, the government is a democracy, though this number is considerably less than half the entire population. It is also to be remarked, that where there is a class of subjects or slaves who are excluded from all political rights and all share in the sovereignty, the numbers of the dominant community are alone taken into the account in determining the name we are to give to the form of the government. Thus, Athens at the time of the Peloponnesian war had conquered a number of independent communities in the islands of the Ægean Sea and on the coasts of Asia Minor and Thrace, which were reduced to different degrees of subjection, but were all substantially dependent on the Athenians. Nevertheless, as every adult male Athenian citizen had a share in the sovereign power, the government of Athens was called, not an aristocracy, but a democracy. Again, the Athenians had a class of slaves, four or five times more numerous than the whole body of citizens of all ages and sexes: yet as a majority of the citizens possessed the sovereign power, the government was called a democracy. In like manner, the government of South Carolina in the United States of America is called a democracy, because every adult freeman, who is a native or has obtained the rights of citizenship by residence, has a vote in the election of members of the legislative assembly, although the number of the slaves in that state exceeds that of the free population.

An *aristocracy*, therefore, may be defined to be a form of government in which the sovereign power is divided among a number of persons less than half the adult males of the *entire* community where there is not a class of subjects or slaves, or the *dominant* community where there is a class of subjects or slaves.

Sometimes the word aristocracy is used to signify, not a form of government, but a class of persons in a state. In this sense it is applied not merely to the persons composing the sovereign body in a state of which the government is aristocratical, but to a class or political party in any state, whatever be the form of its government. When there is a privileged order of persons in a community having a title or civil dignity, and when no person, not belonging to this body, is admitted to share in the sovereign power, this class is often called the aristocracy, and the aristocratic party or class; and all persons not belonging to it are called the popular party, or, for shortness, the people. Under these circumstances many rich persons would not belong to the aristocratic class: but if a change takes place in the constitution of the state, by which the disabilities of the popular order are removed, and the rich obtain a large share of the sovereign power, then the rich become the aristocratic class, as opposed to the middle ranks and the poor. This may be illustrated by the history of Florence, in which state the *nobili popolani*, or popular nobles (as they were called), at one time were opposed to the aristocratic party, but by a change in the constitution became themselves the chiefs of the aristocratic, and the enemies of the popular party. In England, at the present time, aristocracy, as the name of a class, is generally applied to the *rich*, as opposed to the rest of the community: some-

times, however, it is used in a narrower sense, and is restricted to the *nobility*, or members of the peerage.

The word *aristocracy*, when used in this last sense, may be applied to an order of persons in states of any form of government. Thus, the privileged orders in France from the reign of Louis XIV. to the revolution of 1789, have often been called the aristocracy, although the government was during that time purely monarchical; so a class of persons has by many historians been termed the aristocracy in aristocratical republics, as Venice, and Rome before the admission of the plebeians to equal political rights: and in democratical republics, as Athens, Rome in later times, and France during a part of her revolution. It would therefore be an error if any person were to infer from the existence of an aristocracy (that is, an aristocratical class) in a state, that the form of government is therefore aristocratical, though in fact that might happen to be the case.

The use of the word *aristocracy* to signify a *class of persons* never occurs in the Greek writers, with whom it originated, nor (as far as we are aware) is it ever employed by Machiavelli and the revivers of political science since the middle ages: among modern writers of all parts of Europe this acceptance has, however, now become frequent and established.

The word *oligarchy* is likewise of Greek origin, and it means, according to its etymology, a government of a *few*. By the Greek historians it is used as synonymous with aristocracy, nor did it convey any offensive meaning; among modern nations, however, it generally has an opprobrious force, and when used, it commonly implies that the writer or speaker disapproves of the government or dislikes the class of persons to which he applies that name.

There is scarcely any political term which has a more vague and fluctuating sense than *aristocracy*; and the historical or political student should be careful to watch with attention the variations in its meaning: observing, first whether it means a form of government or a class of persons: if it means a form of government, whether the whole community is included, or whether there is also a class of subjects or slaves: if it means a class of persons, what is the principle which makes them a political party, or on what ground they are jointly opposed to other orders in the state. If attention is not paid to these points, there is great danger, in political or historical discussions, of confounding things essentially different, and of drawing parallels between governments, parties, and states of society, which resemble each other only in being called by the same name.

It has been lately proposed by Mr. Austin, in his work on *The Province of Jurisprudence*, to use the term *aristocracy* as a general name for governments in which the sovereignty belongs to several persons, that is, to all governments which are not monarchies. There would, however, be much inconvenience in deviating so widely from the established usage of words, as to make democracy a kind of aristocracy: and it appears that the word republic has properly the sense required, being a general term including both aristocracy and democracy, and signifying all governments which are not monarchies or despotisms. (See *Journal of Education*, Part vii. p. 299, and the words *REPUBLIC* and *DEMOCRACY*.)

ARISTOGITON, an Athenian closely connected with an important event in Athenian history, which will be more particularly treated under the head of **HIPPAS**. We shall only state here, that having conceived a mortal hatred against Hipparchus, son of Pisistratus and brother of Hippas, who held the tyranny of Athens (Thucyd. i. 20), he plotted, in conjunction with another Athenian named Harmodius, the death of the brothers, and succeeded in effecting the murder of Hipparchus at the Panathenæan festival, B.C. 511. Harmodius was slain on the spot; Aristogiton fled, but was subsequently taken and put to death by Hippas. After the expulsion of Hippas, when the constitution of Athens was brought nearer to a democracy, the memory of Harmodius and Aristogiton was honoured as that of martyrs in the cause of liberty. Bronze statues were erected to them in different parts of Athens: among others, by the celebrated Praxiteles. (Plin. xxxiv. 8.) Xerxes, when he took possession of Athens, B.C. 480, carried off the statues of Harmodius and Aristogiton, which he sent to Susa. They were afterwards restored to the Athenians, when Susa fell into the hands of Alexander, and in the time of Arrian they stood in the Ceramicus at Athens. (Arrian, vii. 16.) Various privileges and immunities were conferred on their descendants: and their exploit was regularly celebrated in song at the Panathenæan

festival (Philostratus, *De Vit. Apollonii* vii. 2; ap. Meursius, *Pisist.* c. xiv.), and became (we might instance a similar feeling in the frequent introduction of the names of Hampden and Sidney in patriotic toasts) a very favourite subject for the songs, called *seolia* (σκόλια), with which the Athenians enlivened their festive parties. One of these, composed by Callistratus, is commonly printed among the fragments of various authors at the end of the editions of Anacreon (see also Athenæus, xv. p. 695); and will be found translated in Bland and Merivale's *Anthology*, beginning

'I'll wreath my sword in myrtle bough.'

The first stanza of this is ascribed by Meursius, *Pisist.* c. xiv., to Carcinus. With reference to the custom, and other proofs of the affection with which the memory of Harmodius and Aristogiton was regarded, see Aristophanes, *Eq.* 786; *Ach.* 980, &c. We have, however, the testimony of Thucydides, (an early and dispassionate, though from his political opinions perhaps not a favourable, witness,) that the act of Harmodius and Aristogiton arose entirely out of a private quarrel; and that, far from effecting the immediate delivery of Athens, it made the sway of Hippias jealous and severe, instead of mild and beneficent; and Herodotus speaks to the same effect (vi. 123). That this mistake, as to the motives and merit of their action, was of early date, we may infer from Thucyd. vi. 54. Mitford (ch. vii. § 5) expresses an opinion that it was seditiously inculcated and fostered by the party of the Alcmæonids, the true expellers of Hippias, with a view to the firmer establishment of their own power; a supposition not in itself improbable, but unsupported on the part of the author by any references to authorities. (Thucyd. vi. 54, 9; Mitford, ch. v. 5, ch. vii. 5.)

ARISTOLOCHIA, or the birth-wort tribe of plants, consists of a small number of genera which principally inhabit the hotter parts of the world. They are in many cases used medicinally on account of their tonic and stimulating properties; and some of them are reputed remedies for the bite of venomous serpents. The distinguishing characters of the order reside in the flowers, which have no corolla, and are constantly divided into three segments; the number of the cells of the fruit is also three or six, and the stamens agree in the same ternary character; the fruit is always adherent to the calyx, or, as botanists say, inferior. Notwithstanding the accordance which thus exists between aristolochiæ and monocotyledonous plants in the ternary

number of the parts of their flowers, their structure is otherwise truly dicotyledonous. The arrangement of the woody matter of which their stem is composed is in longitudinal plates, surrounding a central pith, and surrounded by bark; but what is very curious, these plates are not placed in concentric circles like most other exogenous plants, but continue to increase uniformly and uninterruptedly as long as the plant grows. (See Lindley's *Introduction to Botany*, p. 66.) The leaves are veined like those of dicotyledonous plants, and the embryo of the seed has two lobes.

The most common plants of this singular order are the different species of asarum, or, as the gardeners call them, asarabacca; little stemless plants with dingy-brown flowers hidden among the leaves. This colour, which is far from common in plants, appears characteristic of the whole order, for even in those species which have yellow flowers, a brown stain seems to be mixed with the colour so as to change it, or brown spots are scattered over the surface. The most remarkable species of the genus *Aristolochia* are those which, in many of the tropical parts of America, excite the wonder of travellers by the gigantic size or grotesque appearance of the flowers, such as *A. cymbifera*, the border of whose calyx resembles one of the lappets of a Norman woman's cap, and measures seven or eight inches in length (see *Botanical Register*, vol. xviii. t. 1543), and *A. cordiflora* and *gigantea*, the flowers of which are from fifteen to sixteen inches across, and are large enough to form bonnets for Indian children.

ARISTOLOCHIA, MEDICAL USES OF. The most valuable of the species is the *A. Serpentaria*, which grows in North America, chiefly in Virginia, and hence is called Virginian snake-root. Though the whole root is used, the rootlets are more powerful than the solid root. These consist of a large portion of woody fibre and gummy matter, which have no virtues, along with some resin, bitter extractive, and a little essential or volatile oil, on which principles its virtues depend. It communicates its properties to water and to alcohol, which are employed as the means of extracting them, by forming an infusion or a tincture. Decoction should never be employed, as the heat drives off the volatile oil.

Its odour and taste resemble valerian, angelica, and camphor. In its action on the human system it most nearly approaches to camphor, but its effects are more permanent. It chiefly influences the nervous system, and seems to act most beneficially in those cases where the capillaries, either from not receiving an adequate supply of blood, or of nervous energy, are incapable of producing upon the blood those changes, which form secretions in the glands, the skin, and other secreting surfaces, or which are essential for the maintenance of a sufficient degree of vital action in every part of the body. The diseases or disordered states of the system in which it may be advantageously employed can, therefore, be easily inferred.

In protracted fevers, whether of a continued or intermittent kind, it is often eminently serviceable. In those cases of continued fever, which do not assume a very active character, but run on to a lengthened period, commonly called low nervous fever, it is preferable to every other agent, and may either be used alone, or in conjunction with cinchona bark, or some of its preparations. Hence, under the title of Huxham's tincture of bark, it is very much used; but a safer mode of administration is that of an infusion of the serpentaria, to which sulphate of quinine, and orange-peel, or other aromatic, may be added; as recommended under *AGUE* (Vol. I. p. 227).

In eruptive or exanthematous fevers, such as small-pox and measles, when the eruption is imperfectly formed or threatens to recede, an occurrence always betokening great danger, and indicating much feebleness in the powers of the system, serpentaria is an invaluable agent.

In the sore throat of scarlet fever, or in other affections of the throat, where gangrene is to be apprehended, from the depression of the vital powers, serpentaria, given internally, and used as a gargle, alone, or with tincture of capsicum, is more likely to prevent so serious a termination than any other medicine. In none of these diseases should it be exhibited till after the bowels have been thoroughly cleared out by proper purgative medicines. But there are other diseases, not attended with fever, in which serpentaria is extremely useful. In that form of indigestion where no inflammatory state of the mucous membrane of the stomach exists, and where the skin is harsh and dry, serpentaria

Aristolochia.

1. A branch of *Aristolochia siphio*; 2. one of its flowers cut lengthwise, showing the stamens lying in its bottom; 3. a cluster of stamens; 4. a seed-vessel; 5. the same cut across to show its six cells; 6. a seed; 7. a seed cut through to show the minute embryo lying in the albumen; 8. an embryo much magnified.

alone, or better with sulphate of quinine, is eminently serviceable. On the same principle, in the state of torpor or exhaustion to which literary persons are subject, from long-continued or intense mental exertion, this combination is highly useful.

In America, the infusion or tincture of serpentaria is sometimes taken every morning in damp aguish situations, to prevent intermittents. It is likewise said to prove useful in the treatment of a kind of pleurisy accompanied with great derangement of the biliary system, of frequent occurrence in autumn, among persons exposed to the exhalations of the marshes in America.

This species, and several others, both in America, and the East and West Indies, are much employed as antidotes against the bite of serpents; and hence the name snake-root. Dr. Hancock states, that the quaco, used by the South Americans in such cases, belongs to this tribe.

ARISTOMENES, a remarkable personage of ancient Greece, who holds a middle place between the mythic age and the commencement of history. As of the Spanish national hero, the Cid, or our own Richard the Lion-hearted, so we have an outline, probably a correct one, of his life, but filled up with exaggerated facts and fictitious adventures, which the minstrels of a rude age never fail to attribute to those whom popularity or notoriety renders fitting subjects for popular songs.

Of the early history of Messenia we know little. A race of kings descended from Cresphontes, the Heraclid leader to whom that district of Peloponnesus was allotted, governed the country, until, not very long after the legislation of Lycurgus, a series of disputes and skirmishes arose on the borders of Messenia and Laconia, which gave rise to a confirmed hatred. Prompted by this feeling, without declaring war, and indeed with studied secrecy, the men of Sparta bound themselves by oath never to return home until Messenia was subdued; and they commenced the contest by a midnight attack on Amphieia, a frontier town, which they took, and put the inhabitants to the sword. This was the commencement of what is called the first Messenian war. The chronology of these events, which in themselves are half fabulous, must of course be uncertain, and we can only give the dates of the conflicting systems of Newton and Blair, without pronouncing any judgment upon them. The former places the capture of Amphieia B.C. 652; the latter, B.C. 713. Under two able princes, Euphaes and Aristodemus, the Messenians continued the war for twenty years with various success; but in the end they were overpowered, and treated with great rigour. They bore the yoke for twenty five years (Newton, thirty-nine Blair); at the end of which a new generation had grown up, high-spirited, impatient of their national humiliation, and of the tyranny of their Spartan masters. In Aristomenes, a young man of the royal blood, a leader was found qualified to command both their affection and respect. Endowed with prudence as well as courage, he refused to move until assured of external support, of which the ancient jealousy of Arcadia and Argos towards their formidable neighbour, Sparta, gave good hope; and those states proved hearty in the cause. The revolt is dated by Pausanias (iv. 15) thirty-nine years after the end of the first war (O. xxiii. 4), B.C. 685 (Newton places it in 607), and the first battle was fought at a place called Deræ. It was obstinately contested, and each party claimed the victory; but even this doubtful issue was encouragement to the Messenians. Aristomenes performed more than one man seemed able to do, and his countrymen offered to him the regal dignity. This he declined; accepting however (under the title of *στρατηγὸς ἀντοκράτωρ*) the sole direction of military affairs. Upon this he undertook a singular enterprise, 'thinking it important above all things, by scaring the Lacedæmonians in the outset, to become more terrible in their eyes for the future.' He entered Sparta (an unwall'd town, and therefore of easy access) by night, and suspended a shield upon the temple of Athena of the Brazen House, inscribed, 'Aristomenes to the goddess, from the spoil of the Spartans.'

The year after the battle of Deræ a second engagement took place at a village called the Boar's Tomb. The Messenians were supported by auxiliaries from Elis, Argos, Sicyon, and Arcadia; the Lacedæmonians by Corinth and two minor cities. There was a chosen band of eighty Messenians who formed a sort of body-guard to Aristomenes, and fought around him; and to their exertions principally the Messenian legends ascribe the victory gained on this occa-

sion. At their head Aristomenes attacked and routed, after a hard fight, the flower of the Spartan troops ranged round their king, Anaxander. Leaving it to others to improve this success, he led his companions from point to point, wherever the enemy seemed most inclined to make head; and finally achieved so complete a victory, that the Lacedæmonians 'fled without shame, no longer waiting for one another.' Aristomenes lost his shield in a very odd way in the pursuit (see Paus. iv. 16, or *Historical Parallels*, i. p. 41), and we might conjecture from the story, that the Messenians, pressing too eagerly, received a check.

The war was continued in a series of predatory incursions, in the course of which some romantic adventures are told of Aristomenes, B.C. 604. (Blair, 682.) A third pitched battle was fought at Megaletaphrus (the Great Ditch), in which the treachery of Aristocrates, prince of Orchomenus in Arcadia, and commander of the Arcadian auxiliaries, who was bribed by the Lacedæmonians, led to the entire defeat of the Messenians. So great a number were slain, that 'having before expected to become masters instead of slaves of the Lacedæmonians, they now gave up even the hope of safety.' Aristomenes found himself too weak to maintain his ground in the open field, or even to defend the inland forts; and he withdrew with his followers to the strong hold of Eira near the sea, abandoning to the Lacedæmonians all the country except a strip of land along the coast, held by the Pyliaans and Methonæans. From Eira he kept up a war of constant incursion along the Laconian border, carrying off agricultural produce and prisoners both from Laconia itself, and from Messenia, now occupied by the Lacedæmonians. At last the Lacedæmonians were obliged to prohibit the cultivation not only of Messenia, but of the borders of Laconia, 'as tilling the land rather for those who were in Eira than for themselves.'

This compelled the Messenians to seek their spoil in more distant excursions, in one of which Aristomenes was taken prisoner, and cast, with several of his companions, into a pit called Cendas; such was the name of a place into which criminals at a later period were thrown at Sparta. All but Aristomenes were killed by the fall. For three days he lay waiting the slow approach of death: at the end of that time, his eyes being accustomed to the dim light, he saw a fox attracted by the dead bodies. The idea of escape then suggested itself: he caught the fox, and allowing it liberty enough to choose its own path, was conducted along a narrow passage terminating in a crevice just wide enough to admit the animal. He enlarged the opening with his hands, and returned to Eira. The news of his escape soon spread abroad; but the tale was so singular that the Lacedæmonians refused to credit it, until the rout of a body of Corinthians, with great slaughter, on their march to join in the siege of Eira, convinced them that 'Aristomenes, and no other, had done this.' After this exploit, he offered for the second time to the Ithomæan Jupiter the sacrifice called hecatomphonia, a rite peculiar to the Messenians, and performed by those who had slain a hundred men in battle. In the course of the war he had occasion to perform it a third time.

In the eleventh year of the siege of Eira, the fulfilment of an oracle warned Aristomenes that the contest could not be much longer protracted. The Messenians were in possession of some mystical treasure, which, if preserved, so it was said by oracles, would ensure the ultimate restoration of their national existence. This Aristomenes buried secretly in the most desolate part of Mount Ithome, hoping that the gods who had hitherto favoured them would watch over this the last deposit of the hopes of his countrymen. One stormy night, when the vigilance of the Messenian sentinels was lulled by the violence of the tempest, and by the knowledge that Aristomenes, confined by a wound, was unable to exercise his usual superintendence, the Spartans, warned by a deserter, took possession of the walls. When the alarm was given, the Messenians flew to arms, and for three days maintained possession of the place. At length, being overmatched in numbers, and exhausted by constant fighting, they found it necessary to abandon the place. Aristomenes collected the survivors, and placing their women and children in the midst, demanded, by signs, a free passage. The Spartans opened their ranks rather than encounter the onset of such an enemy reduced to desperation.

The remnant of the Messenians took shelter with their faithful friends, the Arcadians. Bent on avenging his country, Aristomenes selected 500 men of approved courage,

and, in presence of the Arcadians, asked if they were ready to die with him, to obtain that end. All assented, and he disclosed his plan, which was to assault Sparta by night, while the army was still absent, and, if they could get possession of the city, to hold it as a pledge for the restoration of their own land; if not, to meet a glorious death. Three hundred Arcadians volunteered to join them; but the enterprise was frustrated by the traitor Aristocrates, who sent intelligence of it to Sparta. This time, however, his perfidy was detected, and he was stoned by his indignant countrymen. The Messenians, invited to join in the execution, looked towards Aristomenes, who sat weeping, with his eyes fixed on the ground; and we may infer, though it is not so stated in the story, that according to the old legend they withheld their hands.

The remnant that escaped from Eira, joined by the Messenians of Pylos and Methone, emigrated in a body, intending to seek the rich island of Sardinia, and they requested Aristomenes to put himself at their head. This he declined, saying, that he would never cease to war against the Lacedæmonians, and that he was sure some mischief would be continually accruing to them at his hands. In this hope he was disappointed. Damagetus, prince of Ialysus in Rhodes, being advised by an oracle to marry the daughter of the bravest man in Greece, selected Aristomenes as unquestionably deserving that title. Aristomenes went with his daughter to Rhodes, where he died, ungratified in his wish of striking another blow at Sparta. The exploits of Aristomenes formed the subject of a poem by Rhianus, in which the hero made as conspicuous a figure as Achilles in the poem of Homer. (Pausan. book iv. 6, &c.; Mitford, iv. 3: *Historical Parallels*.)

ARISTOPHANES, a celebrated comic poet of Athens, son of Philippus, or Philippides; his first play was exhibited on the Athenian stage B.C. 427, and his last, B.C. 388. There seems every reason to believe that he was a native of Athens, though Suidas brings him from the island of Rhodes, and others from Ægina, where he certainly possessed some property. (See Suidas, *Aristophanes*, for the various opinions as to the place of his birth.) He had three sons, whose names are recorded. Of his private history, the few facts which have been transmitted are of little moment. Though the period during which he lived was full of transactions of great importance in the eventful history of Greece, Aristophanes does not appear to have been actively engaged in any of them. His life, in fact, was entirely devoted to literature, and the numerous plays which we know him to have produced prove that his attention could have been occupied with little else. He is the only writer of the old comedy of whom we have any considerable remains, and it is chiefly through his works that we are able to form an opinion respecting this particular species of dramatic composition. The writers of the old comedy sometimes brought real characters, without even a change of name, upon the stage. At first sight, the power thus assumed by them seems of a nature incompatible with the peace and security of society, but in reality it was not greater than that possessed by the public journals of the present day. The comic writer, in fact, may be considered to have supplied the place of the journalist of modern times; but with far inferior effect, as the times, at which the plays were represented, were at considerable intervals, and they could only be witnessed by a limited number. We believe, too, that they followed rather than led the opinions of the public, and that they did little more than give a more pointed expression and a somewhat wider circulation to the opinion already entertained of the individual whom they satirized, or of the class whom they held up to ridicule. Neither are we inclined to allow that they exercised much influence on the Athenians, or ever led to any important decision. It was the orator, and not the comic writer, 'who wielded at will the fierce democracy' of Athens.

Aristophanes was the author of fifty-four comedies (Suidas), of which eleven have been preserved. Suidas enumerates the same plays that we now possess, and mentions no others as being extant. In the fourth year of the Peloponnesian war, B.C. 427, the poet brought out his first play, entitled *Δακρυλόγος*, holding up to public contempt the character of the spendthrift; and next year he produced the *Babylonians*, in which he attacked in no measured terms the demagogue Cleon, and the constituted authorities of Athens: of these plays we possess only a few fragments. His severe treatment of Cleon in the *Babylonians* is said to

have caused the demagogue to question the right of Aristophanes to be considered a citizen of Athens. Aristophanes was tried, and came off victorious by repeating the two verses put into the mouth of Telemachus by Homer, when he was asked whether he was the son of Ulysses: 'My mother, replies Telemachus, 'says so, but I know not; for no person ever yet was sure as to his parentage.' (*Odys.* i. 215.) This story, which is told in an anonymous life of Aristophanes, as to the quotation from Homer, is rather a ridiculous one.

In 425, during the sixth year of the Peloponnesian war, he gained the first prize in a contest with Eupolis and Cratinus: his play was entitled the *Acharnians*, in which he recommended to the Athenians the cause of peace, as openly and as strongly as the nature of the people whom he addressed would permit. The scene lay chiefly in Acharnæ, one of the *demi*, or small towns of Attica; and the object he had in view was pointed out by introducing on the stage the rustic Diereopolis, who, disapproving of the obstinacy of his fellow-citizens, had concluded with the Spartans a separate peace, and is exhibited in the full enjoyment of its fruits. The result of the opposite line of conduct is shown in the sufferings of Lamachus, who is exposed to the want of the first necessities of life, and withering under severe wounds received in the field of battle. There is one scene in particular which is full of that comic humour for which Aristophanes is so distinguished. It is a sort of *Amœbean* dialogue between Lamachus and Diereopolis. The commands of the former are those of a man preparing for a campaign; the responses of Diereopolis are those of a person making ready for a convivial entertainment. This play contains a bitter satire on Pericles for his attachment to Aspasia, and at the same time a strong testimony to the vigour and eloquence of this great man. (*Acharn.* 524-534.)

Aristophanes had already made the demagogue Cleon writhe under his satire; but it was not till B.C. 424 that he poured forth upon him the full measure of his wrath. It was in that year that he produced the *Knights*, or, as Wieland more aptly designates it, the *Demagogues*, the most valuable, perhaps, of all his extant plays. He held up before the Athenian people a faithful picture of their own character with a boldness which we cannot but admire, knowing, as we do, that they allowed any one to be brought upon the stage except themselves. Athens is represented as a house, and its master is a stupid old gentleman, Demos (*people*): Nicias and Demosthenes are his slaves, and Cleon his confidential servant, or slave-driver; Agoracritus, a sausage-seller, is the person whose destiny it is to subvert the demagogue. Thus the dramatis personæ are few, and the plot is perhaps still more meagre. It consists of humiliating pictures of Cleon, and a succession of proofs to Demos that this favourite servant is wholly unworthy of the trust and confidence reposed in him. As an historical document, however, this play cannot be too highly valued, as furnishing a strong and faithful picture of one of the most singular nations of antiquity. It gives by no means a favourable view of their character. Demos is irritable, jealous, full of suspicions, a prey to superstition, fickle in his opinions, and inconstant in his pursuits; a curious mixture of acuteness and blindness, of insolence and servility. It is said that no one was found with sufficient nerve to act the part of Cleon, or to make a mask to represent him, and that Aristophanes was himself obliged to appear on the stage in that character with his face merely painted. The *Knights* was the first play that Aristophanes brought on the stage in his own name. There are many touches in Arbutnot's *John Bull*, as Mitford remarks, strongly rescuing the most striking traits in the character of Demos, the personification of the Athenians.

Next year, B.C. 423, he produced another play, the *Clouds*, which only gained the third prize, though in later times it has acquired a notoriety which it does not seem to have enjoyed at first. This arose, probably, from an idea first started by Ælian in one of his gossiping stories, that it was a main cause of the condemnation of Socrates (see also one of the Greek arguments to the play); but when it is known that the philosopher survived the satire of the poet for upwards of twenty years (Socrates died B.C. 399), nothing more is required to prove the untenable nature of such an opinion. Still it is probable enough that this play may have done serious injury to the true character of Socrates among the populace of Athens. It contains a powerful and severe attack on the schools of the sophists,

a race of philosophers who 'could make the worse appear the better reason'; but nothing, in our judgment, can justify the personal attack which the poet makes on Socrates, whose character, as far as we can form an opinion of it, was very different from that which is represented in the play. The plot is simple and clear; it is wrought up in a masterly style by a variety of comic incidents, and the characters are full of humour. Strepsiades is the most prominent; his rusticity strangely contrasts with the pedantry of the sophists. His son has ruined him by his extravagance, and he is willing to have recourse to any plan, however unprincipled, which he thinks likely to extricate himself from his embarrassments. He imagines that he has discovered a resource in the school of Socrates, by the sophistry and chicanery of whose doctrines he expects to be relieved from the dunning of his creditors. He presents himself before the philosopher, whom he finds suspended aloft in a basket; and the whole dialogue which follows between two characters so forcibly contrasted is conceived in the very best style of the author. At last, however, Strepsiades is convinced that his genius does not lie in that direction, and he determines to send his son Phidippides to benefit by the philosopher's instructions. Cratinus, whom Aristophanes in his *Knights* had represented as sunk into a state of dotage, gained the victory over the *Clouds*. The youth makes great proficiency, which he shows in his dealings with his creditors and by beating his father, and then trying to convince the old gentleman that it is all right. The play closes with Strepsiades setting fire to the school-house of Socrates (*φωρτιστήριον*), and burning out all the disciples; a significant hint, which, coupled with the concluding verses of the play, was well calculated to raise a religious persecution against Socrates. This play was caricatured by Eupolis, but it did not prevent the poet from labouring to improve his first idea, and it is probably the amended copy which we now possess. (See this point discussed by Wieland, *Att. Mus.* ii. 2; and by Hermann, *Pref.* xix.; see also the *Clouds* of Aristophanes, by F. G. Welcker.)

In B.C. 422 appeared the *Wasps*, an attack upon the jurisprudence of Athens, levelled chiefly at that numerous class of citizens who gained a livelihood by executing the office of *dicast*—an office somewhat resembling that of our Westminster special jury men; but the parallel, to be complete, would require that the same special jury men should be almost daily in attendance, and should be eager to discharge the duty. There cannot be said to be any plot. Philocleon is described as absolutely phrenzied with that passion of which all his countrymen partook—a taste for litigation and frequenting the courts of law. His son Bdelycleon endeavours to reclaim him; but force, persuasion, and argument, are all tried in vain. The son is nearly driven to despair by the obstinacy and prejudices of his father, and at last falls upon a scheme which promises to extricate him from his difficulties. He proposes to convert his house into a court of justice, and to supply it with all suitable pomp. The old gentleman is pleased with the scheme, and the theft of a Sicilian cheese by a house-dog enables him to put it into immediate execution. To understand this play requires a minute acquaintance with the manners of the Athenians, and also with their judicial system. This play furnished Racine with the idea of his *Phèdre*.

The play of the *Birds* was exhibited, B.C. 414, in the seventeenth year of the Peloponnesian war, and during the absence of the Salaminia, an official ship which was despatched to bring back Alcibiades from Sicily. (Thucyd. vi. 53. See *ALCIBIADES*.) Nearly every writer on this play, we believe, has found it almost impossible to say what is the leading idea of the plot; and consequently many critics have pronounced an unfavourable opinion on it. In the Transactions of the Royal Academy of Sciences of Berlin (1827) there is an essay by Süvern on the *Birds* of Aristophanes, the object of which is to demonstrate that the key to the true interpretation of the play is only to be found by referring to the date of the exhibition and the mission of the Salaminia. We understand that Mr. W. Hamilton is preparing a translation of Süvern's essay.

In B.C. 406 appeared the *Frogs*, in which Aristophanes attacks, with little generosity, the poet Euripides, who had lately died. Bacchus descends to the infernal regions in search of a good tragic writer, and after listening to a trial of skill between Æschylus and Euripides, decides that the merits of the former are far superior to those of the latter.

The best of his other extant works is the *Plutus*, which

appeared first in B.C. 408, and again twenty years afterwards, B.C. 388. It does not belong to the old comedy, nor does it appear to have any reference to political subjects, being intended probably to vindicate the conduct of Providence in its ordinary distributions of wealth, and to show the great tendency of riches to corrupt the morals of those who possess them. The choral parts of the *Plutus* are lost, or at least do not exist, and it contains no Parabasis. The other plays which have been preserved are the *Peace* (B.C. 419); *Thesmophoriazuse* (B.C. 411), an attack on Euripides, in which the plot is better managed than in most of the other plays; *Lysistrata* (B.C. 411); *Ecclesiazuse* (B.C. 392).

Aristophanes is distinguished by the exuberance of his wit, his inexhaustible fund of comic humour, and the Attic purity and great simplicity of his language. He introduces, when it suits his purpose, every variety of dialect, coins new expressions for the occasion, makes bad puns without ceasing, and displays, at the same time, all the riches and beauties of the Greek language. It must be confessed, however, that his wit is frequently of a kind which cannot be relished by the taste of the present age, partly because his allusions are sometimes necessarily obscure, and partly, also, because they are grossly obscene. Indeed, the indecency of his allusions and the indecency of his expressions can only be excused because it was the fault of the time and people among whom he lived, and others were probably worse than himself. The exact rank which he ought to hold among ancient comic writers it is difficult to assign, as none of their entire works have been preserved; but if we are inclined to trust the judgment of Plutarch, he was in every respect inferior to Menander, (vol. ix. p. 387, ed. Reisk.) Plato, however, is said to have had a high admiration of Aristophanes, and recommended the perusal of his plays to Dionysius the younger as the best mode of acquiring the purity of the Attic dialect. So fond, indeed, was Plato of his works, that they are said to have been found under his pillow after his death. (*Vit. Anonyma*.)

The plays of Aristophanes, especially in the choral parts, often contain passages of great poetical beauty, but his subject did not allow such efforts to be either frequent or of any great length. We doubt, indeed, if he was capable of any continued effort of this description, as we observe a kind of mock solemnity in most of the poetical parts; and he could not long refrain from a joke, or some oblique stroke of satire. Where Aristophanes appears to be speaking in his own person, he is the advocate of morality, and the un-pungent censurer of the gross and degrading habits of many of his countrymen. He was a friend to peace, and, to his credit, the enemy of Cleon. The real test of his character must be the *Clouds*. We do not see how it is possible to esteem the character of Socrates, and at the same time to believe that Aristophanes was an honest man. All the explanations and apologies with respect to this exhibition of Socrates appear to us unsatisfactory. Probably, like many wits of his own and subsequent ages, Aristophanes had neither the ability nor the turn of mind which would qualify him to investigate the principles of moral science, and he may have turned the philosopher into ridicule without knowing or caring what his doctrines were. Aristophanes often introduces the gods in the most degrading situations, and he makes an undisguised mockery of all the deities of Olympus. How this was tolerated, even in his age, it is difficult to understand.

There are numerous editions of the plays of Aristophanes. The first edition was printed at the Aldine press in Venice, 1498, fol., containing only nine plays. The *Thesmophoriazuse* and *Lysistrata* were wanting. The edition of Kuster contains the valuable Scholia. One of the most complete, containing a Latin version, an index, and a large collection of notes, is that of Bekker, in 5 vols. 8vo. Lond. 1829. Bekker's text is founded on the collation of two exceedingly good MSS., the Ravenna and the Venetian, which were unknown to the earlier editors. It contains also the Scholia. The valuable Scholia on Aristophanes have been lately published by Dindorf, 3 vols. Lips. 1826. The *Knights*, *Acharnes*, and the *Wasps*, have been translated into English verse by Mitchell (London, 1822); and the *Clouds*, more successfully, by Cumberland (1797). There are several prose translations of single plays; *Plutus*, by Fielding and Young; the *Birds*, by a Member of one of the Universities (London, 1812); *Acharnians*, *Knights*, *Wasps*, and *Birds*, by a Graduate of Oxford (Oxford, 1830). Aristophanes is

translated into French by Poinset de Sivry (1784), 4 vols. 8vo.; into German by Voss (Brunswick, 1821); and the *Clouds* and *Frogs* by Welker (Giessen and Darmstadt, 1810, 1812). Wieland translated the *Acharnes*, *Clouds*, *Knights*, and *Birds*. (See Ritscher, *Aristophanes und sein Zeitalter; eine Philologische-Philos. Abhandlung zur Alterthumsforschung*. Berlin, 1827.)

ARISTOPHANES of Byzantium, the pupil of Callimachus and Zenodotus, the master of Aristarchus, and the founder of the Alexandrine school of criticism, was perhaps born about B.C. 240, or somewhat later. It is not known at what time he removed to Alexandria, but probably he went there young. (See Suidas, *Ἀριστοφάνης*.) The invention of the Greek accents is attributed to Aristophanes, and the introduction of a system of punctuation. He was the first who attempted to arrange the Greek writers into classes, according to the branches on which they wrote, separating those of the highest authority from writers of inferior merit. This canon of classical writers was afterwards corrected and confirmed by his pupil Aristarchus. The immense number of works already extant in that age rendered some critical enumeration and classification of them necessary, and perhaps we are indebted to Aristophanes and his more distinguished pupil, not only for the purer text, but also for the preservation of many of the best writers, which, if they had not been stamped with their approbation, might have been neglected for those of inferior merit. But it is also probable, as it has been remarked, that many writers of the second class fell into undeserved neglect, and ceased to be copied in consequence of being excluded from the canon. [See ARISTARCHUS.]

Nothing of Aristophanes remains except what may form a part of the large commentary of Eustathius, the Venice *Scholæ*, &c. (See Villerson's *Scholæ*, II. i. 298, 321, &c. where Aristophanes' edition of the *Iliad* is referred to.) Aristophanes wrote a work on *Συγγράμματα*, or 'terms implying relationship' (see Eustath. II. z. p. 618; who also quotes other works written by Aristarchus). A mere fragment of Aristophanes is printed in Boissonade's *Ἐπιγραφαὶ* of Herodian, 1819, 8vo.

See a passage in Athenæus (book xiii. p. 583, Casaub.) apparently referring to a work by this Aristophanes.

ARISTOTLE (the Greek form of the name is *Aristóteles*) was born at Stageira (the name, before Aristotle's time, appears to have been Stageirus), a town on the west side of the Strymonic gulf in Chalcidice, in the first year of the ninety-ninth olympiad, or B.C. 384. Nicomachus, the friend and physician of Amyntas II., king of Macedonia, and the author of some medical treatises now lost, was his father; his mother was named Phaestis; and they both belonged to the

his father's relations with Amyntas appear, however, to have produced an acquaintance between him and Philip, the son of Amyntas, which was probably one of the reasons why that prince, when he had succeeded to the throne of Macedonia, chose Aristotle as the preceptor of his son Alexander. After the death of his parents, he was brought up under the care of Proxenus, a citizen of Atarneus, a city of Mysia in Asia Minor, but who was then settled at Stageira. Aristotle testified his gratitude to Proxenus and his wife by directing in his will that statues of them, as of his parents, should be set up at his expense: he likewise educated their son Nicomachus, to whom he gave his daughter Pythias in marriage.

In his eighteenth year (Olymp. ciii. 2, B.C. 367) Aristotle left Stageira, and went to Athens, the centre of letters and learning in Greece, attracted thither doubtless in great part by the fame of the philosopher Plato. It appears, however, that during the first three years of his residence there Plato was absent on a visit to Sicily. There can be no doubt that Aristotle paid a particular attention to anatomy and medicine, as appears both from his extant and what we know of his lost writings; and it may be possible (as is indicated by some statements of ancient writers) that in his youth he practised, like Locke, the healing art: but he must from an early age have devoted his whole time to the study of philosophy and the investigation of nature, and have abandoned all thoughts of an exclusively professional career. His eagerness for the acquisition of knowledge, and his extraordinary acuteness and sagacity, doubtless attracted Plato's attention at an early period: thus we are told that his master called him *the intellect of the school*, and his house *the house of the reader*; that he said that Aristotle required the curb, while Xenocrates (a fellow-disciple) required the spur: some of which traditions are probably true. We are likewise informed that, when reading, he used to hold a brazen ball in his hand over a basin, in order that, if he fell asleep, he might be awakened by the noise which it made in falling. Although Aristotle did not, during Plato's life, set up any school in opposition to his master (as some writers have falsely stated), he taught publicly in the art of rhetoric, and by this means became the rival of the celebrated Isocrates [see ISOCRATES], whom he appears (although then at a very advanced age) to have attacked with considerable violence, and to have treated with much contempt. Cephisodorus, a disciple of Isocrates, wrote a treatise in four books to defend his master against Aristotle's attacks, in which he likewise charged that philosopher with degrading himself by the composition of a work on proverbs: whence we learn that Aristotle published some writings during the lifetime of his master.

Aristotle remained at Athens till Plato's death in B.C. 347, having at that time reached his thirty-seventh year. Many stories are preserved by the ancient compilers of anecdotes respecting the enmity between Plato and Aristotle, caused by the ingratitude of the disciple, as well as by certain peculiarities of his character which were displeasing to the master. But these rumours appear to us to have no other foundation than the known variance between the opinions and mental habits of the two philosophers; and particularly the opposition which Aristotle made to Plato's characteristic doctrine of ideas: whence it was inferred that there must have been an interruption of their friendly relations. The probability however is, that Aristotle, at whatever time he may have formed his philosophical opinions, had not published them in an authoritative shape, or entered into any public controversy, before his master's death; in his Nicomachean Ethics moreover, which was probably one of his latest works, he says, that 'it is painful to him to refute the doctrine of ideas, as it had been introduced by persons who were his friends: nevertheless, that it is his duty to disregard such private feelings; for both philosophers and truth being dear to him, it is right to give the preference to truth.' (i. 6.) He is likewise stated to have erected an altar to his master, inscribing on it that he was a man 'whom the wicked ought not even to praise.' It has moreover been supposed that Aristotle was the author of the calumny, that Socrates had married a second wife during the lifetime of his first; but the charge rests on the inaccuracy of Diogenes Laertius, Plutarch, and other late writers, who have misrepresented a passage from Aristotle's work on Nobility, preserved in Stobæus, which treatise, it should be observed, is attributed to Aristotle on very doubtful authority. (See Luzac, *Lectiones Atticæ, De Dignitate Socratis*, § 4.)

Bust of Aristotle, from a fine statue of the natural size in the Spada Palace at Rome, engraved in Maffei's work on the Statues of Rome, pl. 185. (See Visconti, *Iconographie Grecque*, vol. i. p. 186.)

race or clan of the Aselepidæ, who were supposed to derive their origin from Aesclepius or Esculapius, the God of Healing, and of whose members many practised the medical art. Aristotle lost both his parents at an early period of his life:

It appears that during Aristotle's first residence at Athens he was employed on an embassy to Philip, to whom he was attached by a double tie, as being both a Macedonian subject and the son of his friend and physician. It is also stated that he was the means of obtaining from Philip some favours for the Athenians. His departure from Athens at the time of Plato's death may therefore not improbably have been caused by the enmity between Philip and the Athenians, which arose at that time from a successful attack on Olynthus by the former. It may likewise have originated from the circumstance that Speusippus, the nephew of Plato, and not Aristotle, succeeded him as head of the academy. However this may be, Aristotle, together with his fellow-disciple, Xenocrates, a man, as it appears, of very rare excellence, went at this time to the court of Hermias, the prince of Atarneus, who had previously received instruction in rhetoric from Aristotle at Athens, and now invited his former master to Asia Minor. Hermias was a eunuch, and had been the domestic slave of a banker; but having returned from Athens, where he received a liberal education under Plato and Aristotle, he succeeded with Eubulus in liberating from the Persian yoke Atarneus and the neighbouring territory, of which, after the death of Eubulus, he remained sole ruler. After Aristotle had resided three years at Assus, a town near Atarneus, Hermias fell into the hands of Mentor, a Greek general in the Persian service, by whom he was delivered to Artaxerxes Ochus, and by him put to death. Upon the death of their protector, Aristotle and Xenocrates fled from Assus, and the former took refuge in Mytilene, the chief city of the neighbouring island of Lesbos (Olymp. ciii. 4, B.C. 345). Aristotle moreover, seeing that Pythias, the sister of Hermias, would, if she were left behind, be exposed to the utmost misery, when the country came to be occupied by the Persian soldiery, and actuated not only by his friendship for Hermias, but also by the excellent character and disposition of Pythias, made her his wife, and saved her from the enemy by a rapid flight. (This account is given by Aristocles the peripatetic, from Aristotle's lost epistles to Antipater ap. Ruseh, *Præp. Evang.* xv. p. 793, A. Strabo, xiii. p. 610, calls Pythias the niece of Hermias; perhaps she was his adoptive sister.) For the patriotic and philosophic prince, thus destroyed by the treachery of a Greek renegade, Aristotle had a fervent and sincere affection, and he dedicated to his memory a beautiful poem, still extant, which, on account of the admiration which he expresses in it for the virtues of his lost friend, gave rise at a late period of his life to the absurd charge that he had deified a mortal, and was thus guilty of impiety. His wife Pythias died a few years afterwards in Macedonia, leaving him a daughter of the same name: he then took to his bed a domestic slave named Herpyllis, and by her he had a son, Nicomachus, to whom he addressed his great work on Ethics.

After two years' stay at Mytilene, Aristotle was (in Olymp. cix. 2. B.C. 342) invited by Philip to Macedonia to superintend the education of his son Alexander, then fourteen years old. There can be no doubt that much of what was admirable in the character of Alexander the Great is attributable to the influence of Aristotle. His love of literature, his veneration of great poets (instanced in his sparing the house of Pindar in the destruction of Thebes, and his destination of the precious casket in the Persian spoils to the works of Homer), his fondness for physical and even medical pursuits, and his intimacy with philosophers, were all doubtless the fruits of Aristotle's instruction, and distinguish him most advantageously from those illiterate and brutal conquerors who have been the scourge of the human race. Lord Bacon, in his *Advancement of Learning*, after citing some of Alexander's wise sayings, adds, that he considers him 'not as Alexander the Great, but as Aristotle's scholar.' The same sentiment is likewise expressed in the following epigram:

Maximus hic regum, doctissimus ille sophorum,
Magnus Alexander, major Aristoteles.
Doctus Alexandrum meliorem reddidit ille,
Non hic majorem magnus Aristoteles.

Two letters between Alexander and Aristotle are preserved by Plutarch (*Vit. Alex.* c. vii.), and Aulus Gellius (xx. 5), in the first of which Alexander reproaches his master with having made public the treatises which had served for his education, as he wished to surpass other men not less in knowledge than in power. To this Aristotle replies, that 'they have been published and not published: for that they are only intelligible to those who have heard him

explain them.' Even if the suspicions of some writers that these letters are spurious should be approved, still there would remain no doubt of the important influence exercised by Aristotle on the mind of Alexander: it is likewise stated that he advised his pupil to consider all the Greeks as his friends, and all barbarians (or foreigners) as his enemies: a maxim of policy which Alexander unquestionably followed, so far as the direction of his conquests was concerned, and which agrees remarkably with Aristotle's views as developed in the first part of his 'Politics.' It was during his residence with Alexander that Philip re-established his native town, Stageira, which had been demolished in war; in memory of which benefit the Stagiritæ consecrated a festival, *Aristotelia*, to their great fellow-citizen, and called a month after his name.

Alexander probably did not enjoy Aristotle's instruction for more than three or four years: as from his seventeenth or eighteenth year his time was almost entirely occupied with public affairs and war. In B.C. 336, when Philip was assassinated, he succeeded to the throne of Macedonia, and two years afterwards he began his expedition into Asia, when he parted for the last time from his master, who went to Athens, having previously recommended to him as a companion in his campaigns a near relation of his own, the philosopher Callisthenes, who had received his instruction with Alexander. Xenocrates had two years before succeeded Speusippus in the academy: Aristotle, however, on his arrival at Athens, resolved to open a school, and chose a house which from its proximity to the temple of Apollo Lyceus was called the *Lyceum*. Attached to this building was a garden with walks (in Greek *peripaton*), where Aristotle used to deliver his instruction to his disciples; whence his school obtained the name of the *Peripatetic*. It appears that his habit was to give one lecture in the early part of the day on the abstruser parts of his philosophy to his more advanced scholars, which was called the *morning walk*, and lasted till the hour when people dressed and anointed themselves; and another lecture, called the *evening walk*, on more popular subjects, to a larger and less select class. It was probably during the thirteen years of his second residence at Athens that Aristotle composed or completed the greater part of his works which have descended to our days: the foundation of most of them was doubtless laid at an early period of his life; but they appear to have been gradually formed, and to have received continual additions and corrections. Among the works which especially belong to this period of his life are his treatises on natural history; which, as has been correctly observed by a late writer on this subject (Dr. Kidd, *Bridgewater Treatise*, &c., p. 299), are not to be considered as containing the result of his own observations only, but as a collection of all that had been observed by others as well as by himself. It is stated by Pliny (*Nat. Hist.* viii. 7) that 'Alexander the Great, being smitten with the desire of knowing the natures of animals, ordered several thousand persons, over the whole of Asia and Greece, who lived by hunting, bird catching, and fishing, or who had the care of parks, herds, hives, stews, and aquaries, to furnish Aristotle with materials for a work on animals.' We are likewise informed that Aristotle received from Alexander the enormous sum of 800 talents to prosecute his researches in natural history: a circumstance which did not escape the malice of his traducers, who censured him for receiving gifts from princes. (*Athenæus*, ix. p. 398 [comp. Boeckh's *Economy of Athens*, vol. i. p. 20]. Seneca *De Vita Beata*, c. 27. *Ælian*, *Var. Hist.* v. 19, who states that Philip furnished Aristotle with large sums of money for his history of animals, has doubtless confounded the father and son.) Callisthenes, who, as we have already seen, attended Alexander in his expedition to Asia, sent from Babylon to Aristotle, in compliance with his previous injunctions, the astronomical observations which were preserved in that ancient city, and which, according to the statement of Porphyrius, reached back as far as 1903 years before the time of Alexander the Great; that is, 2234 years before the Christian æra. (Simplicius in *Aristot. de Cælo*, fol. 123 A. l. 18, ed. Ald. 1527. The transmission of the observations to Aristotle is stated by Simplicius as a known fact: the length of time he gives on the authority of Porphyrius. See Bailly, *Histoire de l'Astronomie Ancienne*, liv. 4. éclaircissements. § 17-23. On Aristotle's astronomical knowledge, see Bailly, *ibid.* liv. 9. § 10, 11.) The fact that astronomical observations of considerable antiquity were sent from Babylon to Aristotle

(though they are nowhere mentioned in his extant writings) appears to be undoubted: the epoch from which they date is however uncertain, and is variously stated by ancient writers. (See Pliny, *Nat. Hist.* vii. 56. explained by Bailly, *ibid.* liv. 1. *Éclaircissements* § 15.) We know from Cicero (*de Rep.* i. 16) that astronomical observations were sometimes calculated back by the ancient priests; and consequently that observations stated to be of remote antiquity may not be less fabulous than the adventures of early kings and heroes.

Aristotle had at this time reached the most prosperous period of his life. The founder and leader of the principal school of Greece, and the undisputed head of Grecian philosophy, surrounded by his numerous disciples and admirers, protected by the great conqueror of Asia, and by him furnished with the means of following his favourite pursuits and of gratifying his universal spirit of inquiry, he had probably little left to fill up the measure of a philosopher's ambition. But he did not continue to enjoy the favour of Alexander till the end. Callisthenes, by his free-spoken censures and uncourtly habits, had offended his master, and had been executed on a charge of having conspired with some Macedonian nobles to take away his life (see ALEXANDER and CALLISTHENES); and the king's wrath appears to have extended to his kinsman Aristotle, as being the person who had originally recommended him. (Letter of Alexander to Antipater in Plutarch, *Alex.* c. 55.) It is not, however, probable that this circumstance caused any active enmity between the royal pupil and his master; nor, even if we did not know to a certainty that Alexander died a natural death, would there be any reason for listening to the absurd calumny that Aristotle was concerned in poisoning him. Aristotle indeed appears to have been considered to the last as a partizan of Alexander, and an opponent of the democratic interest. When the anti-Macedonian party obtained the superiority at Athens in consequence of Alexander's death, an accusation against Aristotle was immediately prepared, and the pretext selected was, as in the case of Socrates, *impiety or blasphemy*. He was charged by Eurymedon the hierophant and a man named Demophilus (probably a leader of the popular party) with paying divine honours to Hermias; and perhaps with teaching some irreligious doctrines. In order to escape this danger, and to prevent the Athenians (as he is reported to have said) from *trice sinning against philosophy*, in the beginning of B.C. 322 he quitted Athens, and took refuge at Chalcedon, in Eubœa, an island then under the Macedonian influence, leaving Theophrastus his successor in the Lyceum. There he died of a disease of the stomach, in the autumn of the same year, being in the sixty-third year of his age. His frame is said to have been slender and weakly, and his health had given way in the latter part of his life, having probably been impaired by his unwearied studies and the intense application of his mind. The story of his having drowned himself in the Euripus of Eubœa is fabulous.

The characteristic of Aristotle's philosophy, as compared with that of Plato, is that, whereas the latter gave a free scope to his imagination, and by his doctrine of ideas independent of the objects which they represent opened a wide door to the dreams of mysticism, the latter was a close and strict observer of both mental and physical phenomena, avoiding all the seductions of the fancy, and following a severe, methodical, and strictly scientific course of inquiry, founded on data ascertained by experience. The truly philosophical character of his mind, and his calm and singularly dispassionate manner of writing, are not more remarkable than the vast extent both of his reading and of his original researches. His writings appear to have embraced the whole circle of the theoretical and practical knowledge of his time, comprising treatises on logical, metaphysical, rhetorical, poetical, ethical, political, economical, physical, mechanical, and medical science: he likewise wrote on some parts of the mathematics; and, besides a collection of the constitutions of all the states known in his age, both Grecian and barbarian, he made chronological compilations relating to the political and dramatical history of Greece. His works, however, though embracing so large an extent of subjects, were not a mere encyclopædia or digest of existing knowledge; some of the sciences which he treated of were created by himself, and the others were enriched by fresh inquiries, and methodized by his systematic diligence. To the former belong his works on analytics and dialectics, or, as it is now called, logic; to the invention of which science he distinctly

lays claim, stating that 'before his time nothing whatever had been done in it.' (*Soph. Elench.* c. 34. § 6.) Nearly the same remark applies to his metaphysical treatise. 'But of all the sciences (we use the words of Cuvier) there is none which owes more to Aristotle than the natural history of animals. Not only was he acquainted with a great number of species, but he has studied and described them on a luminous and comprehensive plan, to which, perhaps, none of his successors has approached; classing the facts, not according to the species, but according to the organs and functions, the sole method of establishing comparative results: thus it may be said that he is not only the most ancient author of comparative anatomy whose works have come down to us, but that he is one of those who have treated this branch of natural history with the most genius, and that he best deserves to be taken for a model. The principal divisions which naturalists still follow in the animal kingdom are due to Aristotle, and he had already pointed out several, which have recently been again adopted, after having once been improperly abandoned. If the foundations of these great labours are examined, it will be seen that they all rest on the same method. Everywhere Aristotle observes the facts with attention; he compares them with sagacity, and endeavours to rise to the qualities which they have in common.' (*Biographie Universelle, in Aristotle.* See also Kidd's *Bridgewater Treatise*, c. 10. § 3, and *Appendix*, who has given a more detailed comparison of Aristotle's account of animals with the discoveries of modern science.) Among the sciences which he found partly cultivated, but which he greatly advanced, the more prominent are those of rhetoric, ethics, and politics. Of rhetoric he defined the province and analysed all the parts with admirable skill and sagacity; his treatise on the passions, in this class but comprehensive work, has never been surpassed, if it has ever been equalled, by writers on (what may be termed) descriptive moral philosophy. His ethical writings contain an excellent practical code of morality, chiefly founded on the maxim that virtues are in the middle between two opposite vices: as courage between cowardice and foolhardiness, liberality between niggardliness and prodigality, &c.: his remarks on friendship are also deserving of especial notice: a subject much discussed by the ancients, but which has less occupied the attention of philosophers since love has played a more prominent part in consequence of the influence of the Germans and the introduction of the manners of chivalry in western Europe. His treatise on Politics is not, like Plato's *Republic* and the works of many later speculators on government, a mere inquiry after a perfect state: but contains an account of the nature of government, of the various forms of which it is susceptible, and the institutions best adapted to the societies in which those forms are established; with an essay, though unhappily an imperfect one, on education. This treatise is valuable not only for its theoretical results, but also for the large amount of information which it contains on the governments of Greece and other neighbouring countries. Throughout these last mentioned works, the knowledge of the world and of human nature displayed by Aristotle is very observable: and although his mind appears to have preferred investigations of physical and metaphysical science, yet he holds a very high place in the highest rank of moral and political philosophers. Aristotle, it will be remembered, did not lead the life of a reclusé student, but, as the friend of Hermias, the teacher of Alexander, and the head of a philosophical school, he was brought into contact with a great variety of persons, and learnt by practice to know life under many different forms and in many different relations.

In these philosophical treatises Aristotle occasionally mentions others of his writings, which he calls *exoteric*. From the manner in which he sometimes speaks of them, referring to them on points of no great obscurity or difficulty with a sort of contemptuous or condescending tone it would seem as if they were not of a strictly scientific character. (*Eth. Nic.* i. 13; vi. 4. *Polit.* iii. 4; vii. 1.) In another place he says, that he has often considered the Platonic doctrine of ideas both in his exoteric and his strictly philosophical works (*Eth. Eud.* i. 8): with which Plutarch agrees, who states that Aristotle everywhere attacked this Platonic doctrine, as well in his ethical and physical works, as in his *exoteric dialogues*. (*Adv. Colot.* vol. ii. p. 1115 B. comp. *Arist. Met.* xiii. 1.) From this passage it appears that some at least of Aristotle's exoteric works were composed in the form of a dialogue: Cicero likewise mentions this

circumstance when, in writing to Atticus on his dialogue *de Republica*, he says that 'he prefixes *proœmia* or introductions to each book, as Aristotle does in those works which he calls *exoterice*.' (*Epist. ad Att.* iv. 16. Other circumstances of Aristotle's dialogues are mentioned by Cicero, *Epist. ad Att.* xiii. 19. *Ad Fam.* i. 9.) His systematic treatises, which formed a connected body of philosophy, were called *acroamaticæ*, that is, destined for lectures (though he never himself uses that name in his extant writings); and were thus, as Galen says, confined to his scholars and friends. This distinction between his *acroamatic* and *exoteric* writings is mentioned by Gellius (*N. A.* xx. 5), who states that the former included subjects of a refined and abstruse philosophy, and physical and dialectical questions: the latter rhetorical and sophistical exercises and political knowledge. Ammonius (Ammonius Hermiæ, in *Aristot. Categ.* fol. 6 B. ed. Ald.), an ancient commentator on Aristotle, divides his works into those which he wrote in his own person, or *acroamaticæ*, and those which he wrote in the form of a dialogue, or *exotericæ*: the latter, he adds, differ much from the former in the clearness of the style and the mode of reasoning employed in them. Simplicius (*Ad Aristot. Phys.* fol. 2 B.), another commentator, gives the same division into *acroamaticæ* and *exotericæ*, and makes the same statement as to the popular nature of the latter; but under *exotericæ* he includes Aristotle's historical works as well as his dialogues. To this difference Themistius (*Orat.* 26. p. 319) alludes when he says that some of Aristotle's works are obscure and hard of comprehension; but that others are perspicuous, fitted for general readers, and written in an attractive and ornamented style. The statement above quoted from Gellius that Aristotle's scientific and popular treatises were distinguished by their subjects is probably not quite correct: doubtless everything discussed in the latter was included in the former, though perhaps treated in a more summary and abstruse manner. Their difference appears to have consisted chiefly in the form of the work (most of the *exotericæ* writings being dialogues), in the selection of the arguments, and in the nature of the style. Cicero particularly speaks of the copiousness and sweetness of Aristotle's diction (*Thyrea*, c. 1); and Quintilian doubts whether Aristotle is the more remarkable for the multiplicity of his knowledge, the quantity of his writings, *the sweetness of his style*, the acuteness of his discoveries, or the variety of his works (*x. l. 33*): in his extant works, however (all of which belong to the *acroamaticæ* class), his style is in most parts singularly dry and unattractive, and not unfrequently obscure, from the extreme conciseness of the expression and the abruptness of the transitions. It seems, indeed, as if he was sometimes intentionally negligent, and even ungrammatical, from his contempt for all ornament or polish of style. These peculiarities of style are doubtless attributable to the destination of his philosophical writings, which often appear to be rather note-books for his lectures, requiring further expansion and illustration, than finished treatises prepared for publication. This character may be particularly seen in the *Rhetoric* and the *Analytics*; in others, as in the *Nicomachean Ethics*, it is much less apparent. In general, however, all the chief steps of an argument are stated, though sometimes they are only intimated; and the obscurity of Aristotle, which has been so much complained of, is in most parts like the obscurity of a mathematical treatise, which appears so great to a beginner; as in both cases the difficulty of comprehension arises not from the defect of the expression, but from the closeness and subtlety of the reasoning. The works which were thus used as lecture-books probably never obtained much circulation during Aristotle's lifetime, except among his disciples and friends; and they received from time to time additions and corrections; a circumstance alluded to by Cicero, and confirmed by allusions contained in them, which indicate different times of composition. (Cicero *de Fin.* v. 5. Niebuhr, *Hist. of Rome*, vol. i. note 30.)

None of Aristotle's *exoteric* writings have come down to us: all his extant works belong to the *acroamaticæ* or strictly scientific class. This would be the more singular, if the story told by some ancient authors with regard to the preservation of his writings were true. It is stated by Strabo that Theophrastus, to whom Aristotle had bequeathed his library, left all his books to Neleus, who removed them to Scepsis, a town in Asia Minor; from him they passed to his descendants, who, being ignorant persons, kept the books

locked up, and took no care of them. Afterwards, hearing of the eagerness of the Attalian kings, in whose domain Scepsis was situated, to collect a library at Pergamus, they hid them in a cellar, where they were injured by damp and moths; at last the family sold them to Apellicon of Teos, at a high price, who, being fonder of books than reading, and seeking to supply the defects of his manuscripts, filled the chasms unskillfully in the copies which he caused to be made, and published the works full of errors. Immediately after the death of Apellicon, Sylla, at the capture of Athens, brought his library to Rome: where Tyrannion, the grammarian, made use of them, as also some booksellers, who increased the number of errors, by employing careless transcribers. Strabo adds, that the Peripatetic school after Theophrastus had scarcely any of Aristotle's works, except his *exoteric* writings; and they followed no accurate and systematic study of philosophy (xiii. p. 608). Such is the substance of Strabo's account, which is in part confirmed by Plutarch (*Sylla*, c. 26) and Athenæus (i. p. 3); but the researches of recent scholars have shown that this narration deserves little faith: inasmuch as it appears that nearly all Aristotle's scientific works were known to the followers of Theophrastus in the Peripatetic school, and that there were numerous copies of them in the Alexandrine library; all which and other facts, which we have not space to notice, are inconsistent with the supposition that Aristotle's philosophical works were concealed from the world till the time of Apellicon, more than two hundred years after his death. The text of most of his extant works moreover bears no marks of the supplements of unskilful revisers or of changes caused by the decay of manuscripts: this, however, is not the case with all: the *Poetic*, for instance, has come down to us in a mutilated form, and in many parts of the *Politics* the text has suffered severely.

Aristotle's genuine extant works may be divided into three classes: 1. Those relating to the philosophy of the mind. 2. Those relating to the physical sciences. 3. Those relating to moral and political philosophy. To the first class belong the *Metaphysics*, the *Categories*, the treatise on Interpretation, or the Meaning of Propositions, the first and second *Analytics*, the *Topics*, and the work on the Refutation of Sophistical Arguments, which, with the exception of the first, obtained the name of his *Organon*, or instrument for the analysis of reasoning. Several of his logical works are lost, particularly his *Methodics*, or treatise on Method, in eight books. (See *Rhet.* i. 2. 10.) To this head may be referred, though with less propriety, his *Rhetoric* and *Poetic*: the last of which works is imperfect. Under the second class come the *Physics*, the *Treatises on the Heavens*, on Generation and Destruction, on the Soul, on Sensation and the Objects of Sense, on Memory and Recollection, on Sleeping and Awakening, on Dreams and Prophecy in Sleep, on Length and Shortness of Life, on Youth and Old Age, on Life and Death, on Breathing: on the last subject there is also another short treatise. There is likewise a treatise on Colours, and an extract from a work on Sounds. The *Physiognomics* is a treatise on the marks of character in the outward person. The title of his great work on Natural History means, literally translated, *Inquiries concerning Animals* (*περί τὰ ζῷα ἱστορίαι*). To this are annexed treatises on the Generation of Animals, on the Motion of Animals, on the Parts or Members of Animals, and on their mode of Walking. There is also a work on Meteorology, two books on Plants (which is a retranslation from a translation), a short essay on Mechanics, and a treatise on Indivisible Lines, which latter partly belong to mathematical science. A long collection of Problems, chiefly on physical subjects, with which Cicero was acquainted (*Thes. Disp.* l. 33, comp. *Probl.* xxx. 1), has also been preserved. Under this head may be likewise mentioned a treatise on the Doctrines of Xenophanes, Zeno, and Gorgias, attributed to Theophrastus in a MS. collated by Bekker (vol. ii. p. 974): it appears, however, from Diogenes Laertius, that Aristotle wrote on these subjects. To the third class belong the three ethical treatises, the *Great*, the *Eudemian*, and the *Nicomachean Ethics*, which seem to have been written at different periods of his life, the first being the most meagre, and the last, addressed to his son Nicomachus (in which three books of the *Eudemian Ethics* are embodied), the most complete and matured. There is a short abstract of part of Aristotle's ethical system, called a treatise on the Virtues and Vices, which may, perhaps, be genuine: some ethical questions are also treated in the *Problems* (c. 27-30). The *Politics* are intended as a conti-

uation of the Nicomachean Ethics: the genuine Economics are lost, unless the first book of the treatise attributed to him (which is on Domestic, not Political Economy) is an abridgment of them by Theophrastus. (See *Philological Museum*, part i.)

The most valuable of Aristotle's lost works; and indeed the most valuable of all the lost works of Greek prose, is his collection of 158 Constitutions, both of Grecian and Barbarian States, the Democratic, Oligarchical, Aristocratical, and Tyrannical being treated separately, containing an account of the manners, customs, and institutions of each country. (Cicero, *De Fin.* v. 4.) The loss of his works on Colonies, on Nobility, and on Royal Government; of his Chronological Collections, and of his Epistles to Philip, Alexander, Antipater, and others, is also much to be regretted. He likewise revised a copy of the *Iliad*, which Alexander carried with him during his campaigns in a precious casket: hence this recension (called the *casket-copy*) passed into the Alexandrine Library, and was used by the Alexandrine critics. (Wolf, *Proleg. ad Homer.* s. 45.) His entire works, according to Diogenes Laertius, occupied in the Greek manuscripts 445,270 lines.

Writings contained in the collection of Aristotle's works falsely attributed to him are, the treatise on the Universe (*περι κόσμου*), the author of which (Mr. Payne Knight remarks) has 'retailed the common opinions of his age in the common language of a common declaimer, and by a strange inconsistency attributed them to the condensed, refined, and abstruse Stagira' (see also Lord Aberdeen on *Grecian Architecture*, p. 207): the Rhetoric to Alexander: the second book of the Economics, and a treatise on Marvellous Reports, written between the time of Agathocles and the first Punic war, probably about the 130th Olympiad, or B.C. 260. (Niebuhr, *Hist. of Rome*, vol. i. p. 16, and note 342.) An extract about Winds, from Aristotle on the Signs of Bad Weather (*περι ασημεριων*, vol. ii. p. 973, ed. Bekker, omitted in the Table of Contents) is considered by Niebuhr as spurious. (*Hist. of Rome*, vol. i. p. 15.) It appears, however, that Aristotle wrote a treatise on this subject. (*σημια χειμωνων*, Diog. Laert. v. 25, *σημια χειμωνων*, *Anon.* vol. i. p. 64, ed. Buhle; see Theophrastus, vol. i. p. 782, ed. Schneider.) The genuineness of part of the Physiognomics has likewise been doubted. (See Müller, *Archäologie der Kunst*, s. 331, n. 1.) A set of Epistles is also attributed to Aristotle, which, like those of Phalaris, Socrates, Euripides, and others, are all spurious.

Aristotle's philosophical works many centuries after his death obtained a prodigious influence, not only in Europe, but even in Asia: they were translated into Arabic, and from thence an abstract of his logical system passed into the language of Persia. (See Balfour in the *Asiatic Researches*, vol. viii. p. 89-135, ed. 8vo. London.) In Europe they acquired an immense ascendancy in the middle ages, and were considered as an authority without appeal, and only second to that of Scripture: we are even informed that in a part of Germany his Ethics were read in the churches on Sunday in the place of the Gospel. Parts of his philosophy, which are the most worthless, as his Physics, were much cultivated; and his logical writings were in many cases abused so as to lead to vain subtleties and captious contests about words. The connexion between some of his philosophical tenets and the Roman Catholic theology tended much to uphold his authority: which the Reformation lowered in a corresponding degree. His doctrines were in general strongly opposed by the early reformers: in 1518 Luther sustained a thesis at Heidelberg, 'Qui in Aristotele vult philosophari prius oportet in Christo stultificari.' *He who wishes to philosophise in Aristotle must be first stultified in Christ.* (Bayle, in *Aristotle*, n. Y. See also a curious passage of Luther's, containing a most scurrilous attack on Aristotle, cited in Bayle, *Luther*, n. H.) Luther gave way afterwards, and did not oppose Aristotle as to human learning. Melancthon, who was, however, one of the mildest of the reformers, was a great supporter of Aristotle. (See, among his other works, his *Moralis Philosoph. Epitome*, Argentor. 1539; with the introductory address, and the commentary on the fifth book of Aristotle's *Ethics*.) Many of his doctrines were in the same century zealously attacked by Pierre de la Ramée [see RAMUS], a French philosopher; and Bacon afterwards, with others of his followers, added the weight of their arguments and authority. Aristotle's philosophy accordingly fell into undeserved neglect during the latter part of the

seventeenth and the whole of the eighteenth century: of late years, however, the true worth of his writings has been more fully appreciated, and the study of his best treatises has much revived.

The best edition of Aristotle's entire works is that by Bekker, 1831, Berlin, 3 vols., quarto, in which the text is established on the authority of more than 100 MSS. of Italy, France, and England. Two volumes containing extracts from the Greek commentators, edited by Brandis, will complete the work. A cheaper and smaller edition has been recently published by Tauchnitz at Leipzig. Among the numerous editions of his separate works, the most worthy of notice are those of the *Metaphysics*, by Brandis; of the *Organon*, by Buhle; of the *Rhetoric*, by Gaisford; of the *Poetic*, by Tyrwhitt, Hermann, and Gräfenham; of the *Nicomachean Ethics*, by Zell and Cardwell; of the *Politics* and *Economics*, by Schneider and Götting; of the *History of Animals*, by Schneider; and of the spurious treatise *De Mirabilibus*, by Beckmann.

The English translations of Aristotle are, for the most part, of little value, on account of their unfaithfulness and inaccuracy. That of the *Poetic*, by Twining, should, however, be excepted. A translation of all Aristotle's works, by Mr. T. Taylor, was published in 9 vols., quarto, London, 1810, but the large amount of the price and the small number of the copies printed have confined the knowledge of this work within very narrow limits.

On Aristotle's life, see the ancient biographies prefixed to the first volume of Buhle's edition, and Stahr's *Aristotelia*, 2 vols., Halle, 1830 and 1832. On his speculative doctrines, see the historians of philosophy, Brucker, Tennemann, and particularly Ritter, vol. iii. p. 3-395. On the effect of his writings on philosophy and religion in the middle ages, see Launoy, *de Varia Aristotelis Fortuna*; Bayle's article on *Aristotle*; Jourdain, *Recherches sur l'Age et l'Origine des Traductions Latines d'Aristote*; and Hampden's *Bampton Lectures*; and on all these subjects, see Fabric. *Bibl. Græc.* vol. iii. p. 195-408, ed. Harles.

ARISTOXENUS of Tarentum, the earliest of the extant Greek writers on music. He was a disciple, first of his father Mnesas, who was acquainted with music, and subsequently of Aristotle, but, according to Suidas (*Ἀριστοξένος*), never spoke well of his great master after the latter had appointed Theophrastus as his successor. On the same authority it is stated that he wrote 453 treatises on music, philosophy, history, &c. This is all we know of his life, except that he is the author of a work on the Elements of Harmony, and the founder of a musical sect, usually called Aristoxenean, in opposition to the Pythagorean. The disciples of the former were also called μουσικοί, which should here be translated *musicians by ear*, in opposition to *καρμωτικοί*, as the latter were termed, that is, *musicians by rule*. As this controversy not only excited much attention, but various writings on both sides have descended to us, we will endeavour to give a slight notion of the merits of it, so far as that can be done without inflicting on our readers the repulsive details of the Greek musical theory. The matter is of no great general interest, since, of all the fine arts, music is the only one in which Greece has not erected a lasting memorial of herself. Aristoxenus, indeed, is cited by Vitruvius as the representative of music in the same sentence with Apelles as that of painting, yet there are but few musicians who even know his name.

The Pythagoreans had discovered the simplicity of the ratios [see ACOUSTICS] which exist between the notes of the diatonic scale. Founding their notions entirely upon arithmetic, they laid down intervals, as concordant or discordant, by theory alone, even to the extent of rejecting the interval of an eleventh from among the consonances, though of course they retained the fourth. They had also discovered the unequal intervals which exist between the tones of the scale, and, had they considered different keys, would have been obliged to invent a method of temperament. In the entire rejection of the ear they were undoubtedly wrong; and Aristoxenus was equally so in taking the other extreme. The latter maintains that the ear and judgment are not only sufficient, but that 'those who reject the senses as not accurate enough, but help them by reasoning, and who stand up for numerical proportions and ratios of velocities as the causes of gravity or acuteness, not only use means foreign to the matter, but produce results absolutely contrary to the phenomena.' He asserts that the octave consists of six whole tones, each of them equal to the interval between the

fourth and fifth to the tonic; that the fourth consists of two such tones and a half, the fifth of three and a half. It is now sufficiently known, that this system is erroneous even in the judgment of the ear, and that the only mark of musical tact displayed in it is the determination of the tone, not from the unassisted ear, though on its principles that would be admissible, but from the previous determination of a fourth and fifth. Six whole tones, are more than an octave, and three different tones would be derived from the octave, fourth, and fifth, as defined by Aristoxenus. To put it in the power of any one to try his system, we subjoin the number of parts out of a thousand which each note requires; that is, calling the length of the string which sounds C, 1000, the length (tension being the same) corresponding to the several notes appears underneath them.

System of	C	D	E	F	G	A	B	C
Aristoxenus	1000	891	794	749	667	595	530	500
Perfect Intervals	1000	889	800	750	667	600	533	500

Of course the system of Aristoxenus is, so far as it goes, that now known by the name of *equal temperament*, which Dr. Smith (a stern theorist) prefers to all others, but which we trust will never be in common use, as its first principle is the abolition of all distinction between the characters of the different keys. The above is not on the exact principle of Aristoxenus, which cannot be represented, because it disagrees with itself; but the *practical* truth of the fourth and fifth of its scale (a mere accident) brings the preceding representation very close to it.

The system of Aristoxenus had its followers till the time of Ptolemy, who wrote against it in his *Harmonics*. One of the two treatises attributed to Euclid is Aristoxenean, but the other decidedly the reverse. Theon mentions both sects; and, if we may use the term, quizzes both, but asserts that they might do good by uniting their principles.

There is an opinion attributed to Aristoxenus, that the soul bears to the body some such relation as the sound of a string to the string itself: this is perspicuous poetry, but rather cloudy philosophy. (See Tenneman, *Manuel*, &c. Cousin's translation, who cites G. L. Mahne, *Diatr. de Aristoxeno Philos. Peripatetico*, 8vo. Amsterdam, 1793.)

The editions of Aristoxenus which we find noticed, are the following: *Aristoxeni Musici Antiquiss. Harmonicorum Element.* libri iii. &c. ab Ant. Gogauino Grauiensi, Venet. 1562; Latin only. The first Greek text appears to be, *Aristoxenus, Nicomachus, Alypius*, by J. Meursius, Leyden, 1616; *Antique Musice Auctores septem, Gr. et Lat.* a Marco Meibomio, 2 vol. 4to. Elzevir, 1652. The fragments of the book on Rhythm were published for the first time by J. Morelli, Venice, 1785, 8vo. For further information, refer to Hawkins's *Hist. of Music*; Montucla, *Hist. de Math.*; Wallis, Appendix to his edition of *Ptolemy's Harmonics*; Gregory, Preface to his edition of *Euclid*.

ARITHMETIC, from the Greek ἀριθμητική (*arithmētikē*), 'the art of numbering,' should mean the science of number in general, including a great part of what is commonly called *algebra*; it is, however, usually restricted to mean only the science of the expression of numbers by symbols, and the application (not investigation) of all rules relating to them which are useful in the arts of life. Agreeably to the plan which we have laid down for the treatment of general terms (see **ACOUSTICS**), we shall here confine ourselves to the elucidation, philosophical and historical, of the method of naming and representing numbers; in doing which we shall refer to such other articles as will, all together, furnish the most complete view of the subject our work can afford. For the method of applying principles in practice, see the names of the various rules, **ADDITION**, **SUBTRACTION**, &c. For the account of what we must call the metaphysics of arithmetic, see **NUMBER**; and for the history of this branch, see **PYTHAGORAS**, **PLATO**, **THEON**, **EUCLID**, **DIOPHANTUS**, **FERMAT**, &c.; for that part of algebra which particularly concerns pure arithmetic, see **NUMBERS**, **THEORY OF**; for the arithmetic of concreto numbers, see **WEIGHTS** and **MEASURES**, and such articles as **YARD**, **POUND**, &c.

All the information hitherto possessed on the main points of arithmetical history (and a great deal more) has been lately presented to the world in so complete a shape, that it would be little better than affectation to make any more references than one, in an article which has no pretensions to original research. Of course we allude to Mr. Peacock's *History of Arithmetic* contained in the *Encyclopædia Me-*

tropolitana, which is certainly the most complete treatise yet written on any one point of mathematical history. In using this work as our universal reference, we regret that our limits will not allow us to make such a formal abstract of it, as would oblige us to ask the permission of its owners before we published this number. But as the Treatise itself is of a length answering to more than eighty pages of this Cyclopædia, such an account of its contents would be impossible; and we therefore use it only as authority for citations of fact, in which we shall refer to the paging of the *Encyclopædia Metropolitana*. We, however, feel bound to bear testimony to its correctness on all points which our access to books has enabled us to investigate.

We find ourselves in possession of a method of representing numbers so simple and powerful, that the principle and practice of the most complicated rules follows from it with ease. It is so well known that we need not explain it: but when we separate from the rest the part which particularly distinguishes our *Numeration* from that of the ancient Europeans, we shall find that our superiority consists in the adoption of the following conventions.

1. The value of a figure depends not only upon the simple number for which it stands when alone, but upon the place in which it stands. Thus, in 888 the three eights mean eight, eight tens, and eight hundreds.

2. The place of a figure, considered as affecting its value, is determined by the column in which it stands, and in the absence of succeeding figures to indicate the existence of other columns, their place is supplied by ciphers, which of themselves are considered as having no value. Thus the 8 in 800 is of the same value as that in 863.

To complete our particular system, on which, however, none of its advantages depend, we must add that each figure is increased *tenfold* for every place which it is removed to the left. In the first two conventions consists what is called the 'local value' of the figures: in the last is found the reason for the term 'decimal notation,' from the Latin word, *decem*, ten.

There can be no doubt that the mere decimal notation, which has been in use in almost every age and country, has arisen from the facility which the ten fingers afford for making calculations. The names of numbers have been almost universally formed distinct as far as ten, after which compound names have been employed. The exceptions to the rule are additional proofs of the generality of the principle: they are either deduced from five or from twenty, the number of fingers on one hand, or the number of fingers and toes together. We call the simple symbols of numbers *digits*, or fingers; the Caribbees call the number ten by a phrase which signifies 'all the children of the hand' (Peacock, 390); and in many languages the phrases for five, ten, and twenty, are connected, either by direct derivation or common etymology, with those for the hand or fingers. In France the scale from 60 to 100 is strictly vicenary (by twenties), and in the Indian archipelago the ancient scales are vicenary. For more discussion on this point, we refer to **NUMERALS**. We shall here only quote two results of observation, as laid down by Mr. Peacock (371), which appear to be very well borne out. They are, that 'the natural scales of numeration alone have ever met with adoption,' meaning, by natural scales, those derived from the hands, or hands and feet; and that 'amongst all nations practical methods of numeration have preceded the formation of numerical language.'

But this does not mean that every nation has gone high in the scale of numbers. There are tribes which have never even risen to a *quinary* scale (by fives), owing to their never wanting, and therefore never giving names to, numbers as high as five. Aristotle (P. 391) mentions a tribe of Thracians which never counted higher than four; and the Yancos on the Amazon have been stopped by the complexity of their language. They count no higher than three, the name for which, in their language, is (P. 390), according to La Condamine, *Poettarrarorincoraoac*.

One of the Abipones, in describing a number of men greater than ten, would mark out a space of ground sufficient to contain them. This is, in its principle, the same resource as that to which the Greeks were driven by their cumbrous notation, viz., the substitution of geometry for arithmetic. [See **SQUARE**, **EUCLID**.]

To enable our reader rightly to estimate the advantage which we possess in our notation, we will here describe that of the Greeks, which is only equalled by that of the Chinese

in its near approach to the Indian, or generally received system, and is very much superior to that of the Chinese in the simplicity of its symbols. We shall omit the substitution of letters for numbers, and content ourselves with abandoning the principle of 'local value,' and substituting in its place such a system of symbols as, without departing from the principle of Greek notation, will not confuse the reader by the adoption of new digits. For the actual signs used by the Greeks, see NUMERATION, NUMERALS. Let the first nine numbers be represented as usual; but let *ten* (instead of 10, in which 1 has local value) be represented by 1', twenty by 2', &c. Let 1'' be one hundred, 2'' two hundred, and so on; 1''' one thousand, 2''' two thousand, and so on. Let M stand for ten thousand, and let M affixed to a number make its value ten thousand times as great; thus, 4'2M is 420,000 in our notation. We have here improved upon the system of the Greeks, unavoidably, in order not to confuse the reader, since 2000, 200, 20, and 2, would not among them present to the eye that analogy which exists between 2''', 2'', 2', and 2, being in fact denoted by

 $\beta_1, \sigma, \kappa,$ and β .

We now write some high numbers in our own decimal scale, accompanied by our imitation of the Greek.

46379268	4 ^m 6 ^m 3 ⁷ M.9 ^m 2 ^m 6 ⁸
6007.0030	6 ^m 7M.3 ⁷
72007106	7 ^m 3 ^m M.7 ^m 1 ^m 6

In the first number, *where there is no cipher*, the Greek looks so like our own, that we might be led to imagine there was no essential difference. We might say, that as it would be natural, and was in fact usual, to write the higher numbers first, the mere occurrence of a fourth column would suggest the idea of thousands, so that a notion, which we must call one of *local value*, would be inevitably formed. And perhaps it was so; indeed it is surprising that neither Archimedes, Apollonius, or Diophantus, ever detected and improved the idea. But when we come to look at the second and third number, we see immediately that the continual derangement of the columns would prevent this notion from acquiring consistence. The symbol of *vacuity* is wanting; and we cannot see how great an impediment that defect presented, because we learn 20, 30, &c., as soon we learn *twenty, thirty*, &c. And though perhaps 2', 3', &c., might have suggested such a contrivance, yet there was no analogy between κ (20) and λ (30) and β (2) and γ (3).

The ingenuity both of Archimedes and Apollonius was employed in the extension of the preceding system, without alteration of its principle. That of the latter we shall illustrate. Calling 10,000 M_1 , let ten thousand times ten thousand be called M_2 , ten thousand times that number M_3 , and so on, and let any one of these placed immediately after a number mean that the preceding is to be taken ten thousand times if followed by M_1 , ten thousand times ten thousand if by M_2 , and so on. The following number

1768,9360,0142,0193

would then be represented by

 $1''7''6''8M, .9''3''6'M, .1''4''2M, 1''9''3$

on which we may make the same remarks as before. The method of Archimedes (which preceded this) differed from it only in making ten million the *radix* of the system. We now see why our arithmetic was called *ciphering*, cipher coming from an Arabic word signifying *vacant*. One such thought as occurred to Archimedes in the bath (see ARCHIMEDES) might have been fourteen centuries gained to the science.

We look in vain for anything like local value in the system of the Egyptians, or any other nation of antiquity who are known with *certainly* to have very ancient records. That of the Jews was similar to the one just described, so far as it went, and the use of some letters common to both (P. 106) in the numeral system, but not so in the *alphabets* of the two, proves that the notation of both had a common source. [See NUMERALS.]

To the same article we must also refer for the Roman system, which extended itself throughout Europe during the first twelve centuries. It is much more rude than the Greek, and is a sufficient proof of the well known inaptitude of the former people for scientific invention.

The Chinese had several systems of numeration, all containing complicated symbols, and somewhat resembling that

of the Greeks in principle; but with this important difference, that the symbol for 30, for example, has direct analogy with that for 3, being made by the juxtaposition of a symbol for ten; so that the improvement upon the Greek scale which we have been obliged to make in order to explain it, renders our imitation of the Greek a better resemblance of the Chinese. But they have no written method of expressing local value; though their *Schuan-pau* [see ABACUS] is a practical use of the principle.

Before we proceed to the history of our own scale, we must extend our remark, that the 'decimal notation' and system of local value are distinct things. When we agree that 10 shall stand for ten, we merely express that a number in the second column from the right shall stand for ten times as much as the same in the first column. But we are at liberty to suppose that a number in the second column shall mean nine, eight, or any other number of times what it does in the first. Thus, if we choose a *quinary* scale, in which 10 stands for 5, we reject the symbols 5, 6, 7, 8, and 9, and our numerical scale runs thus :-

1	2	3	4	10	11	12	13	14	20	21	22	&c.
one	two	three	four	ten	eleven	twelve	thirteen	fourteen	twenty	twenty one	twenty two	&c.

Thus 20 is *ten*, because 2 in the second column counts five times 2. But if we choose a higher scale than the decimal, we shall have to invent, instead of rejecting symbols; if, for instance, we take a *duodecary* scale, in which 10 means twelve, we are left without symbols for *ten* and *eleven*. Let *t* and *e* stand for these; then our scale of number, beginning from *ton*, is as follows:

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35	36	37	38	39	40	41	42	43	44	45	46	47	48	49	50	51	52	53	54	55	56	57	58	59	60	61	62	63	64	65	66	67	68	69	70	71	72	73	74	75	76	77	78	79	80	81	82	83	84	85	86	87	88	89	90	91	92	93	94	95	96	97	98	99	100	101	102	103	104	105	106	107	108	109	110	111	112	113	114	115	116	117	118	119	120	121	122	123	124	125	126	127	128	129	130	131	132	133	134	135	136	137	138	139	140	141	142	143	144	145	146	147	148	149	150	151	152	153	154	155	156	157	158	159	160	161	162	163	164	165	166	167	168	169	170	171	172	173	174	175	176	177	178	179	180	181	182	183	184	185	186	187	188	189	190	191	192	193	194	195	196	197	198	199	200	201	202	203	204	205	206	207	208	209	210	211	212	213	214	215	216	217	218	219	220	221	222	223	224	225	226	227	228	229	230	231	232	233	234	235	236	237	238	239	240	241	242	243	244	245	246	247	248	249	250	251	252	253	254	255	256	257	258	259	260	261	262	263	264	265	266	267	268	269	270	271	272	273	274	275	276	277	278	279	280	281	282	283	284	285	286	287	288	289	290	291	292	293	294	295	296	297	298	299	300	301	302	303	304	305	306	307	308	309	310	311	312	313	314	315	316	317	318	319	320	321	322	323	324	325	326	327	328	329	330	331	332	333	334	335	336	337	338	339	340	341	342	343	344	345	346	347	348	349	350	351	352	353	354	355	356	357	358	359	360	361	362	363	364	365	366	367	368	369	370	371	372	373	374	375	376	377	378	379	380	381	382	383	384	385	386	387	388	389	390	391	392	393	394	395	396	397	398	399	400	401	402	403	404	405	406	407	408	409	410	411	412	413	414	415	416	417	418	419	420	421	422	423	424	425	426	427	428	429	430	431	432	433	434	435	436	437	438	439	440	441	442	443	444	445	446	447	448	449	450	451	452	453	454	455	456	457	458	459	460	461	462	463	464	465	466	467	468	469	470	471	472	473	474	475	476	477	478	479	480	481	482	483	484	485	486	487	488	489	490	491	492	493	494	495	496	497	498	499	500	501	502	503	504	505	506	507	508	509	510	511	512	513	514	515	516	517	518	519	520	521	522	523	524	5
---	---	---	---	---	---	---	---	---	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	---

But the scale which best exemplifies the principle is the binary, in which 10 stands for 2, and in which there are consequently no symbols except 1 and 0. The system of numbers in this scale (from one to ten) is as follows:—

1 10 11 100 101 110 111 1000 1001 1010

A Jesuit at Peking (P. 392) communicated to Leibnitz the following Chinese symbol, called by them the Cova, or *Linaton*, and attributed to Fohi, the founder of the empire. It is suspended in their temples, and considered as a mystery :

id	name	description	status	created_at	updated_at	deleted_at

If the long line be interpreted to mean *one*, and the broken line *nothing*, these symbols, each being read from the bottom to the top, give a system of binary arithmetic from 0 to 7 (both inclusive). And Leibnitz asserts that there is a larger *Cava*, which goes up to 63. But as no additional information has been obtained upon the subject, which, for anything certainly known to the contrary, may be a hoax, we can only say that there is some presumption that the Chinese long ago possessed the complete principle of the 'local value.'

We trace our own knowledge of the decimal system direct to the Hindoos, who themselves ascribe it to the divinity. As to the manner of its introduction, there are some differences of opinion on that subject. One and the old account is, that Gerbert, after Pope Sylvester II., found it in Spain among the Moors (P. 115) in the latter part of the tenth century. But upon this there are strong reasons for hesitating. [See SYLVESTER II.] Another, and more probable account is, that Leonard of Pisa [see BONACCII and ALGEBRA] introduced it, in 1202, in a work entitled *Liber Abaci*, &c. And some have supposed that the *Alonsine* (or Alphonsine) *Tables*, being constructed principally by Moors at the court of Alonso, must have been the first in which the system appears. (P. 113.) It is certain that this system had been before the twelfth century, and most probably as early as the ninth, in the hands of the Persians and Arabs, who ascribe it to the Hindoos, and call it by a name which signifies 'Hindoo science.' It is also certain that the Hindoos themselves have long used it (see *BIJA GANITA* and *LILIWATI*, names of Hindoo works), and that it is easy to trace the manner in which our numeral symbols have been derived from those of the Sanscrit. In this latter language there are distinct names for *units, tens, &c.*, up to

what we should call *hundreds of thousands of millions of millions*. But whether we are to look to a Hindoo for the invention is a question on which no surmise can be made, till some probable account of the origin of Hindoo literature can be given.

The steps by which the new notation made its way through Europe are not capable of being very clearly traced. Montfaucon (P. 417) found them in an Italian manuscript which was finished in 1317; and many manuscripts of the works of authors a century older contain them, but it is well known that it was usual to substitute the new figures for the old in recopying. In the library of Corpus Christi College, Cambridge, (P. 418,) is a catalogue of eclipses from 1300 to 1348, to which they are subjoined. Gravenlates on inscriptions have been given by Wallis and others as old as 1330; but, upon examination, reason has been found to suspect that 5 has been mistaken for 3. There does not seem to be evidence of any general use of the Arabic numerals before the invention of printing, and even the works of Caxton do not contain them, except in a woodcut. Merchants continued their accounts in Roman figures up to the sixteenth century. On the whole, we think that the general use of these numerals in scientific works did not much precede, if at all, the diffusion of algebra.

The only material addition which has been made to this groundwork of arithmetic is the invention of decimal fractions. This is an extension of the principle of local value, of so simple a character, that it is surprising the Hindoos never adopted it. They write fractions as we do, omitting only the line which separates the numerator and denominator, and they make great use of decimal fractions in approximating to the square roots of numbers, but without any peculiarity of notation.

The first fractional notation which we find among the Greeks consisted in writing the denominator where we now

wrote the *exponent*. Thus, retaining our imitation, $\frac{207}{365}$

would be written $207 \frac{365}{1}$. This system is principally used by Diophantus; and in Eutocius we also find a peculiar symbol, something like κ , for *one half*. Ptolemy made a further step, in the application of the method of dividing the circle to all units whatsoever, known by the name of the *sexagesimal* notation. The degree of the circle is divided into sixty minutes, the minute into sixty seconds, that again into sixty thirds, and so on; Ptolemy divides every unit in the same manner. We have still retained in our division of the circle the $^{\circ}$, $'$, $''$, &c., used by him. In the notation alluded to (which is that of Ptolemy in the particular point referred to)

$27 \ 33' \ 21'' \ 65'''$

would denote

$27 \text{ units, } \frac{33}{60}, \frac{21}{3600}, \text{ and } \frac{65}{216,000}.$

This sexagesimal notation retained its ground until the introduction of the Arabic numerals, and, with the aid of tables of reduction, was of material use.

Stifelius and Stevinus (P. 440) used circumflexed digits instead of $^{\circ}$, $'$, &c., in the *sexagesimal* system, and an application of the same principle to the *decimal* system was first made by Albert Girard in or about 1590. This consisted in expressing fractions by tenths, hundredths, &c., in the following way—

$\frac{16}{10} \frac{3}{10} \frac{4}{100}$ would be written 1 6 3 4,

the number in brackets over a digit being the exponent of the power of ten, which must be used with that digit as a denominator. Here the application of the principle of local value practically begins; and it is clear, from the examples cited by Mr. Peacock, that the *cipher* was made use of to denote a vacant column. One of those examples is

(0) (1) (2) (3)
9 1 3 0 4

The rejection of the cumbrous and unnecessary exponents was made in some instances by Wright in 1616, and the system was formally introduced by Napier in 1617: the use of it was much extended by Oughtred in 1631. (See DECIMAL FRACTIONS.) From that time the modern form of the Indian arithmetic must be considered as established. The invention of LOGARITHMS (which see) is the principal aid to calculation which has been engrafted upon the system.

We subjoin a list of names, which the reader may consult on various points connected with the history of arithmetic, either in this work or elsewhere. The figures refer to the century before or after Christ in which the individual is supposed or known to have lived; and the Italics are works which are cited.

B.C. 6—Pythagoras. 4—Euclid, Aristotle, Plato. 3—Archimedes, Apollonius. 1—Vitruvius.

A.C. 2—Ptolemy, Diophantus. 3—Nicomachus. 4—Pappus, Theon. 5—Proclus, Eutocius. 6—Boethius. 9—Mahommed Ben Musa. 11—Gerbert. 12—Jordanus, Leonardo Bonacci. 13—Sacrobosco, Planudes. 15—Lucas de Borgo. 16—Schenkelius, Stifelius, Recorde, Albert Girard. 17—Briggs, Napier, Oughtred, Stevinus, Wright, Bouillaud, Mersenne, Wallis, *Algebra*, Bachet de Meziriac. 18—Weidler, *Historia Astronomica*, Kästner, *Geschichte der Mathematik*, Montucla, *Hist. des Mathématiques*, Delambre, *Hist. de l'Astronomie Ancienne*, Hutton, *Tracts, History of Algebra*, Colebrooke, *Preface to Bija Ganita*.

We need not of course refer to the work of Mr. Peacock, which we have so often cited.

ARITHMETIC, POLITICAL. [See STATISTICS, INTEREST, ANNUITIES, POPULATION, MORTALITY, &c.]

ARITHMETIC OF SINES. [See TRIGONOMETRY.]

ARITHMETIC, SPECIOUS. [See VIETA.]

ARITHMETICAL COMPLEMENT is that which a number wants of the next highest decimal denomination. Thus, what 7 wants of 10, or 3: 32 of 100, or 68: 159 of 1000, or 841: 1017 of 1, or 983: are the arithmetical complements of these numbers. The best way to find them is, to begin from the left, subtract every figure from 9, and the last significant figure from 10, as in the following examples, which include all the cases:—

No.	17631	190018	1734000
Ar. Co.	82366	809982	8266000

ARITHMETICAL MEAN. By the arithmetical mean is meant, that number or fraction which lies between two others, and is equally distant from both. Thus the arithmetical mean between 6 and 11 is 10. To find this arithmetical mean, take the *half sum* of the two numbers. Thus, that of 4 and 17 is $10\frac{1}{2}$. But any numbers are also said to be arithmetical means between two others, when all together form a series of equally increasing or decreasing numbers. Thus, 8, 10, 12, are three arithmetical means between 6 and 14. To interpose any number of arithmetical means between two numbers, divide the difference of those two numbers by one more than the number of means required, which gives the difference between the means. Thus, to interpose four arithmetical means between 27 and 102, divide $75 (102 - 27)$ by 5 ($4 + 1$) which gives 15. The means are, therefore, $27 + 15$ or 42, $42 + 15$ or 57, $57 + 15$ or 72, and $72 + 15$ or 87. If the means are fractional, the same process is employed. [See AVERAGE.]

ARITHMETICAL PROGRESSION is a name given somewhat improperly to a series of numbers which increase or decrease by equal steps, such as 1, 2, 3, &c.; 2, 4, 6, &c.; 15, 2, 23, &c. The difference between any two successive terms, being common to all, is called the common difference. The data which distinguish one arithmetical progression from another, are the *first term*, the *common difference*, and the *number of terms*: from these it is easy to find the last term and the sum of all the terms. To find the last term, multiply the common difference by one less than the number of terms, and add the first term to the product. To find the sum of all the terms: take

the number of terms,
the sum of the first and last,

and multiply the half of either (whichever is most convenient) by the other. Thus, for 100 terms of either of the series

3	6	9	12...	&c.	(A)
1	$1\frac{1}{2}$	2	$2\frac{1}{2}$...	&c.

To find the last, or 100th, term of (A), multiply 3, the common difference by 99 ($100 - 1$) and add 3, the first term which gives 300. Similarly to find the last, or 100th, term of (B), multiply $\frac{1}{2}$ by 99 and add 1, which gives $50\frac{1}{2}$. For the sums we have

	(A)	(B)
No. of terms	100	100
Sum of first and last	303	$50\frac{1}{2}$

Multiply half of 100 by 303, and by $50\frac{1}{2}$, which gives 15150 for the sum of (A), and 2525 for that of (B).

Algebraically, let a be the first term, x the common difference, and n the number of terms. Let z be the last term and S the sum. Then

$$z = a + (n-1)x$$

$$S = \frac{1}{2}n(a+z) = na + \frac{n-1}{2}x$$

from which any three of the letters being given, the other two can be found.

For the theory of which this article is a part, see SERIES, DIFFERENCES, INTEGRATION.

ARITHMETICAL PROPORTION, the relation which exists between four numbers, of which the first and second have the same difference as the third and fourth. Thus:—

1	2	81	82
7	3	16	12
$2\frac{1}{2}$	$3\frac{1}{2}$	$1\frac{1}{2}$	$2\frac{1}{2}$

are severally in arithmetical proportion, and in every such proportion the sum of the extremes is equal to that of the means. Thus—

$$12 + 7 = 3 + 16$$

ARIUS (*Ἀρίδιος, martialis*) was a native of Cyrenaica, in Africa: the date of his birth seems to be unknown. He was distinguished for personal beauty, graceful manners, extensive learning, logical eloquence, and ascetic abstinence. He has been accused, but without sufficient ground, of restless ambition, and a predilection for innovations. The doctrine which he taught was not at that time a novelty, but had been propagated in the Alexandrine school of divinity, especially by those men, who, having an acute understanding, were nevertheless deficient in the contemplative faculties of the mind. Arius, the two Eusebii, and others, seem to have been rather anxious to defend the church against the introduction of creeds which appeared novel to all who had been brought up in the Alexandrine method of philological divinity. Arius obtained the favour of three successive patriarchs of Alexandria. The patriarch Peter of Alexandria ordained him deacon, but prohibited him from the exercise of ecclesiastical functions, upon Arius, A.D. 306, joining the party of Meletius. The patriarch Achilles of Alexandria, moved by the repentance of Arius, made him, A.D. 313, presbyter and pastor of the church Baucalis, at Alexandria; and the patriarch Alexander gave him the first rank among his clergy, although he is said by Theodoretus (*Hist. Eccles.* i. 2) to have been one of his competitors for the patriarchate. But Philostorgius (i. 3) says, on the contrary, that Arius, observing the choice likely to fall on himself, turned it to Alexander.

The patriarch Alexander, A.D. 318, having asserted, in a conference with his clergy, the unity of substance in the three persons in the Deity, Arius, in reply, accused the patriarch of having fallen into the error of Sabellius, who had confounded the three divine persons. Arius maintained that the Son was created out of nothing before the creation of the universe, and that he could be called God only on account of his participation in extraordinary powers. This doctrine Arius propagated in private; and after he had obtained many followers, he preached it publicly in the church. In order to introduce his opinions among the lower classes, he composed songs for sailors, millers, and travellers, in the measure of popular melodies. The work of Arius called *Thaleia* contained his doctrine in prose and verse. Alexander endeavoured to reclaim Arius by private admonitions in letters and by conferences, but failing in his attempts, he cited him, A.D. 321, before a synod of nearly one hundred Egyptian and Libyan bishops, convened at Alexandria, where his doctrine, his person, and his followers, were anathematized. Two letters of Alexander on this occasion are still extant: one is a circular report to the orthodox bishops (Soerat. *Hist. Eccles.* i. 6; Mansi, *Collect. Conc.* t. ii. p. 793; *Opera Athanasii*, ed. Montfaucon, t. i. pt. i. p. 397); the other is a letter, full of bitterness, to Bishop Alexander, at Constantinople. This letter calls the Arians *Exoukrontians*, in allusion to the phrase *ἐξ οὐκ ὄντων*, out of nothing. Among the followers of Arius were two bishops, and several priests, deacons, and virgins.

Arius now began to travel through the neighbouring countries, where he excited sympathy for his misfortunes, and propagated his doctrine. Eusebius, bishop of Nicomedia, to whom Arius wrote a letter, still extant (Epiph. *Hæres.* 69. 6; Theodoret, *Hist. Eccles.* i. 4), absolved him from the Alexandrine excommunication; he also con-

vened, A.D. 323, a synod in Bithynia, probably at Nicomedia, in his behalf; wrote in his favour to all the oriental bishops, and to the Emperor Constantine the Great, who, being at that time yet unbaptized, considered the dispute as trifling in itself, and recommended peace, A.D. 324, in a letter addressed to Alexander and Arius jointly.

Constantine commissioned Hosius, bishop of Corduba, to examine this dispute at Alexandria. Hosius having made a report unfavourable to Arius, Constantine convened the bishops of his empire, A.D. 325, in order to settle the points in dispute between Arius and Alexander. In this council at Nicæa 318 bishops were assembled. Before this body Arius still persisted in rejecting all confessions of faith which maintained the divinity of Christ and the consubstantiality of the divine word, and he opposed the expression *ὁμοούσιος*, applied to the Son as being of the same essence with the Father. Consequently he was again anathematized by the synod, and exiled by the emperor to Illyricum, together with two bishops, Theonas of Marmarica in Libya, and Secundus of Ptolemais, who continued to adhere to him, after Eusebius of Nicomedia, Theognis of Nicæa, and Maris of Chalcedon, alarmed by the emperor's threats, had forsaken his party. Capital punishment was denounced against all who would not deliver up the writings of Arius. After three years, Constantine became reconciled to Arius, through the instrumentality of an Arian priest, who was secretly sent to the emperor by Eusebius, bishop of Nicomedia, and by his sister Constantia. A confession of faith, which seemed to be in unison with the Nicene Creed, was drawn up, and presented by Arius, A.D. 330, to the emperor, by whom he was reinstated in his church at Alexandria; but Athanasius, then bishop of Alexandria, would not admit him. The synods of Tyre and of Jerusalem, A.D. 335, through the influence of Eusebius, re-admitted Arius into church communion, and recommended him to Athanasius; but Arius was sent by his opposers from Alexandria to Constantinople, in order to exculpate himself on account of the troubles excited by his presence at Alexandria. Arius presented to the emperor, A.D. 336, a third confession of his faith, and professed by oath to submit to the synod of Nice. It was accordingly resolved that Arius should be received into church communion in a solemn manner; but according to Soerates he was taken ill of a bowel complaint, during the procession, near the church which was appointed to be the scene of his triumph, and died on the same day, A.D. 336. Some writers ascribed his death to poison. But Athanasius, who probably had more accurate information, states, that Arius died on the evening preceding the Sunday on which he was to be received into church communion. Some Arians asserted that Arius had been killed by the magical practices of his enemies. This accusation contains, at least, a defence against the suspicion of poison.

Eusebius, who became bishop of Constantinople A.D. 339, obtained permission for the Arians to celebrate public worship at Alexandria and other places of the eastern empire. After the death of Constantine, A.D. 350, and the fall of the pretender Magnentius, A.D. 353, Constantius became ruler of the whole empire, and used his power to support the Arians in the councils of Arles, 351, and Milan, 355, the decrees of which he maintained by arms against the Athanasians. Many persons, unable to understand the distinction between the doctrines of Athanasius and Arius, were influenced in the choice of their party by unworthy motives. Most bishops, moved by the court, signed Arian creeds, although some continued to teach Athanasian doctrine. The people, except in occasional tumults, gave themselves little trouble about debates which they did not comprehend. The strict Arians rejected the doctrine of Christ being *ὁμοούσιος*, of similar essence, as well as that doctrine which made him *ὁμοούσιος*, consubstantiate, or of equal essence, but the Semi-Arians maintained the opinion of his being *ὁμοιούσιος*. The strict Arians, called also Ariomanites, insisted upon the Son being *ἑτεροούσιος*, of another substance. The Goths, Vandals, Suevi, Burgundians, and Lombards embraced Arianism, but exchanged it afterwards for orthodoxy.

The history of Arianism may be divided into three periods: the first commenced a considerable time before the life of Arius, having originated in the Alexandrine schools of divinity of which Origen was the most splendid luminary. It terminated in the synod of Nicæa, A.D. 325. The second period began with the opposition of the Eusebians to the council of Nicæa, and terminated in the second synod of

Airmium, A.D. 357. During this period the following synods were held: one at Tyre, A.D. 335, in which Athanasius was deposed and exiled to Gaul by Constantine; and immediately afterwards one at Jerusalem, in which Arius was received into church communion.

Another synod was held at Antioch, A.D. 341, in which the bishops declared that they could not be followers of Arius, because, 'how could we, being bishops, be followers of a prosbyter?' In this synod, four creeds were approved, in which an endeavour was made to steer a middle course between the Nicæan *Homœusios* and the definitions of Arius; which two points were considered to be the two extremes of divergence from the then standard of ecclesiastical orthodoxy in the East. These four Antiochene creeds are extant in Athanasius *de Synodis*, § 22-25. A general council was again assembled at Sardica in Thrace, in which the emperors Constantius and Constans endeavoured to reconcile the combatants for oriental and occidental orthodoxy. Their endeavour proved fruitless. The orientals retired to the neighbouring city of Philippopolis, leaving their occidental opponents alone at Sardica.

Eusebianism was, under Constantius, as victorious in the east as the Nicæan creed was under Constant in the west. The Eusebians thought that the *Homœusian* orthodoxy might lead to Sabellianism, and therefore procured the deposition of Marcellus, bishop of Ancyra. The Sabellianism of his disciple Photinus was condemned in the second council of Antioch, A.D. 343, and by another council at Milan, A.D. 346. After the death of Constant, A.D. 350, and the victory over Magnentius, A.D. 353, Constantius endeavoured to establish Eusebianism by violent means in the west. In the synods of Arles, A.D. 351, and of Milan, A.D. 355, he compelled the assembled bishops to sign the condemnation of Athanasius.

The third period terminated with the suppression of Arianism by Theodosius I. The last vestiges of Arianism in the Roman empire are found in a law of Theodosius II. A.D. 428.

[For the sources of information on the Arian controversy, see the following articles: —EUSEBIUS Pamphili, bishop of Cæsarea; EUSEBIUS, bishop of Emesa; CYRILLUS, bishop of Jerusalem. These were the most distinguished writers in behalf of the Antitrinitarian party. The best writers among the Homœusians were ATHANASIUS, bishop of Alexandria; HILARIUS, bishop of Poitiers; EPIPHANIUS, bishop of Constantia; BASILIUS, bishop of Cæsarea; GREGORIUS, bishop of Nyssa; GREGORIUS of Nazianzus ὁ Θεολόγος; AMBROSIIUS, bishop of Milan; EPIPHRAEM, diaconus of Edessa, *propheta Syrorum*. Modern works on the history of Arianism are: —*Storia critica della Vita di Arrio*, scritta da Gaetano Maria Travasa, Clerico regolare Teatino, Venezia, 1746-8; Walch's *Historie der Ketzerreien*, Th. 2. p. 385, &c.; J. A. Stark's *Versuch einer Geschichte des Arianismus*, Berlin, 1783-85, 2 tom. 8; J. Chr. F. Wundemann's *Geschichte der christlichen Glaubenslehren*, tom. i. p. 264, &c.; Münscher's *Dogmengeschichte*, Bd. 3. p. 351, &c.; Gieseler's *Kirchengeschichte*, book i.; Neander's *Kirchengeschichte*, Band. II. 767, &c.]

ARK, a chest or coffer. This term is frequently used by our earliest English and Scottish poets.

In 1347, in the brewhouse of the priory of Lindisfarne, was an *ark* for meal (see Raine's *North Durham*, p. 92); and among other articles of furniture occurring in an inventory of the household goods belonging to Sherborn hospital, taken in 1636, in the boulding-house, is '1 boulding ark.' (Hutch. *Hist. Durh.* ii. p. 599.) The same word is still in use, in the north of England, for the chest which is employed in containing meal.

Noah's ark was so named from its supposed resemblance to an ark or chest; by which name it occurs both in the Gothic and Anglo-Saxon versions of the passage in Luke, xvii. 27. Wiclif, in this passage, instead of ark, reads ship. The same term *ark* is used in our translation of the Old Testament, for the basket or cradle in which the infant Moses was laid when he was put into the Nile. (See Boucher's *Glossary*, by Stevenson.)

ARKANSAS RIVER, the largest affluent of the Mississippi next to the Missouri, rises in the Rocky Mountains, but its source is not known. Darby, in his *Geographical View of the United States*, conjectures that its source is nearly as far N. as 42°, and 111° W. of Greenwich; but this must only be taken as a guess; the lat. is certainly in excess, and the long. thus assigned is probably too much.

James Peak, one of the highest summits of the Rocky Mountains, which lies between the Arkansas and Boiling Spring Creek, is about twenty-five miles N., 67° W. from a point near this Creek, which is placed in 38° 18' 19" N. lat., 105° 39' 44" W. long., by Major Long's party. The Arkansas joins the Mississippi in 33° 56' N. lat., 91° 10' W. long., with a course, following its bends, estimated at 2000 miles.

The sources of the Arkansas and of the great Rio dei Norte are probably near one another. Captain Bell, who was with Major Long's party, traced the Arkansas into the mountains till his progress was stopped by the almost perpendicular gneiss rock, through a deep and narrow fissure in which the river pours with great violence. The Arkansas valley, near the mountains, is bounded by high cliffs of inclined sandstone; lower down these disappear, and there is a slope of alluvial earth extending on each side for several miles; and further down still, horizontal sandstone appears, forming high bluffs, or precipices, on each side of the valley. Trees of considerable size here grow along the margin of the river, but their tops are not so high as the level plain on each side, and the descent into this deep-sunk channel is in many places quite impracticable; at a short distance, this narrow valley is not seen at all.

The Arkansas has a general eastern course as far as the meridian of 99°; it has then a winding S.E. course to about 35° N. lat., 95° E. long., from which point it resumes an eastern winding course to about the meridian of 92° 30', from which its course is about S.E. to its junction with the Mississippi. From its sources to about the meridian of 96°, the Arkansas flows through the great plains which stretch eastward from the base of the Rocky Mountains. Though the term plain is more applicable to this region than any other name, it is not strictly a plain; it is an undulating surface, presenting here and there detached table-lands at a small elevation above it, with some knobs and small ridges, the whole cut up into numerous extensive parterres by the beds of streams, to the action of which a great part of the present irregular form of the country is considered to be due, by those who have explored it. The Arkansas valley, for more than 100 miles from the place where it leaves the mountains, contains a considerable quantity of timber, chiefly cotton wood; but further E. the timber almost disappears, and the wide spreading prospect is nothing but a prairie. The river-valley widens in its eastern course, and the bluffs become less elevated; the bottoms are not more than a few feet above the level of the river, which in some parts is spread out a mile in breadth, and contains numerous islands. At some seasons the river is said almost to disappear. About the meridian of 97°, the Arkansas crosses the line marked in Major Long's map as the western boundary of the limestone and coal strata connected with the Ozark mountains; and about a degree, or a degree and a half, E. of this, it enters and traverses the hilly region of the Ozarks, in which it continues to the neighbourhood of Little Rock, when it enters the low alluvial country. Little Rock is about 120 miles from the Mississippi, not including all the small bends of the river.

This river is joined by numerous large tributaries. Running into it on the right bank are the Nebracka or Red Fork, and the Nesuketonga or Grand Saline, which join the Arkansas W. of the meridian of 97°; both of them probably come from the Rocky Mountains.

Near the meridian of 95° the Arkansas is joined on the right bank by the Great Canadian, which rises in the Rocky Mountains, probably three degrees at least S. of the sources of the Arkansas, and is computed to run 1000 miles before it joins the main stream. Its general course is E., with a considerable bend to the S.; a space of great extent is thus included between the Arkansas and the Canadian, in which numerous streams, several hundred miles in length, have their origin and course. The great affluent of the Canadian, the North Fork, lies in this intermediate space; it joins the Canadian on the left bank six or eight miles lower down than the South Fork, which enters the Canadian on the right bank. Near its source the valley of the Canadian is narrow, and faced by bluffs from 200 to 500 feet high. Lower down its bed is wide, and only a few feet below the bottom land which lines it on each side. Though it drains an immense extent of country, it is quite stagnant for a large part of its course in summer, and its wide bed is in many places entirely dry; in one instance observed by Major Long, the Canadian was buried in its sands for more than 100

miles. The waters of the Canadian contain various proportions of common salt and sulphate of magnesia in solution, which often render them unfit for use. Saline and nitrous effluences, and considerable incrustations of salt, characterize some portions of the country drained by the Arkansas and the Upper Canadian. Major Long's party, in their exploring expedition of 1819, 1820, mistook the Canadian for the Red River, and were not undeceived till they had traced this stream to its confluence with the Arkansas.

The character of this extensive region, W. of the Ozark mountains, and included between the Arkansas and the Rocky Mountains, will be best understood from reading the interesting narrative of Major Long's expedition. The trees are found almost exclusively on the banks of the streams; the high flats above the bottoms present in general nothing but a covering of grass or stunted shrubs. Sandy plains covered with wormwood and other plants: a burning sun which, even in September, raises the thermometer above 90° in the shade: and a general want of timber, water, and navigable streams, render these regions difficult and even dangerous to cross, and only fit for the residence of a nomadic people. Wild animals are sometimes found in abundance, and sometimes it is difficult to meet with them: the black bear, deer, antelope, white wolf, jackal, lion, sometimes seen in countless herds, wild turkey, Virginia partridge, and marmot, commonly called the prairie dog, form part of the inhabitants of this wilderness. The wandering tribes of Indians are inconsiderable in numbers.

The annual flooding of the Arkansas commences early in March, and it attains its greatest height in the delta of Louisiana in the month of June: the flooding of the Arkansas is after that of the Red River, which lies further S., and contemporaneous with that of the Ohio. The flooding from the Missouri is the latest. In the bluffs of the Canadian, as well as on the upper part of the Arkansas, extensive beds of gypsum appear embedded in a ferruginous clay and a fine sand of a deep red colour; owing to this, the Arkansas, and the Canadian also, are generally of a deep red colour, especially during the floods. The waters of the North Fork of the Canadian and of the Upper Arkansas are of a greenish colour when not swelled by the rain.

(Darby's *View of the United States; Long's Expedition to the Rocky Mountains.*)

ARKANSAS TERRITORY, one of the territories of the United States not yet raised to the rank of a sovereign state. It is bounded by the state of Missouri on the north, the Mississippi on the east, Louisiana on the south, Texas on the south-west, and on the north-west by the western territory of the United States. It lies between 34° and 36° 30' N. lat., and 89° 41' to 100° 5' W. long. from Greenwich. The river boundary on the east is about 350 miles, not reckoning all the small curvatures. A line of 170 miles drawn west along a parallel of latitude separates it from Louisiana. The Rio Roxo or Red River, one of the large affluents of the Mississippi, forms the remainder of the southern boundary separating Arkansas from the Mexican territories. The 100th western meridian from Greenwich forms the western limit of Arkansas; and the parallel of 36° 30' separates Arkansas on the north from the north-west territory and from the state of Missouri, all but a small portion where the line follows the St. Francis river for 30' south, and then runs for 34 miles eastward to the river Mississippi. The circuit of Arkansas is about 1320 miles, and the area is computed at 121,340 square miles, between one-fifth and one-sixth more than the reputed area of Great Britain and Ireland.

Arkansas may be divided into three physical regions, an eastern, a central, and a western region. The eastern, bordering on the Mississippi, is low and flat, generally covered with dense forest, without good water, and almost without stones. In the central section the ground begins to ascend gradually, and the forests are interspersed with prairies; hills also begin to appear increasing in elevation as we advance westward. These hills, known most commonly under the name of the Ozark mountains, form a continuous chain which probably is an offset from the Mexican system; but about this there is still some doubt. The Ozarks enter Arkansas from the province of Texas, and crossing the territory in a general north-east direction, but nearer to the eastern than the western limit, enter the state of Missouri. The Ozarks are not a ridge of hills, but, like the Appalachians, a mountain-system, probably occupying two degrees

or more in breadth; the general direction of the mountain mass is from south-west to north-east. The falls on the upper Washita (34° 25' N. lat.) are formed by a kind of hard freestone, extending across the bed of the river in the direction just mentioned.

The western portion of Arkansas is an extensive elevated level, continually increasing in height as it runs westward towards the Rocky Mountains: it is a country of grass almost without trees, traversed by the long streams which join the Rio Roxo and the Arkansas river. Besides the Rio Roxo, which forms, for above 400 miles, the south-western boundary of Arkansas, the territory is watered by other affluents of the Mississippi. White River and St. Francis both rise in the Ozarks of Missouri, north of the Arkansas River. White River is formed by the union of numberless streams which rise in the Ozarks, and are united in two main streams, the western called the White River, and the eastern the Big Black River. The Big Black River is formed by numerous streams which rise further N. in the Ozarks; one of these, called Spring River, which is not 200 miles long, discharges more water into the Big Black River than the Canadian, 1000 miles long, into the Arkansas. The united stream, under the name of White River, has a general southern course, and joins the Mississippi fifteen miles above the outlet of the Arkansas, after a course of above 400 miles. A channel forks off three miles above the junction of the main stream with the Mississippi, and runs into the Arkansas. The St. Francis flows between the White River and the Mississippi in a general southern direction, and joins the Mississippi about sixty-five miles direct distance N.E. of the junction of the Arkansas with the Mississippi.

The Ozarks, between the Arkansas and Red River, rising above the low lands and spreading out into a hilly region of great extent, become the sources of numerous streams. Of these, one of the principal is the Washita. We are not aware that the remotest source of this stream is yet laid down with any accuracy, but the position of the hot springs near one of its sources has been ascertained to be in 31° 31' N. lat., and 92° 50' W. long. There are four principal springs: the highest temperature observed was 151° of Fahrenheit; the lowest temperature was 132°. It was computed by Mr. Dunbar's party that the quantity of hot water discharged by all the four springs and some minor sources is about 37711 hogsheds in twenty-four hours. Later visitors make the hot springs seventy in number. Major Long, who visited them in 1818, states the highest temperature to have been 151°. Several springs discharged respectively ten, twelve, and twenty gallons of hot water per minute: some of them were at least 100 feet above the bed of the river. Cold springs also exist on the same area as the hot springs. The hot water is colourless and tasteless, but makes a deposit of lime, siliceous matter, and oxide of iron. The Washita, increased by the Saline and several other tributaries, takes a southern course turning a little to the east. The junction of the Washita, Catahoola, and Tenza (about 31° 30' N. lat.), forms the Black River, which empties itself into the Red River.

The climate and productions of this extensive territory vary with the elevation of the surface and the distance from the level of the Mississippi. The low region along the Arkansas is covered with a dense forest of trees, and an impenetrable undergrowth of shrubs and cane; its fertile soil produces cotton, Indian corn, melons, sweet potatoes, and some tobacco, but the sugar cane will not succeed so far north. The peach, the nectarine, the grape, the papaw, and a variety of other fruits, succeed better than the apple, which is small. The papaw is sometimes thirty or forty feet high, and its trunk not less than a foot in diameter. The heat in summer is intense, and the annoyance from mosquitoes sometimes almost insupportable. The only water fit to drink is the rain water, which is preserved in large jars sunk in the ground; the river water when filtered is fit for use, though many of the inhabitants are obliged to dispense with this process. Snakes and other venomous reptiles abound in the thick forests. In the early part of the year, the cold is often severe for a short time, and both snow and ice are occasionally seen at this season. Thunderstorms in summer are often terrific, and the rain descends in torrents. The climate is unhealthy, especially for new comers; ague and bilious fevers prevail in the summer and autumn, and are often fatal.

The Ozark region, which commences near Little Rock on the Arkansas, and extends nearly as far W. as the junction

of the Canadian and Arkansas, is only partially known. Near the hot springs of the Washita, the soil in the river-valley is of good quality, and the lower hills, which are not above 300 feet high, as well as the base of the higher hills, are covered with a soil of middling quality. The black and red oak, with a variety of other woods, and a considerable undergrowth, are found in the valleys of this region. On the rocky parts of the hills there are three or four species of vines, said to produce an abundance of excellent grapes. An immense bed of dark blue schistose rock (clay slate) appears to form the base of the hot spring hill, and those near it; and pieces of this rock in a state of decomposition, possessing a strong aluminous taste, are frequently met with. The temperature of the atmosphere at the springs on the 31st of December, 1804, was 29° at sunrise, 32° at 3 p.m. with a wind S.E. and snow. On the morning of the 30th of December it was 9° at sunrise, 38° at 3 p.m. with a high N.W. wind. On January 2, 1805, the thermometer was 6° at sunrise. The Ozarks between the Arkansas and the Red River, though resembling the Appalachians as to general direction, are said not to show, like the mountains east of the Mississippi, a set of parallel ranges.

The real sources of the Washita are about 100 miles N.W. of the hot springs in an elevated region, from which some small tributaries flow into the Arkansas, and others into the Red River. The hills in this part are so thinly covered with pine and post oak, that the grey sand tone is the prevailing colour in the landscape. In the river-valleys of these mountains, as, for instance, on the Saline branch of the Washita, there are lands not inferior to any in the Mississippi valley; the timber is pine, oak, ash, hickory, and sugar maple. These trees, the undoubted marks of a rich soil, are also found along the base of the mountains, S.E. of the hot springs, and form an exception to the general remark, that the best soils in Arkansas are in the river alluvium. The deer and the wolf abound in these high regions; and the wild turkey is still numerous on the banks of the White River. (For the geological structure and general character of the Ozarks, see that article.)

The region W. of the Ozarks has been already partially described. It commences near the junction of the Canadian and Arkansas; and though timber and thick undergrowth are found in the bottoms of the rivers, we trace from this point, or about a degree westward, the great red sandstone formation with its bare and monotonous surface which extends to the Rocky Mountains. The red colouring matter of the sandstone stains the waters of the Canadian a dark red colour, and the soluble salts associated with this rock give its waters a strong saline taste.

The mineral wealth of the territory is yet hardly known. Iron certainly exists, and probably lead and coal; salt might probably be produced in abundance from the salines near the Washita, and in other places.

The Arkansas derives its name from a tribe of Indians, probably now extinct; they spoke the Osage language. It was first explored and settled by the French in 1665. In 1763, the whole of Louisiana was ceded to Spain, who kept possession of it till 1800, when, by a secret treaty, it was given back to France. In 1803, Louisiana was purchased by the United States from France for 15,000,000 dollars, and it contained, according to the terms of the purchase, not only the state so called, but Arkansas, Missouri, and the N.W. territory. The post of Arkansas, on the left bank of the Arkansas river in the low country, is an old Spanish settlement. Little Rock, the seat of government, is higher up the country, on the right bank of the same stream, 31° 43' N. lat., 92° 15' W. long. The population in 1830 was 30,358, of whom 4576 were slaves.

The governor is appointed by the president, with the consent of the senate; the term of office is three years, and the salary 2000 dollars. There are four judges, with salaries of 1200 dollars each. The militia of the territory was 2028 in 1831. The territory sends one delegate to congress. The most recent division of the state that we have seen makes fifteen counties. According to a statement in the *Encyclopædia Americana*, the limits of what is properly called Arkansas territory have been reduced to 45,000 square miles. The population of Arkansas consists of Indians, some French, a very few Spaniards, Americans, and such adventurers from all countries as are found on the verge of civilization. Education does not exist in the territory, and the power of law is yet too feeble to repress and punish acts of personal violence, which are not uncommon.

Of the Indian tribes as at present existing in Arkansas, we can give no satisfactory account. The Quapaws, Choctaws, some Osages, and other tribes, still inhabit the territory. The Chickasaw Indians are now endeavouring to select a suitable spot in Arkansas for their future home.

(Darby's *View of the United States*; President Jefferson's *Message of February 19, 1804, communicating Dunbar and Hunter's Visit to the Hot Springs of the Washita*; Long's *Expedition to the Rocky Mountains*; Nuttall's *Arkansas*; *American Almanac*, 1834.)

ARKEEKO, a sea-port on the western coast of the Red Sea, in 15° 38' N. lat. and 39° 37' E. long. It lies three miles S. of the small island and town of Massowah, where the vessels from Jidda and other parts cast anchor. The goods that are destined for the Abyssinian market are then carried to Arkeeko, where the kafilas or caravans assemble. From Arkeeko the kafilas journey in a southward direction, passing over the Taranta mountains, and proceed to Dixan, the first Abyssinian town on that side, and thence to Adowa, the chief mart of trade in the kingdom of Tigre. [See ADOWA.] Arkeeko is about forty-miles N. by E. of Dixan, and about 100 N.N.E. of Adowa, but the distance is much greater by the road or track which the kafilas follow. Arkeeko lies in a sandy flat country which stretches between the coast of the Red Sea and the foot of the Taranta and Assauli mountains which divide it from Tigre. This maritime region is not now under the power of the Abyssinians, but is occupied by native independent tribes, nomadic and predatory like those of the Arabs, and often at war with their Abyssinian neighbours. They are nominally Mohammedans, and speak various dialects, of which Mr. Salt gives short vocabularies. The Hazorta tribe occupy the country immediately to the south of Arkeeko, and when at peace they escort the kafilas between Arkeeko and Dixan. The town or village of Arkeeko is under the rule of a nayib, or native chief, who is himself under a sort of dependence on the aga or military governor of Massowah, which latter used to be appointed by the shereef of Mecca. The authority of the pasha of Egypt has now superseded that of the shereef. The aga levies a duty upon all goods which are imported into Abyssinia. Arkeeko is a small and miserable place; its only importance consists in being the point of the coast nearest to the Abyssinian territories, and through which all intercourse by sea to that country is now carried on. The territory of the Baharnegash, a dependency of the kingdom of Tigre, stretches to within twelve or fourteen miles W. of Arkeeko. Mr. Salt gives a very bad account of the people of Arkeeko; they are much worse than their neighbours of Massowah, who are themselves not so good as the worst of the Arabs. The bay of Arkeeko is separated to the eastward by the Gellam mountain and promontory from Annesley's Bay, which stretches southward to Zulla, the ancient Adule, which was formerly the maritime emporium of Abyssinia. [See ADULE; Salt's *Abyssinia*; Valentia's *Travels*.]

ARKLOW, a town in Ireland, in the barony of Arklow, county of Wicklow, 16 miles south of Dublin, on the road to Wexford, in 52° 18' N. lat., 6° 10' W. long., from Greenwich. It is on the south bank of the Oyoca, or Avoca, about 500 yards from the sea, and has a main street, running nearly parallel to the stream, with a gentle descent towards the sea; this forms 'the Upper Town.' At the upper end of this is a barrack with a walled yard, connected with an old tower partly destroyed by Oliver Cromwell. Towards the lower end of this street, the road by the coast from Wicklow, which leads by a bridge of many arches over the Oyoca, enters the town; and a little below this is the part denominated the Fishery, consisting of mud cabins, built very irregularly. There is a handsome modern church, on a rising ground about the centre of the town, and a square chapel on an open and convenient spot in the Upper Town. The shore is skirted by a line of sand hills. Some steps have been taken to improve the haven, which is bad and little used, except by the fishermen. The herring fishery employs a number of boats, which have usually six hands in each. In the intervals between the herring seasons, the men dredge for oysters on the beds off the coast; they carry their oysters to Liverpool, and bring back earthenware and coals. Their children in the mean time make nets. This fishery is the chief occupation of the inhabitants of the town, who amounted in 1821 to 3808, and in 1831 to 4383. Arklow has a fever hospital and a dispensary. There are four fairs, at which are sold cloths and woollens of different descriptions, also black cattle, pigs, &c.

The parish of Arklow is a rectory and vicarage in the diocese of Dublin, episcopally united from time immemorial to the vicarage of Enorely, or Ennerily, and the curacies of Kilbride, Killahurder or Kilnain, and Temple Michael, all contiguous. Besides the ruins of the castle above-mentioned, there were the remains of a monastery for Cistercian friars, founded in the thirteenth century by Theobald Fitzwalter, fourth butler of Ireland (a former officer of state); but these are now removed.

In the rebellion of 1798, Arklow was the scene of a very severe contest. On the 9th of June, a body of insurgents (whose numbers are variously given at 'above 20,000, of whom 4000 or 5000 carried guns,' and at 31,000) advanced against the town, which was defended by nearly 1600 men, under the command of Major-General Needham and Colonel Skerrett. The assailants advanced with great impetuosity, and succeeded in entering and burning the part of the town nearest the sea—the 'Fishery,' which consisted then, as now, of thatched cabins, inhabited by fishermen. The contest, however, was severest at the upper end of the town, and was maintained with great courage, the Durham Fencibles especially distinguishing themselves in the defence. Ultimately, about nightfall, the rebels were repulsed, and retired, without being pursued, towards Gorey, after suffering considerable but not well ascertained loss. (Carliste's *Top. Dict.*; *New Stranger's Guide*; Musgrave's *Memoirs of the Rebellion in Ireland*; Gordon's *Hist. of Ireland*; Shaw Mason's *Stat. Account of Ireland*.)

ARKWRIGHT, SIR RICHARD, one of those extraordinary men whose ingenuity has exerted a most powerful influence upon the condition of civilised society, was born at Preston, in Lancashire, on the 23rd of December, 1732. His parents moved in an humble walk of life; and as he was the youngest of thirteen children, we may suppose that the amount of school learning which he received was exceedingly scanty. He was brought up to be a barber, an occupation which could afford but little promise of distinction, and it is probable that, had he continued to follow that business, the powers of mind which he exhibited, and to which his great success in life must be attributed, would have lain dormant, or might have been stifled by the petty cares attendant upon a low and precarious profession. About the year 1760 he quitted business as a barber, which he had previously carried on in the town of Bolton, and became a dealer in hair. This article he collected by travelling up and down the country, and when he had dressed it, sold it again in a prepared state to wig-makers. The profits of this business were increased, and the circle of his customers was enlarged, by means of a secret process for dyeing hair which he possessed, and which is said to have been a discovery of his own. This last fact is, however, doubtful, as chemistry was not among the subjects which he at any time studied; and it is probable that, had his first successful project been the result of his own investigations in that branch of science, he would have continued to devote his attention to similar objects, and not have been led away to the study of mechanics, of which also his knowledge appears to have been for some time exceedingly limited.

His first effort in mechanics was an attempt to discover the perpetual motion. This direction having been given to his thoughts, it may naturally be supposed, that the circumstance of his living in the midst of a manufacturing population, the growing demand for whose productions placed them in continual difficulty as to procuring the material principally required for their manufacture, would lead him to consider the possibility of contriving some machine by which that difficulty might be lessened or overcome.

Up to the time we have mentioned, the cloths of English manufacture called calicoes, which were made in imitation of Indian goods, and so called from Calicut, the place of their production, were formed by a mixture of linen and cotton: the warp was composed of linen and the weft of cotton, it being found impossible, by any means then known, to spin the fibres of cotton into a thread sufficiently strong to be used as warp. The cotton for the weft was at this time delivered in the raw state by the master manufacturers, together with the linen yarn, to cottagers living in the little villages of the district, who both carded and spun the cotton wool, and wove the cloth. The demand for these cloths soon became so great, that the females in the weaver's family by whom the carding and spinning processes were performed, could not prepare sufficient weft to keep the looms employed, and the weaver was obliged to engage

additional hands for preparing the cotton. The limit to which this species of employment could be carried was soon reached, and if some more productive mode of spinning than that by the one-thread wheel, then the only machine known, had not been discovered, the progress of the cotton manufacture must have been stopped, or at best would have been extremely slow. Mr. Guest, in his *History of the Cotton Manufacture*, tells us, that at this time 'it was no uncommon thing for a weaver to walk three or four miles in a morning, and call on five or six spinners, before he could collect weft to serve him for the remainder of the day.'

It has been said that the cotton yarn then produced in England did not exceed in quantity what is turned off by 50,000 spindles at the present day, being about the one hundred and fiftieth part of the number now in constant use. It is not our intention to go into further particulars on this subject, which may be better detailed under the head of COTTON MANUFACTURES, but some slight notice of the state of things preceding the great invention of Arkwright appears necessary, in order to show more clearly the advantage which the country has derived from his inventions.

It has been much the fashion to depreciate Arkwright's talents, and even to deny him altogether the merit of being an original inventor; and he has sometimes been considered as a plagiarist or pirate of other men's ideas. If, however, the evidence is carefully weighed upon which it has been attempted to convict him of this serious charge, we think it will be found to rest upon very slight grounds: while the proofs which he exhibited of possessing talents of the very highest order in the management of the vast concerns in which he was afterwards engaged, are unquestionable. The evidence brought forward upon the trial for repealing his patent in 1785 was that of persons in a low station of life, who spoke of circumstances which had occurred eighteen years before. One of the witnesses—the principal one—had been employed by Arkwright to assist in making the models for his machine, and, in order to invalidate the patent, he accused himself of having betrayed the confidence of the real inventor, for whom he had previously made a similar machine. The combination against Arkwright which produced this trial was of a very powerful description, and without wishing to impute to any persons so serious a crime as subornation of perjury, it is at least probable that all were ready to listen to and to reward witnesses who were willing to aid their cause, without inquiring too nicely into the actual merit of their testimony. Of late, the case of a still earlier invention has been brought forward, to which no allusion was made upon the trial in 1785; a circumstance which makes it probable, that the memory of its true nature was at that time completely lost. It is, therefore, consistent, not only with charity, but also with strict justice, to suppose that Arkwright himself, then a very illiterate and ill-informed man, knew no more of this earlier invention than the rest of the world after attention had been directed to the subject for so many years. We allude to the case of a patent for spinning by means of rollers, which was taken out in the year 1738, by Mr. Charles Wyatt, of Birmingham, in the name of Lewis Paul, a foreigner, with whom Wyatt had formed a partnership. The specification of Wyatt's invention has recently been brought to light and published, and there can be no doubt that it contains the principle of Arkwright's patent to an extent which deprives him of the honour of having been the first inventor of his plan, while it equally deprives of that honour the men upon whose testimony Arkwright lost his cause. It cannot, however, be considered impossible, or even improbable, that two men should actually invent the same machine. Wyatt's contrivance had been tried in Birmingham and at Northampton in 1741, but was so far from being successful, that the machinery was sold in 1743, and it is not known what became of it. That twenty years afterwards Arkwright should have had more than a traditionary knowledge of Wyatt's plan is not very likely. In the 'Case' which he drew up to be presented to Parliament in 1782, and which was printed and extensively circulated three years before the trial already alluded to, he makes mention of the fact in these words:—'About forty or fifty years ago, one Paul and others of London invented an engine for spinning of cotton, and obtained a patent for such invention: afterwards they removed to Northampton and other places. They spent many years and much money in the undertaking, but without success; and many families who had engaged with them were reduced to poverty and distress.' This 'Case' was drawn up at a time when his patent-right was

being constantly invaded, and it is incredible, that, if he had possessed a knowledge of the particulars of Wyatt's patent, he should have thus drawn public attention to it, since he must, in that case, have known that the production of the specification would at once have deprived him of every ground upon which he attempted to establish his own rights as an inventor.

It is perhaps unnecessary on this occasion to enter at greater length into this matter, which, however, it was impossible to pass over unnoticed, considering how greatly the question of Arkwright's inventive talent has at various times been controverted. We shall now proceed in our account of this extraordinary man, on the supposition of his having been in reality what he represented himself to be, the inventor of the ingenious machine for which he obtained his patent.

In the course of his inquiries after some person qualified to assist him in making the movements for his first projected machine, which, as we have already said, was one for producing perpetual motion, Arkwright became acquainted with a clockmaker, named Kay, then residing at Warrington, whose services he engaged and retained for four or five years, first at Preston and afterwards at Nottingham. The account which Kay himself gave of this connexion upon the trial in 1785, where he was the principal witness, was, that it broke off in consequence of his having been unjustly accused of felony.

From the year 1767, it appears that Arkwright gave himself up completely to the subject of inventions for spinning cotton. In the following year, he went to Preston, and set about constructing his first machine, which was put up in the dwelling-house attached to the free grammar-school of that town. At this time Arkwright's poverty was such, that, 'being a burgess of Preston,' he could not appear to vote during a contested election, till the party with whom he voted gave him a decent suit of clothes. Shortly after, apprehensive of meeting with the same kind of hostility which had a short time previously been shown to a man named Hargreaves, who also had invented a machine for abridging labour in cotton-spinning, Arkwright left Lancashire and went to Nottingham. Here he made arrangements with Messrs. Wrights, bankers in that town, for obtaining the necessary supply of money: but these gentlemen, after a short time, declined to continue their advances, and introduced him to Mr. Need, a stocking-manufacturer of that place, as a gentleman likely to enter into his plans. Mr. Need was at that time in partnership with Mr. Jedediah Strutt, of Derby, the ingenious improver and patentee of the stocking-frame, whose opinion he naturally asked upon the occasion: and it is a remarkable fact, strongly corroborative of Arkwright's claim to be the original inventor, that, although Mr. Strutt saw and at once acknowledged the great merit of the invention, he pointed out various deficiencies which the inventor, from the want of mechanical skill, had been unable, with all his powers of contrivance, to supply. These defects were easily remedied by Mr. Strutt, and in the year 1769 Arkwright obtained his first patent for spinning with rollers, and Messrs. Need and Strutt became his partners in the manufacturing concern which it was proposed to carry on under it.

The improvement for which this patent was obtained consisted principally in the use of two pairs of rollers, the first pair slowly revolving in contact with each other; while the second pair, at a little distance, was made to revolve with greater velocity. The lower roller of each pair was fluted longitudinally, and the upper one was covered with leather, by which means the two would have a sufficient hold upon the cotton passed between them. The cotton, when passed through the first pair of rollers, had the form of a thick but very soft cord, and was no further altered in its texture than receiving a slight compression: but it is evident that, as the second pair of rollers moved with twice, thrice, or ten times the velocity of the first, the cotton must be drawn out twice, thrice, or ten times smaller than when delivered from the first rollers. The validity of this patent was contested in 1772, on the ground of Arkwright not having been the original inventor of the process, but a verdict was given in favour of the patent, which no one afterwards attempted to disturb.

The first mill erected for spinning cotton by this method was at Nottingham, and was worked by horse-power; but in 1771 another mill was built at Cromford, in the parish of Wirksworth, in Derbyshire, to which motion was given by

water; from this circumstance the machine was called the water-frame, and the thread received the name of water-twist.

Previous to this time no establishment of a similar nature had existed, none at least to which the same system of management was applicable; and it strongly marks the judgment and mental powers of Arkwright, that although the details of manufacturing or commercial business were altogether new to him, he at once introduced a system of arrangement into his works which has since been universally adopted by others, and which, in all its main features, has remained unaltered to the present time.

The great invention, which has been very slightly described above, was followed up by various improvements and combinations of machinery, for which a second patent was obtained in 1775. His right to this patent was disputed in 1781, on the plea that some of the contrivances which it comprehended were not original; and his monopoly was invaded to such an extent by other cotton-spinners, that to maintain it he was obliged to bring actions against nine different parties. The first of these actions was tried in July, 1781, when he was non-suited, not on the ground originally taken by his opponents, but because it was held that the specification or description of the invention which he had enrolled, did not comply with the terms upon which the patent was granted, viz. that it should contain such a full and particular account of the invention as would enable the public to avail themselves of its advantages after the expiration of the term for which the monopoly was granted.

The result of this trial occasioned Arkwright not only to abandon the other eight actions which remained to be tried, but also, for a time at least, to forego the rights derived from his second patent. It was on this occasion that he drew up and published a pamphlet, to which allusion has already been made, and which he called his 'Case.' The object of this pamphlet was to impress the members of the legislature with the propriety of interfering for his protection.

Having in the beginning of 1785 obtained the testimony of several competent persons in favour of the sufficiency of his specification, Arkwright then commenced a new action, which was tried in February of that year, and decided in his favour, thereby reinstating him in the possession of his monopoly. By this time, however, the number of persons interested in destroying that monopoly had greatly increased: on the faith of the former verdict large capitals had been embarked which would have been subjected to heavy depreciation if the patent could have been sustained, and accordingly in a very few months an action was brought for the cancelling the patent by a writ of *scire facias*, nominally at the suit of the crown, but actually prosecuted by the cotton-spinners of Lancashire, who would have been liable to penalties for continuing to use the invention. These parties actually formed an association for the purpose of trying this cause: and engaged scientific gentlemen to discover the technical defects of the patent and to arrange the evidence for its overthrow. It was on this occasion that the testimony of Kay was adduced to show that, previously to his having been employed in 1767 to make a model for Arkwright, he had been similarly engaged by another person who was likewise brought forward to corroborate the fact, and upon this evidence the jury found a verdict for the crown, and thereby annulled the patent. A new trial was applied for in the following term, on the ground that Arkwright had procured evidence to rebut that upon which the verdict was grounded, but the motion was refused by the court.

The opposition here described was not the only difficulty which Arkwright had to encounter from rival manufacturers. Although the yarn which he made was so far superior to that produced by the old method of spinning that it could be used for warp, they combined to discountenance its use. A very considerable stock lay upon his hands in consequence, and he and his partners were driven to undertake the conversion of this yarn into manufactured goods. They first used it with perfect success in making stockings, and soon after established the manufacture of calicoes, such as they are made at the present day. But here another difficulty assailed them. Their orders for this description of manufacture, then new to England, were exceedingly great, but could not be complied with, on account of the demand on the part of the officers of excise of a duty of sixpence per yard, as being calicoes similar to those imported, and upon which a like duty was levied, while other English-made cloths were subject to only half that rate. It was not until application for relief had been made to parliament that this

obstacle was removed, and a large accumulated stock of cloths was disposed of. On this occasion an act of parliament was passed, in spite of the strenuous opposition of the Lancashire manufacturers, declaring that 'Whereas a new manufacture of stuffs made entirely of cotton spun in this kingdom has lately been introduced, and some doubts are entertained whether it is lawful to use it, it is declared to be not only a lawful but a laudable manufacture, and is therefore permitted to be used on paying threepence per square yard when printed, painted, or stained with colours.'

Five years expired from the first establishment of the works at Crompton before any profit was realized, but after that time wealth continued to flow in abundantly to the proprietors. The establishments were greatly extended, several new ones were formed, and, in many cases, Arkwright took a share with other persons in the erection and working of cotton mills. This tide of prosperity continued to set in notwithstanding the adverse decision of the courts in regard to his patent. For several years, the market prices of cotton twist were fixed by Arkwright, all other spinners conforming to his scale. The same quality of this article which now sells for about 3s. per pound, sold, in 1790, for ten times that price, and was as high as 17. 18s. per pound in 1786; and although a great part of this difference is no doubt owing to a progressive economy attained in the processes of manufacture, it is not difficult to imagine that the larger price must have been exceedingly profitable to the spinner.

Mr. Arkwright was appointed high-sheriff of the county of Derby in 1786, and on the occasion of presenting an address of congratulation to the king on his escaping the attempt at assassination by Margaret Nicholson, received the honour of knighthood. Notwithstanding the increasing inconvenience which he experienced from a severe asthma, with which he had been occasionally afflicted from early life, Sir Richard continued to give the most unremitting attention to business, and superintended the daily operations of his large establishments, adding from time to time such improvements to the machinery as were suggested by experience and observation. He sunk at length under a complication of disorders, accelerated if not produced by his sedentary habits, and died in his house at Crompton, on the 3d of August, 1792, in the sixtieth year of his age, leaving behind him a fortune estimated at little short of half a million sterling.

Considering the difficulties in which he was placed by the deficiency of his early education and the unfavourable tendency of his early employment, Arkwright must be acknowledged to have been a very extraordinary man. Even without claiming for him the honour of having been an original inventor, - an honour which, upon the best consideration we can give to the conflicting evidence brought forward, we are still inclined to award him, - we may certainly ascribe to him the possession of a clear and comprehensive mind, as well as the most unerring judgment. His plans were all laid with skill, and pursued with energy; he displayed the most unwearied perseverance in pursuit of his object under difficulties which would have borne down most men; and he forms one among the bright instances afforded by the annals of this country, that talent, when thus allied with patient energy and persevering industry, will not fail to ensure ultimate success to its possessor. (*Library of Entertaining Knowledge*; Baines's *History of the County of Lancaster*; Godson's *Treatise on the Law of Patents*.)

ARLES (*Arelate*, *Cæsar*; *Ἀρελᾶται*, *Strabo*), a town in France, in the department of Bouches du Rhône, 453 miles S. by E. from Paris, through Lyon, Avignon, and Tarascon; or, about 140 by Monde, Nîmes, Beaucare, and Tarascon, crossing the Rhône between the two last-mentioned towns. It is 75 miles by a circuitous route through Aix and Tarascon, from Marseille, the capital of the department, but considerably nearer by the road through Jonquieres and the marshes near the coast. 43° 40' N. lat., 4° 35' E. long. from Greenwich.*

The city is on the left bank of the Rhône, just at the point where the river, dividing into two channels, encloses the marshy island of La Camargue, or Carmague. It is in a district abounding in marshes and pools, which surround it on almost every side, and produce vapours which are carried to the city by the winds. But for this circumstance, it would be one of the most delightful situations in France; the country around, with its verdant meadows, presents some

* So in the Map of France published by the Society for the Diffusion of Useful Knowledge. By Bruce's Map (Paris, 1818), it is 2° 18' E. of Paris, equivalent to 4° 38' E. of Greenwich.

agreeable scenes; and the alleys of mulberry-trees make pleasant promenades.

The town itself is but ill built, with narrow, crooked streets, and old houses. A bridge of boats unites it with the suburb of Trinquetaille, on the opposite bank of the Rhône, and serves also as a place of resort when the inhabitants wish to enjoy a cooling breeze. There is a Gothic cathedral, built, it is said, partly by St. Virgilius, archbishop of Arles, A.D. 626, and partly by Cardinal Allemanu, one of his successors, in the 15th century. The portal is distinguished by sculpture of a grotesque and somewhat indelicate character. The most striking modern edifice is the town-hall, which was built in 1673, after the design of the architect Mansard. It is of white stone; and its two façades (for it stands between two *places*, or squares) display three orders of architecture intermingled. There are several antiquities in it.

The situation of Arles on the banks of the Rhône gives it considerable advantages for trade. There is also a navigable canal, which runs through the marshy district on the left bank of the eastern or main channel of the Rhône, from Arles to the Port de Bouc, on the Mediterranean, at the entrance of the Etang de Berre, or, according to the Society's map, to Foz, which is between Arles and the Port de Bouc. This canal, for the greater part of its course, runs nearly parallel to the above-mentioned branch of the Rhône, and not far from it. The corn, wine, fruits, manna, and oil, of the surrounding country, find sale at Arles; and several manufactures are carried on, as of glass bottles, soap, silk, tobacco, and brandy. The saunders of this place are in high repute. The population is about 20,000. There are a school of navigation, a high school, a museum of antiquities, and a public library. Before the revolution there were many religious houses.

Arles is the capital of an *arrondissement* containing thirty-three communes, and about 70,000 inhabitants. It was formerly the seat of an archbishop, who had for his suffragans the bishops of Marseille, Toulon, Orange, and St. Paul-trois Châteaux the remains of a much greater number of bishops who once acknowledged him as their metropolitan. At present, the archbishopric is united with that of Aix.

The claims of Arles to notice rest mainly upon its former greatness and its numerous existing antiquities. It is first mentioned by *Cæsar (de Bello Civili, lib. i. 36, ii. 5)*, who built here twelve ships of war, previous to the siege of Massilia (Marseille). *Strabo* mentions it as a place of no small trade in his time. *Pomponius Mela*, a writer somewhat later than *Strabo*, describes it as one of the richest cities of the province of Gallia Narbonensis. Other authors make it a Roman colony; and it was probably from the circumstance of some of the colonists belonging to the sixth legion, that it got the name of *Arelate Sextanorum*. The name is variously written. *Arelate* is most common, but we find also *Arelas*, especially in the poets, *Ἀρελᾶται* (*Ἀρελᾶται*, *Strabo*), and *Arelatum* (*Ἀρελᾶτον*, *Ptolemy*), and in later times, *Arelatus*. The city appears to have suffered considerably from the *Allemanni* during the decline of the Roman empire, but in the early part of the fourth century it rose to greatness and distinction under the patronage of *Constantine the Great*. This prince appears to have built that part of *Arelate* which lay beyond the Rhône, and which forms in the present day the suburb of *Trinquetaille*, in the island of *La Camargue*. He gave to Arles the name of *Constantina*, which it continued to bear in the time of *Honorius* (a century later), who transferred to it the seat of the prætorian prefect of Gallia, which had previously been fixed at Trèves.

The dignity of Arles survived the fall of the western empire. It was the residence of a king of the Visigoths, and of a prefect under Theodoric, king of the Ostrogoths, who afterwards got possession of it. Under the kings of the Franks of the Merovingian family, who became masters of Arles after the Ostrogoths, the city declined. In the confused period which succeeded the death of *Charlemagne*, we find it giving name to a kingdom, sometimes called the kingdom of Arles, sometimes of Burgundy; the duration and extent of which are subject to considerable doubt. Arles passed under the dominion of the emperors of Germany, and, by the permission of *Frederic II.*, became, in 1212, a republic, governed by a chief entitled the *Podestat*, elected by the people. It had also a chief judge, the *Viguier*, appointed by the *Podestat*, and two Consuls, nominated by the

Archbishop, to take charge of the police. In a word, it appears to have become a municipal corporation; and under this constitution flourished to such a degree that its alliance was sought by Genoa and other commercial towns. Its independence was indeed overthrown, in the middle of the same century, by Charles I., Count of Anjou (brother of Louis IX. of France, or St. Louis), who was recognized as Lord of Arles, in feudal subjection to the emperor of Germany. Above a century after, the emperor Charles IV. appointed the dauphin, afterwards Charles VI. of France, his vicar in all the kingdom of Arles; and as the emperors quietly withdrew from all supremacy over it, the city, with its territory, came finally under the kings of France.

The antiquities of Arles are numerous and important; but the doubtful nature of some of the buildings, to which different names have been given, makes them apparently more numerous than they are, and occasions some difficulty in the description. There are the ruins of an aqueduct: of two temples, one supposed to be of Diana; of a triumphal arch; of a theatre, three columns of which make up what is called *Tour de Roland*; of a building, which is variously supposed to have been a temple of Minerva, a palace of Constantine (called *La Trouille*), and the capitol or seat of the municipal legislature: of baths, the stoves and galleries of which were discovered in digging for the foundation of the town-house and of the pedestal of the obelisk; and of urns, lacrymatoria (tear-bottles*), paterae, lamps, and other utensils which have been obtained from the tombs. Three remains deserve a more extended notice: the obelisk, the amphitheatre, and the ancient cemetery, called the Campus Elysus (Elysian Field), or, by corruption, *Eliscamp*.

Obelisk of Arles.

The obelisk decorates one of the squares next to the town-hall. The time when it was brought to Arles and the other circumstances attending its transport are unknown. It is of granite similar to that of the obelisks which were carried from Egypt to Rome, but is without any hieroglyphics. It appears never to have been set up in ancient times, but to have lain where it was placed on being landed. For many ages, it was buried in the earth in the garden of a private individual; but was discovered in 1389, and in 1675, under the direction of the town-council, was brought from its concealment, and raised on a pedestal. It was

* So called on account of their supposed use; considered by others to have been intended for perfumes.

originally of one piece, but when dug out, was found to be broken at the point: the broken part was discovered in another place. Its dimensions are about fifty-five English feet high, and the base is about seven feet and a half square. It rests on four lions couchant at the four corners: the lions lie on the pedestal, which is above twenty-one feet high, and has on its four sides Latin inscriptions, containing the most fulsome panegyrics on Louis XIV., to whose honour the obelisk was erected. The summit was crowned with a globe covered with *fleurs-de-lis*, and surmounted by the sun, the ensign of *Le Grand Monarque*. Whether these emblems of royalty have survived the fervours of the revolution, we have not been able to ascertain; but the obelisk itself, which is the only antient part of the monument, maintains its place.

Of the amphitheatre, the circuit is yet entire; and the remains, although blocked up with houses, are sufficient to convey an idea of the former grandeur of the edifice. It consisted of three stages, the lower of which, owing to the uneven surface of the site, was for the most part under ground, except on the north and north-east, where several arches appear above ground. The inequality of the site, by thus concealing or burying the greater part of the first stage, made it necessary to place the principal entrances on the second, which contains sixty arches (including the four principal entries), the number which is also in the third stage. The parapet which surmounted the third stage has disappeared, and it is impossible to say of what kind it was. The architecture is of the Composite order. The rows of seats which surrounded the arena [see AMPHITHEATRE] have almost entirely disappeared, and the space which they once occupied, as well as the arena itself, is filled with earth to the level of the second stage, and covered with houses. Three towers have been built during subsequent wars. The once open arches of the outer wall have also been built up, and the exterior defaced and hidden by houses erected against it. This amphitheatre is built of stone, inferior in hardness and whiteness to that of the amphitheatre at Nîmes: it is less perfect than that edifice, but was capable of holding about five thousand more spectators.

The principal dimensions are thus given in Guis' *Description des Arènes ou de l'Amphithéâtre d'Arles*. 1665:—

Each foot

Circumference of the oval	1265 or 1245
Longer diameter, N. to S.	466
Shorter do. E. to W.	311 or 338
Longer do. of the arena	249 or 246
Shorter do. do.	126 or 124

Breadth from the outer wall to the parapet
of the arena, across the benches 110 or 109

Number of persons whom the amphitheatre would contain, above 23,000.

The measurement of the circumference given in *Le Grand Dictionnaire de Martinière* rather exceeds the above: and he gives the height of the arches in the exterior wall as above twenty-one English feet, the width as eighteen or nineteen. He adds that the walls are above two toises or about thirteen English feet thick, formed of massy blocks of stone without lime or cement to unite them: and that the amphitheatre would conveniently hold 30,000 persons.

Excavations have been made in the amphitheatre within a few years, and many antiquities discovered.

The cemetery of Campus Elysus is on a pleasant hill out of the city. It is divided into two parts. In the first of these, called *Moulaire* (from which is a beautiful prospect), the antient monumental stones have mostly been carried away to present to different individuals, or broken up to be used as building materials: but the second part, which is still called *Eliscamp*, contains several tombs, those of the Pagans being distinguished by the letters D M (*Dus Muni-bus*), and those of the Christians by a cross. The same causes which have led to the removal of nearly all the tombs of the other part, have materially diminished those in Eliscamp.

An antient statue, which is called by Martinière and others a statue of Venus, but which an old writer, François de Rebattu, Dean of the See of Arles (in a tract bearing date 1639), and the writer in the *Encyclopédie Méthodique*, describe as a statue of Diana, was dug up in 1651. It was found in digging a well, in several pieces; and has been

* These dimensions are to be considered as approximations rather than as rigidly exact; for the two columns, though both taken from the same author, one being reduced from the Provencal measures, canes and pans (the cane = 3 pans, and the pan = 94 in. French), and the other from French toises, feet, and inches, do not agree,

much admired. It was restored and transferred in 1684 to the gallery at Versailles, and subsequently to the gallery of the Louvre.

It is supposed that the country round Arles was by no means so marshy in the time of the Romans; the obstacles which prevent the waters from flowing into the sea or into the channel of the Rhône having arisen since.

The people of Arles are considered to have retained more than those of most other towns of the manners of ancient times. One instance of their adherence is far from creditable: bullfights were kept up here till a comparatively late period. Horse and foot races are still practised. The beauty, grace, and gentility of the women are much praised.

Arles was the native place of the Emperor Constantine II. son of Constantine the Great: of Morand and Patrat, dramatists; and of Saverien, a mathematician and biographer of some merit. (*Le Grand Dictionnaire de Martinière; Géographie de la France; Encyclopédie Méthodique; &c.*)

ARLON (the Roman Orolanum), a small town in the Duchy of Luxembourg, belonging to the King of the Netherlands, in 49° 42' N. lat., and 5° 47' E. long. It stands on a hill, near the sources of the Semoy, a branch of the Meuse, fourteen miles W.N.W. of the town of Luxembourg, and between that and the town of Neufchâteau. Its population is about 3,600. It has some iron works and furnaces, a considerable corn trade, and linen and woollen manufactures. Arlon was once a town of considerable importance; it was fortified, and was taken and re-taken by the French and the Spaniards in the wars of Louis XIV. It was entirely destroyed by a fire in 1785. Arlon was the birth-place of the two learned brothers Busleyden, one of whom became cardinal and archbishop of Toledo in the time of Charles V.; the other was the founder of the College of the three languages at Louvain.

ARMADA. This term, which is derived from the Latin word *armata*, 'armed,' and consequently comes from the same root as the French *armée* and our *army*, is used in Spain to denote exclusively a naval armed force, or fleet of war. *Flota* is used in the same language for a fleet of merchant-men. Armado, which occurs in Shakspeare's *King John*, act iii. sc. 4, Sandys's *Travels*, p. 51, &c. is a corrupted term; so Fairfax, in the translation of *Tasso*, i. 79,

* Spread was the huge armada wide and broad.

Ben Jonson, however, writes it correctly, Armada.

Nares, in his *Glossary*, thinks that this word was not known in England before the Spanish projected invasion in 1588; and it is now rarely used but in speaking of that particular fleet the fitting out and destruction of which form the subject of the next article.

ARMADA, SPANISH. In the beginning of May, 1588, the preparations of Philip II. for the invasion of England, which had so long kept Europe in amazement and suspense, were brought to a conclusion; and the Spaniards, in the confidence of success, previous to its sailing, gave their fleet the name of the Invincible Armada. It consisted, at this time, of 130 vessels: 65 of these were galleons and larger ships; 25 were pink-built ships; 19 tenders; 13 small frigates; 4 were galleasses; and 4 galleys. The soldiers on board amounted to 19,295, the mariners to 8050; of these, 3330 soldiers and 1293 mariners had been supplied by Portugal: besides which, the rowers in the galleasses amounted to 1200, and in the galleys to 889. There were also on board 2431 pieces of artillery, and 1575 quintals of powder: 347 of the pieces of artillery had likewise been supplied by Portugal. Two thousand volunteers of the most distinguished families in Spain, exclusive of the sailors and soldiers already mentioned, are stated to have accompanied the expedition.

Philip's preparations, in the Netherlands, of a further force, were not less advanced than those of Spain. Besides a well-appointed army of 30,000 foot and 4000 horse, which the Duke of Parma had assembled in the neighbourhood of Nieuport and Dunkirk, that active general had provided a number of flat-bottomed vessels, fit for transporting both horse and foot, and had brought sailors to navigate them from the towns in the Baltic. Most of these vessels had been built at Antwerp; and, to prevent the Dutch from intercepting them should they pass by sea, they were sent along the Scheldt to Ghent, thence by the canal to Bruges, and so to Nieuport by a new canal dug for the particular occasion. This laborious undertaking, in which several thousand workmen had been employed, was already finished, and the

duke now only waited for the arrival of the Spanish fleet; hoping that, as soon as it should approach, the Dutch and English ships, which cruised upon the coast, would retire into their harbours.

The details of the regular force which the English assembled to oppose the Armada, both by sea and land, are minutely given in a manuscript now in the British Museum (*MS. Reg. 18 C. xxi.*), formerly belonging to the Royal Library. At the time when Queen Elizabeth began her preparations, her fleet did not amount to more than thirty ships, none of them near equal in size to those of the enemy. Ultimately, however, the different descriptions of vessels, large and small, which formed her navy, amounted to 181 ships, manned by 17,472 sailors. The military force consisted of two armies, one for immediately opposing the enemy, under the Earl of Leicester; the other for the defence of the queen's person, commanded by Lord Hunsdon. The army appointed for the defence of the queen's person amounted to 45,362, besides the band of pensioners, with 36 pieces of ordnance. Lord Leicester's army amounted to 18,419; the total of both armies to 63,511, besides 2000 foot who were expected from the Low Countries. The forces of the Presidentship of the North remained stationary, in case anything should be attempted on the side of Scotland; as were also the forces of the Presidentship of Wales.

The Armada was to have left Lisbon in the beginning of May, but the Marquess de Santa Cruz, who had been appointed admiral, at the moment fixed for the departure was seized with a fever, of which he died in a few days; and by a singular fatality, the Duke de Paliano, the vice-admiral, died likewise at the same time. Santa Cruz was reckoned the first naval officer in Spain; and Philip found it extremely difficult to supply his place: he at last filled it with the Duke de Medina Sidonia, a nobleman of high reputation, but entirely unacquainted with maritime affairs. Martinez de Recalde, however, a seaman of great experience, was made vice-admiral.

In these arrangements so much time was lost, that the fleet could not leave Lisbon till the 29th of May. It had not advanced far in its voyage to Corunna, at which place it was to receive some troops and stores, when it was overtaken by a violent storm and dispersed. All the ships, however, reached Corunna, La Coruña (the Groyne, as it is called by our historians and sailors), though considerably damaged, except four. They were repaired with the utmost diligence, the king sending messengers every day to hasten their departure; yet several weeks passed before they were in a condition to resume the voyage.

In the mean time a report was brought to England that the Armada had suffered so much by the storm as to be unfit for proceeding in the intended enterprise; and so well attested did the intelligence appear, that, at the queen's desire, Secretary Walsingham wrote to the English admiral, requiring him to lay up four of his largest ships and to discharge the seamen. Lord Howard was happily less credulous on this occasion than either Elizabeth or Walsingham, and desired that he might be allowed to retain those ships in the service, even though it should be at his own expense, till more certain information were received. In order to procure it, he set sail with a brisk north wind for Corunna, intending, in case he should find the Armada so much disabled as had been reported, to complete its destruction. On the coast of Spain he received intelligence of the truth: at the same time, the wind having changed from north to south, he began to dread that the Spaniards might have sailed for England, and therefore returned without delay to his former station at Plymouth.

Soon after his arrival Lord Howard was informed that the Armada was in sight. He immediately weighed anchor, and sailed out of the harbour, still uncertain of the course which the enemy intended to pursue. On the next day he perceived them steering directly towards him, drawn up in the form of a crescent, which extended seven miles from one extremity to the other. Plymouth was at first supposed to be the place of destination; but it was soon apparent that the Duke de Medina adhered to the execution of the plan which had been laid down for him by the court of Madrid. This was, to steer quite through the Channel till he should reach the coast of Flanders, and, after raising the blockade of the harbours of Nieuport and Dunkirk by the English and Dutch ships, to escort the Duke of Parma's army to England, as well as land the forces which were on board his own fleet. Lord Howard, instead of coming to close and

unequal fight, contented himself with harassing the Spaniards on their voyage, and with watching attentively all the advantages which might be derived from storms, crosswinds, and other accidents. It was not long before he discerned a favourable opportunity of attacking the vice-admiral Recaldo. This he did in person; and on that occasion displayed so much dexterity in working his ship, and in loading and firing his guns, as greatly alarmed the Spaniards for the fate of their vice-admiral. From that time they kept closer to each other; notwithstanding which, the English on the same day attacked one of the largest galleasses. Other Spanish ships came up in time to her relief, but in their hurry, one of the principal galleons, which had a great part of the treasure on board, ran foul of another ship, and lost one of her masts. In consequence of this misfortune she fell behind, and was taken by Sir Francis Drake; who, on the same day, took another capital ship, which had been accidentally set on fire. Several other renccontres happened, and in all of them the English proved victorious. Their ships were lighter, and their sailors more dexterous, than those of the Spaniards. The Spanish guns were planted too high, while every shot from the English proved effectual. The Spaniards, however, still continued to advance till they came opposite to Calais, where the Duke de Medina, having ordered them to cast anchor, sent information to the Duke of Parma of his arrival, and entreated him to hasten the embarkation of his forces. But the duke, though he embarked a few of his troops, informed Medina that the vessels which he had prepared were proper only for transporting the troops, but were utterly unfit for fighting; and for this reason, till the Armada was brought nearer, and the coast cleared of the Dutch ships which had blocked up the harbours of Nieuport and Dunkirk, he could not stir from his then station (at Bruges) without exposing his army to certain ruin. In compliance with this request, the Armada was ordered to advance; and it had arrived within sight of Dunkirk, between the English fleet on one hand and the Dutch on the other, when a sudden calm put a stop to its motions. In this situation the fleets remained for a whole day. About the middle of the night of August the 7th a breeze sprung up, and Lord Howard had recourse to an expedient which had been planned the day before. Having filled eight ships with pitch, sulphur, and other combustible materials, he set fire to them, and sent them before the wind against the different divisions of the Spanish fleet. The Spaniards beheld these ships in flames approaching them with great dismay: the darkness of the night increased their terror, and the panic flew entirely through the fleet. The crews of the different vessels, anxious only for their own preservation, thought of nothing but how to escape from immediate danger. Some weighed their anchors, whilst others cut their cables, and suffered their ships to drive before the wind. In this confusion many of the ships ran foul of one another, and several of them received such damage as to be rendered unfit for future use.

When daylight returned, Lord Howard had the satisfaction to perceive that his stratagem had produced the desired effect. The enemy were still in extreme disorder, and their ships widely separated and dispersed. His fleet having received a great augmentation by the ships fitted out by the nobility and gentry, as well as by those of Lord Seymour, who had left Justin de Nassau as alone sufficient to guard the coast of Flanders, and being bravely seconded by Sir Francis Drake and all the other officers, he hastened to improve the advantage which was now presented to him, and attacked the enemy in different quarters at the same time with the utmost impetuosity and ardour. The engagement began at four in the morning of August the 8th, and lasted till six at night. The Spaniards in every rencontre displayed the most intrepid bravery; but, from the causes already mentioned, did little execution against the English, while many of their own ships were greatly damaged, and ten of the largest were either run aground, sunk, or compelled to surrender.

The principal galleass, commanded by Moncada, having Manriquez, the inspector-general, on board, with 300 galley-slaves and 400 soldiers, was driven ashore near Calais. Fifty thousand ducats were found on board of her. One of the capital ships, having been long battered by an English captain of the name of Cross, was sunk during the engagement. A few only of the crew were saved, who related that one of the officers on board having proposed to

surrender, he was killed by another who was enraged at his proposal; that this other was killed by the brother of the first; and that it was in the midst of this bloody scene that the ship went to the bottom. The fate of two other of the Spanish galleons is particularly mentioned by contemporary historians, the *S. Philip* and *St. Matthew*: after an obstinate engagement with the English admiral's ship, they were obliged to run ashore on the coast of Flanders, where they were taken by the Dutch.

The Duke de Medina now not only despaired of success, but saw clearly that by a continuance of the combat he should risk the entire destruction of his fleet. The bulk of his vessels rendered them unfit not only for fighting but for navigation in the narrow seas. He therefore determined to abandon the further prosecution of his enterprise; yet even to get back to Spain was difficult: he resolved, therefore, to sail northwards, and return by making the circuit of the British isles. Lord Seymour was detached to follow in his rear, but from the bad supply of ammunition which he had received from the public offices, was deterred from renewing an attack which, in all probability, would have led to the Duke de Medina's surrender.

A dreadful storm arose, after the Spaniards had rounded the Orkneys, and the whole fleet was dispersed. Horses, mules, and baggage, were thrown overboard to lighten a few of the vessels. Some of the ships were dashed to pieces on the rocks of Norway; some sunk in the middle of the North Sea; others were thrown upon the coasts of Scotland and the Western Isles—the wreck of one being still visible, it is said, at Tobermory, in the Isle of Mull; and more than thirty were driven by another storm, which overtook them from the west, on different parts of the coast of Ireland. Port na Spagna, on the coast of Antrim, near the Giants' Causeway, obtained its name from this circumstance. (See *Trans. of the L. Soc.* vol. iii. plate 10.) Of these, some afterwards reached home in the most shattered condition, under the vice-admiral Recaldo; others were shipwrecked among the rocks and shallows; and of those which reached the shore many of the crews were barbarously murdered, from an apprehension, it was pretended, that in a country where there were so many disaffected Catholics it would have been dangerous to show mercy to so great a number of the enemy. Camden says, 'They were slain, some of them by the wild Irish, and others put to the sword by command of the lord-deputy; for he, fearing lest they would join with the Irish rebels, and seeing that Bingham, governor of Connaught, whom he had once or twice commanded to show rigour towards them as they yielded themselves, had refused to do it, sent Fowl deputy-marshal, who drew them out of their lurking-places, and beheaded about two hundred of them.'

The Duke de Medina having kept out in the open seas, escaped shipwreck: and, according to the official accounts, arrived at Santander in the Bay of Biscay about the end of September, 'with not more than sixty sail out of his whole fleet, and those very much shattered.'

Strype, in his *Annals*, reckons the Spanish loss upon the coast of England to have amounted to fifteen ships and above 10,000 men, besides seventeen ships and 5394 men sunk, drowned, and taken upon the coast of Ireland.

The statements, however, published at the time apparently upon authority, say, 'In July and August, ships 15, men 4791; sunk, &c., upon the coast of Ireland, 17 ships, 5394 men: making a total of 32 ships, and 10,185 men.'

There is a very curious work relating to the Spanish Armada preserved in the King's Library at the British Museum; a volume of extreme rarity, which was finished at Lisbon, May 9, 1588, while the fleet was in the port of that place prepared for the expedition, entitled *La Felicissima Armada, que el Rey Don Felipe nuestro Señor mandó juntar en el puerto de la Ciudad de Lisboa, en el Reyno de Portugal, el Año de mil y quinientos y ochenta y ocho*; hecha por Pedro de Paz Salas, fol. Lib. 1588; por Antonio Alvarez, Impressor. This copy in the King's Library was the identical one which was procured at the time of its publication for Lord Burghley, to acquaint him with the true detail of all the preparations; and he has noted in his own hand, in the margins of different pages, a variety of particulars relating to the defeat. In one instance, he has noted the change of a commander from one Spanish vessel to another different vessel. The following are a few of Lord Burghley's notes:—

Galeon *S. Philippe*; 'taken at Flushing, 31 July.'
D. Francisco de Toledo; 'this man escaped into Nuport.'

La Nao Capitana; 'this shipp was taken by Sir Francis Drake.' *El Gran Grifon Capitana*; 'this man's ship was drowned, 17 September, in the He of Furemare, Scotland.' *Barca de Amburg*; 'she was drowned over against Ireland.' *San Pedro Mayor*; 'wrecked in October, in Devonshire, neare Plimmouthe.' *La Galea Capitana nombrada S. Lorenzo*; 'this was drowned asfor Callys.'

The following entries perhaps afford an explanation of the lord-deputy's barbarous conduct in Ireland. Members of some Irish families were on board the Spanish fleet:—

Admundo Estacio; 'brother to James Eustace, Viscount Ballyglass.' Don Carlos Oconor; 'of Ollolly, son to old Oconore.' Tristan Vinglade; 'Wynslad.' Ricardo Borey, Roberto Laseo, Christoval Lombardo; 'of Mounster.'

The copy of this work in the Royal Library, from which a few particulars in the earlier part of the preceding account have been taken, is accompanied by twelve charts of the coast of England, showing the different situations of the Spanish Armada and the English fleet through the whole of the contest. This also, which is a separate work, is of very rare occurrence, entitled *Expeditionis Hispanorum in Angliam Fata Descriptio*, Anno Do. MDLXXVIII. published by Robert Adam, and engraved by Augustin Ryther. The different actions and positions represented in these charts are minutely explained in a quarto tract, printed by A. Hatfield in 1590, and sold at Augustin Ryther's shop, entitled *A Discourse concerning the Spanish Fleet invading England in the yeere 1588*,—a copy of which is also preserved in the library of the British Museum.

Camden, speaking of this great victory, says, 'Whereupon several monies were coined, some in memory of the victory, with a fleet flying with full sails, and this inscription, *Veni, vidit, fugit*, "It came, it saw, it fled;" others in honour of the queen, with fire-ships and a fleet all in confusion, inscribed, *Dux femina facti*, that is, "A woman was conductor of the exploit." The medals and jettons, however, which were struck on this occasion, were entirely Dutch. None were struck in England. The most remarkable of considerable size is that which represents the Spanish fleet upon the obverse, with the words *Flavit Jehovah et dissipati sunt*, 1588, 'Jehovah blew and they were scattered.' Reverse, a church on a rock, beaten by the waves, *Altitor non ledor*. These, and one or two more, will be found in the *Histoire Medallique des Pays-Bas*, tome i. p. 383-386; and in Pinkerton's *Medallie History of England*, pl. viii. no. 7, 8; pl. ix. no. 1, 6.

Philip II. published two jettons, with the inscription, *Immensi Tremor Oceani*, 1587 and 1588.

It is usually said that the circulation of an English newspaper first began in 1588, when *The English Mercurie* was published by authority for the prevention of false reports. Copies of several of these Mercuries, dated Whitehall, July 24th, July 26th, and Nov. 24th, are preserved among Dr. Birch's historical collections in the British Museum; but as they are marked as Nos. 50, 51, and 54 in the corner of the margin, we are to conclude that such publications had occasionally been resorted to at critical times, much anterior to the event of the Spanish Armada.

The chief details in the preceding account have been drawn from Camden's *History of Elizabeth*; Strype's *Annals of the Church*; Ellis's *Original Letters*; and Watson's *History of Philip II.*

ARMADILLO (*Dasypus*, Linnaeus), in zoology, a genus of mammals belonging to the order *Edentata*, and forming, with the allied genera *Chlamyphorus* and *Orycteropus*, a small but very distinct family intermediate between the sloths and ant-eaters, and characterized by the possession of molar teeth only. The sloths, on the contrary, as has been shown in the article *AI*, have not only the ordinary molar teeth of common quadrupeds, but are likewise provided with large and powerful canines; though, as far as we know anything of their economy, they appear to be a purely herbivorous family, and to be even incapacitated by other details of their organization for the capture or destruction of a living prey; whilst the ant-eaters, as we have seen under that article, are not only deprived of canine, but likewise of molar teeth; consequently, are without teeth of any description, and thus form the only family of the order *Edentata* that literally answers to the name and definition. Nor are these the only distinctions which subsist between the three families of edentulous mammals which we have here indicated. Others have been already pointed out in the articles just referred to, and it will be sufficient to mention, in ad-

dition, that the ant-eaters differ from the other two families by the want of clavicles, a most important and influential element in the anatomical structure of all vertebrated animals, and the armadillos, the more immediate subject of our present consideration, by the peculiar nature of their external covering. 'When we speak of a quadruped,' says the eloquent Buffon, 'the very name carries with it the idea of an animal covered with hair, as that of a bird or a fish suggests the corresponding ideas of feathers or scales respectively, as attributes inseparable from these beings; yet nature, always more fertile in her resources than we are skilful in tracing her relations or appreciating her designs, escapes at every moment from our most extensive observations, and astonishes us by her exceptions, still more than by her general laws.' A remarkable instance of the truth of these observations is presented by the genus of quadrupeds which we are about to consider. Instead of hair, the armadillos are covered with a species of hard bony crust, forming three bucklers on the head, shoulders, and rump, respectively, the two latter being connected by a number of transverse moveable bands, very similar in form and appearance to the plate armour of the middle ages, from which indeed these animals have acquired the name of armadillos, a name of Spanish origin, which has been adopted by English writers. These bucklers likewise hang down on each side, so as to form an effectual protection to the belly, and partially to cover the legs and feet; whilst the pliancy produced by the moveable bands interposed between the bucklers of the rump and shoulders, and which are themselves connected by the soft pliant skin of the animal, permits the most varied and rapid motions. The bucklers themselves, as well as these connecting moveable bands, are composed of numerous small polygonal plates, placed contiguous to one another like the stones of a mosaic pavement, but without any actual articulation, and they are incapable of separate motion. The whole thus forms a kind of shelly buckler not unlike that of a lobster: and though incapable of actual motion, yet the thinness of the shell, and, during life, the pliancy occasioned by the animal oil which penetrates it, allow it to yield to a certain degree, and thus to accommodate itself in some measure to the motions of the body. But the great and principal motions, as already observed, are entirely due to the moveable transverse bands, interposed between the two principal bucklers of the body, and which vary in number according to the species, and even within certain limits according to the age, sex, or individual. These are situated immediately above the loins, or in the region to which all the principal motions of the animal economy have been assigned: the bucklers of the head and shoulders are entirely disunited, and have none of these moveable bands interposed between; but that of the head projects considerably backwards, and affords complete protection to the neck, which is indeed so short as to be barely distinguishable. We have in former articles had repeated occasion to speak of the megatherium, and to point out the analogies which that singular extinct animal bore to the sloths and ant-eaters. Here again it presents itself to our notice under a new point of view, and in fact it appears to have been a kind of connecting link between the most opposite and incongruous animals, and to have had a more or less intimate relation to every known genus of *Edentata*. It was but very lately, however, that we had reason to suspect that it presented any very close affinity to the armadillos in particular, other at least than the general want of incisor teeth, which forms the distinguishing characteristic of the order to which both these genera belong; but the recent discovery of fossil bones of the megatherium in the republic of Buenos Ayres has made us acquainted with a new and unexpected analogy between these animals. The bones in question were accompanied by the fragments of a buckler, of very large dimensions, manifestly belonging to the same animal, and perfectly similar in structure and appearance to that of the armadillos. This discovery was alone wanting to enable us to form a perfect and correct idea of the most remarkable inhabitant of the antediluvian world.

The throat, breast, belly, and thighs, of the armadillo are naked, or covered with a thick granulated skin, thinly furnished with warts or tubercles, which give origin to a few coarse, bristly hairs. The commissures of the moveable bands on the loins are likewise provided with a number of long hairs; but, with this exception, the body is covered only by its peculiar shell. The tail is straight, round, thick, and pointed: it is adapted, at the root, to a

notch or cavity in the posterior edge of the buckler of the croup, and, with the exception of one species, is universally covered with bony rings, formed, like the rings of the bucklers, of numerous small pieces connected together, but capable of a certain degree of motion, and thus admitting of considerable flexibility in the tail itself. The head of the armadillos is flat, and terminated by a pointed muzzle, which assists them, like the snout of the hog and mole, to turn up the earth in search of roots and worms. Their ears are erect and pointed, and their eyes very small. They have flat, corpulent bodies; and their legs are so disproportionately thick and short, that they barely serve to elevate the body above the surface of the ground. Their toes, also, of which there are either four or five on the anterior and invariably five on the posterior extremities, are remarkably short, but they are furnished with extremely long powerful claws, slightly curved, and in every respect well adapted for digging or burrowing. So rapid indeed are the armadillos at this operation, that they easily bury themselves to any depth beyond the reach of their pursuers. They can only be forced from their subterranean retreat by directing smoke or water into their burrows: their strength and the tenacity of their hold are so great, that they have been known to leave their tails in the hands of the hunter, rather than permit themselves to be drawn forth. Yet, notwithstanding the shortness of their legs, and the heavy corpulent make of their bodies, the armadillos run with a velocity which could not be anticipated from their general appearance. Most of the species will easily outstrip a man. Their ordinary burrows most commonly run for three or four feet, at an angle of about 15° to the plane of the horizon, then make a sudden bend, and terminate at the distance of eight or ten feet from the mouth. Here, for the most part, they conceal themselves during the day time; for the greater number of the species are nocturnal, and never move abroad whilst the sun is above the horizon. This rule, however, admits of some exceptions: a few species being found abroad at all times indifferently; and it has been remarked that these are neither so swift nor so timid as the nocturnal species.

The teeth of the armadillos are all of a simple cylindrical form, and stand apart from one another like those of the generality of cetacea and reptiles. They vary in number, from seven or eight to seventeen or eighteen on each side of each jaw; and are so arranged, that when the mouth is closed, the upper teeth fit into the interstices of the under, and these into the interstices of the upper teeth alternately. The animals never attempt to bite, it is their nature given them any other means of defence than the swiftness and rapidity with which they avoid danger by burrowing. Their food consists principally of fallen fruits, roots, and worms; but they do not reject carrion, and have been known to penetrate into graves, when not properly protected by stones or brick-work. Azara informs us, that ants are never found in the districts inhabited by the armadillos, and that these animals break into the ant hills, and devour the insects as greedily as the true ant eaters. Nature, it is true, has not provided them with the same apparatus for this purpose, but the armadillos may, notwithstanding, destroy vast quantities of ants, though it is probable that they expel them from their own peculiar districts as much at least by destroying the habitations as by actually devouring the insects themselves. The ordinary food of the armadillos consists chiefly of the roots of the manioc, of potatoes, maize, and other similar substances of a vegetable nature, though, as already observed, without rejecting animal substances naturally soft or so far decomposed as to be easily torn without the help of canine teeth. They are also very destructive to the eggs and young of such birds as build their nests on the ground, and greedily devour worms, frogs, small lizards, and, M. d'Azara says, even vipers. The chief animal food of the armadillos, however, is derived from the immense herds of wild cattle which cover the plains and savannas of every part of South America. These are rarely slaughtered but for the sake of the hide and tallow; and as the carcases are left to rot on the pampas or plains, the smell soon attracts vast crowds of carnivorous animals of various species, and among others, great numbers of armadillos, which greedily devour the half-putrid flesh, and soon become extremely fat and corpulent. In this condition, notwithstanding the filthy nature of their food, their flesh is esteemed a great delicacy, both by the native Indians and by the Portuguese and Spaniards of

America. The animal is roasted in its shell, and considered one of the greatest dainties which the country produces.

The armadillos see but indifferently, particularly in bright sunshiny weather; but their sense of hearing is extremely acute, and amply compensates for any imperfection of sight. When alarmed by any unusual or strange sound, they prick up their ears, stop for a moment to satisfy themselves of its distance and direction, then commence a precipitate retreat to their burrow, or, if that be too remote, begin to construct a new one. Smell is, however, by far the most acute of their senses. Azara tells a singular story, which strikingly illustrates the intensity of this sense in the armadillos, as well as the unerring certainty with which, by a kind of intuitive knowledge of the principles of engineering, they are enabled to direct their subterraneous course to any particular point. 'My friend Noséda,' says he, 'having arranged a trap for the purpose of taking chibigonzous, and having placed in it, by way of bait, a cock, with a small quantity of maize to support him, it so happened that a few grains of the maize fell through between the boards which formed the bottom of the trap. An armadillo arrived during the night, and wishing to get at the maize thus accidentally spilt, opened a trench or burrow at some distance from the trap, and without deviating a hair's breadth from the straight line of his direction, pushed it on to the very spot where the grain had fallen, and possessed himself of the booty.'

It is generally believed that the female armadillo brings forth but once during the year, but she produces at a birth frequently six, eight, or even ten, young ones; yet she has never more than four teats, and, according to the report of M. Azara, the most accurate and extensive observer who has written upon the history of these animals, in some species only two, an anomaly, with respect to the number of young and the number of teats, which appears to contradict the general rule observable among other mammals. Azara, indeed, supposes that some of the young die for want of proper nourishment, and that the mother only rears those for which she has a sufficient supply of milk. In support of this supposition he adduces the instance of a female armadillo in the possession of an acquaintance, which produced nine young ones at a birth, out of which three died shortly afterwards, and the remaining six were nursed by the mother. This was no doubt true in this particular instance, but it is difficult to believe that the rule can be generally true, or that so complete a contradiction, as such a phenomenon would indicate, can possibly subsist between the functions and structure of organs in other respects so intimately allied to one another as the matrix and the mammae. The only actual anomaly, or exception to the general rule which subsists among other animals, is to be found in the disproportion subsisting between the number of teats and the number of young produced at a time; and this is more apparent than real, since we can easily conceive that two or even more young ones may be supported by a single teat.

The tropical and temperate regions of South America are the original and proper habitat of all the known species of armadillos. Ignorant or careless writers, it is true, have frequently mentioned them as natives of Asia and Africa, but such mistakes probably arise from confounding these animals with the pangolins (*manis*), or scaly ant-eaters of the Old World, a very different genus, and more nearly allied to the true ant-eaters than to the present genus in all respects save the horny nature of the covering which supplies the place of hair, and even this differs essentially in its character from the bucklers of the armadillo. The armadillos are active, hardy animals, and thrive and breed rapidly with a moderate portion of care in most temperate countries. Such of the species as prefer a vegetable food, and whose flesh is consequently the most palatable and wholesome, might even be domesticated with advantage, and bred in warrens, like rabbits. In their native climates, however, they still abound in such incredible numbers, that the inhabitants will not be at the trouble of rearing what they can so readily procure to any required amount. When, therefore, the natives of Brazil or Buenos Ayres maintain the armadillo as a domestic animal, it is more for curiosity than for profit: the woods and pampas supply the wild animal in inexhaustible abundance. They are most usually taken in traps during the night; or, when found in open day at any distance from their burrows, are pursued by snail dogs, which intercept their retreat till the hunter has time to secure them. One species only, when

thus attacked, has the faculty of rolling itself up in a round ball like a hedge-hog, but they are generally timid and extremely helpless, and none ever attempt to defend themselves either by using their teeth or claws.

Up to the year 1801, the period of the publication of Don Felix Azara's *Essays on the Natural History of the Quadrupeds of Paraguay*, a work invaluable for the numerous original and acute observations which it contains upon this department of zoology, the various writers upon this subject had distinguished the different species of armadillos from one another by the comparative number of the moveable bands which separate the bucklers of the croup and shoulders. Azara, however, showed that the number of these bands is by no means, as had been heretofore supposed, constant in the same species, but that within certain prescribed limits this number varies continually according to the age and sex of the individual, and consequently that it is necessary to seek in other characters for more definite and certain means of distinguishing the species. 'Of all the species,' says this author, 'which I have described, I have had individuals of the second, fourth, and seventh, with both six and seven bands each: of the fifth I have seen individuals with six, seven, eight, and even nine bands; of the sixth with five, six, and seven bands; and although, having encountered but few individuals of the other species, I cannot affirm the same thing so positively of them, yet I have no doubt but that they are subject to the same variation as the others.' These observations of Azara have rendered it necessary to look for other and less variable characters of specific distinction: and accordingly Baron Cuvier, for greater facility of definition, has divided the whole genus into five small groups, principally distinguished from one another by the number and form of their teeth and claws. After the example of Buffon, he and other French zoologists employ the name of *tatu*, or *tatou*, by which these animals are distinguished among the Guaraní Indians, the aboriginal inhabitants of Paraguay and the southern provinces of Brazil, instead of the more common and certainly very appropriate name of armadillo, by which they are known to English and Spanish writers. The first of Baron Cuvier's subdivisions,

1. The *CACHICAMES*, have four toes on the anterior and five on the posterior extremities, seven teeth only on each side both of the upper and lower jaw, a pointed muzzle, and a long tail, surrounded by a succession of osseous rings, each of which is composed of a number of polygonal plates arranged in numerous series. The two middle claws are excessively large and of equal length; the lateral, particularly the internal, which represents the thumb, are much shorter, but all are powerful, trenchant, and well fitted for burrowing. To this division belongs

1. *The peba* (*D. peba*, Desmarest), called by the Guaranis *tatouhou*, or *black tatu*, is extremely common in Paraguay, though it does not extend to the province of Buenos Ayres. This species is well figured in the original edition

of Buffon's celebrated *Histoire Naturelle*, and described by Daubenton under the name of *cachicame*, which, according to Gumilla, is the generic name of the armadillos among

the Indians on the banks of the Orinoco: Azara calls it the black armadillo, from its Guaraní name; and it has been admitted into the generality of zoological catalogues under the somewhat ambiguous appellations of *Dasyppus novemcinctus*, *D. octocinctus*, and *D. septemcinctus*, three different species being thus formed from the same animal, under the erroneous supposition that the number of moveable bands between the bucklers of the shoulders and croup was invariable in the same species.

The length of the peba, from the snout to the origin of the tail, is about sixteen inches; that of the tail fourteen, and its circumference at the base six inches. The head is small, long, and straight; the nose extremely elongated, taper, and terminated by a sort of small muzzle something resembling the snout of a hog; the mouth is large, the eyes small, and placed on the sides of the head; the ears long, and placed close together; the tail long and attenuated; the legs short; and the feet small. The buckler of the shoulders extends in front over the whole neck, and towards the rear as far as the back, descending on each side to the elbows. It is composed of small pieces adhering to one another, and disposed in numerous parallel concentric rings, having the concavity towards the front, the first ring embracing the neck of the animal. The buckler of the croup extends from the back to the origin of the tail, and descends on each side to the knees. It is composed, as in the former case, of small pieces arranged in a great number of parallel concentric rings, passing transversely over the hips, but having their concavity turned in the opposite direction from that of the rings on the shoulder, or in such a manner that the last embraces the root of the tail. When viewed externally, the little pieces composing these bucklers have the appearance of irregular tubercles, but when examined on the under side of the buckler they are found to be hexagons almost as regular as those of the cells of bees, and fitted as precisely to one another. Between the bucklers of the shoulders and croup are interposed a variable number of transverse moveable bands marked with zig-zag lines forming very acute angles, and in some degree gliding over one another according to the different motions of the animal. Out of fourteen individuals examined by Azara, there were two with six of these moveable bands, one with seven, seven with eight, and four with nine; and it was observed that the full-grown ones always had the greatest number of bands, which renders it extremely probable that new bands are detached from the bucklers as they are required by the increasing growth of the animal. The buckler of the head descends from the ears to the muzzle, and covers each cheek as far down as the orbits: and there are small detached scales interspersed in various situations over the throat, the under-jaw, the legs, and feet, and even on the outer face of the ears. The tail is extremely long and taper: it is composed of a great number of osseous rings forming a long tubular case, and connected like the joints of a cane. The peba, or, as it is commonly called in Brazil, tatu-peba, has thirty-two teeth, eight on each side both of the upper and lower jaws. It inhabits Guiana, Brazil, and Paraguay, is a timid nocturnal animal, tolerably swift-footed, and very expert in burrowing: it is never found in the woods, but delights in the open plains and cultivated fields, and is much hunted by the inhabitants on account of the delicacy of its flesh, which, when roasted in the shell, is fat and well tasted; it is said to resemble that of a sucking pig.

2. *The mule armadillo* (*D. hybridus*, Desmarest), called *Mbouriqua*, or mule tatu, by the Guaranis, in allusion to its long upright ears, differs from the last species principally by its smaller size, and the comparative shortness and smallness of its tail. The length from the nose to the origin of the tail is stated by Azara to be only eleven inches and a quarter; the tail itself is six inches and a quarter long, and three inches in circumference at the root; whence it appears that the tail of the present species is only half the length of the body, whilst in the tatu-peba its dimensions are very nearly equal. The legs of the present species are also rather shorter than those of the peba, the body is broader and less covered with hair on the under surface, and the moveable bands generally fewer in number, and capable of being separated to a greater distance from one another. Their number generally varies from five to seven without distinction of sex, but it is to be observed, that the former number is only found in very young animals; and altogether the small size and general external resemblance of the two species make it sometimes difficult to distinguish

between the adult *M'bouriqua* and the young *peba*, especially if great attention be not paid to the comparative length of the body and tail, which forms the only certain criterion. This species inhabits the open uncovered country, like the former, but extends much farther south, and is common on the pampas of Buenos Ayres. It differs from the *peba* more by its habits than in external form, for it is not nocturnal, nor does it burrow with the same facility as that species. The female brings forth from eight to twelve young ones about the beginning of October, and it is a common belief among the country people, confirmed, in one instance, by an actual dissection performed by Azara, that the individuals of a particular litter are invariably of the same sex.

3. The *tatu verdoleiro* (*D. verdoleiro*) is a species very similar in size and proportions to the mule armadillo; but the point of its tail is terminated by a horny case of a single piece; the moveable bands are broader, and the plates of the croup buckler are of considerably larger size. We know very little more about this species than the few characters here reported. It inhabits the woods of Brazil, resides in burrows, and is found abroad at all hours during the day time. Koster is the only traveller who mentions this animal, but Baron Cuvier had an opportunity of establishing its specific distinctions, by the examination of some specimens brought to France by M. Auguste de St. Hilaire.

II. The second subdivision which Baron Cuvier establishes among the armadillos, and which he calls *APARS*, is characterized by having the claws and teeth in all respects similar to those of the preceding, save that the number of the latter amounts to nine or ten on each side both of the upper and lower jaws; but the animals of the present group are immediately distinguishable from all others of the genus by the faculty which they possess of completely rolling themselves up like a hedgehog into a round ball, in which situation they may be trampled about, or even, it is said, thrown over precipices, without receiving any material injury. There is but a single known species.

[The Matusa. *D. Apar*.]

4. The *Matusa* (*D. apar*, Desmarest, and *D. tricinctus*, Linnaeus), called also *Bolita*, or the little ball, from its faculty of assuming a spherical form, is nearly fifteen inches long from the nose to the origin of the tail; the head is three inches long, and the tail not quite two inches and a quarter. The head is oblong and of a pyramidal form; the muzzle pointed; the ears short and nearly round; and the legs and claws comparatively smaller and weaker than in the other species; the tail also is much shorter, and does not taper so much; it is flattened at the root, and covered above with a rough granular crust. The small pieces which compose the bucklers and moveable bands are themselves of very irregular figures, and disposed in a more confused manner than in other species, bearing no distant resemblance to a number of small rough fragments of stones thrown at random over the surface. The buckler of the shoulders forms a prominent angle on each side which advances forwards over the cheek; it is composed of nine or ten parallel bands of small plates, of a polygonal figure, except those of the last row, which, like the plates of the

moveable bands, form irregular parallelograms. The buckler of the croup is composed of thirteen transverse rows of small plates, similar to those of the shoulders, and between the two bucklers are interposed three moveable bands only; a number by which the *matusa* is readily distinguishable from all other armadillos, though it is probable that it may vary in a small degree, as it is found to do in other cases. Its usual resource, and only defence when frightened or surprised, is to roll itself up; for it does not construct burrows like the *tatu peba*, nor does it possess sufficient speed to escape by flight. It is found in Brazil, Paraguay, and Buenos Ayres, but is nowhere very common.

III. The *Eucouberets*, or third division of Baron Cuvier, have five toes on the fore feet, and nine or ten teeth throughout, but they are principally distinguished by having two teeth in the intermaxillary bones of the upper jaw, representing, as it were, the incisor teeth of ordinary mammals, and thus forming an exception, not only to the other armadillos, but even to the order of edentata, which are principally characterised by their want of teeth of this description.

5. The *payou* (*D. Eucouberet*, Desmarest, *D. Sericinctus*, Linnaeus), or yellow-footed armadillo (for thus Azara interprets the name), measures about sixteen inches from the nose to the origin of the tail, which is itself about half the length of the body. The head is large, flat, and nearly triangular, the face short, the muzzle obtuse, the ears erect and of moderate size, and the eye small. The number of moveable bands varies from seven to eight, according to the individual; the tail is surrounded at its base with three or four bony rings, but throughout the rest of its length it is merely covered with regular tuberculous scales; the interstices of the moveable bands give origin to a great number of long, bristly, grey hairs, and the female is provided with only two pectoral mammae. But independently of all other considerations, the *tatu payou* is easily distinguished from all the other armadillos by the unusual flatness and broadness of its body, and the consequent comparative shortness of its legs. It is very common in Paraguay, and burrows in the ground with an almost incredible agility. Its strength and activity are very remarkable; and notwithstanding the shortness of its legs, it runs so swift, that few men can outstrip it.

[The Payou. *D. Eucouberet*.]

It is of a restless, unquiet character, bold, curious, and intrepid; when any noise is made at the entrance of its burrow, or when otherwise tormented, it grunts like a young pig, and comes forth without fear to investigate the cause; yet when actually attacked it is incapable of making any sort of defence, and can only save itself by retreating to the bottom of its hole, or burrowing to a still greater depth. The *payou* feeds much upon carrion, and for this reason its flesh, though fat, is never eaten by the inhabitants of European origin, though the Indians make no distinction in this respect between it and the other armadillos. When it stops or rests, it has a custom of squatting close to the ground like a hare in her form, and in this situation the great breadth of the body is remarkably apparent, being nearly three times its height.

6. The hairy armadillo (*D. Villosus*, Desmarest) measures fourteen inches in length from the nose to the origin of the tail; the head is nearly four inches in length, the ear two-

thirds of an inch, and the tail five inches. In form and appearance this species bears a very strong resemblance to that last described, but it is of smaller size, and is comparatively better covered with hair, a circumstance from which it derives the name by which it is most usually distinguished. The head is triangular, the muzzle pointed, the ears large, elliptical, and inclined outwards, and the number of moveable bands varies from six to seven according to the individual. The border of the bucklers, as well as the lower side of the moveable bands, is indented in a remarkable manner, and forms sharp angular points, which serve to approximate the present species to the following, not less than to distinguish it from all the other known armadillos. There are eight teeth on each side, both above and below; numerous long, flexible, brown hairs spring from every part of the body, but more especially from the sides and belly, and even cover the first half of the tail; and the female, as in the poyou, has only two pectoral mammae.

This species does not inhabit Paraguay, nor, as far as we are at present aware, any other part north of the Rio Plata, but it is found at every step on the Pampas or plains of Buenos Ayres, south of that river. 'In an expedition,' says Azara, 'which I made into the interior, between the parallels of 35° and 36° south latitude, I met with vast multitudes of this species of armadillo, so that there was scarcely an individual of the party who did not each day capture one or two at least: for, unlike the poyou, which moves abroad only during the night, this animal is to be found at all times, and upon being alarmed promptly conceals itself, if not intercepted. In March and April, when I saw them, they were so extremely fat, that their flesh surfeited and pulled the appetite; notwithstanding which the pioneers and soldiers ate them roasted, and preferred them to beef and veal. The hairy armadillo,' continues M. Azara, 'like others of the genus, has undoubtedly a very acute sense of smell, since it scents the carcasses of dead horses from a great distance, and runs to devour them; but as it is unable to penetrate the hide, it burrows under the body till it finds a place which the moisture of the soil has already begun to render putrid. Here it makes an entrance with its claws, and cuts its way into the interior, where it continues feasting on the putrid flesh, till nothing remains but the hide and bones, and so perfectly do these preserve their position, that it is impossible, from a mere external view, to anticipate the operations which the armadillos have been carrying on within.' The same author observes further, that this species never constructs burrows to reside in, that it avoids low, damp situations, and is only found on the dry upland plains.

7. The *pickiy* (*D. Minutus*, Desmarest) measures only ten inches in length from the snout to the origin of the tail, which is itself four inches and a half long; the head is two inches and eight lines long, two inches broad across the orbits, and the ears are a quarter of an inch in length, and very sharp-pointed. The frontal buckler is composed of irregular plates, the eyes being small and nearly concealed under its margin; there are no plates on the temples, but their place seems to be supplied by a pencil of stiff brown hairs; the neck is extremely short, and furnished above with a row of minute scales; the shoulder buckler presents nothing remarkable, but that of the croup is deeply indented along the edges, and the moveable bands, to the number of six or seven, according to the age of the individual, are composed of rectangular plates, bordered on each side by compressed scales, lunated and pointing backwards. Each scale is more or less distinctly marked with two longitudinal linear depressions, which divide it into three parts, of which the middle is plain and of an oblong figure, but the lateral are, as it were, divided into six or eight tubercles. The claws are but moderately developed, the tail is covered with strong scales disposed in rings, and the interstices of the scales and bands are furnished with a considerable quantity of hair, though less abundantly and not so long as in the last species.

The *pickiy* inhabits the Pampas to the south of Buenos Ayres, and extends from 36° of latitude southward to the confines of Patagonia. It inhabits burrows, to which, however, it does not confine itself during the day, like some other species; its flesh is said to be remarkably tender and well tasted. Two individuals of this species which had been brought from Port Desire, on the east coast of Patagonia, lived for some time in the Jardin des Plantes at Paris, and would doubtless bear even the rigour of our more northern climate without injury or inconvenience.

IV. The *KABASSOUS*, or fourth division of Baron Cuvier, have likewise five toes, both on the anterior and posterior extremities, but those of the fore feet are disposed obliquely, in such a manner, that the thumb and index are small, the middle and fourth toes armed with tremendously large trenchant claws, and the fifth very small. This construction gives them the means of burrowing with extraordinary facility, and of clinging to the ground with such determination and obstinacy, that it is with the utmost difficulty they can be taken from it. They have nine or ten teeth throughout.

8. The *Tatouay* (*D. Tatouay*, Desmarest), or wounded armadillo, is so called by the Indians in allusion to its tail, which is naked, or as it were rudely deprived of the crust or bony tube which covers this organ in all the other species. The whole length of the *tatouay*, as given by Azara, is twenty-six inches and a half, from which if we subtract seven inches and a half for the length of the tail, it leaves one foot seven inches for that of the body. The tail is round, pointed and naked, with the exception of a few small round scales or crusts on the under surface of the third nearest to the extremity, which frequently trails along the ground when the animal walks; the rest is covered with soft brown fur, interspersed with a few stiff short hairs on the superior surface. The head is longer, narrower, and more attenuated than that of the poyou, though considerably less so than in the peba and mule armadillo; there are eight molars on each side of the upper, and seven on each side of the lower jaw; the ears are unusually large, being nearly two inches long, and in figure forming a segment of a circle; the body is round; the claws of the fore feet, particularly that of the middle toe, are excessively large; and the female is provided with only two pectoral mammae. The bucklers of the croup and shoulders are composed of ten and seven rows of scales respectively, each scale forming an oblong rectangle, those of the coccia being the largest of all; the moveable bands are thirteen in number, composed of scales much smaller than those of the bucklers, and of a nearly square figure. The habits of this species are altogether

[The *Tatouay*. *D. Tatouay*.]

unknown. It inhabits Guyana and Brazil, and is rarely found so far south as Paraguay. Baron Cuvier, in his enumeration of the species of armadillos, inserted in the fifth volume of the *Ossemens Fossiles*, part i. p. 120, mentions an undescribed species closely allied to the present, but differing, among other characters, by the comparative shortness, and still more perfectly naked tail. We know nothing more of this animal than what is contained in this slight notice.

V. THE *PRIONONTES*, or last subdivision of the armadillos, in addition to the unequal toes and enormous claws of the kabassous, have from twenty-two to twenty-four small teeth throughout, on each side of the jaws, making in all from eighty-eight to ninety-six teeth—a greater number than are found in any other mammal. This group contains but a single species at present known, viz. :—

9. The *Great Armadillo* (*D. Gigas*, Cuvier), which is nearly three feet three inches in length, from the nose to the origin of the tail; the head is seven inches and a half long, the ears an inch and three-quarters, and the tail one

[Great Armadillo, *D. gigas*.]

foot five inches. Its superior size is alone sufficient to distinguish this species from all the other known armadillos, but it possesses numerous other characters not less remarkable. Its head is proportionably smaller than in the other species, the forehead is more protuberant, and the face, from the eyes downwards, assumes a tubular cylindrical form, like that of the peba; the ears are of a moderate size, pointed, and habitually couched backwards; the bucklers of the shoulders and croup are composed of nine and eighteen rows of plates respectively, and separated by moveable bands to the number of twelve or thirteen, formed of rectangular scales, about half an inch square. The tail is remarkably thick at the root, being upwards of ten inches in circumference: it is gradually attenuated towards the tip, covered with plates disposed in rings at the base, and forming spiral or crescent-shaped lines throughout the rest of its length. The claws are remarkably large and powerful, but in their relative form and dimensions differ little from those of the *tatouay* already described.

This species inhabits Brazil and the northern parts of Paraguay. It is never found in the open country, but keeps close to the great forests, and burrows with surprising facility. Those who are employed in collecting the Jesuits' bark frequently meet with it in the woods, and report that when any of their companions happen to die at a distance from the settlements, they are obliged to surround the body with a double row of stout planks, to prevent it from being scratched up and devoured by the great armadillo.

ARMAGH, an inland county in the north of Ireland, in the province of Ulster. It is bounded on the N. by Lough Neagh [see **NEAGH**, **LOUGH**], on the E. by the county of Down, on the S. by the county of Louth, and on the W. by the counties of Monaghan and Tyrone. The greatest length, which is from north to south, is nearly 32 English miles; the breadth, from east to west, is about 20 miles. The area is estimated, by Dr. Beaufort, at 451 square miles, or 290,786 acres; but he observes that this is very much under the full number of acres, from fractions having been rejected in the calculation; other estimates give 458 square miles, and 293,919 acres. It is subdivided into eight baronies, divisions nearly corresponding to the hundreds of English counties. The county was erected by the Lord Deputy of Ireland, Sir John Perrot, in 1581. (*Ware's Antiq. of Ireland*.)

The surface is hilly, but, except in the south and west parts of the county, which are more rugged, the hills do not rise to any great height: the soil is generally fertile, except in the mountainous district just noticed, though even there the land is cultivated to a considerable extent, and is thickly peopled. The principal mountains are Slicbh Gullen (1900 feet); Slicbh Girkin, or the Newry Mountains (1340 feet); the Fathom Mountains, lying along the Newry river (820 feet); and the Foughall or Faughell Mountains (822 feet), a little to the north-east of Jonesborough. These may all be considered as forming one group in the south-east part of the county. They are a continuation of the Mourne Mountains of the county of Down. [See **DOWN**.] Granite is their principal constituent. To the N. of this mountainous district a considerable tract extends from the

the other, in which greywacke and greywacke-slate are the prevalent rocks: while red sandstone predominates in that part which lies along the margin of Lough Neagh. Sienite is traced in the neighbourhood of Newry; and mica-slate composes the sides of the narrow valley between Slicbh Gullen and Slicbh Girkin. Limestone skirts the Blackwater and Callenwater. (*Trans. of Geol. Soc. vol. iii.*)

The Callen, the chief river in the county, rises in the barony of Fews, and flows N. into the Blackwater; but its course cannot be estimated at more than twenty-six or twenty-seven miles. There are some small loughs or lakes, as Lough Clay in the west, from which a small stream flows into the Callen; Lough Ross, and the loughs of St. Patrick and St. Peter, on the border towards the county of Monaghan. The river Bann with the Newry Canal forms the eastern boundary of the county, separating it from that of Down, and affording water-carriage from Lough Neagh to the Bay of Carlingford; the Blackwater on the N.W. separates it from the county of Tyrone.

In 1788 the medium temperature in the neighbourhood of the city of Armagh, distant about thirty-two English miles from the Irish Sea, and elevated about fifty-eight feet above the coast, was ascertained (by means of a well sunk sixty feet to the bottom of a gravelly hill) to be 47.5° of Fahrenheit. (*Trans. of Royal Irish Acad. 1788.*) But we are informed that it is 49.5 at the observatory.

In the neighbourhood of the chief town, numerous inclosures and cultivated fields indicate an abundant population, and in this vicinity there are a few orchards. In the northern part of the county, towards Lough Neagh, there are very extensive bogs, the soil of which is very black and deep; but the increase of population has led to the cultivation of some parts of these, as well as of the greatest part of the mountainous districts. The principal landed proprietors are Lords Charlemont, Gosford, and Caledon; Mr. Brownlow, Mr. Cope, and others. A large portion of the soil belongs to the church and to college establishments and corporations, which have not the power of granting freehold leases for lives; the common tenure on other properties is a lease for twenty-one years and one life. To such an extent has subletting been carried, that the country has been described as resembling in some parts a disjointed village, and general poverty has been the usual result. If a father had a family the land was divided among his sons, and part of it went frequently as a portion to the daughters. The linen trade, carried on as it is by the individual weaver, is considered to have promoted this division of land. There seems, however, to be a disposition at present to check this system, and to consolidate the small holdings into larger farms.

In the hands of such occupiers we cannot expect superior husbandry. The description given of the state of tillage in the flat parts of the county of Antrim [see **ANTRIM**] will, in a great degree, apply to the neighbouring county of Armagh. The rotation of crops, if so irregular a succession deserves that name, is similar in each; the joint contribution of animals to form a team for the plough, and the 'con-acres' of the dry cotter, as described in the account of Antrim, are found in this county also. The joint team for the plough is indeed rather more respectable, consisting usually of two horses, one belonging to the driver, the other to him who holds the plough. Oats are the chief kind of grain raised. Wheat and barley are not so extensively grown. The cultivation of wheat, which was introduced into Ulster at a comparatively recent epoch, has increased materially; and Belfast, the great outlet of its produce, now exports corn of excellent quality to England: the consumption of wheaten bread among the peasantry is also much greater than formerly. Potatoes and flax are also among the chief articles of agricultural produce; but the potatoes are very inferior in quality to those grown in the south of Ireland.

Grazing is little attended to in any part of the north of Ireland. The little farmers or cotters keep cows, but they are badly managed and hardly treated: patches of the artificial grasses are sown; and part of the grass (which, in Ulster, is commonly confined to the banks of rivers) also serves the cows for food, but the want of fodder in winter materially diminishes the quantity of milk. Few beasts are fattened, the crowded population leaving little land for pasture. There are no extensive dairy farms; but as the little farmers keep cows, a considerable quantity of butter is sold for exportation. The breed of cattle is small and stunted. Sheep are not much attended to, and their wool is not produced in greater quantity than the domestic

purposes of the grower require. The horses are inferior in size and appearance: the linen merchants, who travel about to different markets, use a small, hardy, and sure-footed native breed of hacks. Goats and pigs are reared, the latter in great numbers.

Although agriculture has been improving since the time of Mr. Wakefield's publication (to which we are indebted for many of the foregoing particulars), yet it is still very inferior to that of England. The fields are ill-inclosed and ill-drained, and not kept clear of weeds; the farming in many cases is slovenly, though there are instances to the contrary.

Linen is the staple manufacture, and the county has consequently been affected by the decline of that business. The mode of manufacture by small farmers has been already described. [See *ANTRIM*.] It does not appear that the cotton manufacture has gained any footing; but a mixed fabric of cotton and flax, called 'Unions,' has been partially substituted for that of linen. The demand for linen is not so active as it has been, and yet all that the weavers bring to market is sold. The introduction into England and Scotland of machinery for spinning flax has been felt in Ireland, where it has reduced the wages of spinners, which were always low. They cannot now earn more than eighteen pence per week. Spinning machinery has been introduced to a certain extent into this county.

The condition of the weavers has been materially affected by these causes. At one time they could earn 2s. per day, and, by working extra hours, 2s. 6d.; now their earnings do not average more than 1s. a day (which is about the pay of a field labourer), but it does not appear that there are many of them out of employ. The depression of the linen trade has led some to go to Manchester and the neighbourhood; others give more time to their little farms; and the introduction of steam communication with England has given them a new and better market for their produce. The condition therefore of the peasantry has rather improved than otherwise. Their food, except the increased consumption of wheaten bread, still consists of potatoes, milk, bread, and butter, and occasionally pork. The clothing of the females is better than it used to be, though they still go without shoes or stockings. The habitations of the peasantry are also improved.

The moral character of the females is correct; and the peasants show a disposition to provide for the wants of their aged parents. Mendicants here, as in Ireland generally, are numerous, and, as a body, very immoral.

The mineral productions of this county are inconsiderable. Marble is quarried near Armagh; and at Keady, about eight miles from that city, a lead mine was once worked. The chief roads are those from Dublin to the city of Armagh, one through Newry, and the other through Castle Blaney; the continuation of these to Coleraine; and the roads from Armagh to Belfast, Monaghan, and Londonderry.

The population in 1821 was 197,127, and in 1831 220,651. It was estimated by Dr. Beaufort, in 1790, at 120,000. The only towns of any importance are Armagh (population 9,189), and Lurgan (population 2,812). [See *LURGAN*.] The others are all small, as the following list, with their population in 1831 will show:—Tandragee, 1559; Rich-hill, 937; Newtown Hamilton, 1050; Keady, 896; Charlemont, 517; Market-hill, 1013; Blackwater, 528; Loughgall, 325; and Portadown, 1591. Part of the more important town of Newry (population 13,131) is in Armagh; the greater part is in the county of Down. [See *NEWRY*.] It appears that though the population of the county is dense, it is not much collected in towns and villages. The number of pupils at schools in the county in 1821, was 12,407, viz., 8,529 boys, 3,878 girls; in 1824 it was about 13,700, viz., about 7900 boys, 5,200 girls: of about 600 the sex was not stated.

Three members are returned to the imperial parliament from this county: two for the county itself, and one for the city of Armagh. Newry returns a member.

It is difficult, from the variation of authorities, to state the number of parishes in the county. In the population return for 1821, twenty-three parishes, as used for civil purposes, are given as wholly or partly in this county; but these, from the consolidation of parishes into unions and the erection of perpetual curacies, must not be regarded as coincident with the existing ecclesiastical divisions.

It is not very easy to ascertain the state of religious

parties in the county. In 1812 Mr. Wakefield estimated the proportion of Catholics to Protestants as three to one, the Catholics occupying all the mountainous parts, and being mixed with Protestants in the more level. He observes that the influence of the priests was small; and the bigotry of their flocks not so great as in the south of Ireland. In the year 1821, according to the reports of the commissioners of education in Ireland, the proportion of Catholic scholars to those of Protestants of all classes, was 53 to 81 by the returns of the Protestant clergy, or 52 to 78 by those of the Catholic clergy; but the different rank in life of the Catholics and Protestants renders this an unfit criterion of the relative population. The proportion of the pupils of the Established Church to Presbyterians was at the same time about 17 to 29, according to the returns of the Protestant clergy, or 11 to 30, according to those of the Catholics. Thus, as the parties are on a more equal footing in their rank in society, affords a better criterion; but Mr. Wakefield, in 1812, thought that of the Protestants in this county (county?) a very small proportion belonged to the Established Church. But we have reason to believe that in this opinion Mr. Wakefield was mistaken.

Among the antiquities of the county may be mentioned the cairn on the top of Sliebh Gullen, said to form the roof of a cavern of artificial construction; and that called the vicar's cairn, about five miles south-east of the city of Armagh, on a lofty hill, which is thought to be excavated. (*M. R. I. A.* vol. viii.; Wakefield's *Account of Ireland*, 1812; Dr. Beaufort's *Memoir of a Map of Ireland*, 1792; *Parliamentary Papers*.)

ARMAGH, a city of Ireland, in the barony and county to which it gives name, 81 miles from Dublin. It is in the northern part of the county, and not far from the little river Callen, a feeder of the Blackwater, which flows into Lough Neagh.

The town is on an eminence, with the cathedral in the centre crowning the summit, and is surrounded by other small eminences. Some of the streets form an irregular circuit round the cathedral, and on the slope of the hill; all the others, leading into the town from the surrounding country, terminate in this circuit, except three, which are continued to the summit, and lead to the cathedral enclosure. Armagh, which had sunk greatly to decay, owes much of its renovation to the munificence and public spirit of Dr. Richard Robinson, Baron Rokeby, who was archbishop from 1765 to 1791. The town is rather more than three-quarters of a mile from north to south, and above half a mile from east to west.

Of public edifices the cathedral deserves the first notice, although in richness and beauty of architecture it is inferior to many of our English cathedrals. Its situation is commanding, from being on the summit of the hill on which the city is built. After undergoing many changes from the period when St. Patrick is said to have founded it (viz., in 115), it was destroyed in 1566 by Shane O'Neill, who wished to revenge some insult which he thought had been offered him by the primate (Loftus). It was rebuilt in 1616 by primate Hampton, and in 1642 it was again destroyed by Sir Phelim O'Neill during the primacy of the celebrated Usher. It was again rebuilt by primate Margetson in the year 1675, and repaired and improved by primate Robinson; and a complete restoration is at present going on. It is in the form of a cross 183½ feet long from east to west; and in breadth across the transepts 119 feet in the clear. From the intersection arises a square tower (the battlement of which is 31 feet above the roof) surmounted by a spire 40 feet high. From the ground to the top of the weathercock is 150 feet.

Part of the tower and the spire were built during the primacy of Robinson. The same prelate built near the town a handsome archiepiscopal palace, of large dimensions, and in a light and pleasing style of architecture. It is in the midst of a lawn skirted by plantations; the offices are detached and hidden behind a plantation at a small distance. He also contributed largely to the erection of a new school-house in the town, containing large dormitories, dining-room, and school-room, apartments for the master, and a spacious walled play-ground. This school, an exceedingly well-endowed royal foundation of Charles I., long maintained, under Mr. Carpendale, the master whom primate Robinson appointed, a high reputation, and was regarded as the Westminster or Eton of Ireland. A public library and an observatory were built and endowed by the same

primate, who also directed the erection of barracks, procured the establishment of a county infirmary, and ornamented the city with a new market-house and shambles. By refusing to grant leases except on the condition of the tenants rebuilding the houses, he raised the place from an almost deserted village, a nest of mud cabins, to be one of the most beautiful and flourishing inland towns in Ireland*.

Armagh is the assize town of the county, and has a jail, as well as a handsome court-house, lately built. It is lighted with oil, but as gas works are being erected, it is expected that it will soon be lighted with gas. The footways are neatly and durably flagged, the streets are clean, and the care of the magistrates keeps away beggars. The magistrates of the place are a 'sovereign,' and a 'registrar.' There are several excellent walks about the town. Water is supplied from a pool or reservoir called Lowry's Lough, on an eminence east of the city. Main and lateral pipes run through every street; but the water is not very good, owing to the preparation of flax in the surrounding district.

The chief trade is in linen, which is made in the country around, and brought into the town on the market day (Tuesday), and sold by the weavers to the drapers for bleaching. There are five fairs in the year. It is probable that the general depression of the linen trade has affected the prosperity of this place. The population of the town, in 1821, was 8,193, and in 1831, 9,189; but the whole parish contains about three times that number. Armagh sends one member to parliament. Before the Reform Bill, the franchise was in the hands of twelve burgesses, self-elected, who returned the primate's nominee.

The see of Armagh is said to have been founded by St. Patrick in the fifth century, and was made an archbishopric in 1152. The archbishop bears the title of 'Lord Primate and Metropolitan of all Ireland.' The diocese was once divided into two parts, the English, now the upper, and the Irish, now the lower part. It extends into five counties—Armagh, Londonderry, Louth, Neath, and Tyrone. The archbishop's province includes the sees of Dromore, Down and Connor, (united), Derry, Raphoe, Clogher, Kilmore, Ardagh, and Meath: the province of Tuam is to be incorporated with it whenever that see becomes vacant. The chapter consists of a dean, precentor, chancellor, treasurer, archdeacon, and four prebendaries, with eight vicars choral. The see is valued in the king's books at 183*l.* 17*s.* 1*d.*, and by the board of first-fruits at 100*l.* The primate's income was estimated by Mr. Arthur Young, in 1779, at 8000*l.* per annum, and by Mr. Wakefield (1812) at 12,000*l.*: it was really 15,000*l.*, but is diminished by the Church Temporalities Act. He presents to sixty parishes in his own diocese, and to six parishes in other dioceses.

The number of benefices in the diocese has varied considerably, from the formation of unions and the erection of perpetual curacies. By the report of the commissioners of ecclesiastical inquiry in Ireland (dated April, 1831), it appears that there were then eighty-three benefices, sixty-eight consisting of single parishes or separate portions of parishes, and fifteen consisting of parishes or portions of parishes united. The diocese of Clogher, when vacant, is to be incorporated with that of Armagh.

Armagh is a rectory, being, with several other parishes, comprehended in a parochial union, in which six curacies (four of them perpetual) have been instituted. The living has been for a long time held by the dean of the cathedral. The cathedral is the parish church; and there is another place of worship belonging to the establishment. There are also a Roman Catholic chapel and a Presbyterian meeting-house, both on a large scale: a place of worship for the Seceders; another for the Independents, and two Methodist meeting-houses. There are several churches in the out-parts of the parish. One of them, at Grange, owes its erection to the munificence of primate Robinson. It is of white stone, and its tall spire makes it a handsome object. Besides the county infirmary above-mentioned, there is a lunatic asylum for 106 patients of the counties of Monaghan, Cavan, Fermanagh, and Armagh. A fever-hospital has been built, and is maintained at the expense of the present lord primate; a 'shop for the poor' has been instituted by some individuals of his family; and a mendicity sub-

scription afforded relief in the year 1830 to 500 persons, to the amount of nearly 584*l.*

Besides the royal foundation school there are several establishments for education, as, a chartered school for 20 girls, founded by Dr. Drelinecourt; a school for fifty girls, supported by Lady Lifford, and two for eighty boys and as many girls, by the primate; and a Sunday school for 160 boys. The whole number of children under instruction in the city, in 1821, was 1071 (934 boys and 137 girls), and in the whole parish 2319, viz., 1899 boys and 420 girls.

Armagh formerly contained many monastic establishments. The priory of the regular canons of St. Augustin was said to have been founded by St. Patrick, and was, for some years, one of the most celebrated religious establishments in the world. There were a priory of the Culdees (*Culdei* or *Colidei*), who were secular priests, and served in the choir of the cathedral, their prior being a precentor there; a friary of Dominicans, and one of Franciscans.

In the early periods of its history the town was subject to many severe visitations. Conflagrations happened in the years 670, 687, and 778. In 832 the Danes plundered it; and in 839 they burned it to the ground with all its sacred edifices. On six other occasions in the same century it was laid waste by these barbarians. The annals of the three following centuries abound with notices of plunderings or fires. During that period Armagh was plundered thirteen times; it has been burnt (partly or wholly) seventeen times. Probably no other town ever suffered such a succession of misfortunes. (*Young's Tour; Wakefield's Account of Ireland; Liber Hibernie; Parliamentary Papers, &c.*)

The position of the observatory of Armagh is 54° 21' 12" N. lat. 6° 38' 52" W. long.

ARMAGH OBSERVATORY. [See OBSERVATORY.]
ARMAGNAC, a county in the province of Gascony (Gascogne), chiefly comprehended in the present limits of the department of Gers. While the old divisions of France continued in use, it had Languedoc on the east, the Agenois and Condomois on the north, Gascony Proper on the west, and Bearn, Bigorre, and Comminges on the south. All these, except Languedoc and Bearn, are subdivisions of Gascony. Few maps that we have seen give this county in all its extent, as described by Pigamol de la Force, (*Nouvelle Description de la France*, 2d edit. 1722.) It extended on the east to the Garonne; and on the south, some of the districts included in it (as les Quatre Vallées) stretched into the very heart of the Pyrenees. It comprehended the districts of High or White Armagnac, Low or Black Armagnac, Astarac, Brullos, L'Eauzan, Fezenzac, Gaure, Fezenaguet, Lomagne, Les Baronies, Riviere-Verdun, Riviere-Basse, les Quatre Vallées (de Magnoac, de Neste, d'Aure, and de Barousse), already noticed, and Nebouzan. The chief towns were Auch (population, in 1826, 11,000), Lectoure (population 6000), Vic Fezenzac (population 4000), L'Isle Jourdain (population 4000), Mirande (population 2000), Nogaro, Fleurence (population 3000), Leyrac Vic, or Lavit, Castelnan de Magnoac, La Barthe, Mauléon, Arreu, or Arreau, and Sarraneolin. These, which, with the exception of Leyrac and Mauléon, may be traced in the departments of Gers and Hautes Pyrenées, in the map of France published by the Society for the Diffusion of Useful Knowledge, will give some idea of the extent and ramifications of the province of Armagnac*. [For an account of such of these places as require further notice, see AUCH, LECTOURE, MIRANDE, GERS, and HAUTES PYRENEES.]

The county of Armagnac arose in the tenth century by the division of the lands of the Count of Fezenzac, whose younger son Bernard received that part of the county of Fezenzac which adjoins Bigorre, and thus became the first Count of Armagnac. The failure of the elder branch of the family of Fezenzac (which had retained that title) brought the territory under the sway of the younger or Armagnac branch in the early part of the twelfth century. The domains of these nobles were extended by subsequent acquisitions, especially under Bernard, Count of Armagnac, constable of France under Charles VI. in the fifteenth century, a man of great ambition, haughtiness, and cruelty, who gave name to one of the factions which then divided that unhappy country. John, the last Count of Armagnac, having incurred general odium by his crimes, and rendered himself obnoxious to Louis XI. of France by his political conduct, caused the

* Primate Robinson died at Clifton near Bristol, in October, 1794, but his body was brought over to Armagh and interred in a vault under the cathedral. A bust of him, by Bacon, adorns that edifice, which contains also a whole-length figure of the late Primate Stuart by Chantrey, one of Dean Drelinecourt by Rysbrack, and some other pieces of sculpture by Irish artists.

* It may be noticed here that the district marked 'Armagnac' in the Society's map of France in Provinces, is not so extensive as that above described, even though the small nameless divisions in that map lying to the S. and E., which properly belong to Armagnac, be included in it.

downfall of this antient and powerful family. Besieged in 1472-3 in Lectoure, of which he had got possession, he was himself killed and the town taken by the perfidy of his enemies. The county was confiscated; and though it was subsequently re-established by Francis I., it reverted to the crown by inheritance on the accession of Henry IV. It was again re-established in 1645, during the minority of Lewis XIV. in favour of Henry of Lorraine, Count of Harcourt, and his heirs male.

Armagnac was commonly divided into High and Low: High Armagnac comprehended only the district so called, in which are the towns of Auch and Lectoure; and Low Armagnac included all the other districts given above. It is very fertile in grain and wine. Its brandy is of good quality, but not equal to that of Cognac. Very fine Bon-Chretien pears are also produced. (Piganiol de la Force, *Des r. de la France*; Martinière, *Le Grand Dictionnaire*; Balbi.)

ARMAGNAC, COUNTS OF, were descended from the antient dukes of Aquitaine and Gascony, and took their title from the county of Armagnac. John I. increased the importance of his family by marrying a daughter of the House of Bourbon. He was one of the powerful chiefs, in the south-west of France, strongly opposed to the claims of the English, and for this reason highly trusted by the French king, by whom he was made governor of Languedoc. Although we find him accompanying the Black Prince in his Spanish expedition against Peter the Cruel, he was still the prince's enemy when France and England renewed the contest. He died in 1373. His grandson, John III., who married the heiress of the House of Comminges, led an army of adventurers into Italy, where he laid siege to Alessandria, and fell under its walls in 1391. Bernard, younger brother of John III., succeeded him: he became the most celebrated of his family, and gave his name to the great party which he headed in opposition to the Burgundians. His aunt married the Duke of Berry, one of the French princes; and Bernard, in 1410, gave his daughter in marriage to the Duke of Orleans, then too young to head his party, and the task consequently fell to the Count of Armagnac. This distinction enabled him to rally under his banner the warlike and needy population of Gascony, whom he led, in the year 1410, to attack Paris. The cruelty with which these rude bands treated the court and the people round the capital inspired them with horror for the cause of Orleans, and contributed in no small degree to give that character of atrocity to the civil wars of the time in which they stand unequalled. The Armagnacs were composed of a rustic or pastoral population: the Burgundian cause was chiefly supported by the burgesses of the north of France and Flanders; and thus the mutual hatred of citizen and peasant increased the animosity between the opposite parties.

In 1412 both Armagnacs and Burgundians courted the alliance of England. The former made the higher offers, and stipulated to restore Aquitaine to Henry IV. of England, in return for his support. The discovery of the articles of this treaty, which were found upon one of the emissaries, did more to weaken the party of the Armagnacs in France, than even their cruelty or their want of success. In the following year, however, the excesses of the Burgundians having disgusted the Parisians, the Armagnacs obtained for the first time the superiority in the capital, and indeed throughout the kingdom.

The accession of Henry V. to the throne of England, his alliance with Burgundy, his invasion of France, and the victory at Agincourt, changed the face of affairs. The Count d'Armagnac, who had not been present at the battle, but who hurried from the south with a small army to defend the capital, was now the sole reliance of the dauphin. He was accordingly created Constable in the last days of 1415, and he soon showed himself an active and severe leader. Towards the citizens, especially of Paris, he showed himself a merciless tyrant, levying contributions, disarming them, forbidding them to meet in any numbers, however small, and punishing the least murmur by the sword of the executioner. In the field he was not so successful. The Earl of Dorset, with very inferior forces, put an army of Armagnacs to disgraceful flight: and the Count, in his rage, had no other satisfaction but that of hanging some of his own runaway soldiers. His cruelties and his defeat weakened his party, which he still however supported by terror. His harshness made an enemy of the queen, who meditated on making use of the authority of the dauphin to shake off the

Armagnac yoke. The dauphin, John, son of Charles VI., soon expired, it was said by poison; and at the same time the death of other foes or rivals showed either the good fortune or the treachery of the Count d'Armagnac.

Queen Isabel, whom the Count of Armagnac had confined at Tours, was not, however, without her revenge. She communicated to the Duke of Burgundy her wish to escape from the bondage in which she was held; and an expedition undertaken by that prince rescued Isabel from the hands of the Count. The Burgundians soon drove the soldiers of Armagnac from the open country, and compelled the Count to concentrate his force in Paris; but the universal hatred borne to him rendered all his efforts at resistance vain. One of the gates was betrayed in the night to the enemy, and the Burgundians got possession of Paris, but not without a struggle. At first the persons of the Count and the chief members of the Armagnac party were respected, but after a few days the populace, being exasperated by past struggles, and excited by recollection of the tyranny of the Armagnacs, burst open the prisons, and massacred all within. This took place on the 12th of June, 1418. A white scarf, worn obliquely over the person, was the badge of the Armagnacs. The populace cut a stripe of flesh, in form of this scarf, from the body of the murdered Count. More than 3900 persons are said to have perished in this revolution.

John, Count of Armagnac, grandson of the preceding count, though less powerful as a party chief, was equally notorious for his crimes and his turbulence. An incestuous intercourse with his sister, which he avowed, and sought to cover by a marriage, first drew upon him the indignation of the pope Pius II., and of his sovereign, Charles VII. He was excommunicated, and forced by the royal troops to take refuge in exile. A prosecution was commenced against him before the parliament of Paris: he first appeared to answer the charges, but upon his again taking to flight, he was condemned, and his domains confiscated. The count, by repairing to Rome, contrived to soften the pope's anger, and procured the reversal of his sentence of excommunication. Under Louis XI., in 1461, the Count of Armagnac obtained possession of his fiefs, but soon joined in the revolt against that prince, which the Burgundians abetted. Louis XI. purchased the cessation of his enmity at the price of 10,000 crowns,—a sum bestowed in vain. For several years, Armagnac seemed an enemy in every sense worthy of Louis XI.,—revolting, defending himself bravely, when overcome at last vowing submission once more, and again acting the traitor. In his character and career he resembles the late Ali Pacha of Janina, and he met with a similar fate. Cardinal d'Albi, who was sent against him by the king, entered into negotiations with him, concluded terms of peace, and even a consecrated wafer was broken and taken by both parties in sign of good faith. Relying on this, Armagnac relaxed in the vigilance of his guard; and the soldiers of the cardinal found means to introduce themselves into the fortress of Lectoure, and to massacre the count and his followers in 1473. The king's commands required the total extermination of the Armagnac race. Jeanne de Foix, the legitimate wife of the count, who was pregnant, was compelled to swallow a draught of poison. His brother Charles was seized, tortured, thrust into an unwholesome dungeon, but survived, and was liberated after the death of Louis XI.

A descendant of the family was created cardinal under Francis I.; he was known as an upright administrator and a patron of letters. He died in 1585, at a very advanced age. [See NEMOURS.]

ARMATOLI, a sort of national militia among the Greeks, instituted, according to some, during the Byzantine empire, but others refer it to a period subsequent to the conquest of Greece by the Turks. They were originally the mountaineers of northern Greece. The sultans, finding great difficulty in reducing them to submission, were constrained to come to terms of pacification with them, and, on the payment of a trifling tribute, they were allowed to retain their arms, and to form themselves into a military community, occupying their native districts, and governed by their own laws. They were charged with the suppression of brigandage in the mountain passes. The chiefs were styled Capitani, Polemarchis, or Protatos; the jurisdiction of a chief was called an armatolie, and he resided generally in the principal village of his canton. The office was hereditary, descending to the eldest son, who obtained a diploma

from the pacha of his district, to whose authority he submitted. The band was composed of and commanded by Greeks exclusively; and, according to Fauriel, the number of cantons, immediately prior to the revolution, amounted to seventeen. The members who, in point of number, are unrestricted, were called pallikari: their costume was that generally known as the Albanian; their arms consisted of a yataghan, sabre, musket, and pistols; they were brave and temperate, and inured to hardship and fatigue.

About the middle of the last century, however, the Porte thought fit to appoint a Dervenji Bashii, in whose hands the care of all the passes was placed: this was a measure designed for the subversion of the armatoli. Ali, pacha of Joannina, having been also appointed Dervenji Bashii, made strenuous efforts to destroy their independence; but his cruelties drove the greater part to rebellion, and they fled to their native fastnesses. Here, as in the Morea, they maintained a sort of turbulent independence, and, at the first cry of the revolution, issued forth to assist in the liberation of their country. (Emerson's *Modern Greece*; See Leake's *Morea*, ii. 106.)

ARMENIA. The extent of country designated by the name ARMENIA is not defined by any permanent natural boundaries. In the course of its history we find its limits exposed to constant changes.

When taken in the widest sense of the expression, ARMENIA may be said to embrace the country from lake Urmia and the junction of the rivers Kur and Araxes in the east, to the upper course of the Kizil Irnak or Halys in the west; and from the upper course of the rivers Chorek and Kur in the north, to the Taurus mountains in the direction of Bir, Mardin, and Nisibis, in the south. This extent is given to ARMENIA in the outline of a map prefixed to Aydall's translation of Michael Chamich's *History of Armenia*. (Calcutta, 1827, 2 vols. 8vo.)

The ARMENIA of Herodotus (v. 52) bordered on the west on Cilicia, from which country it was separated by the Euphrates; towards the N. it included the sources of the Euphrates (i. 180); towards the S. and E. its limits are not distinctly defined: probably Mount Masius separated it from Mesopotamia, and Mount Ararat from the country of the Saspis, who occupied the valley traversed by the Araxes. (See Rennell's *Geograph. Syst. of Herodotus*, vol. i. p. 369, 2d edit.)

The ARMENIA of Strabo (xi. 14) is limited on the S. by Mesopotamia and the Taurus; on the E. by Great Media and Atropatene; on the N. by the Iberes and Albani, and by the Parachoathras and Caucasus mountains; on the W. by the Tibareni, the Paryadres and Skydises mountains, as far as the Lesser ARMENIA, and to the country on the Euphrates which separates ARMENIA from Cappadocia and Commagene.

Abulfeda and other oriental geographers not only extend the limits of ARMENIA considerably to the N., so as to include Tiflis and part of Georgia, but also comprehend Cilicia and part of Cappadocia under the appellation of Belad-al-Armen. (See the geographical index to Alb. Schultens' *Uta Sahadini*, Lugd. Batav. 1755. fol., and the *Geographical Works of Sadik Isfahani*, edited by Sir William Ouseley, London, 1832, 8vo. p. 6.)

The greater part of ARMENIA constitutes an elevated tableland, intersected in all directions by rapid streams, and with numerous ranges of higher mountains rising above it. ARMENIA, in fact, belongs to the great plateau of Iran; its southern boundary, which rises like a wall above the lower level of Mesopotamia, is the Kurdistan range, which passes in a W.N.W. direction a little to the N. of Mosul, is cut by the deep bed of the Tigris at Jezirah, passes a little N. of Nisibin, and past Mardin to the point where the Euphrates traverses the great range of the Taurus.

Near the town of Erzerum we find a chain of mountains which, by several projecting branches, is connected with the Caucasus, and separates the valley of the Chorek and its tributary streams in the west from that of the Kur and Araxes in the east, while the upper course of the northern branch of the Euphrates, often called the North Frat, marks its southern declivity. Its parts bear different names: among the Turks they are known by the appellations of Elkezi, Cheldir, Bin-Gheul (i.e., the thousand lakes), &c., and among the Armenians by the names of Khakhdik, Barkhar, Garin, &c. These mountains partly correspond to the situation of the Paryadres, Skydises, and Montes Moschici, of the ancients. The Bin-Gheul, or Pinkiol, gives origin to

the Araxes and to the northern branch of the Euphrates [see ARAS]; on the Barkhar the river Kur has its source.

The chain of hills which separates ARMENIA from Georgia, commencing near Akhalzikh (41° 37' N. lat.), and accompanying in a south-easterly direction the course of the river Kur, is by the Georgians named Khardjethi or Taosi, by the Armenians, Modin (i.e. The Dark), or Sdorin-Govgas (i.e. The Low Caucasus).

South of the Araxes we meet with a range of mountains, called by Colonel Monteith the Mosian (Masian?) hills, some of which are covered with eternal snow, extending from the banks of the Araxes opposite Erivan westward to the Euphrates. They are in Turkish called Kus-dagh, Kiziljeh-dagh, Aghir-dagh, or Ala-dagh; in Armenian, Dagher-dagh and Masis. They must not, in consequence of the last name, be confounded with the Montes Masii of the Greek and Roman geographers, which are farther south. At the eastern extremity of this chain, and washed by the Araxes, is situated an elevated mountain, the Abus of Ptolemy (Mannert, v. ii. p. 110), called by the Turks Agri-dagh, and by the Persians Koh-i-Nuh (i.e. Mount Noah), and believed by the natives to be the Ararat of Scripture. Parrot, the first European traveller who ascended this mountain, found its height to be 16,200 Paris or about 17,280 English feet. According to another popular tradition in the country, the Ararat of Scripture is the present Mount Judi, S.W. of the Lake Van, in the Gordyean mountains. At a distance of about forty miles from Mount Ararat, on the northern side of the Araxes, there is another high peak, Mount Ali Guz, the height of which Colonel Monteith states to be 15,000 feet. [See ARARAT.]

S.W. of the Masis is Mount Nebad or Nebiragan, according to Saint-Martin the Niphates of the ancients. Towards the south of the Nebad are situated the Drachge hills, in which the Murad-chai has its source.

South of the Murad, and forming the separation between ARMENIA and Mesopotamia, are the Kurdistan Mountains, already described as part of the southern boundary of the high land, or, as these parts of it were antiently called, the Masius and Carduchian mountains. The Armenians themselves have no general appellation for this line of mountains, which constitutes the southern frontier of their country.

East of the Tigris, and immediately south of the lake Van, we find the Karch, Judi, and Amadiah mountains (the Montes Gordyari of the ancients), and towards the frontiers of Persia the Kara-dagh. (See Saint-Martin, *Mémoires sur l'Arménie*, vol. i. p. 36-54.)

These chains of mountains and their accumulations of snow contain the sources of innumerable streams. The Tigris has its origin in the Niphates, but its sources have not yet been determined with precision. Herodotus (v. 52) speaks of three rivers, each bearing the name of Tigris: the two western streams coming from the country of the Armenians, the third, farther to the east, from the Maticeni. This is supposed by Mannert to refer to the three upper branches of the Tigris, viz. that of Diarbekir, that of Meia-farekin, and that of Erzen. But there are some objections to this opinion, as it includes the Great Zab, and other streams, which must have been crossed on the road to Susa. Pliny makes the remark (*Hist. Nat.* vi. c. 31) that the Tigris is called by this name only when it flows rapidly, and that as far as its course is slow it is named Diglith; according to Josephus (*Antiq. Jud.* i. 2), the entire river was called Diglath; this name survives almost unchanged in the present Dijlat. What Pliny relates of the Tigris passing through the lakes Arethusa and Thospitis seems applicable to the branch which passes by Erzen, for the lake Thospitis of Pliny is probably the same as the Thonitis or Arsene of Strabo (xi. 14, t. ii. p. 461, ed. Tauchn.). The river Kentrites, mentioned by Xenophon (*Anab.* iv. c. iii. 1) as forming the frontier between ARMENIA and the country of the Karduchi (or Gordyari), is supposed by Mannert to be the Nikephorides of later writers, now called Khabur or Serad (our river of Bedlis), which has its source in the mountains south of the lake Van.

The Euphrates, and its first great auxiliary stream, the Murad-chai, also designated as the southern branch of the Euphrates, have their sources in the very heart of ARMENIA. The northern Euphrates arises in the Bin-Gheul hills in the district of Garin near Erzerum. In the name Garin it is easy to recognize that of Caramitis, where Pliny (v. 24) says that the Euphrates has its origin. According to

Pliny, this river bears at first the name of Pyxirates, and farther on that of Omirras, and is called Euphrates only after entering the plains of Syria and Mesopotamia. The Murad-chai flows in a western direction as long as it remains within the limits of Armenia. It is probably the river called Euphrates by Xenophon (*Anabasis*, iv. c. v. 2), who says that the ten thousand Greeks in their retreat forded it, the water only reaching up to the navel; the sources of the river they understood to be at no great distance, but in this they were somewhat misinformed, if they crossed it, as we suppose, on the W. side of Lake Wan. The river Teleboas, over which the Greeks had passed before they came to the Euphrates (*Anab.* iv. c. iv. 3), has not yet been well determined. The Murad-chai joins the Euphrates near Kebban, 38° 40' N. lat. Below that place, and in its passage through the Taurus mountains, the course of the Euphrates is interrupted by rapids which obstruct the navigation to and from Syria.

The Cyrus or Kur is the principal river of Armenia. It has one of its sources in the hills north of Kars, and another in the Lake Pharlavan near Akhal-kalak. They meet at Pikelek. The Kur then passes by the forts of Khertwis and Aspidnza, and farther down by the towns of Gori and Tiflis. Near Jebat or Jevat the Araxes joins the Kur, and the two rivers pour their united waters through three mouths into the Caspian Sea. Of the Araxes or Aras, which has its source at Dekman in the Bin-Gheul hills near Erzerum, some account has already been given in a separate article. [See ARAS.]

The Chorok has its source in the hills west of Baberd. In its upper course it is called Masatteresi, and farther down takes the name of Chorokh. It passes the towns of Baberd, Sper, Khotjur, Berdagrae, and Ardvin, and after having during the greater part of its course followed a north-eastern direction turns westward, and falls into the Black Sea between Batum and Kunia or Gonja. (See the *Nouveau Journal Asiatique*, vol. xii. p. 458-470.)

Among the lakes of Armenia, that of Wan is the most important. It lies in a basin surrounded by lofty hills on the S., W., and N., and is separated from the lake of Urmia to the E. by a chain of hills. Its elevation is no doubt several thousand feet, but we are not aware of any measurements being made. Ptolemy mentions it under the name of Lake Arsissa: this name still survives in the fortress of Arjis situated on the northern side of the lake, which is noticed as one of the principal towns of Armenia by oriental geographers. (See Abulfeda, in the *Index* to Schultens' *Vita Saladin*; Ouseley's *Sudik Isfahani*, pp. 6 and 62.) The circumference of the lake is estimated at 240 miles. It contains two considerable islands, on which have been built Armenian convents. Fourteen vessels are constantly employed in conveying goods from the different towns on its banks. Eight rivers fall into the lake, but none of them are of great importance. Jaubert (*Voyage en Arménie et en Perse*, p. 127) describes the scenery of the surrounding hills as extremely picturesque. (See Col. Monteith, in the *Journal of the Royal Geographical Society*, vol. iii. p. 50.)

Towards the north-east of Erivan is the lake of Goukeka or Sevan, also named Kiagar Kuni. From it springs the river Zengay or Zenghi, which passes by Erivan and then falls into the Araxes.

In the Masis or Mosian hills, west of Mount Ararat, and at a distance of twenty-seven miles towards the south from Kara-kulla on the Araxes, Col. Monteith visited a lake of twenty-four miles in circumference, at the extraordinary elevation of 6000 feet. At its western extremity a stream came from it, passing Bayazid and Maku, and then falling into the Araxes.

The climate of Armenia, notwithstanding its southern position, is, in the higher regions, extremely cold. The summits of several of its mountains are covered with eternal snow. The German traveller, Schulz, who visited Armenia in 1827, found the hills between Trebizonde and Erzerum, especially the Ghulat and the Karakapas, covered with deep snow in the month of June; and Tournefort found the wells near Erzerum thinly frozen over during the night in July. On the southern boundary of Armenia, and on the road from Diarbekir to Bedlis up the valley of the river of Bedlis, Father Avril found the tops of the hills covered with snow in April. (Avril, *Voyage en divers états d'Europe et d'Asie*, Paris, 1692, 4to., p. 40, &c.) The climate at Etchmiadzin near Erivan in the valley of the Araxes around Mount Ararat, Ker Porter found even in November mild and

delightful; but he observes, that the cold during winter even here is sometimes 16° or 18° below zero of Reaumur (4° and 8° 5' below zero of Fahrenheit). (*Travels*, vol. i. p. 191.) The plains verging towards Azerbaijan and Persia are said to be scorched in summer with excessive heat, and to require much artificial irrigation for the purposes of agriculture.

The soil of Armenia exhibits in many places appearances of volcanic products. This was particularly remarked by Col. Monteith in the neighbourhood of the town of Maku, situated in a narrow valley which extends from the Araxene plain near Ararat in the direction of the Lake Van; and also in the country around the lake of Goukeka.

Strabo (xi. c. 14. t. ii. p. 461) and Pliny (xxxvii. 23) notice the wealth of Armenia in precious stones and metals. Strabo, in particular, mentions gold-mines at a place named Kambala in the country of Hyspiratis (probably in the northern part of Armenia, between the rivers Kur and Phasis), which were worked by the natives at the time of Alexander's expedition. (An account of the mines in a neighbouring part of the country, ceded to Russia by the peace of Turkmanchai, in 1829, may be seen in the *Nouveau Journal Asiatique*, vol. vi. p. 152-157.) In modern times the Armenian mines have produced plenty of excellent iron and copper, which are exported to Mosul. Rich mines of gold and silver are at this day known to exist near Kebban and Argana, in the two branches of the Taurus which inclose the valley of Karpoot (antiently Sophene), through which the Euphrates passes in its way from Armenia to Syria.

Abundant mines of rock-salt are found in the valley of Kulpia, which slopes towards the Araxes, at a distance of four miles below the fortress of Koor Ougley. 'These mines,' Col. Monteith observes, 'have for many ages supplied Georgia and even the Caucasus with salt. A range of hills, bordering the valley on the east side, is apparently entirely composed of that mineral, and in the sides of the numerous excavations have been made. Under the Persians, these mines were farmed for 3000*l.* per annum, and a village of 100 families was employed exclusively in working them.'

Marco Polo (edit. of the Paris Geogr. Soc. p. 311), in his account of Armenia, notices a copious well of mineral oil near the confines of Georgia. The oil, he says, is extensively used for burning and other purposes, and people come from remote countries to get it.

The valleys of Armenia are fertile in grain, tobacco, manna, hemp, cotton, and in fruit-trees, particularly a large description of apple, and walnuts. The excellence of the Armenian cotton is noticed already by Marco Polo ('*Ibi est bambace pulchrior de mundo et melior*,' l. c. p. 311).

Strabo (xi. c. 14. t. ii. p. 462, ed. Tauchn.) speaks with praise of the Armenian horse. 'Horses from the house of Togarmah' (i. e. from Armenia) are enumerated by the Hebrew prophet Ezekiel (xxvii. 14) among other articles of traffic brought for sale or exchange to Tyre. Near Erivan, Sir Robert Ker Porter saw a large kind of buffalo employed for the purposes of agriculture.

Armenia seems at an early period to have been divided into the Greater and the Lesser Armenia. Armenia Minor was the part west of the Euphrates. It appears to have comprised, in the time of Strabo, the districts of Arabkir and Devriki in the present Turkish pashalic of Siwas, and those of Erzincan and Duruperan in the pashalic of Erzerum. During part of the middle ages the country was also named Cis or Sis, in allusion to the capital of Cilicia, which for a time formed part of Armenia Minor.

Armenia Major is by native writers divided into fifteen provinces, which Saint-Martin (i. p. 65) enumerates as follows:—1. Upper Armenia, 2. Daikh, 3. Kukarh, 4. Udi, 5. Fourth Armenia, 6. Duruperan, 7. Ararat, 8. Vashburagan, 9. Siunikh, 10. Artsakh, 11. Phaidagaran, 12. Akhd-snikh, 13. Mogkh, 14. Gordjaikh, 15. Porsarmenia.

At the present day Armenia is divided among Turkey, Persia, and Russia. The Russian frontier between the Black and the Caspian Sea commences on the Euxine at Fort St. Nicholas, about ten miles south of the river Phasis or Rion; following the course of the hills which here inclose the valley of that stream, the frontier first takes an eastern direction; it then turns southward, traverses the S.W. branch of the Kur, follows the course of the Arpat-chai to its junction with the Araxes, and after crossing the latter river proceeds S.E., straight towards the Ararat, leaving the western summit of that mountain on the Russian

side. The frontier then follows the Araxes during the greater part of its middle course, till where that river breaks through the Talidj or Talish hills: here the frontier turns south, and reaches the border of the Caspian Sea near Astara. The line which separates the Persian from the Turkish dominions in Armenia begins at Mount Ararat, and proceeds in a southern direction, following the range of hills which separate the streams falling into the Tigris and lake Van from those that run towards the Araxes and lake Urmia.

The name of the ancient capital of Armenia was Artaxata, or Artaxiasata. (Strabo, xi. 14, t. 2, p. 460. Tacit. *Ann.* vi. 33, xiii. 39, &c.) It was situated, according to Strabo, on a sort of peninsula formed by a curve of the river (*ἐν χερσονήσιν ὁρίζοντος ὕγκωνος*). Tavernier, Tournefort, and Chardin, suppose that a mass of ruins, found near where the Zengay or Zenghi falls into the Araxes, marks the situation of Artaxata, and Mannert (v. ii. p. 168) adopts this opinion. To Colonel Monteith, however, the situation of these ruins did not appear to answer to the description of Artaxata: he thinks that the remains of the ancient capital are situated farther down the Araxes, in a bend of the river, at the bottom of which he saw the ruins of a bridge of Greek or Roman architecture. (*Journal of the Royal Geogr. Soc.* iii. 47.)

The German traveller Schulz discovered, in 1827, near Wan, the ruins of a very ancient town, called Shamiramakert (i. e., the town of Semiramis), by Armenian historians, the foundation of which is by them ascribed to Semiramis. Mention of it is made by Moses Chorenensis, who names Maribas Catina, a Syrian writer who wrote about the year 140 before our era, as his authority for the account which he gives of the town. Schulz found the ruins covered with inscriptions in the arrow-headed characters, many of which he copied. In one of them (an inscription trilinguis) the late M. Saint-Martin found the name of Kshearsha son of Darcoush (Xerxes son of Darius) mentioned repeatedly, which in his opinion can apply only to the Xerxes who led the great expedition against Greece. (See *Nouveau Journal Asiatique*, vol. ii. p. 161, &c.) According to the Armenian historians, the town of Shamiramakert was called Wan from a king of that name, who was the last but one of the Haik dynasty. (See *Aydall, History of Armenia*, vol. i. p. 44.)

The town of Tigranocerta, which according to Tacitus (*Ann.* xv. 5) was situated at a distance of thirty-seven miliaria N.E. of Nisibis, must, in the opinion of D'Anville and Mannert, be sought near the river Khabar, which they take to be the ancient Niephorius (the Kentrites of Xenophon). Armenian writers call the town Dikranagerd, and take it identical with the modern town of Kara-Amid or Diarbekr. (Saint-Martin, *Mémoires*, &c. i. pp. 170, 171.)

Magnificent ruins still exist of the celebrated ancient town of Ani. They are about four miles west of the monastery of Katchiwan, in a plain, protected towards the south and east by a deep and impassable ravine through which the river Arpatchai runs. The place is laid down on Sir Robert Ker Porter's map in 40° 32' lat., 43° 36' long. E. of Greenwich. On the history of Ani, called 'Anio' by the Greeks, see a note by Klaproth in the *Nouveau Journal Asiatique*, xii. p. 191.

The remains of many other noble cities are still to be seen on the banks of the Araxes. The ruins of a bridge near Kara-kulla are supposed to mark the site of the ancient Armavera. Farther down the Araxes, Colonel Monteith saw the ruins of a magnificent temple of Diana in the valley of Guerney.

Marco Polo (Paris edit. p. 310) in his account of Armenia, mentions an important mercantile town of the name of Laias (written also Layas and Laras in different MS. copies), where tradersmen from Venice, Pisa, Genoa, and from India (*mercatores Veneti, Pisani, et Januenses, et de omnibus partibus Indiarum*) met and exchanged their merchandise.

Abulfeda notices the following as the principal towns of Armenia: Arjish, Dabil, or Al-Dabil, Dawin, Wastan, Arzenjan, Mush, Arzen, or Arzen-al-Rum (Erzerum), Melazjerd, Bidlis (Bedlis), and Akhlut. (See the geographical index to Schultens' *Vita Saladini*, s. v. Adserbeisjana.) Sadik Isfahani adds Alah-tak, Wan, and Takrit. Most of these towns still exist. Erzerum or Arzen-al-Rum (antiently called Garin, and in Greek, Theodosiopolis), at a distance of fourteen days' ride from Constantinople, is the principal place of Turkish Armenia: Jaubert estimates the number of its inhabitants at 70,000. Akhalzikh, a fortress near the

river Kur, is the principal town in Turkish Georgia. Arjis or Arjish and Akhlut are antient towns on the northern and western borders respectively of the lake Wan. The town of Wan is supposed by Colonel Monteith to have at present about 20,000 inhabitants. Eriwan and Nakhshivan are the two principal towns of Russian Armenia. The former is situated in a delightful plain watered by the Araxes, and its tributary river the Zenghi, and peopled by numerous villages: it has about 14,000 inhabitants. At a short distance from Eriwan is situated the celebrated Armenian convent of Etchmiadzin, or Etchmiatchin, the seat of an Armenian Patriarch: it was founded according to tradition by St. Gregory, A.D. 301. It is among the Turks known under the name of Uch-kilisia, i. e., 'the three churches.' This convent is all that now remains of the great city of Vagharshabad, which is supposed by Saint-Martin (vol. i. p. 115) to have been founded in the sixth century before the Christian era.

The latest publication relating to Armenia seems to be the *Researches of the Rev. E. Smith and the Rev. H. G. O. Dwight in Armenia*, &c. 2 vols. Boston, 1833. We have not had an opportunity of consulting this work for the present article.

History of Armenia. The Armenians call the progenitor of their nation and the first ruler of their country Haik, or Haik, whose father they believe to have been Torgama, the Thogama of Scripture (Genesis x. 3), the son of Gomer and grandson of Japhet. Haik had originally lived in the country of Shinaar; but he retired from the oppression of the Assyrian king Belus, and established himself in the hills of the neighbouring Armenia. Belus pursued the emigrant with an armed force into his new abode, but was defeated by Haik and fell in battle. This is said to have happened twenty-two centuries before the Christian era. (*Ardall*, i. 6.)

About three hundred years later, Aram, the sixth successor of Haik ruled over Armenia. He signalized his reign by the conquest of part of Media, Assyria, and Cappadocia. The governor appointed by Aram in the last province had the foundation of a town, which he called after his own name, Mishak, Majak, or Mazaca: it was subsequently named Cæsarea. The conquest of Aram first made known people over whom he ruled, and neighbouring nations called them Aramides, and subsequently Armenians, from the name of their king. (Moses Chorenens. p. 47-49. ed. Whist.)

His son and successor, Ara, fell in a war with the Assyrian queen, Semiramis. Armenia then became dependent on the Assyrian throne, though it was still governed by native princes. King Seavordi, about the middle of the eighth century before Christ, threw off this allegiance. His son, Paror, or Baror, joined Arbaces and Belesis, the governors in Media and of Babylon, in their revolt against Sardanapalus. After this, the kings of Armenia were again independent sovereigns.

In the reign of Haikak, the contemporary of Nebuchadnezzar, and the fifth king in succession from Paror, the family of one of the exiled Jewish nobles, Shambat, came into Armenia. From him descended the great family of the Bagratians, which subsequently, about the middle of the ninth century of our era, came to the throne of Armenia.

The next king but one after Haikak, was Dikran, or Tigranes I., who assisted Cyrus in his rebellion against Astyages and the Medes. To him Armenian authors (Moses Chor. p. 71; *Aydall*, vol. i. p. 11) ascribe the foundation of the city of Tigranocerta; but Plutarch and Strabo assign it to Tigranes, the contemporary of Mithridates. He was followed by his youngest son, Vahagn, who became celebrated by many deeds of valour in his wars with the Medes: the Armenians and Georgians composed and sang poems in his praise.

A corps of Armenians formed part of the Persian army in the expedition of Xerxes against Greece. They, and a corps of Phrygians, were the same kind of armour, and were both commanded by Artochmes, a son-in-law of Darius. Herodotus, in mentioning these facts (vii. 73), expresses an opinion that the Armenians were a colony of the Phrygians; Strabo (xi. c. 14., t. ii. p. 463, ed. Tauch.) seems inclined to consider them as of Thessalian origin, but his arguments are not very convincing.

About the middle of the fourth century before our era Vahag was upon the throne of the Haigs. He assisted Darius in his war with the Macedonians, but fell in battle in the year B.C. 328. Armenia became a Macedonian province, and was ruled by governors, the first of whom, Mith-

rines, a Persian, was appointed by Alexander three years after the death of Vahy. Already in the year 317, however, the Armenian chief, Ardwand, or Erwand (Ardoates), headed a revolution against the reigning governor, Neoptolemus, threw off the Macedonian yoke, and maintained himself for thirty-three years as an independent sovereign. After his death the Armenians were obliged to submit for a time to the supremacy of the Seleucids, until two Armenian nobles, Artaxias and Zariadras, availed themselves of the moment when Antiochus the Great had suffered a defeat from the Romans (B.C. 190), to declare their country free from its allegiance to the Syrian kings. Armenia was at this epoch divided into two kingdoms, that of Armenia Minor on the western, and that of Armenia Major on the eastern side of the Euphrates. In Armenia Minor the descendants of Zariadras continued to rule till the fall of Mithridates; thenceforward the country became attached to one or the other of the neighbouring states, and in the reign

the emperor Vespasian was made a Roman province. Subsequently its limits were extended so as to embrace Mesopotamia, Aravie, and part of Cataonia; and under the Byzantine emperors we find it divided into Armenia Prima and Secunda, the former governed by a consul, the latter by a *dux* (ὑπάτος). (See F. A. Cramer's *Geographical and Historical Description of Asia Minor*, Oxford, 1832, vol. ii. p. 148, &c.)

In Armenia Major the family of Artaxias (the Armenian Arsacids) maintained itself till the year B.C. 5, and gave eight, or, according to others, ten kings to the Armenian throne. The most important of these is Tigranes I. (B.C. 95-60), the son-in-law and ally of Mithridates. He rendered himself master of Armenia Minor, Cappadocia, and Syria, but lost all these conquests after the defeat of Mithridates. Lucullus invaded Armenia, and defeated near Tigranocerta the mixed and numerous army of Tigranes. (Plut. Lucull. 25, &c.) The peace concluded in the year B.C. 63 only left him Armenia. His son and successor, Artavasdes, was perfidiously seized by Marcus Antonius, and delivered prisoner into the hands of Cleopatra, the queen of Egypt (B.C. 31). After this time Armenia became an object of unceasing contention between the Romans and the Parthians, who alternately installed and dethroned its rulers.

In A.D. 232, Armenia was conquered by Ardeshir, the first of the Sassanide kings of Persia. The country remained subject to this dynasty till Dertad, or Tirdates, the son of Khosru, and the only survivor of the Arsacide family, supported by a Roman army, made it free again. Early in the fourth century Tirdates and many of the Armenian nobility were converted to Christianity by St. Gregory, whom pope Sylvester I., in A.D. 319, confirmed as pontiff of Armenia. The conversion of Constantine to the Christian faith occurred about the same time; this circumstance, while establishing friendly relations between the Greek empire and Armenia, exposed the latter country to the in-

cessed hatred of the heathen government of Persia. New conflicts and disturbances ensued, till (A.D. 387) Theodosius the Great entered into a compact with the Persian king, Sapores, according to which the eastern part of Armenia was to belong to Persia, and the western part to the Roman empire. Sapores, with a view to conciliate the minds of the Armenian nobles, many of whom were quitting the country in disgust, appointed Khosru, an off-spring of the Arsacide family, as a tributary king over Persian Armenia. In 428, however, the Persian king, Behram V., deposed Artavasdes, or Artashir, the last of the tributary Arsacide rulers, and, with the consent of the degenerate Armenian nobles, appointed a Persian officer to govern the country. All the efforts of the Persian court were now directed towards the suppression of Christianity in Armenia, and the introduction of the doctrine of Zoroaster, as the difference of religion appeared to be the chief obstacle to the lasting fealty of the province. On these grounds the Armenian Christians became subject to constant vexations, and even cruel persecutions, from their Persian rulers. The *History of Artax*, translated from the Armenian of Elisæus, by C. F. Neumann (published by the Oriental Translation Committee, London, 1830, 4to.), exhibits a detailed and highly interesting picture of the religious wars under which Armenia was suffering about the middle of the fifth cen-

Even after the fall of the Sassanide dynasty in 632, Armenia did not enjoy tranquillity, as its provinces soon became the scene of conflict between the Grecian and the

rising Mohammedan empire. In 855, during the caliphate of Motawakkel, an Arabian army, under the command of Buga, conquered Armenia: many of its principal nobles were brought to Bagdad, where the greater number of them were forced to become converts to the Mohammedan religion; only Sempad, the Bagratide, died a martyr to Christianity. His son, Ashod, gained the confidence of the Caliph, who, in 859, installed him king of Armenia. He became the founder of the Bagratide dynasty, which occupied the throne of Armenia till the year 1080. During the greater part of the tenth century, in the reign of Apas (928-951), Ashod III. (951-977) and Sempad II. (977-989) Armenia enjoyed tranquillity. Not long afterwards the country became an object of contest between

Byzantine empire and the Seljukide Turks. Gagik, the last of the Bagratide kings, was treacherously killed (1079), and Armenia, though still partially governed by native princes (the Orpeliens and others), became mainly dependent on the Greek empire, while in the northern provinces, the Turks, and in the southern parts, the Kurds, encroached upon its limits.

From the year 1226, Georgia and Armenia suffered much from the incursion of the Mogols, which continued till near the end of the thirteenth century. (See Klaproth's paper *Des Entreprises des Mongols en Géorgie et en Arménie*, &c. in the *Nouvel Journal Asiatique*, vol. xii. pp. 193 and 273.)

After the murder of Gagik, and the fall of the Bagratide dominion in Armenia Proper, Rupen, a relative of the last king, fled with his family into Phrygia, and established an Armenian principality in the Taurus mountains north of Cilicia, which gradually extended its boundaries to the coast of the Mediterranean Sea. It soon derived importance from the services which its princes rendered to the monarchs of Europe during the crusades. Leon II., who reigned from 1185 till 1219, was in 1198 crowned king of Cilicia, by Archbishop Conrad of Mainz, who was sent for that purpose by the German emperor, Henry VI., and Pope Celestine III.; and a crown was likewise presented to him by the Greek emperor, Alexis. The Cilicio-Armenian kingdom continued till the latter part of the fourteenth century. The last king, Leon VI., was in 1375 taken prisoner by the Mamluks of Egypt, and, after a long captivity, wandered as an exile through Europe, from one country to another, till he died at Paris in 1393. (See Vahram's *Chronicle of the Armenian Kingdom in Cilicia*, translated by C. F. Neumann, London, 1831, 8vo. Published by the Oriental Translation Committee.)

The Mamluks were soon obliged to yield up their rule over Cilicia, and part of Armenia Proper, to the Ottomans. The Armenians, now a nation without a country or home, rather than endure cruel persecutions in the land of their fathers, spread themselves all over Asia and Europe. As early as the year 1331, Armenian refugees came to Kamenz in the Lausitz (Lusatia). Others followed the Ottoman conquerors to Constantinople (1453), where the Grand Signior gave them a patriarch. They were well received in Russia, where numbers established themselves at New-Nakhchivan, on the Don, at Moscow, and at St. Petersburg. In 1605 twelve thousand families were led forcibly away from Armenia into Persia, by the command of Shah Abbas. They settled at Julfa, one of the suburbs of Ispahan, giving to this quarter of the city the name of their city, Julfa, on the Araxes, in Armenia. Many who still remained at Tauriz, Erzerum, Kars, and Bayazid, have recently withdrawn to the Russian provinces south of the Caucasus. Armenian merchants are now found established in India, on the islands of the eastern Archipelago, in Singapore, in Afghanistan, Persia, in every part of Asia Minor, in Syria and Egypt, and in nearly all the countries of Europe. Almost every important fair or mart, from Leipzig and London to Bombay and Calcutta, is visited by them.

The Armenian language, observes M. Klaproth (*Encyclopédie des Gens du Monde*, t. ii. p. 298), is rough, and overcharged with consonants. Besides a great number of Indo-Germanic roots, it shows many analogies to the Finnic dialects of Siberia, and other languages of northern Asia. According to Balbi (*Atlas Ethnographique du Globe*) and Adelung (*Mithridates*, vol. i. p. 420, &c.), the Armenian does not belong to any known family of languages, but stands quite alone. Its grammar is excessively complicated. Like the northern languages of Europe, it has an article attached to the end of words. It does not distinguish the

genders. The declension has ten cases in the singular and plural; and in the conjugation of the verbs we find a corresponding copiousness of inflection. The ancient or literary Armenian is so different in its grammar and structure from the present Armenian that it may be considered as a dead language. In good Armenian authors, of any age or country, no diversity of dialect is observable. The construction resembles that of the Greek language. Into the modern Armenian many foreign words have been introduced, especially from the Turkish; the grammar is altered, and the construction of sentences is modelled after the fashion of the Turkish language.

To those who wish to study the Armenian language the following works are recommended: -J. J. Schöderi *Thesaurus Lingue Armenice antiquæ et hodiernæ*. Amst. 1711. 4to. *A Grammar, Armenian and English*, by Father Paschal Aucher. Venice, 1819. 8vo. *Dictionnaire abrégé Français-Arménien*, par Paschal Aucher. Venice, 1812. 2 vol. 8vo. *Choix de Fables de Vartan en Arménien et en Français*. Paris, 1825. 8vo.

Armenian Literature. -Previous to the introduction of Christianity, the religion and civilization of Armenia appear to have been similar to those of the neighbouring Persians and Parthians. With the exception of a few fragments of ancient songs preserved by Moses Chorenensis, we possess no literary remains out of this period. With the Christian religion, however, a taste for the study of the Greek language and literature became prevalent. Till the beginning of the fifth century, the Armenians, in writing their language, used various foreign alphabets: the Persian, the Greek, or the Syrian, particularly the latter; but as the number of characters in these alphabets was insufficient to express all the sounds of the Armenian language, Mesrob invented, for the use of his countrymen, a particular alphabet written from the left to the right, and originally consisting of thirty-six characters, to which, subsequently, two more were added. This alphabet, which was introduced in the year 406, is that which the Armenians still use.

The continuous succession of writers, in various departments of literature, which Armenia has produced from the commencement of the fifth century down to our own age, and the zeal with which the Armenians, since their dispersion, have established printing-offices wherever they have settled in any considerable numbers, prove their fondness for the cultivation of letters. They either have, or have had, printing-offices at Amsterdam, Leipzig, Venice, Leghorn, at Leopold in Poland, at Constantinople, at Smyrna, in several towns of Russia, at Astrakhan, at Etchmiadzin, at Julia near Ispahan, at Madras, and in several other places.

Besides the alphabet of which he was the inventor, Mesrob presented his countrymen with a translation of the Bible, made, as far as the Old Testament is concerned, from the Septuagint; but the Greek text, from which we must suppose it to have been made, does not agree altogether with any one of our recensions. The Armenian version is supposed by some critics to have been interpolated in the sixth century from the Syriac Peschito, and in the thirteenth from the Latin Vulgate.

The Armenian historians are valuable on account of the information which they supply on the history of the Byzantine empire, of the Sassanide, the Mohammedan Arabs, the Seljuks, the crusades, the Mogols, and, in short, on the entire history of the East since the fourth century. They show, upon the whole, more judgment than the Arabian and Persian historians in the selection of the facts which they record, and display a better taste in their manner of relating them: some appear rather too fond of interrupting the narrative by long strains of pious meditations. The Armenian chronicles should, however, be used with caution, particularly as regards the more remote periods of history. Saint-Martin has pointed out an important anachronism, into which, he says, Gibbon has been led by Moses Chorenensis, regarding the history of Armenia contemporary with the reigns of Constantinus and Constantius. (*Nouveau Journal Asiatique*, t. iv. p. 402, &c.)

The most ancient Armenian historian probably was Agathangelus, the secretary of King Tiridates, early in the fourth century. The authenticity of a chronicle which is attributed to him seems, however, to be questionable.

Zenob, a Syrian by birth, pupil and secretary to St. Gregory, lived early in the fourth century. To him is ascribed a chronicle of the province of Daron, which was printed at Constantinople, 1719, 12mo.

Moses of Khoren, or Khorni, in the province of Daron, surnamed Kerthogh, or Kerthoghair, i.e. 'the grammarian poet,' is considered by the Armenians as the first of their classical writers. He had from his early youth attached himself to Sahag (or Isaac), the patriarch of Armenia, a descendant of St. Gregory, who, in concert with Mesrob, most zealously endeavoured to propagate Christianity, and to diffuse a love for knowledge among his countrymen. Moses was by him sent to Alexandria (A.D. 434) in order to make himself perfectly familiar with the Greek language. He remained there several years, and returned to Armenia (442) by way of Rome, Athens, and Constantinople. Moses was subsequently raised to the archiepiscopal see of the provinces Pakrevant and Ardzruni, and died in A.D. 487, it is said at the age of 120 years. We possess a Chronicle by him, divided into three books (edited, in Armenian and Latin, by the brothers Whiston, London, 1736, 4to.), in which he gives the history of Armenia from the time of Haïg down to the death of Mesrob and Sahag: also a treatise on rhetoric, and a work on geography. Saint Martin is also inclined to ascribe to Moses of Khoren an Armenian translation of the *Chronicon* of Eusebius (edited, in Armenian, by Aucher, at Venice, in 1818, and in Latin, in the same year, by Mai and Zohrab, at Milan), which was printed from an old MS. on vellum, found in 1794 by Zohrab at Constantinople.

Elisus, or Eghishe, a contemporary of Moses of Khoren, was secretary to Vartan, a prince of the family of the Mamigonians: in 449 he was appointed bishop of the district of the Amalunians. He wrote a history of the religious wars of Vartan with the Persians, of which he himself had been eye witness. An English translation of this work, by C. F. Neumann, was published at London in 1831 by the Oriental Translation Committee.

Another distinguished contemporary of Moses Chorenensis was the philosopher David. He visited Athens, where he attended the lectures of Syrianus, the teacher of Proclus: he afterward went to Constantinople, where he seems to have remained for a considerable period. He died in Armenia, it is supposed, early in the sixth century. (See C. F. Neumann's *Mémoire sur la Vie et les Ouvrages de David*, in the *Nouvel Journal Asiatique* of 1829.)

Lazarus of Parb (Pabetsi), surnamed the Rhetorician, who flourished in the sixth century, wrote a history of Armenia during the years 386-485. (Printed at Venice in 1793.)

Thomas the Ardzrunian, a contemporary of Lazarus, wrote a history of the life of Vartan, and subsequent events, down to the year 500.

Joannes, bishop of the Mamigonians, lived in the seventh century. He wrote a history of Armenia from the commencement of the third century till the year 640. It was printed at Constantinople in 1719.

Anias Shiraguzi, in the seventh century, is the author of several biographical, astronomical, and chronological works.

Joannes Catholikos, in the ninth and tenth centuries, wrote a history of Armenia from Haïg till the reign of the Bagratiun king, Ashot II. (A.D. 920.) This work, which yet remains unpublished, is considered by the Armenians a model of elegant style.

Matthias Erez, of Edessa, in the twelfth century, wrote a chronicle which comprehends the history of Armenia from the reign of Ashot III. (A.D. 954) till the establishment of the Armenian principality in Cilicia (A.D. 1128.) This work was continued by Gregory, in the same century, as far as the year 1161.

Samuel of Ani (Anetsi), likewise in the twelfth century, wrote a concise but accurate chronological work, extending from Adam to the pontificate of Gregory V. (A.D. 1161.) It has been continued by others till the year 1337.

Nerses Klaietsi, surnamed Shnorhali (i.e. 'the graceful'), was born shortly before the close of the eleventh century, and died in 1173. During the last twenty-six years of his life, he resided at Hromkla, commonly called Runkala, a fortified place on the Euphrates. He is considered as the inventor, or principal cultivator, of rhymed poetry. With the exception of a brief history of Armenia, his works are mostly theological. (According to Gregorius Magistros, an Armenian writer of the eleventh century, the Armenians received their theory of prosody and rhyme from the Arab and Sahlum the son of Shahpu, and Aharon the son of Kahan were the first Armenian poets.)

Nerses Lampronetsi, the nephew of the former, was born in

in 1183, and died in 1198. His writings are almost exclusively homiletical and liturgical.

Vartan, a pupil of the monk Vanagan, in the thirteenth century, wrote a history of Armenia, commencing with the earliest times, and going down as far as the year 1272. This work is considered valuable on account of the information about the history of the countries bordering upon Armenia, and of the accuracy and criticism shown by the author.

Vahram, a native of Edessa, and secretary to King Leon III. of Cilicia (who reigned from 1269 till 1289), is the author of a short history of the Armenian kingdom in Cilicia. A more comprehensive work, on the same subject, was written by Sempad, towards the end of the fourteenth century.

After the fourteenth century, we find Armenian literature on its decline. With the exception of a valuable work on the history of Armenia, by Michael Chamechian, which was printed at Venice in 1786 (3 vols. 4to.), we hear of scarcely any work of merit. (See *Quadro della Storia Letteraria di Armenia, estesa da P. S. Somal*. Venice, 1829, 8vo.)

For about a hundred years, there has existed at Venice a congregation of Armenian monks, who are constantly publishing works on religion, theology, literature, and science, such as they think likely to benefit their countrymen. They dwell on the little island of San Lazzaro, and call themselves Mekhitaristes, which name they derive from that of their founder, Peter Mekhitar, who fixed himself at Venice in 1717. (See *A brief Account of the Mechitaristic Society, founded on the island of S. Lazzaro*. By Alexander Goode. Venice, 1825, 4to.) They have a printing-office well stocked with Armenian types, formerly cast at Amsterdam under the directions of Lucas Vanant. Many important works of a general interest have already come from the Armenian press of San Lazzaro: one of the latest is an edition, in Armenian and Latin, of three *Sermones* of Philo the Jew, the Greek original of which is lost. The Armenian text is taken from a MS. written in A.D. 1296, which Zohrab discovered at Leopold in Poland, in 1791, collated with another copy made in the year 1298, and found in the library of the Armenian patriarch at Constantinople.

The Armenian Christians adopt the Apostolic, the Nicæan, and the Athanasian creeds, but reject the decrees of the Council of Chalcedon, and follow the doctrine of Eutyches and of the Monophysites, in admitting but *one nature* in the person of Christ, viz., that he is God only: this is, in the rite of their church, symbolically expressed by the use of red wine, unmixed with water, in the Lord's Supper. They assert that the Holy Ghost proceeds from the Father only, who accordingly, in their profession of faith (Schröder, *Thesaurus Lingue Armenice*, p. 251), is called *genitor Filii et spirator Spiritus Sancti*, while the Holy Ghost is described as *proceedens a Patre, coessentialis Patri et congloriosus Filio*. They have the seven sacraments of the Catholic church, viz., Baptism, the Lord's Supper, Confirmation, Matrimony, Consecration of Priests, Confession of Sins, and Extreme Unction. They admit the doctrine of the transubstantiation of the bread and wine used in the Lord's Supper, which they administer under both forms to laymen as well as to ecclesiastics, though deviating from the rite adopted by other Christian sects, by dipping the bread into the wine. The Armenian clergy are divided into monastics and seculars. The former (under which class are comprised patriarchs, archbishops, bishops, doctors, monks, and hermits) live in celibacy; the secular clergy, i. e. the officiating priests, are permitted and advised to marry. The Armenian Church does not acknowledge the supremacy of the Pope. It was, at the beginning of the last century, governed by four patriarchs, who resided at Etchmiadzin, Sis, Aghthamar, and Gandsasar. The number of their bishops was calculated to amount, about the same time, to between fifty and sixty.

The Armenian Christians have an era of their own, according to which they count their years, and which commences with the year 551 of our Dionysian era. Their year is a moveable solar year. (See Ideler, *Lehrbuch der Chronologie*, p. 439, &c.)

ARMENIACA. [See APRICOT and PRUNUS.]

ARMENTIÈRES, a town in France in the department du Nord, close upon the Belgian frontier, and ten miles W.N.W. of Lille, the capital of the department. It is a neat little town on the river Lys, the navigation of which con-

tributes to its trade. The population is variously given at 6000 (Balbi) and 7700 (Malte Brun) persons, whose chief occupation is spinning flax, hemp, and cotton yarn. Some trade in woollen and linen cloth, lace, and leather, is carried on: also in bricks, of which great quantities are made in the neighbourhood. Armentières, when a frontier town of Flanders, was of some importance as a place of strength; and suffered much in different contests between the French and the Flemings; but upon its capture by Louis XIV. in 1667 it was dismantled. 50° 41' N. lat., 2° 52' E. long. of Greenwich. (M. Brun; Balbi; *Dictionnaire Universel de la France*, &c.)

ARMIGER. [See ESQUIRE.]

ARMILLA, a bracelet, or large ring, for the wrist or arm. The wearing of the Armilla, or bracelet, as an ornament, is of very high antiquity. It occurs in Genesis, chap. xxiv. 22, 23, where Abraham sends his servant to seek a wife for Isaac. The Amalekite who slew Saul (2 Sam. i. 10) 'took the crown that was upon his head, and the bracelet that was on his arm,' and brought them to David.

The Armilla, or bracelet, as a decoration for both sexes, was perhaps the most universal of all ornaments—common to almost every nation, and far more general than the *torques*, or collar for the neck. It was sometimes worn upon the wrist, sometimes near the shoulder, and occasionally upon the ancles. Bartholinus, in his treatise *de Armillis Veterum*, asserts, that it was of such general use as to be worn even by slaves, when they could obtain permission from their masters. This accounts for the great number of armillæ which have been found, of a slender shape and mean form, in bronze, in different countries once possessed by the Romans.

As an ornament of dress, the Armilla is frequently spoken of as massive. Livy (l. i. c. 11) says the golden bracelets of the Sabines were of great weight. Petronius Arbitr (c. 67) speaks of the Roman women as wearing bracelets of six pounds and a half, and even of ten pounds weight, though the fact seems incredible.

It is not, however, as a mere ornament of dress that we are to consider the armilla; its most important use was as a gift of reward. *Ælian* (*Hist. lib. i. c. 22*) says the Persian kings rewarded all ambassadors, whether from Greece or other nations, with presents of armillæ. *Plutarch*, *Xenophon* (*Anabasis*, i. 2. 27), and *Herodian*, all allude to them as military or royal gifts.

Livy, in his account of the Samnite war (l. x. c. 41), says that at Aquilonia, Papirius, who had been engaged in various services, in the field, the camp, and the city, gave *armillæ* and coronets of gold to Spurius Nautius, to Spurius Papirius his own nephew, to four centurions, and to a whole band of the hastati. To the horsemen also, as a reward of valour, he gave armillæ and little horns of silver.

The gift of the golden armilla, however, was reserved peculiarly for the Roman citizen. Pliny says, to auxiliaries and strangers they give gold torques; to their own citizens only silver. But, exclusive of these, the Roman citizens have armillæ given them, which foreigners have not. (*Hist. Nat. l. xxxiii. c. 10.*)

Julius Gellius, in the eleventh chapter of his second book, describing the exploits of Dentatus, says he was called the Roman Achilles; that he had been in more than a hundred and twenty actions; that he had never received a wound in the back, but that he had five and forty wounds in front; and that among his rewards he had achieved eight golden crowns, one obsidional, and three mural crowns; that he had received eighty-three torques, and more than a hundred and sixty armillæ. (*Noct. Att. l. ii. c. 11.*)

Gruter (*Inscript. mxcvi. 4*) has preserved a monumental inscription in memory of Lucius Lepidius, who had served in different legions, and received various armillæ, torques, and other ornaments, as rewards, from the Emperor Vespasian. Suetius (fol. lxxiii. b.) gives another, for a soldier upon whom both torques and armillæ had been bestowed by Trajan. Numerous other such inscriptions will be found in the different collections. *Brissonius* has given the formula of one of these donations: '*Imperator te Argenteis Armillis donat.*'

The draconarii, or standard-bearers, wore armillæ. See *Ammianus Marcellinus* (l. xx. c. 4), where the soldiers crown Julian with one of them.

There was another use to which the armilla or bracelet was applied from the very remotest ages of the world. It

was used as an offering. In the Book of Exodus bracelets are included among the free gifts for the tabernacle.

Offerings of serpentine armillæ, or torques, were also made to Æsculapius.

Gifts of armillæ, however, were not confined to the warriors of Greece and Rome. The practice was as prevalent in the remoter regions of the north. The fragments which remain of the compositions of the Scaldic bards are full of allusions to the gift of bracelets. Snorro Sturleson's History affords ample proof of this. Hrolf Krake, King of Norway, whose reign is ascribed to the fifth century, is mentioned as bestowing them by Saxo Grammaticus. (*Hist. Dan.* ii. p. 29.) In the Saxon Chronicle, under the year 975, the English Edgar is expressly called *beopna beah-gyfa*, the bestower of bracelets, the rewarder of heroes; a term, indeed, usual as an epithet for a great chieftain in most of the Saxon poems. It occurs nowhere more frequently than in the song of the Traveller, and in the well-known poem of Beowulf.

Nor were armillæ gifts of reward made in person only; we find them frequently mentioned as legacies in the Saxon wills. In the will of Brihtic and his wife Ælfswytha (he was one of the Thanes of Archbishop Ælfrie), preserved in the Textus Roffensis, among the articles which formed a legacy to the king, we have a bracelet of gold of the weight of eight mances; and to the queen a bracelet of thirty. In the will of Wulfer, which follows the will of Brihtic in Dr. Hicke's Thesaurus, we find a legacy of a bracelet of sixty mances. (*Dissert. Epist.* p. 51.)

William of Malmesbury informs us, that when Earl Godwin made his peace with Hardiknut, in the year 1010, he sealed it by a magnificent present—a ship, whose stern was richly ornamented with gold; and within it, eighty soldiers, each clothed in the most sumptuous habiliments of war, with armillæ of pure gold on both arms, each weighing sixteen ounces. (W. Malmesb. edit. Francof. 1601, l. ii. p. 77.) The same writer (p. 102), describing the manners and customs of the English in 1066, upon the conqueror's arrival, says their arms were laden with golden bracelets: "*Armille aureis brachiis onerati.*"

Angrim Jonas, in his work on Iceland, speaking of the pagan rites which were used in the chief temple of southern Iceland, in the isle of Kjalarnes, describes an armilla of twenty ounces weight, which was kept upon the altar, and which, being sprinkled with the blood of victims, was touched by those who took any solemn oath. He says it was either of silver, or silver and brass mixed. (*Crymog. Rer. Island.* l. i. p. 63.) He adds, that for this purpose it was worn upon the Judge's arm during trials. (*Ibid.* p. 76.)

There is a passage in the Saxon Chronicle, under the year 876, which refers to a ceremony not altogether unlike the practice in Iceland. It says, that when the Danes made their peace with the English Alfred, at Wareham in Wessex, they gave him the noblest among them as hostages, and swore oaths to him upon the holy bracelet.

Armillæ, as we learn from Bartholinus, were sometimes marriage presents. Virgins, it appears, did not usually wear them. (*De Armill. Vet.* p. 79.) From different passages in the Roman classics, we learn that they were sometimes given as birth-day presents. Placed among treasures, there was a superstition that an armilla would augment them. Lovers thought them efficacious; and ivory armillæ were used in the cure of epilepsy. See other superstitions in Pliny. (*Hist. Nat.* ed. Harduini, tom. ii. 451, 11; 472, 10; 531, 22.) Armillæ are still used as playthings for children.

Among the articles which from time to time have been turned up in the bogs of Ireland, armillæ of gold have not been the least numerous. Some years ago, several in this metal, of different sizes, were found under Beachy Head in Sussex, amongst the chalk which the tide had undermined. Two or three of these are still preserved in Mr. Payne Knight's collection of bronzes.

The Hamilton, Townley, and Knight collections of antiquities, in the British Museum, contain armillæ in great quantities, and of almost every variety of form, in gold, in silver, and in bronze. See the Hamilton Room, Case 68; Mr. Knight's collection, Case 8; and the Hamilton and other gems.

In vol. xii. of the *Archæologia*, pl. li., a bronze armilla is engraved, found upon the wrist of a full-sized skeleton at Westwang Field in the East Riding of Yorkshire. See also, in the same work (vol. xxii. p. 285) some observations upon an ancient bracelet of bronze, found on the sand-hills of Altyre on the coast of Murrayshire: from these observa-

tions many of the materials for this account of the armilla have been derived.

ARMILLARY SPHERE. The Latin word *armilla* signifies a bracelet, and the armillary sphere is one in which the principal circles of the heavens are constructed of some solid material, and put together into their relative positions; thus presenting the appearance of a hollow sphere, of which all the surface has been cut away except the equator, ecliptic, colures, &c. This instrument is now little more than a toy, the complete sphere being generally preferred for the purposes of instruction; but in the ancient astronomy, and even so late as the time of Tycho Brahé, an instrument, the simple description of which is, that it was the whole or part of an armillary sphere, was extensively used in astronomical observation. On this point we refer the reader to **ASTROLABE**.

ARMINIANS are the followers of James Arminius, or those who are considered to entertain his sentiments. It does not appear that the conference in which Arminius was engaged at the time of his death, was productive of any good effect upon the state of party feeling in Holland. The government, however, were evidently leaning towards his side; for in the following year (1610), on sending an embassy to France, Uitenbogaert was appointed chaplain. At Paris Uitenbogaert had frequent conferences with the celebrated J. Casaubon, who was then overseer of the Royal Library at Paris, although a Protestant. These conferences served to strengthen Uitenbogaert in the opinions which he had adopted, inasmuch as Casaubon, for the most part, agreed with them.

In the mean time, during the absence of Uitenbogaert in 1610, the disputes went on in Holland with increasing violence. They had now spread so widely that nearly all the country were engaged in them, clergymen and laymen, the learned and unlearned. A large majority of the clergy and leading religious men adopted the sentiments of Gomarus, and espoused his cause. The Arminian party, fearing that matters would come to extremities, and that their party might be crushed, drew up a representation of their sentiments, which was presented to the States-general, and was named by its authors *Remonstratio*, or *Remonstrantie*, that is, Remonstrance. This gave rise to the name Remonstrants, by which the party has been usually called on the continent of Europe, from that time to the present. The Wesleyan Methodists call themselves Arminians, and their magazine appeared formerly under the title of the Arminian Magazine. [See REMONSTRANTS; OLDEN BARNEVELD; GROTIUS; DORT; EPISCOPUS; BOGKIMANN; HEINSIUS.]

ARMINIUS. James Arminius (called in Latin Jacobus Arminius, and in Dutch Jacob Hermann, or von Harmine, or Harmensen) was born in 1560, at Oudewater, a small but pleasant and thriving village in South Holland. His father died while he was an infant. It happened, however, that there was at Oudewater a priest called Theodore Emilius, distinguished for erudition and piety, who had forsaken the Romish church, and had emigrated from place to place in order to avoid its persecution. Moved by compassion for the indigent condition of Arminius, Emilius took him under his care, instructed him in the learned languages, and inculcated frequent lessons of practical piety. He became so interested in the extraordinary talents and rapid improvement of his young pupil, that he continued his education until he was sufficiently advanced in his studies to be sent to a university. It appears that some time before his death Emilius had removed to Utrecht with his pupil; and there he died, leaving the young Arminius without any means of support. Soon after this event, however, the youth obtained a second patron in Rodolph Snell, a native of Holland, who on account of the incursion of the Spaniards had been obliged to quit his residence at Marburg in Hesse. Snell was himself distinguished for his knowledge of the mathematics. He soon returned to Hesse, accompanied by his young pupil; but he had scarcely arrived there before news came that the Spaniards had taken Oudewater, burnt it, and massacred all the inhabitants. Arminius set out immediately for his native place: on his arrival, he found it a heap of ruins; every house was burnt, and his mother, sister, brother, relations, and nearly all his fellow-townsmen, murdered. He returned immediately to Hesse, performing the whole journey on foot. Here, however, he did not stay long. News reached him that the University of Leyden had been founded by the prince of Orange, on which he set out once more for Holland, and at first repaired to Rot-

terdam, then an asylum for the surviving sufferers at Oude-water, and also for many refugees from Amsterdam.

At Rotterdam, Peter Bertius, the father of P. Bertius who afterwards wrote the funeral eulogy of Arminius, was persuaded to receive him into his own family; and he afterwards sent him, with his son P. Bertius, to the University of Leyden. Here young Bertius was the constant companion of Arminius, whom he describes as exceedingly devoted to literary pursuits. Arminius cultivated the study of poetry, mathematics, and philosophy, and became the ornament and example of the whole class to which he belonged. His principal instructor in theology was Lambert Danæus, who had taught at Geneva, and was distinguished by his knowledge of the Christian fathers and the scholastic divines.

After remaining at Leyden about six years, the senate of Amsterdam, being moved by the high reputation for brilliant talents and extraordinary application which Arminius had acquired, sent him in 1582, at their own expense, to Geneva, then the head quarters of the reformed Calvinistic churches. Here he enjoyed the instruction of the celebrated Beza, the friend and successor of Calvin, in the famous theological school of Geneva. But he soon created a prejudice against himself among the leading men in this school on account of his enthusiastic attachment to the philosophy of Ramus, which he taught to his fellow-students in private, and which he boldly and zealously defended in public. The philosophy of Aristotle was at that time considered as the summit of perfection, not only at Geneva, but in all the schools and universities of Europe. The views of Ramus were opposed to this philosophy; and of course Arminius, who appeared as a zealous advocate for the opinions of Ramus, could not expect to meet with the approbation of the instructors at Geneva. Accordingly he was soon obliged to quit the place, and he immediately repaired to Basle, where Jacob Grynaeus was then a distinguished teacher. Here he won so much applause and admiration by his attainments and devotedness to study, that he was speedily offered a doctorate in theology by the theological faculty at Basle, being at that time only twenty-two years of age. This, however, he declined, deeming himself too young to be made the subject of such an honour.

The commotion excited at Geneva by his opposition to the philosophy of Aristotle, began to subside in his absence. In 1583 he returned to Geneva. His own feelings were now greatly moderated on the subject of Ramus's philosophy, and he appears to have lived in tranquillity during his second residence at Geneva. How long he remained here during his second residence is not well ascertained: but as he returned to Geneva in 1583, and went into Italy in 1586-7, it seems probable that his stay was about three years.

He was attracted to Italy by the philosophic fame of James Zabarella of Padua, whither he went, attended by a young Hollander, his constant companion. After hearing a course of lectures, he travelled through Italy, visited Rome, then returned to Geneva for a short time, and soon after to Holland. While on his travels, he and his companion carried with them a Greek Testament and a Hebrew Psalter, which they read daily, in their exercises of devotion. In 1587 Arminius returned to Holland, and on repairing to Amsterdam he found that reports had been circulated there greatly to his disadvantage, respecting his favourable views of the Roman Catholic religion. Among other things, it was said that he had kissed the Pope's feet; that he was intimate with Jesuits; that he was introduced to Cardinal Bellarmine; and that he had renounced the Protestant religion. All this was entirely false.

Arminius found his patrons at Amsterdam cold and suspicious when he first returned. He succeeded, however, in satisfying them that he had been slandered, and he soon received an invitation as minister in one of the churches at Amsterdam, over which he was placed in 1588, being then twenty-eight years of age. On his return from Italy he had passed through Geneva, where Beza gave him a letter to his patrons, in which he speaks highly of him as *'animo ad faciendum officium optime comparatus, si Domino Deo placeret ipsius uti ad opus suum in ecclesia sua minister.'*

Arminius soon became exceedingly popular as a preacher at Amsterdam. His sweet and sonorous voice, his manner, his ardour, his distinguished talents, and finished education, all combined to give him extensive popularity and influence. The rumours which had been set afloat concerning his inclination towards Catholicism gradually died away, and all

classes of men united in extolling his talents as a preacher and a pastor.

Volkerts Coornhart, a man of distinguished talents and learning, who lived at this time at Amsterdam, was strongly opposed to the doctrine of predestination as held at Geneva and in Holland, and had written much against it. Two ministers at Delft, Arfoid Cornelius and Renier Duuteloek, had undertaken, in conference and by writing, to oppose Coornhart. In order to do this, however, as they thought to the best advantage, they had relinquished the views of Calvin and Beza in respect to the *decretum absolutum*, viz. the doctrine that the decree of election and reprobation preceded all respect to the fall of man and to his obedience or disobedience. This is what has since been called supralapsarianism. On the other hand, the ministers at Delft maintained, not only that God in his decree regarded man as created, but also that he had respect to his lapsed condition. This is what has since been called sublapsarianism. The work which the Delft ministers published at this time, entitled *'Answer to some Arguments of Calvin and Beza on the subject of Predestination,'* first gave rise to these denominations in the Christian church. The book of the Delft ministers, containing strictures on the supralapsarianism of Calvin and Beza, was sent by its authors to Martin Lydius, then professor of theology at Franeker. He was dissatisfied with it; but instead of undertaking to answer it himself, he solicited Arminius to defend his teacher, Beza. This Arminius was at first inclined to do; but after a thorough perusal of the answer, he repented his purpose, as his mind had been filled, by the perusal of the book, with doubts or difficulties in regard to some positions of Beza and Calvin. In 1597 Arminius repaired to Leyden, to confer with the celebrated F. Junius, who was then professor of theology there. The result of this was a long and amicable correspondence on the subject of decrees, necessity, liberty, &c., which is published in the works of Arminius. Junius treated these subjects with mildness and great ability, but he did not satisfy the scruples of his friend.

Uitenbogaert, a very popular and able minister, at this time resident at the Hague, was known to sympathize in sentiment and feelings with Arminius. To him Arminius wrote, beseeching him to assist in the examination of the difficult questions in which he was engaged. Uitenbogaert, as appears by the sequel, entered warmly into his views.

In 1598 Arminius wrote his *'Examen Modestum Libelli Perkinsii, T. E.,'* or his examination of a treatise in defence of predestination, which Perkins, an Englishman, had published under the title of *'Armilla Aurea.'* In 1599 Arminius and his friend Uitenbogaert endeavoured to move the states of Holland to order a new translation of the Bible to be made by that excellent scholar Drusius. But in this they failed, owing to a strong suspicion entertained by many of the clergy, that they were aiming at the overthrow of the opinions then prevailing in the churches of Holland.

In 1600 Arminius opposed those of his brethren who were urging an annual subscription of all the ministers to the creed and catechism of the churches in Holland. In 1602 the plague made dreadful ravages in this country, and particularly at Amsterdam. Arminius is said to have distinguished himself greatly by his attention and kindness to the sick and to those who lost their friends. During this plague F. Junius and L. Treleatius, professors of divinity at Leyden, died, and the curators of the university in 1603 elected Arminius to fill the place of Junius. It was only by the interposition of the curators at Leyden and of the leading men in the government of the states, that the synod at Amsterdam could be persuaded to allow Arminius to leave his church at Amsterdam; a fact which strongly marks the attachment of the people to their minister.

It is said, that F. Gomar, a distinguished professor of theology in Leyden at this time, was opposed to the election of Arminius. Soon after the new professor entered on his office, he and his colleague Gomar were brought to a friendly conference, in which Arminius explained himself so plainly and fully against the doctrines of Pelagius, that Gomar professed to be satisfied. But during the next year Arminius delivered a lecture on predestination, in which he maintained that God had eternally decreed to save believers and to punish the impenitent; the one to the praise of his glorious grace, the other in order to display his power and

* The name occurs in various forms. Uitenbogaert, Uitenbogaart, &c.—We have adopted that orthography which occurs in some old Dutch books.

his indignation against sin. Arminius doubtless meant that God had respect in his decree to the belief of the one and the unbelief of the other. Gomar openly attacked this lecture; Arminius replied; and thus commenced a dispute which has not yet subsided. Gomar carried it on actively during the rest of his life. The students of the university soon became engaged in it, and were divided; a part held with Gomar, but the majority with Arminius, whose lecture-room was always crowded.

This state of things very naturally took hold of the public sympathies. The ministers of the Gospel became divided, as well as the students of the university; but the majority appear to have taken the side of Gomar and to have blamed Arminius. As the contest went on, the teachers of religion began first to dispute, then to preach and write against each other, until all Holland was in a state of religious war. In 1601 some theses of Arminius on the divinity of Christ occasioned him new trouble. The matter related to the epithet *αὐτόθεος* as applied to Christ. Arminius explained it according to the Nicene Creed, in which the term occurs, *very God of very God*. His opponents gave it the contrary interpretation, that is, 'One who is God of himself, and has his essence from himself and not from the Father.'

In 1607 the ministers of Gouda published a catechism, which for the most part was expressed in the language of Scripture, and was intended to be simple and brief. Arminius was accused of favouring this catechism, which, it was averred, would open the flood-gates to all manner of error. All these occurrences served to increase the excitement in Holland. This finally rose so high that the States-general were called upon by Arminius and Uitenbogaert to convoke a general synod, before which Arminius might defend himself. The supreme court admitted Arminius and Gomar to a conference before them, and the result was, that this council informed the States-general that the disputes between the parties were on intricate points of little or no importance: and that, with respect to them, a man might believe either one way or the other without forfeiting his faith or injuring the church (*salva fide et salva ecclesia*). The States-general enjoined the parties to drop their disputes, and to teach nothing against the creed or the catechism.

The attempt of the government to put a stop to the disputes concerning religion, although well-meant, was entirely unsuccessful. Arminius and Gomar still carried on their theological warfare: the students of the university, of course, followed their example, and ministers through the country, and, finally, private individuals, became deeply engaged, on one side or the other, in this contest.

In the same year, 1608, Arminius was summoned by the States-general to appear before them at the Hague, and give them an account of his sentiments. This he did in his famous 'Declaratio,' published in his works. The States-general, as a body, were at this time inclined to favour Arminius. But the disputes continuing with increased violence, in the next year (1609) they summoned Arminius and Gomar before them once more, each accompanied by four ministers of his own party, in order that they might hold another conference in their presence. This was soon interrupted by the sickness of Arminius. Gomar and his friends insisted on a general synod, knowing that they had a majority of the clergy on their side. Uitenbogaert, the special friend of Arminius, who was present as one of his assistants, warned the States against being prejudiced by the violence and the number of the opponents of Arminius. He expressed an entire willingness to have a general synod; he only remarked, as Beza once said, that he did not wish Satan to be the president of it.

In the mean time Arminius did, on the 19th of October, 1609. His last sickness was exceedingly severe. Exhausted by the fatigues of body and mind which he had undergone during the many years of his theological warfare, deeply wounded by the ill-reports which the heat of dispute had engendered and zeal against him had extensively circulated, he fell under a complication of diseases—fever, cough, atrophy, and arthritis. It is said, that notwithstanding all his sufferings he died with great calmness and resignation, lamenting the evils to which the Church had been exposed, and earnestly praying for her peace and prosperity. In his last will, made on his death-bed, he solemnly testifies that he had, with simplicity and sincerity of heart, endeavoured to discover the truth, searching the Scriptures, and that he had never preached or taught anything which he did not believe to be contained in them.

ARMINIUS. [See HERMANN.]

ARMLEY, a chapelry in the parish and borough of Leeds. [See LEEDS.]

ARMORICA, ARMORICÆ CIVITATES, the name given in the time of Cæsar, to the maritime districts of Celtic Gaul, situated between the mouth of the Eigers (Loire) and that of the Sequana (Seine); the word is derived from the Celtic, *ar mor*, which means 'near the sea.' That tract of country was occupied by several tribes, the Veneti, Osismii, Carnosolites, Rhedones, Calætes, &c., who formed a sort of confederacy. Their towns and fortresses were built along the coast, and they had a considerable fleet, with which they carried on an intercourse with the opposite coast of Britain. Being subdued by the Romans, after repeated struggles, they formed part of the province called *Lugdunensis Secunda*, which was afterwards subdivided into *Secunda* and *Tertia*; the maritime districts of this province were styled *Armoricanus tractus*, and nearly corresponded in extent to the modern French provinces of Brittany and Normandy. (D'Anville, *Notice de l'ancienne Gaule*.) Maximus, a Roman officer, having revolted with the legions of Britain against the Emperor Gratian, A.D. 383, passed into Gaul with two legions and a large number of islanders, among whom was one Conan Meriadee, a chieftain from the south of Scotland, to whom Maximus assigned the government of Armorica, which appears to have included the modern provinces of Brittany and western Normandy. This is the first recorded emigration of Britons into that province, which was followed by others, as Meriadee, having obtained the confirmation of his government from Theodosius, after the death of Maximus, induced many of his countrymen to come and settle under his protection.

In the middle of the fifth century, thousands of Britons, driven from their native country by the incursions of the Picts from the north, crossed the channel, and sought refuge among their countrymen in Armorica. That country, left unprotected by the Roman emperors, had erected itself into an independent state, under the government of Conan's descendants, and, favoured by its situation, had repelled the attacks of the northern tribes, who devastated

the rest of Gaul. The ships of Armorica carried on a considerable trade in those times, and the country seems to have attained a remarkable degree of prosperity amidst the general desolation of the west of Europe. The Christian religion was early propagated in Armorica: Bishops of Dol, Quimper, and Vannes, are recorded at the end of the fourth century, and the old annals of the country have preserved the memory of numerous saints, whose Celtic names are little known to the rest of the world.

Fresh emigrations continuing to pour in from Britain, the British population seems in a great measure to have been displaced, near the coast at least, the original inhabitants, who withdrew to the interior districts; and from this circumstance the country began to be called Bretaine or Bretagne, and the people Bretons. The council of Tours, held in 567, in one of its canons makes a distinction between the Breton and the Roman inhabitants of Armorica. The successors of Conan were styled Counts of Bretagne. The French historians have said that they did homage to Clovis, king of the Franks, as their sovereign; but this appears doubtful. At all events, their vassalage must have been merely nominal, as we find them acting as independent princes, and frequently at war with Clovis's successors, until the country was finally subdued by Charlemagne. The name of Armorica had long before this event been superseded by that of Bretagne, under which name it again became a separate duchy, with only a nominal dependence on the crown of France. [See BRETAGNE; Daru, *Histoire de Bretagne*.]

ARMOUR is a term generally applicable to any defensive habit, used to protect the person of the wearer from the attack of an enemy. The English word for it in the aggregate, in the fifteenth and sixteenth centuries, was *harness*.

Among the more civilized ancient nations, brass, iron, and other metals, were preferred for its fabrication; and in the time of Asiatic magnificence, even gold was not spared. Herodotus (vii. 71) says that the Libyans who assisted Xerxes in the great army wore leather armour, or probably skins only is meant; of which material, he adds (ib. i. 71), the armour of the ancient Persians also was composed.

But for the earliest memorials of armour we must look to the sacred writings, where we find the shield, the helmet, and the breast-plate used by the Israelites. Goliath of Gath (1 Sam. xvii. 6) wore greaves to defend the legs, which were also worn by the warriors of other Asiatic nations; and, at the siege of Troy, by the Grecians in general. Homer's epithet of *εσχαπιδεῖς Ἀχαιοί* (the well-greaved Achæi) is familiar to every classical reader. His description of the thorax or breast-plate of Agamemnon, at the beginning of the eleventh book of the *Iliad*, shows that decorated armour was used at this early period. The same conclusion follows as a matter of course from the description of the shield of Achilles, and it proves that occasionally great pains and skill were employed in decorating armour. The golden armour of Glaucus (*Iliad*, vi. 236) is stated to be worth a hundred oxen. Among the Egyptians, armour of metal was confined to kings and nobles; the helmet of Psammetichus was of brass; the common soldiery wore quilted linen for helmets, and carried large wooden shields. (Xenophon, *Anab.* i. 8.) The breast-plate which Amasis sent to Athena (Minerva) at Lindos was made of linen, on which figures of animals were woven; the ornamental parts were of cotton-thread and gold. (Herod. iii. 47.) As to Greek armour, several specimens of the helmet and cuirass occur upon the frieze of the Elgin marbles; in one instance (slab 51) we have a scaled cuirass richly ornamented. In the bronzes of Sris, purchased from M. Brøndsted for the British Museum, the warriors have helmets and shields only. One has a round, the other an oval shield; their bodies are unclothed.

The complete Roman armour consisted of the helmet, shield, lorica, and greaves. The lorica was originally of leather, as we learn from Varro; in the time of Servius Tullius, according to Livy, the whole of the Roman body armour was of brass. The laminated lorica was heavy. Tacitus (*Hist.* lib. i.) informs us, that its weight was made a subject of complaint by some of the soldiers in the time of Galba; and the emperor himself, in his old age, found the weight of his cuirass too much for his feeble frame. (*Hist.* lib. i. c. 35.) The Roman lorica was frequently enriched on the abdomen with embossed figures, on the breast with a Gorgon's head by way of amulet, on the shoulder-plates with scrolls of thunderbolts, and on the leather border which covered the tops of the lambre-

quins (or pendent flaps) with lions' heads; and these were formed of the precious metals. Each Roman legion had its own device marked upon its shields. In the time of Trajan, as is exemplified in the armour represented upon his column, the lorica was shortened, being cut straight round above the hips. A bronze breast and back plate of this kind are preserved in the British Museum, upon the front of the former of which one of the paps of the breast still remains, like a high button, to which the shoulder-plates were fastened, which held the back and breast together.

From these facts a general notion will be gathered of the kind of body-armour used among the ancient nations. But as to the minute varieties of it, which are to be found in statues, or upon gems, coins, vases, and other representations, exhibiting the differences and peculiarities which existed, according to the time, the country, or the progress of improvement among the people, the details would be endless. Some of the most important facts will be mentioned under the proper heads, such as SHIELD, HELMET, &c.

Upon the history of defensive armour, as it was worn in England, we shall be more minute. The early Britons are believed to have used none except the shield. Sir Samuel Meyrick, on the authority of Aneurin, the British bard, says, that the Anglo-Saxons under Hengist and others, wore many of them loricae of leather and four-cornered helmets. This armour, he thinks, was probably acquired through the alliance of their fathers with the Romans, under Carausius and his successors. Aneurin says that Hengist wore scale-armour. A very early illuminated manuscript in the Harleian Collection, No. 603, represents a warrior exactly answering this description. Drawings of the eighth century represent the Anglo-Saxon soldier without any other defensive armour than the shield and helmet, which latter, Sir Samuel Meyrick remarks, seems, in general, to have been nothing more than leather, and is often omitted even in representations of battles. His offensive arms are the sword and the spear. The form of the shield at this period is always oval; it is usually surrounded by a broad rim on the outside, and has a sharp boss projecting from the middle, both of metal; the materials were wood, covered with leather. One of the laws of Æthelstan prohibits the making of shields of sheep's-skin, under the penalty of thirty shillings. The helmet, as it is commonly represented in drawings of this era, appears to have been nothing more than a cap of leather, with the fur turned outwards; but personages of rank had one of a conical form made of metal and gilt.

When the tunic supplanted the lorica, Sir Samuel Meyrick observes, the Roman pectoral was still retained, and called *half-beaph* or *beapz*, 'neck-guard'; *bneoyt-beven*, 'defence for the breast'; and *bneoyt-pocce*, 'breast-plate.' It may be seen on a warrior in an illumination in a manuscript of the Cottonian Library, marked Tiberius, B. v., in which the resemblance to the Roman pectoral is quite manifest. The Saxon authors, he continues (*Crit. Inquiry into Ant. Armour*, Introd. p. lxi.), are by no means explicit with respect to the form or materials of the breast-guards, but the epithet applied to such as were of metal is 'rigid.' Others are mentioned which are said to have been 'rough or shaggy,' so that we may suppose them to have been formed of wool or hair, or perhaps of undressed hides.

Notwithstanding these remarks, the word lorica frequently occurs in the writings of the most eminent Saxon authors, and sometimes is mentioned in terms which might imply that it was made of metal. Aldhelm, who lived in the latter part of the seventh century, in some enigmatical lines (*Poet. nonnulla*, 12mo. Mogunt. 1601, p. 51, *De Lorica*), speaks of a warrior's vesture which feared not darts drawn from the long quivers:—

— En! vestis valgi sermone vocabor;
Spicula non vercor longis exempta pharetris.

Whether this was the scaled-armour, such as worn by Hengist, or that made of flat-rings in the Phrygian style (as designated in Hope's *Costume*), is not quite clear. In an illumination, however, of the eighth century, a king habited in a tunic covered with flat rings occurs; and in another manuscript of that period similar armour occurs. (See the Cottonian MSS., Claud. B. iv., and Cleopatra, C. viii.) The Saxon authors call this *gehpynged byrn*, or 'ringed byrne.' Some illuminations seem to show that the rings were worn edgewise, (compare the MS. Cleopatra, C. viii.), and in either case the name is equally applicable.

Towards the close of the ninth century, the corium,

or corietum, was the armour generally used, and appears frequently in the drawings of that period. It was formed of hides cut into the resemblance of leaves, and covering one another; some times all of one colour, as blue, &c., and sometimes of two, as brown and orange; the upper part being of the one, while that which covers the thighs is of the other. It should be observed, that the Saxon byrnie, originally in shape like a tunic, became in form afterwards a complete cuirass, sitting close to the body, and generally terminating with it. Alcuin (*De Offic. Divin.*) speaks of the Anglo-Saxon military tunics of linen in the following terms. 'The soldiers are accustomed to wear linen tunics, so well fitted to their limbs as to enable them, with the utmost expedition, to direct the dart, poise the shield, wield the sword,' &c. The weight of the ringed byrnie seems to have been found a great impediment to activity. Hence, when Harold, in 1063, obtained immediate and decisive success over the Welsh, it was owing to the change of armour among his soldiers. He had observed that these mountaineers could not be pursued to their fastnesses by his troops when clad in ringed tunics, and he therefore commanded them to use their ancient leather suits, which would not impede their activity. (Ingulfus, fol. 68. Joh. Sarisb. *De Nugis Curiorum*, lib. vi. c. vi. p. 185.)

The Saxon artists, it appears, made no distinction between the cynehealm, or royal helmet, and the crown. The monarch is depicted by them, in his court and in the field of battle, with the same kind of head-covering, even when every other part of his dress is marked with decisive variation; but upon the figure of Edward the Confessor, in his great seal, the diadem is evidently put on a helmet. The casque of the nobility is usually pointed in the form of a cone, and made of brass or some other metal. In the two succeeding centuries its shape is the same: but it is ornamented with gold and precious stones, and is improved by the addition of a small piece to protect the nose, called a nasal. (See an illumination in the Cottonian MS., Tiberius, B. v.)

Leg-guards are decidedly mentioned by the early Saxon writers; but they uniformly appear to have been made of twisted pieces of woollen cloth, coming from within the shoe, and wound round the legs to the top of the calves, in imitation of the hay-bands used by their rude ancestors.

The shield still continued oval, and indeed until the Norman conquest; but it differed from time to time greatly in dimensions, especially in the tenth and eleventh centuries, in the drawings of which times it appears of various sizes, from a magnitude sufficient to cover the head and body, to a diameter not greater than a foot and a half. This variation is further supported by historical testimony, for we find mention made of 'little shields,' and 'smaller shields.' In the will of Æthelstan, dated 1015, the shoulder shield is included among the legacies, and it is distinguished from the target. It was probably of the larger sort, and received its appellation from being usually slung upon the shoulder.

When the Danes made their first appearance in England, Sir Samuel Meyrick says, they seem to have had no other armour than a broad collar, which encircled their chest and the lower part of their neck, or a small thorax of flat rings, with greaves, or rather shin-pieces, of stout leather. About Canute's time, the Anglo-Danes adopted a new species of armour, which, he thinks, they probably derived from their kinsmen, the Normans. This consisted of a tunic, with a hood for the head, and long sleeves, and what were afterwards called chausses, *i. e.* pantaloons, covering also the feet, all of which were coated with perforated lozenges of steel, called, from their resemblance to the meshes of a net, *nacles*, or *muscles*. They wore, too, a helmet, or kulleap, in the shape of a curvilinear cone, having on its apex a round knob, under which were painted the rays of a star. This helmet had a large broad nasal, to protect the nose, and the hood was drawn up over the mouth, and attached to it, so that the only exposed parts were the eyes. The authority for these observations is the manuscript in the British Museum commonly called Canute's Prayer-book. Spears, swords, and battle-axes, or bipennes, were the offensive arms, and the shield remained as before.

Such had been the state of armour in Britain when William led his army of Normans and Flemings to the victory at Hastings.

From this period, the great seals of our kings, those of the greater barons, and monumental effigies, give the outline of the changes which took place in the fashions of

armour. The great seal of William the Conqueror represents him on one side seated on a throne, upon the other he is in a hauberk apparently of rings set edgewise, which kind of armour had been used by the Anglo-Saxons. The Norman body-armour represented in the Bayeux tapestry is of two kinds; one of rings or muscles, sewn flat on the vestiture; the other of leather. The helmets are conical, and have the nasal. The ring armour of the Bayeux tapestry forms both breeches and jacket at the same time: 'this,' says Sir Samuel Meyrick, 'I take to be the haubergeon, as there are some few specimens of the tunic or hauberk, and both being mentioned in the *Roman de Rou.* This opinion,' he adds, 'is further strengthened by a specimen of this curiously shaped armour existing on a monument in Ireland as late as the time of Edward III. It appears to have been put on by first drawing it on the thighs, where it sits wide, and then putting the arms into the sleeves, which hang loosely, reaching not much below the elbow, as was the case with the Saxon flat-ringed tunic: the hood attached to it was then brought up over the head, and the opening on the chest covered by a square piece, through which were passed straps, that fastened behind, hanging down with tasselled terminations, as did also the strap which drew the hood, or capuchon, as it was called, tight round the forehead. This is evident in several figures in the Bayeux tapestry: but the manner in which the armour was put on and fastened is best shown where William is arming Harold. The Duke of Normandy is there represented as placing the helmet on the head of the Saxon earl with his left hand, while his right is busied making tight a strap, which is drawn through the rings on the breast of the latter. No examples of such shaped armour in England occur previously or in any subsequent reign; but it appears to have been introduced into Ireland, and worn in that country, as has been above observed, as late as the time of Edward III.; nor does any distinguishing name seem to have been applied to it: hence I conclude that it is what Wace calls the haubergeon, in his description of the appearance at the battle of Hastings of Bishop Odo, the conqueror's half-brother.' The legs of the figures in the tapestry are, generally speaking, bound with bands of different colours, rising out of the shoe in the ancient Saxon manner; but, in some instances, and where the hauberk is worn, they appear covered with mail to the ankles. Such, however, is the case only with the most distinguished characters, as William, Odo, Eustace, &c. This covering for the legs, according to William of Malmesbury, was called *house* or *hose*; whence Robert of Normandy, being rather short-legged, we are told by Ordericus Vitalis, his contemporary, was often called by his father Curti-hose. The shield, as depicted in the tapestry, and introduced by the Normans, was of a very peculiar form. It has been called heater-shield and kite shield by modern antiquaries, from its supposed resemblance to those familiar objects; but by the Normans themselves it was merely termed *ecum*, from the Latin, *scutum*. While in the tapestry most of the Saxon shields are represented round or oval, with a central boss, as in the illuminations of that people, there is no instance of a Norman with any other than the long kite-shaped shield.

The armour of the reign of William Rufus remained precisely the same as in that of the Conqueror; and we have no new specimen of any part, except the *chapel de fer*. This appears on the seal of Rufus, and resembles a Tartar cap, being a cone which projects beyond the head.

The great seal of Henry I. represents that king in ringed armour. Other specimens of his time occur in the enamelled copper of Geoffrey Plantagenet, engraved by Stothard, and described by John of Marmouster, and in a representation of similar date, engraved by Strutt, in his *Dresses and Habits of the People of England*, from a manuscript in the possession of the late Francis Douce, Esq.

In the reign of Stephen, what is called tegulated armour appears to have prevailed, which consisted of several little plates, covering each other in the manner of tiles, and sewn upon a hauberk, without sleeves or hood. The seal of Richard Fitzhugh, Earl of Chester, engraved in the *Vetusta Monumenta* of the Society of Antiquaries, affords a fine specimen of this kind of hauberk. The nasal of the helmet appears to have been disused toward the close of this reign; though, upon his great seal, Stephen is represented with it.

Henry II. is represented upon his great seal in a flat-ringed hauberk, wearing a conical helmet without a nasal. The flat rings, however, gave way soon after the commence-

ment of his reign, and the hauberk with rings set edgewise came into general fashion. The shape of the shield became somewhat shortened, and often more angular on each side at the top.

Richard I., in his first seal, appears in a hauberk of rings set edgewise, from under which falls the drapery of his tunic; in the second seal he has the same without drapery; in both he is represented with chausses: in the first, wearing a conical helmet, but with its apex somewhat rounded; in the second, with a cylindrical one, surmounted by the *planta-genista* (or broom plant) in reference to his name, and having an aventaille or plate to protect the face.

The great seal of John affords the first example of an English king wearing a surcoat: it is put over a hauberk of rings set edgewise. Surcoats are supposed to have originated with the Crusaders, for the purpose of distinguishing the many different nations serving under the banner of the cross, and to throw a veil over the iron armour, so apt to heat excessively when exposed to the direct rays of the sun. Besides the surcoat, the hauberk was a military garment in great esteem during this reign. Thus, in a wardrobe account dated in 1212, we find a pound of cotton was expended in stuffing an aketon belonging to King John, which cost twelve pence, and the quilting of the same was charged at twelve pence more. John is represented with a cylindrical helmet, but without any covering over his face. The monument in the Temple church ascribed to Geoffrey de Magnavilla, or Mandeville, which appears to be about this period, has one very similar, but with a nasal and cheek pieces.

Henry III.'s great seals afford us the earliest specimen of the *ouvrages de pourpointerie*, which came more into fashion toward the latter part of his reign. His hauberk and chausses are of this padded work, stitched. On his first seal his helmet is represented as with the visor or aperture for sight, not in the aventaille, but in the helmet itself, while the latter has merely perforations for the breath, and is therefore fixed at the lower part. His second seal exhibits him in a cylindrical helmet of a more perfect form, the aventaille, which contains both the before-mentioned conveniences, being apparently made to open and shut by means of hinges and a clasp. This seal of Henry III. also represents him in a surcoat. A remarkable monumental effigy of a knight of this reign, in the armour of rings set edgewise, occurs in the church of Malvern in Worcestershire. The monumental figure of Richard Longespée, Earl of Salisbury, who died in 1224, is another specimen. 'The horse soldiers, at this time,' says Sir S. Meyrick, 'consisted of the heavy cavalry, who were the knights, and completely covered with mail, or, as Matthew Paris expresses it, *ad ungum armatos*, the face and left hand excepted.' In a manuscript, entitled *The Lives of the Offas*, written by Matthew Paris (MS. Cotton. Nero. D. i.), and of the time of Henry III., the knights appear generally in gamboused armour (padded work, stitched), with surcoats, and wearing shin-pieces or greaves of steel. One, however, is in a hauberk, with hood and chausses of flat contiguous rings, and probably this is the latest example of such armour being worn. Some appear with visors, consisting of a convex plate of steel, on which is a cross, with perforations for the sight, and punctures for the breath, tied upon the hood. Others have a nasal skullcap, though not the latest representation of this defence; and others the cylindrical helmet common to this period. The helmets of the kings are distinguished from the rest by a crown at top. They have all, too, those coverings for the knees called poleyns. This word is often erroneously confounded with poulaines, which were the long points at the toes of shoes, worn in Richard II.'s time, as well as anterior; but we learn from the following passage from Carolus Blesensis, in Lobineau's *Hist. Bretagne*, vol. ii. p. 566, that they were for the knees: 'Fecit sibi per Oliverium auferri à genibus poleynas, et antebrachia à brachiis.' He caused Oliver to take the poleyns from his knees, and the vambraces from his arms. Pourpointing, or elaborate stitching, it appears, became at this time a trade, and there were several pourpointers in Paris and London. The use of the pourpoint seems greatly to have gained ground, and the military in the delineations of this and the next reign are almost constantly depicted in it. Sir Samuel Meyrick says, 'it has been observed, that in the illuminations of this period, the archers are represented wearing leathern vests over their hauberks of edge-ringed mail. These appear to have been the jack in its primary form, which originated with the English, and which afterwards

assumed a shape so cumbersome. From the *Chronicle* of Bertrand du Guesclin, composed about the time of Richard II., we learn that it continued to be worn over the hauberk, for he says, 'S'avoit chascun un jacque par dessus son haubert.'

each had a jack above his hauberk. This small vest was called jacket, and in the Latin of the time, *jaquetanus*, as was the *jacque*, *jacquemardus* and *jacobus*. The monument of Eudo de Arsie, who died about the latter part of this reign, seems to represent him in the jacque. He is clad in mail, and wears this garment, which is made with sleeves, sits close to the body, is buttoned down the front, and has a puckered skirt reaching to the knees. In later times it was generally of leather, for Coquillart, an old French writer, '*sur les Droits nouveaux*,' describes it as of chamois, extending to the knees, and stuffed with flocks, so as to be a kind of pourpoint. During the latter part of this reign, the shape of the helmet underwent a partial change, taking the form of a truncated cone on the top of a cylinder: the apertures for the sight were horizontal, and pierced in the transverse part of a cross that ornamented the front. The crusade in this reign, says Sir Samuel Meyrick, seems to have introduced a new and most ingenious species of armour, probably of Asiatic discovery, and still worn by those nations at the present day. This was the interlaced rings, which, as dependent on each other, did not require to be sewn to an under garment. The earliest specimen he considers to be the monumental effigy of De l'Isle, in Rampton church, Cambridge-shire, which exhibits him in the flat coil worn during the greater part of this reign, but made, as well as his hauberk and chausses, of interlaced chain. The shape of his shield, however, is that of the close of Henry III.'s reign, and, with his surcoat, is ornamented with his armorial bearings. The *chapel de fer* continued to be used in this reign. The chanfron, or armour for the horse's head and face, first occurs in the clause roll of the fifty fourth Henry III.

Considerable improvements were made in armour during the reigns of the first three Edwards. Ailettes, or shoulder-pieces, appear to have been introduced in that of Edward I. In Edward II.'s time, armour appears to have assumed a mixed character, being neither altogether mail nor wholly plate. *Armures de fer*, toward the close of this reign, became the distinctive term, among the French writers, for plate-armour. The Florentine annals, says Sir Samuel Meyrick, consider the year 1315 as remarkable for a new regulation in armour, by which every horseman who went to battle was to have his helmet, breastplate, gauntlets, cuisses, and jambs all of iron, a precaution which was taken on account of the disadvantages their cavalry had suffered from wearing light armour at the battle of Catinio: but this usage did not find its way into general practice in Europe for at least ten years after. The seal of Edward Prince of Wales, afterwards King Edward III., represents him with ailettes on which are his arms, in the same manner as Edmund Crouchback is exhibited in Westminster Abbey, and in a missal belonging to the late Francis Douce, Esq. What is curious in this is the early representation of the mame-lieres, or pieces put on the breast, from which depended chains, one of which was attached to the sword-hilt, and the other to the scabbard. The armour at the close of this reign may be seen in an initial letter of a grant from King Edward II., constituting his brother, Thomas de Brotherton, Marshal of England. (See the MS. in the Cottonian Library, Nero. D. vi.) In the chancel of Ash church, in Kent, is the monumental effigy of a knight which exhibits still further the progress toward plate-armour.

The helmet on the seal of Edward II. is of a cylindrical form, with a grated or pierced aventaille and visor attached: a clasp which fastens this on the right side is very visible, and it is probable that on the other it was retained by hinges. It was very much the custom during this reign to wear over the armour the cointisse, or surcoat, ornamented with the warrior's arms.

The monumental effigy of John of Eltham, who died in 1329, exhibits the fashion in which armour was worn at the commencement of the reign of Edward III.: similar to which is the figure on the monument of a knight in Ifield church, in Sussex. The splendid manner, it is observed, in which some of the knights of this period chose to have their armour made proved sometimes fatal to them. Froissart tells us, that 'Raymond, nephew to Pope Clement, was taken prisoner, but was afterwards put to death for his beautiful armour.' The monument of Sir Oliver Ingham,

at Ingham church, in Norfolk, who died in 1313, shows the further gradual progress of mixed armour. His monument also affords us one of the earliest specimens of the justing helmet of this time, surmounted by its crest—an owl with wings expanded. The equestrian statue of Bernabò Visconti, at Milan, engraved in the *Archæologia*, vol. xviii. pl. xii. xiii. xiv. with its details, affords a magnificent specimen of the mixed armour used at this time upon the continent. Movable visors attached to the bacinets (or skull-caps in the form of a bason) appear to have come in about the middle of the reign of Edward III. The Black Prince's monument at Canterbury, who died in 1360, is another specimen of the period. The monument of Humphrey de Bohun, Earl of Hereford, in 1367, Sir Samuel Meyrick observes, is the earliest specimen of plate-armour with taces, or overlapping plates to envelope the abdomen, at the bottom of the breastplate, without any surcoat. It was not till the reign of Henry V. that this practice became general. Humphrey de Bohun wears plate over the insteps, but the rest of his feet is covered with chain.

The reigns of Richard II. and Henry IV. were still more distinguished by the increased ornament of armour. The armourers of Italy were much employed at this time by the English nobility. When Henry, Earl of Derby, proposed the combat with the Duke of Norfolk at Coventry, he sent to Galeazzo, Duke of Milan, for armour, who gave the knight who bore Henry's message not only the choice of all his armour, but sent with him to England four of the best armourers of Milan to give personal attendance upon Henry for his equipment. Chaucer, noticing a tournament at this period, says,

There mayest thou see deviling of bacinets
So smooth and so rich, by, and wrought so well
Of goldsmithery, of broding, and of sceler;
The sheldes, bairdte, testeres, and trappures;
Gold bewen helmes, hauberkes, cote armures; v. 2092.

Soon after the year 1400, chain-mail seems to have been entirely disused; and the complete armour of plate adopted. Henry V. is so represented on his great seal, as well as in one of the illuminations of the celebrated Bedford Missal; in the latter he is represented being armed by one of his esquires. Black armour was at this period often used for mourning. Henry IV. is constantly represented in black armour in the illuminations to the celebrated manuscript on *The Deposition of Richard II.*, preserved in the Harleian Collection.

A more splendid specimen of armour of the reign of Henry VI., than that represented on the effigy of Richard Beauchamp, Earl of Warwick, in the Beauchamp Chapel at Warwick, will not be found anywhere: he died in 1439.

The fashion of armour prevalent through the reign of Edward IV. may be judged of from that monarch's great seal, and from the monumental effigy of Sir John Crosby, in the church of St. Helen, without Bishopsgate, in London. The latter died in 1475. Soon after this time, numerous specimens of armour occur with immense elbow-plates; these continued till the time of Henry VIII.

The perfection of plate armour is supposed to have been attained in the reign of Richard III.

A fine and singular suit of armour, which undoubtedly belonged to King Henry VII., is still preserved in the Tower of London, and is considered the greatest curiosity in that collection: it is accompanied by a chanfron, manœuvre, and portral of the same period, for arming the horse.

Fluted armour was sometimes used in the reign of Henry VII.: this fashion is supposed to have come from Germany.

Drawings of various military figures of the middle of King Henry VIII.'s reign, made at the time, occur in the Cottonian manuscript in the British Museum marked Augustus II., and amongst them Henry himself in armour. A great deal of the armour of this period had devices, arms, &c. stamped or engraved upon it; and some was *damasquinee*, or inlaid with gold.

In the reign of Edward VI. a slight change took place in the form of the breast plate, which was again a little changed in the reign of Mary. During Elizabeth's reign, no great alteration took place. 'But armour *cap à pie*,' says Sir Samuel Meyrick, 'began to fall into disrepute soon after the accession of King James I., and, in the latter part of his reign, the jaumbs or steel coverings for the legs were almost wholly laid aside.' At Strawberry Hill, there is a suit of armour said to have belonged to Francis I. of France, which Sir Samuel Meyrick ascribes to the reign of James. It is embossed and gilt, and is considered to be probably

one of the latest specimens of armour with raised figures upon it.

King Charles I. is continually represented in armour; and he took great pains to bring about a uniformity in the fashion of armour among his officers and soldiers. But the troubles of his reign, and the success of the levellers of that period, caused a material alteration, so that soon after the establishment of the Protectorate we find the helmet and cuirass only worn: the latter consisting of a breast and back plate. The wearing of armour to the knees continued only to the time of Cromwell. The cuirass and a kind of helmet, however, are still retained amongst us for the royal regiments of Life Guards; and have, likewise, been resumed in the armies both of the French and German.

For this account of armour, various works have been consulted—Grose's *Treatise*; Gough's *Sealed Monuments*, &c.; but the chief outline has been taken from Sir Samuel Meyrick's *Critical Inquiry into Ancient Armour as it existed in Europe, but particularly in England, from the Norman Conquest to the Reign of Charles II.* The collection of ancient armour possessed by that gentleman's son at Goodrich Court, in Herefordshire, and his own extensive researches, have supplied more information upon the subject than it is probable could have been given by any other writer.

The reader who wishes for further information may consult Sir Samuel Meyrick's *Engraved Illustrations of Ancient Armour from the Collection at Goodrich Court*, 2 vols. fol. Oxford, 1830, where (pl. iv. to x.) a series of tournament armour of successive dates, from 1458 to 1586, is exhibited.

Bordeaux steel is frequently mentioned by Froissart as excellent for armour. Felippo Negroli, of Milan, was the eminent armourer who worked for Francis I. of France, and the Emperor Charles V.

Some remarks on the ancient mode of putting on armour, communicated to the Society of Antiquaries by Sir Samuel Meyrick in 1821 (see the *Archæologia*, vol. xxv.), unravel, by the help of an ancient document, what was previously an enigma. The knight began with his feet and clothed upwards: viz. 1. his sabatons, or steel clogs; 2. the greaves, or shin-pieces; 3. the cuisses, or thigh pieces; 4. the breech of mail; 5. the tuiettes, or overlapping pieces below the waist; 6. the breast plate, or cuirass; 7. the vambraces, or covers for the arms; 8. the ere braces, or arriere bras, the covering for the remaining part of the arm to the shoulder; 9. the gauntlets; 10. then the dagger was hung; 11. the short sword; 12. the cloak, or coat, which was worn over the armour; 13. the bacinnet; 14. the long sword; 15. the pennoneel, held in the left hand; 16. the shield.

ARMS, in a general sense, includes all kinds of weapons, whether of offence or defence. Amongst the earliest, we may probably reckon the bow and arrow. It enabled man to kill wild animals for food before its use was required as a weapon of war. As a military weapon, it was probably succeeded by the sling. Lucretius says,—

* Arma antiqua, maxims, ungues, dentesque ferunt &c.

* Man's earliest arms were fingers, teeth, and nails,
And stones, and fragments from the branching woods,
Then fires and flames they joined, directed soon;
Then copper next, and last, as latest traced,
The tyrant iron, then the copper vein
Less freely found, and sturdier to adhere.

Homer and Hesiod tell us, that, in the early ages, the arms and instruments of the heroes were composed entirely of χαλκός (*copper*), perhaps hardened with tin. The word is commonly translated *brass*, but it could hardly have been the compound metal which we understand by brass. Defensive arms have been already treated of under ARMOUR. The present article is confined chiefly to weapons of offence.

The Jews appear to have had swords, daggers, spears, javelins, bows, arrows, and slings: axes or maces were also used by them as weapons of war.

Herodotus (vii. 61-80) gives a minute description of the weapons used by most of the different nations which formed the great army of Xerxes. Amongst these, the Medes and Persians had short spears, bows, arrows made of reeds, and daggers; the Assyrians, besides spears and daggers, had wooden clubs knotted with iron; the Bactrians and Parthians, bows made of reeds, and short spears; the Arabians had bows, large, flexible, and curved at the ends; the Ethiopians, bows made from the spath (σπαθῆ) of the palm, four cubits, or six feet, long; their arrows were short, and pointed with sharp stones instead of iron; they had spears headed

with the sharpened horns of the *doreas* [See *ANTIKLOPE*, p. 70], and knotted clubs. The Libyans had their spears hardened at the end by fire. The Paphlagonians, Phrygians, and Thracians, had spears, javelins, and daggers. In the Persian army at the battle of Cunaxa, we find chariots armed with scythes mentioned. (Xenophon, *Anab.* I. 8.)

The Grecian armies were composed of various sorts of soldiery. In the earliest ages, as we see from Homer, the chief personages often fought in chariots; but this practice seems not to have existed in the historical ages. The cavalry of Thessaly and that of Macedonia obtained the highest reputation among the Greeks. It was with this cavalry that Alexander mainly defeated both the troops of the Persian king and those of the rulers of the Penjab. With the age of Alexander elephants were brought into use, and they were employed both by Pyrrhus the Greek King of Epirus, and by Hannibal also, in their invasions of Italy. The Greek foot soldiers were distinguished by the terms *οπλίται* (*hoplitai*), those who wore armour, and carried broad shields and long spears; and *ψιλοί* (*psiloi*), the light troops, who, with no other protection than a helmet, were armed with darts, bows and arrows, or slings. The *πτεράσται* (*ptelestai*), who carried the pelta, or narrow-pointed shields, and spears, were a species of light troops, and considered as an intermediate kind. The heavy-armed foot were the chief strength of the Grecian armies.

The Greek spears were generally of ash, with a leaf-shaped head of metal, and furnished with a pointed ferrule at the butt, with which they were stuck into the ground. Pausanias saw a spear in the temple of Minerva at Phaselis, said, according to the legend, to have belonged to Achilles, the blade and ferrule of which were of copper. The same diligent and credulous observer saw a knife at Nicomedia, altogether made of copper, which once belonged to Memnon; that is, it was a very old knife, kept as a curious piece of antiquity. The Macedonians had a particularly long spear called *αἰπύρα* (*aipeira*), which was fourteen or sixteen cubits in length. (See Polybius for this extraordinary length, and the notes to the *Onomasticon* of Julius Pollux, v. *αἰπύρα*.)

Swords, spears, javelins, bows, and slings, were the offensive arms of the Romans, whose infantry soldiers were divided into *hastati*, who fought with spears; *principes*, who led the van; *triarii*, the third line; *velites*, the light troops; *funditores*, the slingers; and *sagittarii*, the archers. Their cavalry used the javelin on horseback. The arrows of the *sagittarii* had not only their pikes barbed, but were furnished with little hooks just above, which easily entered the flesh, but tore it when an attempt was made to draw them out. What greatly contributed to render the Romans masters of the world, was, that as they successively fought against all nations, they renounced their own arms and methods of fighting wherever they met with better. Romulus, after the war with the Sabines, is said by Plutarch (Romulus, 21) to have adopted the broad buckler of that nation, instead of the Argolic buckler (*aspis Argolica*), which the Romans had used till that time: a story of little historical value, but confirmatory of the opinion that the Romans improved their military art by adopting the best things from other nations, and that they traced this policy to the supposed origin of their national existence.

The early Saxons, previous to their arrival in Britain, besides the buckler and dagger, used a sword bent in the manner of a scythe; but their descendants soon changed it for one that was long, straight, and broad, double-edged, and pointed. The ordinary weapons of the Saxons, after their arrival in our island, for the infantry, were spears, axes, bows and arrows, clubs, and swords. Few of the infantry had any other defensive armour than small round shields with spikes in the centre. The cavalry were more uniformly armed with long spears which they carried in their right hands, and swords which hung by a belt on their left sides.

The arms of the Normans differed but little from those of the Saxons; their spears or lances were usually made of some light strong wood, pointed with steel, very sharp, and well-tempered; to these, with the sword and dirk, they added the cross-bow, as has been already shown in the article *ARCHERY*. The Normans also appear to have introduced a kind of field-artillery, consisting of instruments or machines from which darts and stones were thrown to a considerable distance: to which, also, they added arrows headed with combustible matter for firing towns and shipping.

Our military weapons were probably but little altered till the time of Edward I., when the English long-bow seems to have been adopted, or rather arrived at its proper use.

Gunpowder was invented in the thirteenth, and the larger sort of fire-arms in the fourteenth century: these will be separately treated of under the head of *ARTILLERY*.

Portable or hand fire-arms, to which we shall confine ourselves at present, were not invented till a century later. Sir Samuel Meyrick, in a Memoir in the *Archæologia* of the Society of Antiquaries, has collected most of the scattered notices to be found in military writers relating to their introduction. He has, indeed, given the very year of their invention, upon the authority of an eye-witness. 'It was in 1430,' says Bilius, 'that they were contrived by the Lucqueze when besieged by the Florentines;' and we shall find that not only is the credit of the first conception of these weapons due to the Italians, but most of the subsequent improvements.

A French translation of Quintus Curtius, written in 1468, preserved among the Burney MSS. in the British Museum, exhibits two warriors in one of its illuminations, who bear the earliest representations of hand fire-arms with which we are acquainted: they appear to be hand-guns.

The following is the enumeration of the different pieces of portable fire-arms and their accompaniments, almost all of which have been engraved by Skelton, in his *Spectemus of Arms and Armour*. Hand-cannon, hand-gun, arquebus, arquebus à croc, haquebut, demi-haque, musquet, wheel-lock, courier, snaphaunce, caliver, carabine, eslopette, fusil, musquetoon, fowling-piece, petronel, blunderbus, dragon, hand-mortar, dag, pistol, tricker-lock, fire-lock, self loading gun, fancy-gun, musket-arrows, match-box, powder-horn and flask, touch-box, handeleers, cartridges, patron, sweynes feathers, and bayonet. The recollection of the fact, that *phialæ* (small pots) had been sometimes used for casting the Greek fire, was likely to lead to some more dext'rous invention. The Emperor Leo, in his *Tactics*, ch. xix. § 6, *περί ναυμαχίας, on sea-fight*, describing the use made of artificial fires in vessels employed in pursuit after a naval battle, says, 'on the prows of such vessels were placed *σίφωνες* (*siphones*), large tubes; they were of copper, through which these fires were blown into the enemies' ships.' Anna Comnena (*Alex.* I. xiii.) says, 'that soldiers were supplied with copper tubes, and blew artificial fire, in the same way, upon their enemies in battles on land.' Here we have, undoubtedly, the origin of fire-arms.

The *hand-cannon* was a simple tube fixed on a straight stock of wood, about three feet in length. It was furnished with touch-hole, trunnions, and rascable, like a large cannon. The touch-hole was, in the first instance, at top; but the liability of the priming to be blown away led to the improvement of placing a small pan under the right side to hold the powder. This pan was the first step to the invention of the gun-lock.

The *hand-gun* was an improvement on the hand cannon. It was cast in brass, and, as a tube, was of greater length; a flat piece of brass, made to turn upon a pin, covered the pan which contained the powder: it had also the addition

of a piece of brass fixed on the breech, and perforated to ensure the aim. The hand-gun appears to have been in use in England at least as early as 1446. The Greeks made use of it to great advantage in their last defence of Constantinople in 1453.

As soon as the hand-gun had received a contrivance suggested by the trigger of the cross-bow, to convey with certainty and instantaneous motion the burning match to the pan, it acquired the appellation of *arquebus*, corrupted into *harquebus*. Previous to this invention, the match had been held in the hand in using the hand-gun as well as the hand-cannon. The arquebus is first mentioned by Philip de Comines, in his *Account of the Battle of Morat* in 1476. In England, on the first formation of the Yeoman of the Guard in 1485, one-half were armed with bows and arrows, the other with arquebuses. At the battle of Fournoe, in 1495, we read of mounted arquebusiers. A large party of arquebusiers are seen in the picture at Windsor which represents King Henry VIII.'s procession to meet Francis I., between Guisnes and Ardres. The arquebus, like the hand-cannon and hand-gun, being fired from the chest, while its butt remained straight, the eye could with difficulty only be brought sufficiently near to the barrel to afford a perfect aim. By giving to the butt a hooked form, the barrel was elevated, while the horizontal position would be retained. This idea originating with the Germans, gave name to the fire-arms thus constructed, and was thence by the English termed a *haquebut*, *hakebut*, *hagbut*, or *hagbush*. The invention as well as the name was known in England as early as the reign of Richard III. We find numerous *haquebutters* in the English army in the time of Henry VII.

The *demihaque* was a kind of long pistol, the butt-end of which was made to curve so as almost to become a semi-circle. The demihagues were smaller, and probably about half the weight of the haquebuts, the diameter of the barrel being much less. In the *Gesta Grayorum*, printed in 1594, we are told they carried bullets, and sometimes half shots.

The *musquet* was a Spanish invention. It is said to have first made its appearance at the battle of Pavia, and to have contributed in an especial manner to decide the fortune of the day. Its use, however, seems for a while to have been confined. It appears not to have been generally adopted till the duke of Alba took upon himself the government of the Netherlands in 1567. M. de Strozzi, Colonel-General of the French infantry under Charles IX., introduced it into France. The first Spanish musquets had straight stocks; the French, curved ones. Their form was that of the haquebut, but so long and heavy, that something of support was required; and hence originated the *rest*, a staff the height of a man's shoulder, with a kind of fork of iron at the top to receive the musquet, and a ferule at bottom to steady it in the ground. On a march, when the piece was shouldered, the rest was at first carried in the right hand, and subsequently hung upon the wrist by means of a loop tied under its head. A similar rest had been first used by the mounted arquebusiers. In the time of Elizabeth, and long after, the English musqueteer was a most encumbered soldier. He had, besides the unwieldy weapon itself, his coarse powder for loading, in a flask; his fine powder for priming, in a touch-box; his bullets in a leathern bag, the strings of which he had to draw to get at them; while in his hand was his burning match and his musquet rest; and when he had discharged his piece, he had to draw his sword in order to defend himself. Hence it became a question for a long time, even among military men, whether the bow did not deserve a preference over the musquet.

An ingenious contrivance to supplant the match-lock appeared in the reign of Henry VIII. This was the *wheel-lock*, invented in Italy. M. de Bellai informs us, that one of the first occasions on which it was used was in 1521, when Pope Leo X. and the Emperor Charles V. confederated against France, and their troops laid siege to Parma, which was defended by the Marquis de Foix. It was a small machine for exciting sparks of fire by the friction of a furrowed wheel of steel against a piece of sulphuret of iron, which, from such application, acquired the name of pyrites or fire-stone. The spring which turned this wheel was attached to it by a chain, formed like those in watches, and was wound upon the axle, or, as the term was, 'spanned' with a small lever called a spanner. This instrument had at one end a hole made square to correspond with the projecting axle of the wheel, and being adjusted, was moved in the

direction of a screw, which made the wheel revolve, and a little slider that covered the pan retire from over it. The spanner was then removed, as the wheel was held by a catch connected with the trigger, and the cock, like that in modern firelocks, except having its position reversed, containing the pyrites, was brought down upon the wheel, which, rapidly revolving, grated against the pyrites and elicited the fire. Wheel-locks were for a long time chiefly manufactured in Germany. They were certainly brought to England in the time of Henry VIII., in whose reign we find them mentioned in inventories under the name of 'fier-locke.' Benvenuto Cellini (*Memoirs*, vol. i. p. 182, Roscoe's transl.) mentions his mounting a brown Turkish horse, and placing a wheel-lock arquebus at the pommel of the saddle, in the year 1530.

The *Currier*, or *currier of war*, is another species of fire-arm first noticed in a letter from Lord Wentworth to Queen Mary (see the *Hardwick State Papers*), while writing respecting the siege of Calais. It is again noticed in the Earl of Essex's operations in Ireland in the time of Queen Elizabeth. (Birch's *Memoirs*.) The earliest account of it is given in a work entitled *The Knowledge and Conduct of Warres*, printed in 1578. Sir John Smith, in his *Animadversions on the Writings of Captain Barwick*, describes it as of the same calibre and strength as the arquebus, but with a longer barrel.

Grose observes, that the *Snaphaunce* derived its name from the troops who made use of it. These were a set of marauders whom the Dutch termed *snaphans* or 'poultry-stealers.' The use of the match-lock exposed them to this inconvenience, that the light from the burning match pointed out their position, and they were unable to purchase the wheel-lock from its expense. In this dilemma they formed the snaphaunce from a study of the wheel-lock. A flat piece of steel, furrowed in imitation of the wheel, was placed on a steel post, which, being screwed beyond the pan, was made moveable. Then the furrowed piece being brought to stand over it, on pulling the trigger, the flint, which they substituted for the pyrites in the cock, struck against it, and the spark was produced. This was an invention of the time of Elizabeth, and its comparative cheapness rendered it fashionable in France, Holland, and England. The snaphaunce was a near approach to the fire-lock.

The *Caliver* differed from the musquet in being lighter and shorter. It was a fire-arm of a regulated standard as to the diameter of its bore, which was larger than that of the arquebus. It was made to fire with a match-lock. A match lock caliver is preserved at Barningham Castle, Durham, which bears the date of 1611.

Of the *Carabine*, Sir Samuel Meyrick says, 'In the extraordinary for the war in Picardie, in 1599, we first meet with the troops called carabins, who were light cavalry in the service of Henry II., King of France.' M. de Montgommery informs us, that 'they were a curious sloped off the right shoulder, that they might the more readily catch their cheeks to take aim; that they had a cabri-set on their heads, and their bridle arms protected by an elbow-gauntlet. Their offensive weapons were a carabine three feet and a half in length, so named from themselves, and a pistol. Their manner of fighting was, to form a little squadron, deeper than wide, to discharge their pieces rank after rank, wheeling off, and forming immediately and successively in the rear of the rest, and thus prepare for a second discharge.' Now, although the origin of the word is involved in much obscurity, it is more consistent with analogy to suppose that the carabineers were so named from the gun, rather than that from them. The French derived this species of troops from the Spaniards; and DuRoi tells us that the Calabrians, who used the carbine, gave it this appellation. If so, it was probably at first used by them at sea in those vessels termed carabs. M. Bellon, in *Les Principes de l'Art Militaire*, tells us, that 'the carabines were armed with a large wheel lock arquebus, three feet or more in length, a sword, and a short pistol, in the time of Louis XIII., but being suppressed by his successor in 1665, we know that that king formed from them his carabineers.'

The *Eschopette*. The peculiar characteristics of this fire-arm, says Sir Samuel Meyrick, 'I have not been able to discover. It was called in Latin *schopeta*, a diminutive of *schopus*; and occurs in the *Chronicon Estense* under the year 1534, as well as in the decree of the Council of Tarragona in 1591, who forbade the clergy to make use of it. Probably it was only the foreign name of the demihaque.'

'The name of the *Fusil* as a fire-arm, in England,' says the same authority, 'does not appear to be older than the time of Charles II., though invented in France in the year 1630.' There are in the British service three regiments of fusileers or fuzileers, the Scots, now the 21st foot, raised in 1678; the English, now the 7th foot, levied in 1685; and the Welsh, now the 23d, formed in 1688 or 1689. The *Sieur de Gaya*, in 1688 (*Traité des Armes*), describes it as of the same proportions as the 'mousquet,' and furnished with a fire-lock: adding, that 'although by couching the cheek you can take better aim, yet it often misses fire from the use of the flint.' It seems to have been of the same length and calibre, but lighter than the musket. In modern times its size has been diminished.

The *Mousqueton*, or musketoon, was also of French origin. The same author describes it, in 1688, as not so long as the fusil, nor capable of carrying a ball so far by one-third, its barrel not rifled, but differing from the carbine in being furnished with a fire-lock instead of a wheel-lock, and from the carbine à l'extraordinaire not only in this, but in its fluted bore.

The *Fowling-piece*, though properly speaking a fabrication for the sole purpose of killing game, is entitled to a place in the history of military weapons from the circumstance of the Earl of Albemarle noticing it for the soldiers' use, in his 'Observations,' compiled about the year 1646, and published in 1671. He says, 'It is very fit likewise that you have in each company six good fowling pieces, of such a length as a soldier may well be able to take aim, and to shoot off at ease; twelve of them being placed in a day of battle, when you bring a division of foot to skirmish with an enemy, on the flanks of a division of foot, and six on the other flank, as you shall see them placed in these three battals following. Those soldiers that carry the fowling pieces ought to have command when they come within distance of shot of that division of the enemy that they are to encounter with, that they shoot not at any but at the officers of that division.' We have here plainly the origin of riflemen.

The President Fauchet, who lived in the time of Francis I., and that of his successors till the time of Henry IV., introduces to our notice a piece called a *Petronel* or *poitrinal*, because it was rested on the poitrine or chest, after the old manner, and thence fired. It was the medium between the arquebus and the pistol, and differed from the long dag merely in having its butt made broader, so as to rest in its position with proper firmness. Fauchet says, it was believed 'that this arm was the invention of the bandouliers of the Pyrenean mountains.' Mention is made of it in 1592, at the siege of Rouen by Henry IV., and in the Hengrave Inventory of 1603 we have 'Item iij pethernels.' Nicot, in his dictionary, asserts that 'it was of large calibre, and, on account of its weight, carried in a broad baudrick over the shoulder.'

The *Blunderbus*. This is a fire-arm shorter than the carbine, but with a wide barrel. Sir James Turner, in his *Pallas armata*, p. 137, thus describes it: 'The carabineers carry their carabines in bauldriers of leather about their neck, a far easier way than long ago, when they hung them at their saddles: some, instead of carabines, carry blunderbusses, which are short hand guns of a great bore, wherein they may put several pistol or carbine balls, or small slugs of iron. I do believe the word is corrupted, for I guess it is a German term, and should be donderbucks, and that is, thundering guns, donder signifying thunder, and bucks a gun.' Sir Samuel Meyrick remarks that Sir James Turner is right in his etymology, except that 'bus' and not 'bucks' is the term for a gun, a name that became general after its introduction in the word arquebus: the modern German word is blüchse. Blunderbus being called in the Dutch language *donderbus*, in all probability it was from Holland that the English derived it: it does not appear to have been much known before the time of Charles II.

The *Dragon*. The troops called dragoons have been most absurdly said to have been so denominated from the Draconarii of the Romans. They were raised about the year 1600 by the Marechal de Brisac, in order to be superior to the German Reiters, who used the pistol to so much advantage. On this account they had a more formidable weapon like a small blunderbus, the muzzle of which being ornamented with the head of a dragon, gave it its denomination, and from this weapon those who used it were called dragoncers and dragoons. Other, but less satisfactory, ex-

planations of the term dragoon (with no reference to the fire-arm called a dragon) will be found in Sir James Turner's *Pallas armata*, in Pere Daniel's *Milice Française*, and in Count Bismark. The dragon will be found among Skelton's engraved illustrations.

The *Hand-mortar*. Grenades are said to have been first used in 1594, and gave origin at a later date to the troops thence denominated grenadiers. Like the dragon it appears to have been fired from the shoulder.

The *Dag*. In pursuing the inquiry into the origin of this term, says Sir Samuel Meyrick, nothing could be more perplexing than to find, that while dag implied a kind of pistol, pistolese, in the Italian language, signified a great dagger or wood-knife. The weapon appears to have been suggested by the demihaque, and differs from the pistol solely in the form of the butt end, that being invariably terminated by a straight oblique line instead of a knob. In this respect it greatly resembled a petronel, and that it gave the distinction is clear, from what is wrongly called a Highland pistol being by the Highlanders themselves termed a tack, and its having its butt made flat and terminated slant-wise. The dag was of various sizes, and hence in inventories of arms we meet with long, short, and pocket dags, and dags with different kinds of locks. It appears to have been almost coeval with the pistol, which is known to have been invented in the reign of Henry VIII.; for in the inventory, taken in 1547, of stores in the different arsenals in England, 'one dag with two pieces in one stock' occurs, with 'a white tacke with fier Locke graver, and all the stocke white bone: two tacks, after the fashion of a dagger, with fier lockes vernished with redde stockes, shethes covered with blacke vellet garnished with silver and guilt, with purses, flasks, and touch boxes, of black vellet garnished with iron guilt: two tacks, hafted like a knife with fier lockes and double lockes, &c.' The snaphaunce dag seems to be alluded to in the play of Jack Drum's entertainment:

'He would shew one how to hold the dag,
'To draw the cock, to charge and set the flint.'

The *Pistol*, according to Sir James Turner, was invented at Pistoia, in Tuscany, by Camillo Vitelli, and in the reign of Henry VIII. M. de la Noue says, 'the reiters first brought pistols into general use, which are very dangerous when properly managed.' These reiters, or more properly ritters, were the German cavalry, who gave such ascendancy to the pistol as to occasion in France, and subsequently in England, the disuse of lances. We learn this interesting fact from Davila, who, speaking of the battle of Ivry, in 1590, takes occasion to extol the use of lances, and express his regret that the French cavalry, composed of gentlemen volunteers, had, in the revolutions of the civil wars, ceased to use them. He tells us, that in consequence of their having adopted pistols as more ready, in imitation of the German reiters, the king was obliged to oppose the lances of the enemy's cavalry by dividing his own into small bodies, that they might offer less resistance to the charge, and more easily get out of the way. Pere Daniel informs us, that the horsemen who were armed with pistols, in the time of Henry II., were thence called pistoliers, a term subsequently introduced into England. John Bingham, in his *Notes on the Tactics of Adrian*, published in 1616, gives us an engraving of the arms and armour of this species of troops at that time, from which a correct knowledge may be obtained of their form. The first ordonnance of Henry II., King of France, respecting the pistol, is directed to the men at arms, and dated 1549; the regulations of Mary Queen of England were of a similar character; both implying that the adoption of the pistol, in the first instance, was by permission. The manual exercise of this weapon is detailed and exhibited in several plates in Captain Cruso's *Military Instructions for Cavalry*, published in 1632. Sir James Turner, in his *Pallas armata*, published in 1670, says, the French then used locks with half-bends (snaphaunces), as well as for the most part the English and Scots: the Germans rose or wheel-locks; the Hollanders used both.

The *Trickerlock*. 'A match tricker-lock compleat' occurs in a schedule of the year 1629. This was the adoption of what is now termed a hair-trigger, which was added to the former one, and gives a more instantaneous discharge. A tricker wheel-lock of the reign of Charles I., a tricker match-lock of that of Charles II., and a tricker fire-lock of that of James II., upon this principle, are preserved in Mr.

Meyrick's collection of arms and armour at Goodrich Court, in Herefordshire.

The Fire-lock. Sir Samuel R. Meyrick is in possession of a portrait of a republican officer, said to be that of Colonel Joyce, which proves that the modern firelock is an invention as early as the middle of the seventeenth century, for he has a firelock pistol in his hand. This is important evidence, for it has been shown that the name had been equally applied to the wheel-lock. The firelock was evidently suggested by the snaphaunce. It originated with the French about the year 1635. The steel post on which the furrowed piece had been placed was got rid of, and that set upright on the cover of the pan. The cock was moved sufficiently near to permit its opening; the pan, by the sudden impulse on striking this furrowed piece, performing this operation, and giving fire at the same time. Such a firelock of the time of Cromwell will be found among Skelton's engravings. The term firelock was no longer applied to the fire-arm with the wheel, which was now termed 'the rose or wheel lock.'

The Self-loading Gun originated in Italy about the close of the English Protectorate. The butt was made to answer the purpose of a flask, and a small touch-box was attached to the pan. At the breech was a cylinder, with a hole to receive the bullet. To the axle of this cylinder was affixed a lever, on turning which the bullet was conveyed to its proper place; sufficient portions of charge and priming were cut off, and the piece cocked at the same time. This, therefore, rendered the firelock just described as expeditious as the long bow; but the contrivance was attended with great danger, and occasioned the subsequent inventions of a moveable breech containing several charges, or a small barrel to be brought to the breech when requisite to load, &c.; but none of these contrivances were ever adopted by infantry regiments.

In 1712, a brass fire-arm called the *Panegy gun* was invented. It was in the shape of a walking-stick, and might be used as a gun or pistol; but it was never used for military or even general purposes.

Musket-Arrows, sometimes called fire-arrows, are at least as old as the time of Queen Elizabeth. They occur in the inventories of the royal arsenals. Sir Richard Hawkins, in the account of his voyage to the South Sea in the year 1591, speaks of using them with great success. In Elizabeth's time, these arrows, which carried combustibles, were of wood; at a subsequent period they were made of iron. Arrows of this latter kind were used in the Civil Wars, at the siege of Lyme. Lord Bacon says the arrows shot by muskets were called sprights.

The Match-bar. One great inconvenience, says Sir Samuel Meyrick, of the burning match was, that it discovered the soldier on guard, and counteracted the necessary secrecy for enterprizes by night. To remedy this defect, small tubes of tin or copper, pierced full of holes, were invented by a Prince of Orange, apparently Prince Maurice. They are thus described by Walhuysen, a captain of the town of Danzig, in his *Art Militaire pour l'Infanterie*, printed in 1615. 'It is necessary that every musketeer should know how to carry his match dry in moist or rainy weather, that is, in his pocket or in his hat, by putting the lighted match between his head and hat, or by some other means to guard it from the weather. The musketeer should also have a little tin tube, of about a foot long, big enough to admit a match, and pierced full of little holes, that he may not be discovered by his match, when he stands sentinel, or goes on any expedition.' This was the origin of the match-box, till lately worn by our grenadiers on one of the cross belts in front of their chests.

The Powder-horn and Flask. The convenient form of the horn to hold gunpowder, one end being broad, into which it might be conveyed with ease, and the other with a small aperture by which it might be discharged into the barrels of fire-arms, naturally suggested it as best adapted for the purpose. But it was not long before the narrow end was entirely closed, and the broader one furnished with a tube that might contain just sufficient powder for one charge. In this state it appears suspended in front from the necks of the arquebusiers in the triumph of Maximilian I. This modification of the powder-horn suggested the more capacious flask, which, with its name, in reference to its resemblance to a bottle, is of German origin. The flask was known in England as early as the reign of Henry VIII., and appears on a hackbutter of that date in one of Strutt's

engravings, taken from an original drawing in the British Museum, suspended like the horn, but at the hip, instead of on the breast. So in the inventory, taken 1 Edward VI. we have 'One horne for gonne-powder, garnished with silver. Three grete flasks covered with vellet, and three lytle touch-boxes.' And in that of Hengrave, 'xxiij flasks, and as many toothe boxes.' M. Montgomeri Corbisson, in his *Treatise on the French army in the time of Henry IV.* informs us that 'the captain of a company, mounting guard, ought to carry an arquebuse and a powder-flaske, and wear on his head a great plume of feathers. Varieties of powder-horns and flasks will be found in Skelton's engravings.

The Touche-box. Gunpowder was at first not corned: when, however, it had been manufactured into granules, such as were considered proper for the charge, it was discovered that the finer these were made the quicker would they ignite. This was the origin of priming or serpentine powder, and consequently of a small case to hold it, which is in reality a flask on a smaller scale, to which the name given was touch-box.

Bandoliers. To enable the soldier to load his piece with greater rapidity, small cylindrical boxes, each containing one charge of powder, either of wood or tin, and covered with leather, were suspended to a belt or band, put either over the shoulder or fastened round the waist. They seem to have been first introduced in the reign of Henry III. of France. The earliest instance which Sir Samuel Meyrick met with of the bandolier was in Montfaucon's *Monarchie Françoise*, pl. cccxv.; Davis, in his *Art of War*, he says, would induce the belief that the English received them from the Walloons in the neighbourhood of Liège. Sometimes six were placed before, and six behind the person, when slung over the shoulders; sometimes more. Nine are appended to a waist-belt in Mr. Meyrick's collection. Immense numbers still remain at Hampton Court. Sir James Turner, who published his work in 1670, says they were first laid aside about thirty years before by the Germans. Soldiers who were without cloaks could not keep them from snow and rain which soon spoiled them, and made the powder useless; and in surprisals, the noise which they made betrayed those who carried them.

The Cartridge. Sir James Turner, speaking of the pistol, says, 'all horsemen should always have the charges of their pistols ready in patrons, the powder made up compactly in paper, and the ball tied to it with a piece of pack-thread.' In this description we have evidently the cartridge, though not expressed by name. It is a curious fact that these were first confined to the cavalry, and that the general adoption of the cartridge was not earlier than the common use of the modern firelock. Lord Orreby, in his *Treatise on the Art of War*, says, 'I am, on long experience, an enemy to the use of bandoleers, but a great approver of boxes of cartridges, for then, by biting off the bottom of the cartridge, you charge your musket for service with one ramming. I would have these cartridge-boxes of tin, as the rabiners use them, because they are not so apt to break as the wooden ones are, and do not in wet weather, or lying in the tents, relax. Besides, I have often seen much prejudice in the use of bandoleers, which, being worn in the belts for them above the soldiers' coats, are often apt to take fire, especially if the matchlock musket be used; and when they take fire, they commonly wound and kill him that carries them, and those near him; for likely, if one bandolier take fire, all the rest do in that column; they often tangle those which use them on service, when they have fired, and are falling off by the flanks of the files of the intervals to get into the rear to charge again.'

The Patron was an upright semi-cylindrical box of steel, with a cover moving on a hinge, filled with a block of wood with five perforations to hold as many pistol-cartridges. Skelton has engraved some of Elizabeth's time, and in the *Diversarum Gentium Armatura Equestris*, printed in 1617, the German cavalry are represented with a brace of pistols in the same holster at the saddle-bow, and patrons at their hips.

The Sneyes feather, and Musket-rest. To remedy the inconvenience of a musketeer's being compelled to draw his sword, and defend himself after the discharge of his piece, and to render him more competent to act against the pikemen, a long thin rapier blade, fixed into a handle, and carried in a sheath called a sneyes feather, i.e. hog's bristle, the invention of which is by its other name attributed to the Swedes, was given him instead. This, after a discharge, he drew out of its scabbard, and fixed into the

muzzle of his gun, which gave him a weapon of great length; but as the soldier had then more to carry in his hand than previously, an attempt was made to unite the sweynes-feather with the rest. This latter, instead of having a wooden shaft simply, was made of a thin tube of iron, covered with leather, which held within it the feather. Thus it was preserved from rain, and when wanted, it could be ejected by a jerk. The sweynes-feather was invented in the reign of James I. During the civil wars, its name was sometimes corrupted into swan's-feather. One of the musket-rests, armed with a projecting pike from one of the prongs of its fork, is represented in Grose's *Treatise on Antient Armour*, pl. xl. fig. 5. The Duke of Albemarle, in his *Observations upon Military and Political Affairs*, written in 1646, and printed in 1675, recommends arming musketeers and dragoons with muskets and sweynes-feathers, with the heads of rests fastened to them. The rests themselves were apparently disused about the middle, or toward the latter end of the civil wars, the weight and incumbrance of the musket and its apparatus being probably found too great for the active service inseparable from campaigns carried on by small detachments.

The Bayonet. Sir Samuel Meyrick observes, that as the sweynes-feather was laid aside when the rest which contained it was relinquished, the musketeers were reduced to the same inconvenience as they experienced before it had been invented. To resume the simple sweynes-feather was not deemed expedient, as from its length it was extremely awkward to manage, and pikemen were a species of troops that had become disused. This induced such soldiers as were armed with daggers to stick them into the muzzles of their pieces after having fired. In this practice we have the origin of the bayonet, which was so termed from having been first made at Bayonne. The French called them bayonet à marche, and first introduced them into their army in 1671. These were formed with plain handles, formed to fit tight into the muzzles, rather enlarging towards the blade to prevent their entering too far into the piece. Subsequently a ring was added, by which it was placed on the muzzle, in which way the French used it in the reign of William III., to the astonishment of the 25th regiment of foot, on whom they poured a volley, halting in their charge.

Besides the authorities quoted in this article, Grose's *Military History*, Henry's *History of Britain in the Different Periods*, Strutt's *Manners and Customs*, and the various authors quoted by them, may be referred to.

ARMS, COATS OF. [See HERALDRY.]

ARMSTRONG, JOHN, a poet and physician, born at Castleton, in Liddesdale, about the year 1709. He qualified himself for his profession at the university of Edinburgh; and came to pursue his fortune in London, where he obtained some celebrity as an author, but never gained much practice as a physician. He had, however, interest enough to procure the appointment of physician to the army in Germany in 1760. He died in September, 1779.

His principal work is a didactic poem on the 'Art of Preserving Health,' published in 1741. Didactic poems find few readers now; and the poem of Armstrong is probably very seldom read. Yet the work is well spoken of by critics of the last century, as containing vigorous sentiments poetically expressed, and much valuable instruction respecting diet, regimen, and locality in reference to health; it has obtained a place in many collections of the works of British poets. Armstrong's other pieces are numerous, and now nearly forgotten. He contributed to Thomson's *Castle of Indolence* the stanzas at the end of the first canto, descriptive of the diseases produced by indolence. His society seems to have been courted by men of talent, for besides this evidence of intimacy with Thomson, Wilkes, Smollet, and Fuseli, are named among his friends. (Aikin, *Gen. Biog.*; Life in Chalmers's *British Poets*.)

ARMY, THE ENGLISH. The word *army*, like many other military terms, has come to us from the French. They write it *armée*, 'the armed,' the 'men in arms,' which is precisely what the English word *army* means. An army is defined by Locke to be a collection of armed men obliged to obey one man. There are various definitions given by writers on the Law of Nations.

The word *army* is not used to designate a single regiment or battalion, or any small body of armed men. An army is a large body of troops distributed in divisions and regiments each under its own special commander, and having officers of various descriptions to attend to all that is necessary to

make the troops effective when in action; the whole body being under the direction of some one commander, and moving according to his orders. This officer is called the commander-in-chief, the general, and sometimes the generalissimo, that is, the chief among the generals.

We may briefly explain why we limit this article to a sketch of the origin of the English army, without including, as is sometimes done in similar works, an historical sketch of the armies of ancient nations. The armies of Greece, Rome, and the antient Oriental nations, were, owing to various causes, different from those of modern Europe, and the consideration of their true character belongs to the history of those nations. From the impossibility of saying anything satisfactory within reasonable limits, and also from a desire to avoid the errors which we observe in all short sketches of this description, we shall, under such heads as GREEKS, ROMANS, EGYPTIANS, &c., notice their military system, so far as it possesses a distinct character.

The history of the armies of continental Europe, as, for instance, that of Prussia, is inseparably connected with the political history of each state, and will be treated under those heads. For other particulars connected with the formation of an army, see ENLISTING, RECRUITING, SOLDIER, and also MILITIA.

The whole military force of a nation constitutes its army, and it is usual to estimate the comparative strength of nations by the number of well-appointed men which they are able to bring into the field. In another sense, an army is a detachment from the whole collected force; a number of regiments sent forth on a particular expedition under the command of some one person who is the general for that especial purpose. Instances of this latter sense of the word occur in the expressions 'Army of Italy,' 'the Army of Spain,' &c., as formed by Napoleon. Such a detachment may be a large or a small army; and should it return with its ranks greatly thinned and without many of its officers, it would still be an army, if the distribution into divisions and regiments remained, though actually consisting of not more than a single regiment with its full complement of men and officers. In this state it is sometimes not unaptly called the skeleton of an army.

An army is the great instrument in the hands of a government, by which, in the last extremity, it enforces obedience to the laws at home, and respect from other powers who show a disposition to encroach upon any rights belonging to the nation. When the efforts of the ministers of peace and justice at home are inadequate to enforce submission to the laws; when the correspondence of cabinets and the conferences of ambassadors fail in composing disputes which arise among nations, the army is that hand of power which is put forth to maintain order at home and rights abroad.

The legitimate purposes for which an army is maintained are manifestly so important to the well-being of a state, that attention must have been directed to this subject in the very beginning of political society. But to have an army always appointed and always ready for the field can only be effected in a state of high civilization, when the various other offices in a great community are also properly distributed and filled. No better proof can be afforded of the high civilization of Egypt and other countries in early times than the well-appointed and powerful armies which they were able to bring into the field. This was effected in Egypt by having a particular caste or class of soldiers, corresponding pretty nearly to the Kshatriyas of India. (See Herod. ii. 164, &c.) The armies of the Greeks, especially in the post-Alexandrine period, those of Carthage under the command of Hannibal, and the armies of Rome in the best days of the Republic and the Empire, were not inferior to any of modern times in numbers, appointments, discipline, or the military skill of their commanders. It is not, however, to them that we are to trace the origin or the history of our modern armies.

An army, meaning by that term a body of men distinct from the rest of the nation, constantly armed and disciplined, was unknown to the remote fathers of the English; and the other modern European nations. The whole male population was the army; that is, every person learned the use of arms, was ready to defend himself, his family, and his possessions; and in time of common danger, to go out to more lasting warfare under the command of some one chief chosen from amongst the heads of the tribes. Such was the nature of the vast armies which presented themselves from

time to time on the Roman frontier, or contended against Cæsar when he made his conquest of Gaul; and such was the power which, on so short a warning, was arrayed against him on the British coast under the command of Cassibelanus, when he made that descent from which neither honour accrued to the Roman arms, nor benefit to the Roman state. In all these nations the warlike spirit was kept up by the sense of danger, not so much from foreign invaders, as from neighbouring and kindred tribes.

In the writings of Cæsar and of Tacitus, the two authors from whom we derive our best acquaintance with the manners and habits of the Germanic and the western nations of Europe, we see the warlike character of those nations, and the principles on which their military affairs were conducted. A whole male population trained to arms; confederating in time of common danger under some one chief; with little defensive armour, and none offensive but darts, spears, and arrows; throwing up occasionally earthworks to strengthen a position—this is the outline of their military proceedings. (Tacit. *Annal.* ii. 14.) There is little peculiar in the military system of the ancient Britons; yet it must have been by long practice and perseverance that the warriors attained that skill which attracted the attention of Cæsar. His description of one of their chariots, driven by a charioteer whose attention was solely directed to the management of the chariot, while in it stood the painted warrior dealing his darts around him, or running along the beam while the chariot was in its swiftest motion, presents an object at once picturesque and terrible.

When Britain was reduced to the form of a Roman province, a regular army was introduced and permanently settled in the island, for the purpose of enforcing submission, and of defence against foreign invaders. Many of the remains of Roman authority in Britain, as roads, walls, encampments, and inscriptions, are military. In that curious relic of Roman time, the *Notitia*, which is referred to the age of the Roman emperors, Arcadius and Honorius, we have a particular account of the distribution of the whole Roman army, and we see, in particular, how Britain was then divided for military purposes, and what were the fixed stations of particular portions of the Roman legions.

It was the policy of Rome to recruit its legions from among the barbarous nations, but to employ such soldiers in countries to which they did not belong. Thus, in the inscriptions relating to military affairs which have been found in England, many tribes of Gaul, of Spain, and Portugal, are named as those to which particular soldiers or particular bodies of troops belonged. And so in foreign inscriptions the names of British tribes are sometimes found. The grounds of this policy are apparent. The military portion of these nations was thus drawn away. There remained only the quiet and the peaceable, or the females, the young, the infirm, and the aged. As long as the Roman army was sufficient for their protection, it was well. But when that army was withdrawn, we see, as in the case of Britain, that a people so weakened would easily fall a prey to nations which had never been subdued by the Roman arms, and we see also what was probably the true reason of the difference between the spirited resistance which was made to Cæsar on his two landings in Britain, and the clamorous complaint and feeble resistance with which the people of Britain met the Picts and the Saxons.

From this time we lose sight of any entire British population of the part of the island called England. The conquests made by the Saxons appear to have been complete, and their maxims of policy and war became the principles of English polity. They seem to have been at first in that state of society in which every man is a soldier; and the different sovereignties which they established were the occasion of innumerable contests. We have, however, but little information on this subject; and even the supposed policy of Alfred in the separation of a portion of the people for military affairs, in the form of a national militia, is a part of his history on which we have not any very satisfactory information.

We find, however, that the Saxon sovereigns had powerful armies at their command; and the most probable account of the mode in which they were got together seems to be this:—the male population were exercised in military duties under the inspection of the earls, and their deputies the sheriffs or vicecomites, in the manner of the arrays and musters of later times; being drawn out occasionally for the purpose, and being thus ready to form, at any time when

their services were required, an efficient and powerful force.

We see from that curious remnant of those times, a piece of needle-work representing the wars and death of Harold, that the Saxon soldiers were not those half-clothed and painted figures which had presented themselves on the shores of Britain when the Roman armies made their first descent. We see them clothed from head to foot in a close-fitting dress of mail. They have cavalry, but no chariots. The archers are all infantry. Both infantry and cavalry are armed with spears, to some of which little pennons are attached. Some have swords, and others carry bills or battle-axes. They have shields, the bosses on which are surrounded with flourishes and other ornaments; and there are sometimes other devices, but nothing which can be regarded as more than the very rudiments of those heraldic devices which were afterwards formed into a kind of system by the heralds who attended the armies, and by which the chiefs were distinguished from each other, when their persons were concealed by the armour. The piece of needle-work representing the wars of Harold is supposed to be the work of Matilda, the queen of William the Conqueror, and the ladies of her court. It is preserved in the cathedral of Bayeux, whence it is commonly called the Bayeux tapestry. One of the many valuable services rendered to historical literature by the Society of Antiquaries has been the publication of a series of coloured prints, in which we have, on a reduced scale, a perfectly accurate representation of this singular monument of ancient English and Norman manners.

A great change took place in the military affairs of England at the Conquest. It is to that period that the introduction of fiefs is to be referred, a system which provided, among other things, for an army ever ready at the call of the sovereign. It may suffice in this place to say, that the king, reserving certain tracts as his own demesne, distributed the greater portion of England among his followers, to hold by military service; that is, for every knight's fee, as they were called, the tenant was bound to find the king one soldier ready for the field, to serve him for forty days in each year. The extent of the knight's fee varied with the varying qualities and value of the soil. In the reign of Edward I. the annual value in money was 20*l*. The number of knights' fees is said by old writers to have been 60,060. The king had thus provision made for an army of 60,000 men, whom he could call at short notice into the field, subject them when there to all the regulations of military discipline, and keep them for forty days without pay, which was usually as long as their service would be required in the warfare in which the king was likely to be engaged. When their services were required for any longer time, they might continue on receiving pay.

Writs of military summons are found in great abundance in what are called the 'Close Rolls,' which contain copies of such letters as the king issues under seal. But this system, it is evident, had many inconveniences; and the kings of England had a better security for the protection of the realm against invasion and for the maintenance of internal tranquillity, in that which seems to be a relic of Saxon polity. We allude to the liability of all persons to be called upon for military service within the realm: to the power which the constitution gave to the sheriff to call them out to exercise, in order that they might be in a condition to perform the duty when called upon; and to the obligation which a statute of Edward I. imposed on all persons to provide themselves with certain pieces of armour, which were changed for others by a statute of James I. We see in this system at once the practice of our remoter ancestors, and the beginning of that drafting of men to form the county militia which is a part of the military polity of the country at present.

The sheriffs were the persons to whom the care of these affairs was committed; but it was the practice of the early kings to send down into the several shires, or to select from the gentry residing in them, persons whose duty it was to attend the musters or arrays, which were a species of review of these domestic troops, and who were intended, as it seems, to be a check upon the sheriffs in the discharge of this part of their duty. The persons thus employed were usually men experienced in military affairs; and when the practice became more general, there was a permanent officer appointed in each county, who had the superintendence of these operations, and was called the lieutenant: this is the origin of the

present lord-lieutenant of counties, an officer who cannot be traced to a period earlier than the reign of Henry VIII.

Foreigners were also sometimes engaged to serve the king in his wars, but these were purely mercenary troops, and were paid out of the king's own revenues.

We see, then, that the early kings of England of the Norman and Plantagenet races had three distinct means to which they could have recourse when it was necessary to arm for the general defence of the realm: the quota of men which the holders of the knights' fees were bound to furnish; the posse-comitatús, or whole population, from sixteen to sixty, of each shire, under the guidance of the sheriffs; and such hired troops as they might think proper to engage. But as the posse-comitatús could not be compelled to leave the kingdom, and only in particular cases the shire to which they belonged, the king had only his feudal and mercenary troops at command when he carried an army to the continent, or when he had to wage war against even the Scotch or Welch. We are not to suppose that troops so levied, especially when there were but contracted pecuniary resources for the hiring of disciplined troops of other nations, would have been sufficient to make head against the power of such a sovereign as the king of France, and once to gain possession of that throne. And this leads us to another important part of our subject.

The mutual inconveniences attendant on the nature of the military services due from those who held the feudal tenures of the crown naturally disposed both parties to consent to frequent commutations. Money was rendered instead of service, and thus the crown acquired a revenue which was applicable to military purposes, and which was expended in the hire of native-born subjects to perform service in the king's armies in particular places and for particular terms. The king covenanted by indenture with various persons, chiefly those of most importance in the country, to serve him on certain money-terms with a certain number of followers, and in certain determinate expeditions. There appears little essential difference between this and the modern practice of recruiting armies. It was chiefly by troops thus collected that the victories of Creci, Poitiers, and Agincourt were gained.

In the office of the Clerk of the Pells in the Exchequer, Dugdale perused numerous indentures of this kind, and has made great use of them in the history which he published of the Baronage of England. A few extracts from that work will show something of the nature of these engagements.

Michael Poynings, who was at the battle of Creci, entered into a contract with King Edward III. to serve him with fifteen men at arms, four knights, ten esquires, and twelve archers, having an allowance of twenty-one sacks of the king's wool for his and their wages. Three years after the battle of Creci, King Edward engaged Sir Thomas Ughtred to serve him in his wars beyond sea, with twenty men at arms and twenty archers on horseback, taking after the rate of 200*l.* per annum for his wages during the continuance of the war. In the second year of King Henry IV., Sir William Willoughby was retained to attend the king in his expedition into Scotland, with three knights besides himself, twenty-seven men at arms, and one hundred and sixty-nine archers, and to continue with him from June 20th to the 13th of September. When Henry V. had determined to lead an army into France, John Holland was retained to lead an army into France, John Holland was retained to serve the king in his 'voyage royal' into France for one whole year, with forty men at arms and one hundred archers, whereof the third part were to be footmen, and to take shipping at Southampton on the 10th of May next following. In the 12th of Henry VII. John Grey was retained to serve the king in his wars in Scotland, under the command of Giles Lord Daubency, captain-general of the king's army for that expedition; with one lance, four demi-lances, and fifty bows and bills, for two hundred and ninety miles; with one lance, four demi-lances, and fifty bows and bills, for two hundred and sixty-six miles; and with two lances, eight demi-lances, and two hundred bows and bills, for two hundred miles. These were nearly half what is now the usual complement of a regiment.

Troops thus levied, together with foreign mercenaries, make the nearest approach that can be discovered in the early affairs of the English monarchy to a permanent, or, as it is technically called, a standing army. The king might, to the extent of his revenue, form an army of this description: but as to the other means of military defence or offence put

into his hands, the persons engaged were only called into military service on temporary occasions, and soon fell back again into the condition of the citizen or agriculturist. But the king's power was necessarily limited by his revenue, and the maintenance of a permanent force appears to have been little regarded by our early sovereigns, since, before the reign of King Henry VII. it does not appear that the kings had even a body-guard, much less any considerable number of troops accoutred and ready for immediate action at the call of the king. In modern times, Charles VII. of France (1423-1461) first introduced standing armies in Europe: this policy was gradually imitated by the other European states, and is now a matter of necessity and of self-defence. In England, probably in a great degree owing to her insular situation, this took place later than in most continental countries. Still the example, however, of the continental states, a sense of the great convenience of having always a body of troops at command, and the change in the mode of warfare effected by the introduction of artillery, which brought military operations within the range of science, and made them more than before matters which required much time and study in those who had to undertake the direction of any large body of men, disposed the king and the nation generally to adopt the practice of having a permanent army, varying in numbers with the dangers and necessities of the time.

The few troops who formed the royal guard were the only permanent soldiers in England before the civil wars. The dispute between Charles I. and his parliament was about the command of the militia. Charles II. kept up about 5000 regular troops as guards, and to serve in the garrisons which then were established in England. These were paid out of the king's own revenue. James II. increased them to 30,000: but the measure was looked on with great jealousy, and the object was supposed to be the destruction of the public liberties of Englishmen. In the Bill of Rights (1689) it was declared that the raising or keeping a standing army within the kingdom, in time of peace, unless it be with consent of parliament, is against law. An army varying in its numbers has ever since been maintained, and is now looked on without apprehension. It is raised by the authority of the king and paid by him: but there is an important constitutional check on this part of the royal prerogative in the necessity for acts of parliament to be passed yearly, in order to provide the pay and to maintain the discipline.

The following tabular view of the military force of the various civilized nations is from the most recent authorities.

Military Establishments on Foot and in Reserve, 1833, 1834.

	Population.	Army.	Militia, or Nat. Guards, Ac.
America, United States of	13,820,000	6188	1,308,017
Anhalt	198,000	1220	
Austria	33,865,000	271,400	479,000
Baden	1,236,000	10,100	
Bavaria	4,163,000	20,000	
Belgium	4,172,000	110,000	
Brazil	5,130,000	15,000	45,000
Bolivia	1,250,000	2500	30,000
Brunswick	248,000	3087	
Britain, Great (United Kingdom of)	24,900,000	108,673	
Central America	1,800,000	2000	20,700
Chili	1,600,000	8000	20,800
China	188,000,000	1,291,641	
Cochin-China	5,200,000	54,000	15,000
Colombia (Venezuela and New Gra- mada)	1,890,000	30,000	
Church, States of the	2,610,000	10,000	9000
Denmark	2,030,000	38,319	
East Indies (British)	112,800,000	205,200	
Egypt	3,500,000	110,000	
France	32,770,000	360,000	3,639,700
Greece	300,000	10,000	
Hanover	1,660,000	9000	
Hayti	800,000	15,000	60,000
Hesse-Cassel	656,000	8000	
Hesse (Grand Duchy of)	741,800	8000	
Holland, without Limburg or Luxemburg	2,780,000	35,000	42,500
Ionian Islands	194,000	1800	
Lucca	145,000	800	
Mecklenburg-Schwerin	459,000	3000	
Mexico	6,500,000	25,000	
Modena	380,000	800	
Nassau	365,500	1800	
Oldenburg	247,000	1500	
Paraguay	600,000	8000	30,000
Parma	438,000	1320	
Persia	12,000,000	25,000	230,000

Peru	1,700,000	3000	
Plata (States of La)	2,400,000	20,000	
Portugal	3,400,000		
Prussia	13,300,000	122,000	400,000
Russia in Europe, and Poland	50,820,000	630,000	
Saxony (Kingdom of)	1,570,000	12,000	
Saxe-Coburg-Gotha	160,000	600	
Saxe-Meiningen	143,000	500	
Saxe-Weimar-Eisenach	235,400	1100	
Sardinia	4,370,000	29,640	
Scindiah	4,000,000	22,000	
Sweden and Norway	4,050,000	41,540	130,000
Switzerland	2,100,000	83,578	33,878 { reserve }
Sicillies (Kingdom of the Two)	7,500,000	20,000	
Siam	2,900,000	60,000	
Spain	14,900,000	71,300	25,000 { on paper }
Tuscany	1,400,000	5500	
Turkey	8,000,000	30,000	120,000
Württemberg	1,620,000	16,900	

It may be added that, according to Schnabel's calculations in 1832, the standing armies maintained by the principal European States relatively to their respective populations were as follows:—

Denmark	1 in every 50 inhabitants
Sweden	1 — 53
Württemberg	1 — 59
Poland	1 — 60
Prussia	1 — 68
Bavaria	1 — 69
Russia	1 — 70
Austria	1 — 100
France	1 — 110
England	1 — 140
Two Sicilies	1 — 200
Tuscany	1 — 400
States of the Church	1 — 500

We should observe, however, that the data which he assigns as the ground-work of his calculations do not in general agree with our own, which, in most cases, are derived, if not from official, at least from competent authorities.

The following is a more complete subdivision of the British force:—

Officers	Great Britain	4404	
	India	1208	
			5612
Non-commissioned officers	Great Britain	6265	
	India	1468	
			7739
Rank and file	Great Britain	77,847	
	India	17,180	
			95,327
			108,672
Great Britain	88,516		
India	20,156		
			108,672

ARNAOUTS, the name given to the inhabitants of Albania. [See ALBANIA.]

ARNALDO DA BRESCIA was born in the town of Brescia about the beginning of the twelfth century. He studied in France under the famous Abelard. Having returned to Italy, he became a monk. The corruption of the clergy was very great at that time, and Arnaldo, endowed with an impassioned mind and a great flow of oratory, began to hold forth in public against the ambition, the temporal power, and the luxurious life of abbots, prelates, and cardinals, not sparing the Pope himself. The scandalous contest between the church and the empire carried on by the haughty pretensions of Gregory VII. was then fresh in the memory of men. Arnaldo maintained that ecclesiastics as well as laymen ought to be subordinate to the civil power; that the disposal of kingdoms and principalities did not belong to the church of Christ; and that the clergy ought to be satisfied with their tithes and the voluntary oblations of the faithful, and not to hold, as they then did, sovereign lordships and feudal estates. To these doctrines he added others of a mystical character about the Trinity and the nature of the soul, which were eagerly laid hold of and perhaps distorted by his enemies. His declamations against the clergy indisposed the Papal court towards him. By preaching against the temporalities of the church, Arnaldo had excited the passions of the people; Brescia revolted against its bishop, the fermentation spread to other towns, and

complaints against the author of all this poured in at Rome. Innocent II., upon this, had Arnaldo condemned, together with other heretics, in the council of Lateran, in 1139. Such at least is the positive statement of Otho of Freisingen and other historians of those times, but Arnaldo's name is not mentioned in the canons of the council. He was not excommunicated at that time, but was banished from Italy, and forbidden to return without the Pope's permission. (See Mosheim's *Ecclesiastical History*, translated by Dr. Murdock, and the translator's note on the subject of Arnaldo.) He then proceeded to France, where he seems to have found favour with the papal legate Guido, afterwards Pope Celestinus II.; but he met with an unrelenting adversary in St. Bernard, the zealous and vehement Abbot of Clairvaux, who denounced Arnaldo, wrote against him, and forced him to seek refuge at Zürich, where he remained five years. He there resumed his preaching against the abuses of the clergy, and found many favourable listeners. But St. Bernard traced him there also, and caused the Bishop of Constance to banish him from his diocese. Arnaldo upon this returned to Italy, and hearing that the people of Rome had revolted against the Pope, he repaired there, and put himself at the head of the insurrection. Lucius II. had died of the wounds received in a popular affray, and Eugenius III., a disciple of St. Bernard, succeeded him in the papal chair, but was driven away from the city by the people and the senate. Arnaldo exhorted the Romans to re-establish the Roman republic with its consuls, to reinstate the equestrian order, and to emulate the deeds of their glorious ancestors. The multitude, thus excited, hurried on to excesses which Arnaldo probably had never contemplated. They attacked and demolished the houses of the cardinals and nobles of the papal party, killed or ill-treated the inmates, and shared the plunder among themselves in the name of Brutus and Cato, Fabius and Paulus Emilius. Arnaldo, however, still remained poor; he really despised wealth, his morals were irreproachable, and it seems that he judged of others by himself, a common delusion among honest popular leaders.

The Roman senate wrote to the Emperor Conrad III., professing allegiance, and inviting him to come and be crowned at Rome; but the Emperor paid no attention to the invitation. Rome continued for ten years in a state of agitation little differing from anarchy, at war with the Pope and the people of Tibur, and at variance within itself. St. Bernard, in his epistles, draws a fearful picture of the state of the city at that time. Eugenius III. died in 1153, and his successor Anastasius IV. having followed him to the grave shortly after, Adrian IV. was elected Pope in 1154. He was a man of a more determined spirit than his predecessors. A cardinal having been attacked and seriously wounded in the streets of Rome, Adrian resorted to the bold measure of excommunicating the first city in Christendom, a thing without a precedent. The Romans, who had set at naught the temporal power of the Pope, quailed before his spiritual authority. In order to be reconciled to the pontiff, they exiled Arnaldo, who took refuge among some friendly nobles in Campania. When the Emperor Frederic I. came to Rome to be crowned, the Pope applied to him to have Arnaldo arrested. Frederic accordingly gave his orders to the Margrave or Viscount of Campania, and Arnaldo, being delivered into the hands of the Prefect of Rome, was strangled, his body burnt, and the ashes thrown into the Tiber, in the year 1155. [See ADRIAN IV.]

ARNAULD, ANTOINE, a French theological and philosophical writer of the seventeenth century, was born at Paris in 1612. His father, named also Antoine Arnauld, was a distinguished advocate, and a great antagonist of the Jesuits, against whom he both pleaded and wrote; and indeed he mainly contributed to their expulsion from France under Henry IV. The Jesuits were afterwards re-admitted into the kingdom, but they met with an opponent in the younger Arnauld as determined as his father had been. Arnauld, after being ordained priest, was made Doctor of the Sorbonne in 1641. He exhibited an early disposition for theological controversy, by writing the *Théologie Morale des Jesuites*, in which he exposed the dangerous casuistry adopted by several moralists of that order. The Jesuits, who had not forgotten the hostility of the elder Arnauld, retorted against the son, by violently attacking his work *De la Frequent Communion*, which was published in 1643. Soon after, the disputes which broke out among the French clergy about Jansenius, bishop of Ypres, and his book *Augustinus*,

several propositions of which concerning the intricate questions of grace and free-will had been condemned by the Pope, gave Arnauld a fresh opportunity of exercising his polemical talent. [See JANSENIUS.] Arnauld took the part of Jansenius in two letters, which were condemned by the Sorbonne, and the writer, on his refusing to retract his opinions, was expelled from that learned body. He then withdrew to Port Royal des Champs, a convent of nuns, not far from Paris, of which his sister Angelique Arnauld was the abbess, and where Pascal, Nicole, and other learned men of that time, who were friends of Arnauld and shared his opinions, resorted for quiet and studious retirement. There they wrote various works on literature, philosophy, and religion, which bear the name of the works of MM. de Port Royal. Arnauld wrote parts of several of these works, such as the *Grammaire Générale Raisonnée; Eléments de Géométrie*; and *L'Art de Penser*. He also had a share in the famous letters written by Pascal against the Jesuits, which are known by the name of *Lettres Provinciales*. The disputes about Jansenius and his five propositions, after agitating all France for many years, and drawing bulls of censure from several Popes, to which a part of the French clergy refused to submit, notwithstanding the imperious orders of Louis XIV., were at last appeased for a time by the conciliatory spirit of Pope Clement IX., who accepted a compromise. This was called the peace of Clement IX. Arnauld contributed to this desirable arrangement by an eloquent memorial, which he addressed to the pontiff through the Abbé Rospigliosi, the Pope's nephew. After this peace, Arnauld was presented to the Pope's nuncio, and also to Louis XIV., who received him graciously, and invited him 'to employ his golden pen in defence of religion.' His next work, in which he was associated with his friend Nicole, *De la Perpétuité de la Foi de l'Eglise Catholique touchant l'Eucharistie*, was dedicated to the Pope. This occasioned a warm controversy between Arnauld and the reformed minister Claude, in the course of which Arnauld wrote *Du Renversement de la Morale de J. C. par la Doctrine des Calvinistes touchant la Justification*, Paris, 1672. Arnauld, at the same time, continued his war against the Jesuits, and wrote the greater part of the work styled *Morale Pratique des Jésuites*, 8 vols., 12mo., in which many authentic facts and documents are mixed up with party bitterness and exaggeration. That powerful and ambitious society did not bear this patiently: they represented Arnauld as a dangerous man, and the leader of a sect, whose house was the resort of many restless and turbulent spirits, the old adherents to the errors of Jansenius. Harlay, the Archbishop of Paris, assisted in prejudicing the king against Arnauld, and Louis XIV. issued an order for his arrest, which, however, does not seem to have been very earnestly enforced. Arnauld concealed himself for some time at the house of the Duchess of Longueville, who esteemed him and appreciated his talents; but afterwards considering it prudent to leave France, he repaired to Brussels in 1679, where the Marquis of Grana, the Spanish governor of the Low Countries, assured him of his protection. There he published, in 1681, his *Apologie pour les Catholiques*, which is a defence of the English Catholics against the charges of Titus Oates' conspiracy. In this work, laying aside all party animosities, he undertook the defence of his old antagonists the Jesuits, whom he considered as having been calumniated in those transactions. This apology was, at the same time, a refutation of a book of Jurieu, the well-known reformed minister in Holland, who had accused the French clergy of being implicated in the English conspiracy. Jurieu, in reply, published a book entitled *L'Esprit de M. Arnauld*, written in a style of coarse personal invective, to which Arnauld did not condescend to reply. Another work, not so creditable to Arnauld's judgment, is one against the Prince of Orange, William III. of England, whom he styled a new Absalom, a new Herod, and a new Cromwell. (8vo. 1689.) It was published anonymously, like most of Arnauld's works, and many persons did not believe it to be his; but it seems now ascertained that he was the author. It is said that Louis XIV., whose political views it suited, had this book printed and distributed at his own expense.

From his retirement at Brussels Arnauld made several excursions into Holland. His reputation had spread everywhere, and he was kindly received. About this time he entered into a controversy with his old friend Father Mallebranche, who, in his metaphysical works, had announced

some peculiar doctrines on the subject of grace, predestination, and other theological problems. Arnauld began by attacking Mallebranche's definition of the nature of our ideas, and his famous proposition that 'we see all objects in God.' In refutation of these, Arnauld wrote his *Traité des Vraies et des Faussees Idées*, Cologne, 1683; and afterwards, *Réflexions Philosophiques et Théologiques sur le Nouveau Système de la Nature et de la Grâce du Père Mallebranche*, 1685; besides nine letters addressed to the Father on the same subject. This controversy was carried on by Arnauld with his usual vehemence, and it had the effect of souring Mallebranche's naturally pacific temper. The Father wished for a truce; he declared 'he was tired of making himself a spectacle to the world, and of filling the *Journal des Savans* with their mutual wranglings.' But controversy was Arnauld's element; without any feeling of malignity in his disposition, his zeal for truth, or what he considered as truth, joined to a great fluency of expression and a mind of iron, made him restless and fond of disputation. His friend Nicole, whose temper was milder, told him one day he was weary of disputes, and wished to rest himself. 'Rest!' exclaimed Arnauld, 'will you not have enough of rest hereafter during all eternity?' He continued to the last, although past eighty years of age, to carry on his various controversies, with the Jesuits, with Mallebranche, with the Calvinists, and with the sceptic philosophers, among whom was Bayle. He also wrote on several points of dispute between Rome and the Gallican church. His last work was *Réflexions sur l'Eloquence des Prédicateurs*, 1694. He died in his exile at Brussels, on the 8th of August of that year, after receiving the sacrament from the curate of his parish. There is an interesting account of his last moments by Father Quesnel, who was his companion in the latter years of his life. He was buried in the church of St. Catherine at Brussels, but his heart was embalmed and taken to Port Royal des Champs, where it was deposited with the remains of his mother and six sisters, who had all been inmates of that convent. Boileau and Racine wrote epitaphs in honour of Arnauld. His works, which filled more than 100 volumes of various sizes, were collected and published at Lausanne and at Paris, in 50 volumes, 4to., 1775-83. The last volume contains the author's biography. Arnauld was one of the most learned men of his age, a sincere but enlightened Catholic, pious without superstition or hypocrisy, exemplary in his conduct, and disinterested and simple in his habits and manners. Although frequently at variance with Rome, he was esteemed there, and had friends among the cardinals. While he was persecuted in France, Pope Innocent XI. offered him an asylum at Rome. He had, likewise, many friends among the Protestants, in Holland and elsewhere. Arnauld was one of the first to extricate theology from scholastic subtleties; he adopted in his exposition of theological subjects a clear logical method, and supported himself by frequent references to the fathers and to the early councils, in the history of which he was deeply versed, as well as in the study of the Scriptures. He contributed to the French version of the New Testament published at Mons, and he was an advocate for having the Missal, or service of the church, translated into the vulgar tongue. His brother, Henri Arnauld, Bishop of Angers—where he died in 1694, at the age of ninety-five—bore the character of a most benevolent and diligent pastor. Another and an older brother, Robert Arnauld d'Andilly, filled several offices at the French court, but at the age of fifty-five retired to Port Royal, where he died in 1674. He wrote several religious works. Robert's son, Simon Arnauld, Marquis of Pomponne, was employed in several diplomatic missions under Louis XIV., and was made Secretary of State for Foreign Affairs in 1672. He died in 1699. [See PORT ROYAL.]

ARNOLD, JOHN, was born in 1555, at Ballenstadt, in the duchy of Anhalt. He first studied medicine, but afterwards applied himself to theology, and became a clergyman of the Lutheran church. Being placed at the relaxed state of morals among the Protestants of Germany, he wrote a book 'on true Christianity,' with the object of giving the study of religion a practical influence on the moral conduct of its followers. 'Divinity,' says he, 'is not a mere speculative science, a branch of polite learning, but a living experience, and a practical exercise of the mind. We must not content ourselves with a dead and barren faith; true faith ought to be preceded by repentance, accompanied by love, and followed by a renewal of the soul. This work, first published in German, has been translated into Latin,

French, Danish, Flemish, Bohemian, and English, and has been highly praised by Mosheim, Professor Frank of Halle, Dr. Spener, and other distinguished divines. John Wesley, in his Christian Library, gives a copious extract from it. It has been called the Protestant *Kempis*. Arndt was a great promoter of practical religion, or that which, in ecclesiastical history, is called *pietism*. He was accused by the exclusive partizans of the doctrine of grace of attributing too much to the strength and ability of man in the work of conversion. Oslander of Tübingen wrote against him his *Judicium Theologicum*. Yet Arndt's book is still considered one of the best treatises of Christian morality ever written. An English translation was published in 1815 by William Jaques—*True Christianity, or the whole Economy of God towards Man, and the whole Duty of Man towards God*. 2 vols. 8vo. London. Arndt was minister at Quedlinburg, and afterwards at Brunswick. In the latter place, his success as a preacher made him enemies, and he was obliged to leave the town and to withdraw to the village of Isleb, where he remained for some years. In 1611 George Duke of Lunenburg presented him to the church of Zell, and afterwards appointed him general superintendent of all the churches of the duchy. Arndt died at Zell in 1621. He had preached a sermon the day before, and on returning home he said to his wife that he had delivered his funeral sermon. He bore the attacks and persecutions of his enemies with the greatest meekness; his charity to the poor was very extraordinary for his limited means, and it made ignorant people suppose that he had discovered the philosopher's stone. Arndt's favourite authors were St. Bernard, Thomas à Kempis, and Tauler. He must not be confounded with Josiah Arndt, also a Lutheran clergyman, born in 1626, who was professor at Rostock, and who published several works on philosophy, divinity, and history; among others, *Lexicon Antiquitatum Ecclesiasticarum*. 4to. Greifswald, 1669. He died in 1685.

ARNE, THOMAS AUGUSTINE, Doctor in Music, born in 1710, was the son of an upholsterer in King Street, Covent Garden, and educated at Eton, having been intended for the profession of the law: but his bias towards music was too strong to allow him to pursue his legal studies successfully, and after the usual struggles between duty and inclination, the latter, as commonly happens, prevailed. He secretly practised on the spinnet, and took lessons of Michael Festing, an eminent person in his day, on the violin, and the first intimation his father had of his musical progress was at an amateur party, in which young Arne was discovered playing the first fiddle most skilfully. Resistance was now worse than useless, and the resigned parent supplied his son with the means of continuing his favourite pursuit in an advantageous manner. He soon imbued his sister with a love of the vocal art, and qualified her to appear in Lampe's opera, *Amelia*, in which her debut was of so promising a kind, that her brother, though then only eighteen years of age, set for her Addison's *Rosamond*, in which she represented the heroine, and shortly after became the celebrated Mrs. Cibber. The success of this opera led of course to the composition of others, and in 1738 Arne produced his *Comus*, in which he evinced powers of the higher kind, and his reputation was at once established. In 1740 Arne married Miss Cecilia Young, a pupil of Geminiani, and a performer of eminence. In 1742 he went with her into Ireland, where both were engaged by the Dublin manager, the one to sing, the other to compose. There he produced his masques, *Britannia*, and *The Judgment of Paris*; *Thomas and Sally*, an afterpiece; and *Eliza*, an opera. In 1745 he acceded to the request of the proprietor of Vauxhall, who thus added Mrs. Arne to the list of his vocal performers, her husband at the same time becoming his principal composer. Subsequently, he wrote his two oratorios, *Abel* and *Judith*, after which the University of Oxford conferred on him the degree of Doctor in Music. His greatest work, or that which has most contributed to his fame, *Artaxerxes*, was composed in 1762, in imitation of the Italian opera, and to prove the English language not so repugnant to recitative as many had imagined. The attempt was bold, but triumphant; the decided approbation which crowned the composer's labours, and the judgment pronounced on it by posterity, prove beyond dispute its many and great merits. The drama is a translation, by Arne himself, of Metastasio's *Artaserse*; and when compared with many similar works, whether of his contemporaries or of professed authors of a later period, is entitled to the praise which cannot justly be

bestowed on mediocrity. Dr. Arne also produced, in 1765, an entire Italian opera at the King's Theatre, Metastasio's *Olimpiade*, of which no notice is taken by any of his biographers. He afterwards composed *The Fairies*, the music to Mason's *Elfrida* and *Caractacus*, additions to Purcell's *King Arthur*, the dramatic songs of Shakspeare, the airs for the Stratford Jubilee, &c. *Love in a Village* is a *pasticcio*, or compilation from various composers, but many pieces in this still pleasing ballad-opera are by Arne, and among these 'Gentle youth, ah! tell me why?' can never become antiquated. In other departments of music he proved eminently successful. Warren's collection of canons, glees, &c., contains several of his compositions, of which 'Come, shepherds, we'll follow the hearse,' in Cunningham's elegy on the death of Shenstone, must charm as long as vocal harmony retains the power to please. His song and chorus, 'When Britain first at heaven's command,' or 'Rule Britannia,' need hardly be mentioned as the offspring of his genius; it may be said to have wafted his name over the greater half of the habitable world. Dr. Arne died in March, 1778, and was buried in St. Paul's church, Covent Garden, leaving an only son, who died, we believe, without issue.

ARNHEIM, ARNHEM, or AERNEM, the Roman *Arenacum* (though this is sometimes disputed), a fortified city on the right bank of the old Rhine, now the capital of Guelderland, and formerly one of the Hanse towns: it lies 50 Eng. miles S.E. of Amsterdam: 52° N. lat. 5° 52' E. long. Arnheim is first mentioned under this name in a charter, or grant of privileges, from the emperor Otho III. A.D. 996. About two miles above Arnheim the canal of the Yssel branches off from the main river, and carries part of the waters of the Rhine to Doesburg, where this cut joins the Yssel, which flows into the Zuider Zee. This junction between the Rhine and Yssel was made by Drusus, the brother of the emperor Tiberius. Arnheim stands at the foot of a small range of hills, which are not of common occurrence in Holland, called the *Beluwe*, or *Veluwe*, running early northward towards the Zuider Zee. There is at Arnheim a bridge of boats across the Rhine. The fortifications, which were improved and enlarged by Coehorn in 1702, defend the town on the land side. Arnheim was once the residence of the Counts and Dukes of Guelderland, whose monuments are to be seen in the principal church. Arnheim has four gates, a reformed Dutch church with a high tower, which contains the tomb of Duke Charles of Guelderland, a Roman Catholic church, a small Lutheran church, a handsome governor's residence, and a very old-fashioned state-house. It is the market for the district of the *Veluwe* and part of the *Betuwe*; the latter of which is the name of the insulated fertile district between the Rhine, Waal, and Lek. [See *BETUWE*.] Coleseed, rye, oats, &c. are brought in great quantity to Arnheim. The trade is mostly a transit trade along the Rhine, and by land between Amsterdam and Germany. The neighbourhood of Arnheim contains many pleasant country residences of the nobility of Guelderland, who generally spend their winter in Arnheim. The town was taken from the Spaniards in 1585: in 1672 it was taken by the French, on the invasion of Holland in the reign of Louis XIV., from whose extortion and tyranny the inhabitants suffered severely: in 1674 the French left it, after destroying the fortifications. In 1813 the Prussians took it from the French, which contributed materially to the change of affairs in Holland at that time. The population on Jan. 1, 1839, was 7194 males, and 7315 females. (See *Kampen, Beschrijving van het K. der Nederlanden*, 1827: *Hahna's Tooneel*, &c.)

ARNI, the native Indian name of the wild buffalo. [See *BUFFALO*.]

ARNO, called by the Romans *Arnus*, the principal river of Tuscany, rises on the southern slope of Mount Falterona, which is a high western projection from the central ridge of the Apennines, about twenty miles N.E. of Florence, in 11° 39' E. long., and 43° 52' N. lat. On the opposite or north-eastern side of the same ridge are the sources of the Ronco and of the Montone, two rivers which enter the Adriatic below Ravenna. The sources of the Tiber, which several writers have erroneously stated as issuing out of the same mountain, are more than twenty miles further east, and separated from those of the Arno by the mountains of Camaldoli and La Vernia. The Arno descends by the village of Stia into the long and deep valley called Casentino, one of the higher regions of Tuscany, running in a S.S.E. direction between the great central ridge and an

offset from the same, which, detaching itself from the Falterona, divides the Casentino from the Mugello or valley of the Sieve, and afterwards from the Valdarno, forming the mountains of Crocicchie, Gualdo, Consumi, Vallombrosa, and Pratomagno. The Arno receives in its course numerous torrents from both ridges — 'the cool streams flowing down the verdant slopes of Casentino's hills,' which Dante mentions in Canto 30 of his *Inferno*.

Having passed the large village of Poppi and the town of Bibbiena, the direction of the valley, and consequently the course of the Arno, change to a more southern course, being confined to the eastward by another offset from the central ridge, which, detaching itself from the Alpe de Catenaja to the east of La Vernia, runs southwards by Chiusi and Montecatini towards Arezzo, and divides the waters of the Arno from those of the upper Tiber. Issuing from the lower Casentino, the Arno enters the plain of Arezzo, and running in a south direction by Quarata, receives the waters of the northern Chiana, and then suddenly turns to the westward, entering a deep mountain gorge, appropriately called l'imbuto, or 'funnel.' Passing through the small valley of Laterina, it issues out of it by another narrow and wild pass called Valle dell' Inferno, which is three miles in length. The Arno next enters the beautiful region called the Upper Valdarno, one of the most delightful rural spots in Tuscany, and perhaps in the whole world. It is a valley about fourteen miles in length, and from three to five in breadth, bounded by two ranges of hills, and sheltered on the north-east by the lofty and rugged Apennines, among which the wooded summit is distinguished that overhangs the convent of Vallombrosa. The valley itself is a continued succession of gardens and orchards, and the hills are covered with vineyards or verdant pastures. Several neat towns and villages are scattered about, besides numerous hamlets and cottages on the hill slopes. Through this valley the Arno runs in a N.N.W. direction, its course being nearly parallel to that which it followed higher up in the Casentino. At Lucisa the mountains close again on both sides, and the Arno runs through a deep channel excavated in a ridge of limestone rock which is a continuation of the mountains of Vallombrosa, and extends far to the south towards Siena. The river runs here in a direction nearly due north, until it passes Rignano, beyond which, in the mountains on the right bank, a valley opens, through which the Sieve, a large stream coming from the district of Mugello north of Florence, flows into the Arno. Here the Arno, after a circuitous course of more than sixty miles, is only thirteen or fourteen miles direct distance from its source. It now turns westwards by Varlungo, and enters the plain of Florence, dividing that city into two unequal parts. About ten miles below Florence, and beyond the bridge and village of Signa, the Arno runs in a deep channel excavated through the base of Mount Gollolina, which is said to have been cut by the old Etruscans. A wider passage being thus opened for the river, the plain of Florence, which was a marsh before, was drained. The course of the river here diverges one or two points towards the south. Ten miles farther the hills on the left bank recede, and leave a plain between them and the river, in which are the towns of Empoli and San Miniato. Here the Arno receives the Elsa, a considerable stream coming from the south, which has its source in the high lands near Siena that divide the basin of the Arno from that of the Ombrone. On its right bank the Arno receives several streams which come from the northern Apennines above Pistoja, and the waters from the lake or marsh of Fucecchio, and from that of Bientina. About ten miles below San Miniato the Arno, after receiving the Era, a large stream from the south, enters the plain of Pisa, through which it makes several considerable windings, passes through the town of Pisa, and enters the sea about five miles westward of it: 43° 41' N. lat., 10° 15' E. long. Formerly the mouth of the Arno was some miles more to the south, but it having become obstructed, partly by the Genoese sinking many ships in it in their wars against Pisa, and partly by the sand thrown up by the sea during the frequent storms from the S.W., a new cut in a N.W. direction was excavated at S. Pietro in Grado, about three miles below Pisa, through which the waters of Arno were made to run in 1606. The ancient port of Pisa was not at the mouth of the Arno; it was a natural bay formed by the sea, to the southward of the old mouth of the river, at the place where the stream called Calambrone now runs into the sea, and between

that and Leghorn. It is now filled up, and hardly any traces remain of it; but Targioni Tozzetti, in his *Relazione di Viaggi in Toscana*, gives a plan of the harbour as it was, from old documents and drawings. A canal for the *navicelli*, or barges, connects Leghorn and Pisa, and runs partly through the site of the former Porto Pisano. From Pisa barges ascend the Arno to Florence; but the navigation is often interrupted in summer owing to the shallowness of the water. In the time of Strabo (p. 222), and even as late as the fifth century of our era, the Serchio, or river of Lucca, then called the Ausar, instead of discharging itself into the sea, as it now does, entered the Arno below Pisa, and that city stood between the two rivers. How and when the Serchio altered its course is not known, but in the twelfth century it had already assumed its present channel. Still it approaches very near Pisa, to the northward of that city, and in times of inundations its waters mix with those of the Arno. [See PISA.]

The Arno, like all the rivers which descend from the Apennines, is subject to sudden overflows. The quantity of earth and stones which it then carries down from the mountains has raised its bed in many places nearly as high as the adjacent fields. Embankments have been made along the greater part of its course, and are kept up at a considerable expense. But in cases of extraordinary rains and storms in the highlands where it has its source, the Arno rushes down with such fury as to overcome all obstacles and inundate a great part of the country. Among the more disastrous inundations, that of September, 1537, is recorded, when the Valdarno and the whole plain of Florence were overflowed, and trees, mills, cattle, and even houses, were carried away. Two-thirds of the city of Florence were inundated, the water being in some places eight feet above the pavement; and two of the bridges of Florence were carried away. It took several months to clear the mud from the streets and houses. In November, 1740, another great inundation occurred, owing to the prevailing scirocco wind, which melted the snows that had fallen on the Apennines. The confluence of the Sieve, just above Florence, a river which swells from the same causes and generally at the same time as the Arno, greatly contributes to these inundations.

It appears that in remote times the waters of the Arno divided near Arezzo, and part of them flowed southwards by the valley of the Chiana into the Tiber. (Fossombroni, *Memorie Idraulico-Storiche sopra la Val di Chiana*.) A communication by water existed between Arretium and Rome. But the bed of the Chiana becoming raised by deposits of earth, the declivity towards the south, which was already slight, was destroyed, and the whole waters of the Arno turned towards Florence. The northern part of the Val di Chiana then became a marsh, the streams that formerly ran into the Arno remaining stagnant in various places; and it was only in the southern part of the same valley that the waters continued to find their way into the Tiber, after joining the river Paglia near Orvieto. At last the people of Arezzo, in the fourteenth century, cut a canal, which carried part of the waters of the northern Chiana into the Arno. This canal has been since repeatedly enlarged and lengthened by the Tuscan government, and has been the subject of many interesting hydraulic works and experiments. [See CHIANA, VAL DI.]

The whole course of the Arno, with its numerous windings, cannot be less than 140 miles, although in Malte Brun's geography it is stated at 105. Its breadth varies greatly: near Florence it is about 400 feet, but the waters are very low in summer, and the river is then fordable. Within the city of Florence the bed of the Arno is considerably narrower, being confined by the walls of the quays. At Pisa, however, it retains always the appearance of a considerable river. The tract of country watered by the Arno, especially between Florence and Pisa, constitutes the most populous, most productive, and most thriving part of Tuscany. In the upper valleys of the Arno, between Arezzo and Florence, a vast quantity of bones and whole skeletons of the largest quadrupeds of other climates, the mastodon, elephant, rhinoceros, and hippopotamus, are found, as well as beds of lignite. [See APENNINES, GEOLOGY OF.]

ARNOBIUS, according to Hieronymus (*de Viris Illustribus*, c. 79), was a rhetorician and afterwards a presbyter of Sikka in Numidia, in the reign of the Emperor Diocletian. His work *de Rhetorica Institutione* is not extant. Lactantius, the Cicero of the fathers, was the most

distinguished disciple of Arnobius, the Varro of the ecclesiastical writers. Arnobius was as much superior in genius to this pupil as he was surpassed by Lactantius in elegance of diction. Hieronymus informs us, in his *Chronicle*, that Arnobius was in the habit of attacking Christianity, until he had some remarkably impressive dreams, which induced him to wait upon the bishop of Sikka, who, however, did not trust him, knowing his former enmity to the gospel. Arnobius wrote his seven books of 'Disputations against the Heathen' in order to convince the bishop that he was really converted. But the statement of Hieronymus, who refers it to the twentieth year of Constantine, A.D. 326, contains a manifest anachronism. Arnobius appears in his 'Disputations' not like a man recently changed by dreams, nor as a novice; but rather as a man of a ripe conviction, although without ecclesiastical orthodoxy. It may be that the dreams gave the first impulse to his subsequent conversion, or that he was secretly convinced of the truth, without openly professing it, until the dreams induced him to wait upon the bishop, who, in those days of persecution, would be cautious about receiving a man who, as a public character, was known to have been hostile to Christianity, lest he should prove a spy. The caution of the bishop induced Arnobius to declare, in his famous 'Disputations,' his confession of faith and its defence. In this work Arnobius shows a thorough acquaintance with the literature of his age, and thus describes (l. i. c. 39) his change:—'O, blindness! A short time ago I worshipped images coming out from the furnace, and gods made with the hammer on the anvil. When I saw a smooth and anointed stone I spoke to it as to a living power, and prayed to the senseless stone for benefits; and thus unwittingly blasphemed even the false gods, by taking them for stocks, stones, and bones, or fancying that they inhabited such things. Now, I know what all those things are, since I am led by a great teacher into the ways of truth.' It appears that Arnobius came to a knowledge of the truth by carefully reading the New Testament, especially the Gospels, and that he was not biassed by the ecclesiastical orthodoxy of the North African church. Arnobius himself mentions the time when he wrote his 'Disputations' (l. ii. c. 71), saying that Rome had then been built about 1050 years. This would bring us, according to the era of Varro, to A.D. 297. But it appears that Arnobius either used another era, or only mentioned a round number. His work contains allusions to the persecutions by Diocletian, which commenced A.D. 303. This observation applies also to Arnobius, when he says (l. i. 13), 'Nearly 300 years have elapsed since our Christian community began to exist, perhaps somewhat more or less.' It may be, that Arnobius wrote his work at different periods.

Without these dates we might ascertain generally the time in which Arnobius wrote his 'Disputations' from their contents: he refutes that accusation which had excited the Diocletian persecution, namely, that the public calamities of the empire were a consequence of the spread of the Gospel, which caused a general neglect of the gods. Arnobius replies to this accusation:—'If men, instead of relying upon their prudence, and following their own propensities, would try to obey the doctrines of Christ, which bring peace and salvation, the whole world would be soon changed, and the iron taken from the service of war would be employed in the works of peace.' (l. iv. c. 36.)

Arnobius thus addresses the heathen (l. iv. c. 36):—'If you were actuated by pious zeal for your religion, you should have burned those books, and destroyed the theatres in which the dishonour of the gods is daily proclaimed in indecent exhibitions. Why should our books be cast into the fire, and our places of assembly destroyed, in which the highest God is adored, and implored to give grace and peace to the magistrates, the armies, the emperor?—joy and tranquillity to the living and to those who have been released from the bonds of the body,—books and places in which nothing is heard but what is calculated to make men humane, mild, modest, chaste, liberal in dispensing their property, and relatives of all who are united by one bond of brotherhood.' (See *Allgemeine Geschichte der Christlichen Religion und Kirche von August. Neander*, ersten Bandes dritte Abtheilung, p. 1160-1165.)

Only one manuscript codex of Arnobius is known to exist: this is now at Paris. The first edition of the 'Disputations' of Arnobius is that by Faustus Sabaeus, Rome, 1512, fol. The editor has subjoined the *Octavius* of Minutius Felix as an eighth book, mistaking Octavius for Octavus. Subse-

quent editions were published at Basle, 1548, 1560, 8vo.; at Paris, 1580, 1603, 8vo.; at Antwerp, 1582, 1586, 1604, 8vo.; at Rome, 1583, 4to.; at Geneva, 1597; at Leyden, 1598; at Hanau, 1603, 8vo.; at Paris, 1605; at Hamburg, 1610, fol.; at Douay, 1634, 8vo.; Opera cum commentariis variorum, Leyden, 1651, 4to.; this edition contains many inaccuracies: at Paris, 1666, fol.; at Leyden, 1677, fol.; at Paris, 1715, fol. Venetiis in Gallandi Bibl. Vet. Patrum, tom. iv.; at Würzburg, 1783, 8vo.; more recently by Oberthür, and last by Conrad Orelli, Leipzig, 1816, in two volumes, 8vo.: this is the best edition of Arnobius. The 'Disputations' of Arnobius were translated into Dutch by Joachim Oudaer, Harling, 1677, 8vo.

The works of the Semi-Pelagian Arnobius of Gaul have sometimes been erroneously ascribed to Arnobius Afer. Arnobius of Gaul wrote, about A.D. 460, a commentary on the psalms, edited with a preface by Erasmus, at Basle, 1537; at Paris, 1539; at Basle, 1560. The 'Annotationes in Locos Evangelistarum e recognitione Andreæ Schotti' were printed with the preceding. He wrote also the following: *Conflictus cum Scapione, de Deo trino et uno; de Duobus Substantiis in Unitate Personarum et de Concordia Gratiae et Liberi Arbitrii, cum Notis Fearnantii, Col. Agrippinae*, 1596.

ARNOLD, BENEDICT, was born in Connecticut in North America, of parents in very humble life. He is said to have received little education, and to have been at first a dealer in horses. Having been unfortunate in business, he was the more ready, when the revolutionary war broke out, to take up arms, for which he was well fitted both by inclination and capacity. He threw himself into the contest with great ardour, and raised a company of volunteers at Newhaven, in his native state. His activity, boldness, and skill, soon brought him into notice; and when in the summer of 1775 it had been determined to attempt the capture of Quebec, he and General Montgomery were fixed upon by Washington to conduct the expedition. The march of Arnold across a then unknown and pathless region at the close of the year, is one of the boldest military exploits on record. The troops, consisting of about 1100 men, set out about the middle of September from Boston for Newbury Port, at the mouth of the Merrimack; from which point they were conveyed by water to the mouth of the Kennebeck in New Hampshire, a distance of forty leagues. On the 22d they embarked in 200 boats on the Kennebeck at Gardener's Town, and made their way up the river in the face of such a variety of difficulties, that their progress was never more than ten, and sometimes not more than four miles a day. After reaching the head of the river, they had a work of nearly as great fatigue and difficulty still before them—the passage of the mountainous ridge which now divides the territory of the United States from Canada. It was only after crossing these desolate heights that they reached the river Chaudière, down which they proceeded to the St. Lawrence, into which it falls. When they at length reached a house, on the 3d of November, they had been thirty-one days without the sight of a human habitation.

Arnold distinguished himself greatly in the military operations that followed; and was severely wounded in the leg in the unsuccessful assault upon Quebec on the 31st of December, in which General Montgomery fell. On his return from this enterprise he continued in active service, and gave on many occasions the highest proofs of bravery and military talent. In one of the actions which immediately preceded the surrender of General Burgoyne at Saratoga on the 16th of October, 1777, his wounded leg was struck, while he was on horse-back, by a cannon ball; and this accident rendering him unable for some time to take the field, he was appointed by Washington to the command of Philadelphia, which the English had recently evacuated. In this situation the vices of his character soon began to display themselves; and he was guilty of such acts of rapacity and oppression, in order to support the ostentation and luxury in which he indulged, that on a representation being made to congress he was ordered to be tried by a court-martial. The result was, that on the 20th of January, 1779, he was sentenced to be reprimanded by the commander-in-chief. On this dishonour Arnold threw up his commission. The embarrassment of his affairs, however, was so great, and the demands of his creditors became so pressing, that he soon found it necessary to attempt something to repair his broken fortunes. In these circumstances he appears to have formed the deep and atrocious design for which his name is now chiefly remembered, and by which it has

offset from the same, which, detaching itself from the Falterona, divides the Casentino from the Mugello or valley of the Sieve, and afterwards from the Valdarno, forming the mountains of Crocechie, Gualdo, Consumi, Vallombrosa, and Pratomeno. The Arno receives in its course numerous torrents from both ridges -- 'the cool streams flowing down the verdant slopes of Casentino's hills,' which Dante mentions in Canto 30 of his *Inferno*.

Having passed the large village of Poppi and the town of Bibbiena, the direction of the valley, and consequently the course of the Arno, change to a more southern course, being confined to the eastward by another offset from the central ridge, which, detaching itself from the Alpe de Catenaja to the east of La Vernia, runs southwards by Chiusi and Montecatini towards Arezzo, and divides the waters of the Arno from those of the upper Tiber. Issuing from the lower Casentino, the Arno enters the plain of Arezzo, and running in a south direction by Quarata, receives the waters of the northern Chiana, and then suddenly turns to the westward, entering a deep mountain gorge, appropriately called l'imbuto, or 'funnel.' Passing through the small valley of Laterina, it issues out of it by another narrow and wild pass called Valle dell' Inferno, which is three miles in length. The Arno next enters the beautiful region called the Upper Valdarno, one of the most delightful rural spots in Tuscany, and perhaps in the whole world. It is a valley about fourteen miles in length, and from three to five in breadth, bounded by two ranges of hills, and sheltered on the north-east by the lofty and rugged Apennines, among which the wooded summit is distinguished that overhangs the convent of Vallombrosa. The valley itself is a continued succession of gardens and orchards, and the hills are covered with vineyards or verdant pastures. Several neat towns and villages are scattered about, besides numerous hamlets and cottages on the hill slopes. Through this valley the Arno runs in a N.N.W. direction, its course being nearly parallel to that which it followed higher up in the Casentino. At Lucina the mountains close again on both sides, and the Arno runs through a deep channel excavated in a ridge of limestone rock which is a continuation of the mountains of Vallombrosa, and extends far to the south towards Siena. The river runs here in a direction nearly due north, until it passes Rignano, beyond which, in the mountains on the right bank, a valley opens, through which the Sieve, a large stream coming from the district of Mugello north of Florence, flows into the Arno. Here the Arno, after a circuitous course of more than sixty miles, is only thirteen or fourteen miles direct distance from its source. It now turns westwards by Varlungo, and enters the plain of Florence, dividing that city into two unequal parts. About ten miles below Florence, and beyond the bridge and village of Signa, the Arno runs in a deep channel excavated through the base of Mount Gollolina, which is said to have been cut by the old Etruscans. A wider passage being thus opened for the river, the plain of Florence, which was a marsh before, was drained. The course of the river here diverges one or two points towards the south. Ten miles farther the hills on the left bank recede, and leave a plain between them and the river, in which are the towns of Empoli and San Miniato. Here the Arno receives the Elsa, a considerable stream coming from the south, which has its source in the high lands near Siena that divide the basin of the Arno from that of the Ombrone. On its right bank the Arno receives several streams which come from the northern Apennines above Pistoja, and the waters from the lake or marsh of Fucecchio, and from that of Bientina. About ten miles below San Miniato the Arno, after receiving the Era, a large stream from the south, enters the plain of Pisa, through which it makes several considerable windings, passes through the town of Pisa, and enters the sea about five miles westward of it: 43° 41' N. lat., 10° 15' E. long. Formerly the mouth of the Arno was some miles more to the south, but it having become obstructed, partly by the Genoese sinking many ships in it in their wars against Pisa, and partly by the sand thrown up by the sea during the frequent storms from the S.W., a new cut in a N.W. direction was excavated at S. Pietro in Grado, about three miles below Pisa, through which the waters of Arno were made to run in 1606. The ancient port of Pisa was not at the mouth of the Arno; it was a natural bay formed by the sea, to the southward of the old mouth of the river, at the place where the stream called Calambrone now runs into the sea, and between

that and Leghorn. It is now filled up, and hardly any traces remain of it: but Targioni Tozzetti, in his *Relazione di Viaggi in Toscana*, gives a plan of the harbour as it was, from old documents and drawings. A canal for the *navicelli*, or barges, connects Leghorn and Pisa, and runs partly through the site of the former Porto Pisano. From Pisa barges ascend the Arno to Florence; but the navigation is often interrupted in summer owing to the shallowness of the water. In the time of Strabo (p. 222), and even as late as the fifth century of our era, the Serchio, or river of Lucca, then called the Ausar, instead of discharging itself into the sea, as it now does, entered the Arno below Pisa, and that city stood between the two rivers. How and when the Serchio altered its course is not known, but in the twelfth century it had already assumed its present channel. Still it approaches very near Pisa, to the northward of that city, and in times of inundations its waters mix with those of the Arno. [See PISA.]

The Arno, like all the rivers which descend from the Apennines, is subject to sudden overflows. The quantity of earth and stones which it then carries down from the mountains has raised its bed in many places nearly as high as the adjacent fields. Embankments have been made along the greater part of its course, and are kept up at a considerable expense. But in cases of extraordinary rains and storms in the highlands where it has its source, the Arno rushes down with such fury as to overcome all obstacles and inundate a great part of the country. Among the more disastrous inundations, that of September, 1537, is recorded, when the Valdarno and the whole plain of Florence were overflowed, and trees, mills, cattle, and even houses, were carried away. Two-thirds of the city of Florence were inundated, the water being in some places eight feet above the pavement; and two of the bridges of Florence were carried away. It took several months to clear the mud from the streets and houses. In November, 1740, another great inundation occurred, owing to the prevailing scirocco wind, which melted the snows that had fallen on the Apennines. The confluence of the Sieve, just above Florence, a river which swells from the same causes and generally at the same time as the Arno, greatly contributes to these inundations.

It appears that in remote times the waters of the Arno divided near Arezzo, and part of them flowed southwards by the valley of the Chiana into the Tiber. (Fossombroni, *Memorie Idraulico-Storiche sopra la Val di Chiana*.) A communication by water existed between Arretium and Rome. But the bed of the Chiana becoming raised by deposits of earth, the declivity towards the south, which was already slight, was destroyed, and the whole waters of the Arno turned towards Florence. The northern part of the Val di Chiana then became a marsh, the streams that formerly ran into the Arno remaining stagnant in various places; and it was only in the southern part of the same valley that the waters continued to find their way into the Tiber, after joining the river Paglia near Orvieto. At last the people of Arezzo, in the fourteenth century, cut a canal, which carried part of the waters of the northern Chiana into the Arno. This canal has been since repeatedly enlarged and lengthened by the Tuscan government, and has been the subject of many interesting hydraulic works and experiments. [See CHIANA, VAL DI.]

The whole course of the Arno, with its numerous windings, cannot be less than 110 miles, although in Malte Brun's geography it is stated at 105. Its breadth varies greatly: near Florence it is about 400 feet, but the waters are very low in summer, and the river is then fordable. Within the city of Florence the bed of the Arno is considerably narrower, being confined by the walls of the quays. At Pisa, however, it retains always the appearance of a considerable river. The tract of country watered by the Arno, especially between Florence and Pisa, constitutes the most populous, most productive, and most thriving part of Tuscany. In the upper valleys of the Arno, between Arezzo and Florence, a vast quantity of bones and whole skeletons of the largest quadrupeds of other climates, the mastodon, elephant, rhinoceros, and hippopotamus, are found, as well as beds of lignite. [See APENNINES, GEOLOGY OF.]

ARNOBIUS, according to Hieronymus (*de Viris Illustribus*, c. 79), was a rhetorician and afterwards a presbyter of Sikka in Numidia, in the reign of the Emperor Diocletian. His work *de Rhetorica Institutione* is not extant. Lactantius, the Cicero of the fathers, was the most

distinguished disciple of Arnobius, the Varro of the ecclesiastical writers. Arnobius was as much superior in genius to this pupil as he was surpassed by Lactantius in elegance of diction. Hieronymus informs us, in his *Chronicle*, that Arnobius was in the habit of attacking Christianity, until he had some remarkably impressive dreams, which induced him to wait upon the bishop of Sikka, who, however, did not trust him, knowing his former enmity to the gospel. Arnobius wrote his seven books of 'Disputations against the Heathen' in order to convince the bishop that he was really converted. But the statement of Hieronymus, who refers it to the twentieth year of Constantine, A.D. 326, contains a manifest anachronism. Arnobius appears in his 'Disputations' not like a man recently changed by dreams, nor as a novice; but rather as a man of a ripe conviction, although without ecclesiastical orthodoxy. It may be that the dreams gave the first impulse to his subsequent conversion, or that he was secretly convinced of the truth, without openly professing it, until the dreams induced him to wait upon the bishop, who, in those days of persecution, would be cautious about receiving a man who, as a public character, was known to have been hostile to Christianity, lest he should prove a spy. The caution of the bishop induced Arnobius to declare, in his famous 'Disputations,' his confession of faith and its defence. In this work Arnobius shows a thorough acquaintance with the literature of his age, and thus describes (l. i. c. 39) his change:—'O, blindness! A short time ago I worshipped images coming out from the furnace, and gods made with the hammer on the anvil. When I saw a smooth and anointed stone I spoke to it as to a living power, and prayed to the senseless stone for benefits; and thus unwittingly blasphemed even the false gods, by taking them for stocks, stones, and bones, or fancying that they inhabited such things. Now, I know what all those things are, since I am led by a great teacher into the ways of truth.' It appears that Arnobius came to a knowledge of the truth by carefully reading the New Testament, especially the Gospels, and that he was not biased by the ecclesiastical orthodoxy of the North African church. Arnobius himself mentions the time when he wrote his 'Disputations' (l. ii. c. 71), saying that Rome had then been built about 1050 years. This would bring us, according to the era of Varro, to A.D. 297. But it appears that Arnobius either used another era, or only mentioned a round number. His work contains allusions to the persecutions by Diocletian, which commenced A.D. 303. This observation applies also to Arnobius, when he says (l. i. 13), 'Nearly 300 years have elapsed since our Christian community began to exist, perhaps somewhat more or less.' It may be, that Arnobius wrote his work at different periods.

Without these dates we might ascertain generally the time in which Arnobius wrote his 'Disputations' from their contents: he refutes that accusation which had excited the Diocletian persecution, namely, that the public calamities of the empire were a consequence of the spread of the Gospel, which caused a general neglect of the gods. Arnobius replies to this accusation:—'If men, instead of relying upon their prudence, and following their own propensities, would try to obey the doctrines of Christ, which bring peace and salvation, the whole world would be soon changed, and the iron taken from the service of war would be employed in the works of peace.' (l. iv. c. 36.)

Arnobius thus addresses the heathen (l. iv. c. 36):—'If you were actuated by pious zeal for your religion, you should have burned those books, and destroyed the theatres in which the dishonour of the gods is daily proclaimed in indecent exhibitions. Why should our books be cast into the fire, and our places of assembly destroyed, in which the highest God is adored, and implored to give grace and peace to the magistrates, the armies, the emperor?—joy and tranquillity to the living and to those who have been released from the bonds of the body,—books and places in which nothing is heard but what is calculated to make men humane, mild, modest, chaste, liberal in dispensing their property, and relatives of all who are united by one bond of brotherhood.' (See *Allgemeine Geschichte der Christlichen Religion und Kirche von August. Næander*, ersten Bandes dritte Abtheilung, p. 1160-1165.)

Only one manuscript codex of Arnobius is known to exist: this is now at Paris. The first edition of the 'Disputations' of Arnobius is that by Faustus Sabaeus, Rome, 1512, fol. The editor has subjoined the *Octavius* of Minutius Felix as an eighth book, mistaking Octavius for Octavus. Subse-

quent editions were published at Basle, 1548, 1560, 8vo.; at Paris, 1580, 1603, 8vo.; at Antwerp, 1582, 1586, 1601, 8vo.; at Rome, 1593, 4to.; at Geneva, 1597; at Leyden, 1598; at Hanau, 1603, 8vo.; at Paris, 1605; at Hamburg, 1610, fol.; at Douay, 1634, 8vo.; Opera cum commentariis variorum, Leyden, 1651, 4to.; this edition contains many inaccuracies: at Paris, 1666, fol.; at Leyden, 1677, fol.; at Paris, 1715, fol. Venetiis in Gallandi Bibl. Vet. Patrum, tom. iv.; at Würzburg, 1783, 8vo.; more recently by Oberthür, and last by Conrad Orelli, Leipzig, 1816, in two volumes, 8vo.: this is the best edition of Arnobius. The 'Disputations' of Arnobius were translated into Dutch by Joachim Oudaer, Harling, 1677, 8vo.

The works of the Semi Pelagian Arnobius of Gaul have sometimes been erroneously ascribed to Arnobius Afer. Arnobius of Gaul wrote, about A.D. 460, a commentary on the psalms, edited with a preface by Erasmus, at Basle, 1537; at Paris, 1539; at Basle, 1560. The 'Annotations in Locos Evangelistarum e recognitione Andrea Schotti' were printed with the preceding. He wrote also the following: *Conflictus cum Scapione, de Deo trino et uno; de Duobus Substantiis in Unitate Personæ et de Concordia Gratiae et Liberi Arbitrii, cum Notis Fœderentii, Col. Agrippinae*, 1596.

ARNOLD, BENEDICT, was born in Connecticut in North America, of parents in very humble life. He is said to have received little education, and to have been at first a dealer in horses. Having been unfortunate in business, he was the more ready, when the revolutionary war broke out, to take up arms, for which he was well fitted both by inclination and capacity. He threw himself into the test with great ardour, and raised a company of volunteers at Newhaven, in his native state. His activity, boldness, and skill, soon brought him into notice; and when in the summer of 1775 it had been determined to attempt the capture of Quebec, he and General Montgomery were fixed upon by Washington to conduct the expedition. The march of Arnold across a then unknown and pathless region at the close of the year, is one of the boldest military exploits on record. The troops, consisting of about 1100 men, set out about the middle of September from Boston for Newbury Port, at the mouth of the Merrimack; from which point they were conveyed by water to the mouth of the Kennebeck in New Hampshire, a distance of forty leagues. On the 22d they embarked in 200 boats on the Kennebeck at Gardener's Town, and made their way up the river in the face of such a variety of difficulties, that their progress was never more than ten, and sometimes not more than four miles a day. After reaching the head of the river, they had a work of nearly as great fatigue and difficulty still before them—the passage of the mountainous ridge which now divides the territory of the United States from Canada. It was only after crossing these desolate heights that they reached the river Chaudière, down which they proceeded to the St. Lawrence, into which it falls. When they at length reached a house, on the 3d of November, they had been thirty-one days without the sight of a human habitation.

Arnold distinguished himself greatly in the military operations that followed; and was severely wounded in the leg in the unsuccessful assault upon Quebec on the 31st of December, in which General Montgomery fell. On his return from this enterprise he continued in active service, and gave on many occasions the highest proofs of bravery and military talent. In one of the actions which immediately preceded the surrender of General Burgoyne at Saratoga on the 16th of October, 1777, his wounded leg was struck, while he was on horseback, by a cannon ball; and this accident rendering him unable for some time to take the field, he was appointed by Washington to the command of Philadelphia, which the English had recently evacuated. In this situation the vices of his character soon began to display themselves; and he was guilty of such acts of rapacity and oppression, in order to support the ostentation and luxury in which he indulged, that on a representation being made to congress he was ordered to be tried by a court-martial. The result was, that on the 20th of January, 1779, he was sentenced to be reprimanded by the commander-in-chief. On this dishonour Arnold threw up his commission. The embarrassment of his affairs, however, was so great, and the demands of his creditors became so pressing, that he soon found it necessary to attempt something to repair his broken fortunes. In these circumstances he appears to have formed the deep and atrocious design for which his name is now chiefly remembered, and by which it has

been covered with infamy. He resolved to make an offer to the British General, Sir Henry Clinton, of his services in betraying his country and the cause for which he had hitherto fought. His proposals were accepted, and it was agreed that he should employ all his art and interest in order to obtain the command of the important fort of West Point on the Hudson, with the view of delivering it up to the enemy. By a show of strong patriotism, which he resumed, he was not long in accomplishing this object. Washington, generously forgetting his former delinquencies, was prevailed upon to appoint him to the station in question. This was in July, 1780. We refer to the article *ANDRÉ*, for an account of the manner in which this treasonable scheme miscarried. Major André was the person intrusted by Clinton with the active management of the negotiation with Arnold; and the British officer having been sent up the Hudson in a sloop of war from New York, the head-quarters of the army, had an interview with the American General on the bank of the river, near West Point, on the morning of Friday the 22d of September. The next day, on his return to New York by land, he was taken by two Americans when he had nearly reached the British lines, and the plot was detected by the discovery in his boots of the plans and other papers which he had received from Arnold. By the irresolute and inconsiderate conduct of Colonel Jameson, the officer to whom André was carried, he found means to convey an intimation of his capture to Arnold, by whom it was received on the morning of the 25th, just in time to permit him to make his escape. Taking a hurried leave of his wife and infant child, he instantly rushed to the river, and leaping on board a barge which he had in readiness, he ordered himself to be rowed to the English sloop, which he reached in safety. A minute and interesting account of all the circumstances of this affair may be found in the notice of Arnold in the *Encyclopædia Americana*. He was allowed to retain in the British army the rank of brigadier-general, which he had held in that of the United States; but it is asserted by the writer to whom we have just referred, that he did not receive the whole of the sum (30,000*l.*) which was promised him as the reward of his treachery. He attempted to do something to deserve what he got by publishing certain addresses and proclamations, with the view of inducing his countrymen to lay down their arms; but these attempts were not more successful than one of a different description by which they had been preceded. In the beginning of the following year he was sent with an expedition into Virginia, where he committed great devastation. After this he made a still more destructive incursion into Connecticut, his native state. Having taken Fort Trumbull, near New London, he barbarously put the unresisting garrison of the fort to the sword, and set the town on fire. He served afterwards in Nova Scotia, and also in the West Indies, where he was taken prisoner by the French, from whom, however, he made his escape. After the conclusion of the war he took up his residence in England. We find pensions to the amount of 400*l.* granted in 1792 to the children of a Benedict Arnold, whom we presume to be the subject of the present notice. In July of that year a duel was fought near Kilburn Wells, between General Arnold and the present Earl of Lauderdale, in consequence of certain expressions which the latter had used at a public meeting, and would not retract. Arnold was attended by Lord Hawke, and Lord Lauderdale by Mr. Fox. His lordship declined to return his adversary's fire, but said, that if he was not satisfied he might fire on till he was. On this the parties separated. Arnold died in Gloucester Place, London, in 1801.

ARNOLD, SAMUEL, Doctor in Music, was born in 1740, and patronised from his birth by the princess Amelia, daughter of George II., who placed him among the choristers of the royal chapel, under Mr. Bernard Gates; he afterwards completed his musical studies under Dr. Nares. His first production was an air, 'If 'tis joy to wound a lover,' which immediately spread itself far and wide, and, though a mere trifle, at once made the author popular. At the early age of twenty-three he became composer to Covent-garden theatre, and in 1766 also undertook to fill the same office at the Haymarket, then the property of the senior Colman. In the discharge of these duties, he produced about forty musical pieces, the most popular of which were, *The Maid of the Mill*, *The Son-in-law*, *The Castle of Andalusia*, in which are 'Flow, thou regal purple stream,' and 'The hardy Sailor;' *Inkle and Yarico*; *The Battle of Hexham*; *The*

Surrender of Calais; *The Children in the Wood*; *The Mountaineers*, &c.; each containing beauties that never can be entirely forgotten. Of music of the graver cast, he composed Dr. Browne's sacred ode, *The Cure of Saul*, which was allowed to be the best work of the kind since the time of Handel. This was followed by the oratorios of *Abimelech*, *The Resurrection*, and *The Prodigal Son*, which were performed at Covent-garden and the Haymarket theatres for several years, during Lent. The latter was chosen for performance at the installation of Lord North, as chancellor of the University of Oxford, when the composer was honoured with the degree of Doctor in Music. In 1769 an enterprising spirit led him to purchase Marylebone Gardens, then a place of very fashionable resort, for which he wrote many songs, &c.; but, confiding too much in the honesty of those whom he employed, he abandoned this speculation with the loss of ten thousand pounds. In 1783 he was appointed organist and composer to the King. In 1789 he succeeded Dr. Cooke as conductor of the Academy of Ancient Music; and in 1793 became organist of Westminster Abbey, on the presentation of his friend, Dr. Horsley, Bishop of Rochester. In 1786 Dr. Arnold commenced publishing an score of Handel's works, encouraged by George III., who liberally supported him in his arduous undertaking, which proceeded to the extent of about forty volumes. He also printed, in four large volumes, a collection of sacred music, as a continuation of Dr. Boyce's admirable work, to which it has proved a most valuable addition. During many years he carried on the oratorios at Drury-lane theatre, and while these were in his hands, he produced *The Redemption*, a compilation from Handel's works, which met with the greatest success; and *The Triumph of Truth*, selected from various composers, but which has not kept its ground so well as the former, though by no means inferior in point of effect. Dr. Arnold died in 1802, and was interred in Westminster Abbey, with more than usual marks of respect. A simple tablet, near Purcell's monument, marks the place where he lies. He married a lineal descendant of the illustrious Baron of Merchiston, and left a son (who has distinguished himself by his dramatic productions, and by his able management of the English Opera House), and two daughters.

ARNOTTO, or **ARNATTO**, the inspissated extract from the fruit of the *Riva Orellana* [see *BRXA*], is used by dyers principally to give a bright orange colour to silk goods. It is also employed as an auxiliary to give a deeper shade to simple yellow colours. It is further used in many of our dairies to give a reddish colour to cheese, which it does without adding any disagreeable flavour or unwholesome quality.

The Arnotto of commerce is brought to us from South America. It is moderately hard, brown on the outside, and of a dull red within. It comes in cakes of about two or three pounds weight each, and is generally enveloped in large flag-leaves previous to being packed in casks. In this state it receives the name of flag arnotto, to distinguish it from another preparation which is a harder and more concentrated extract from the fruit pods of the same plant, and which contains a larger proportion of colouring matter than flag arnotto. This superior description, of which but little is imported, is known as roll arnotto.

Arnotto is with difficulty dissolved in pure water; it is usual, therefore, to add some alkaline substance, usually potass, which not only facilitates the solution of the extract, but improves the quality of the colour. The liquid sold under the name of Nankin dye is a solution of arnotto in potass and water. A solution is also sometimes made in alcohol, which is used for lacquering and by varnishers.

It is believed that the method employed for making this extract in the country of its production, which is by the application of a high degree of heat in combination with a process of fermentation, is injurious to its colouring properties, an opinion which is confirmed by the fact of the superiority of the colouring matter when procured from the fresh pods. There is reason to suppose that means might be used for precipitating the colouring matter without subjecting it to so great a risk of carbonization by heat as it is usually made to undergo, and without having recourse to the process of fermentation. Some experiments made with this view by Vauquelin seem to confirm this supposition.

The consumption of arnotto has been much increased in this country of late years. In 1820 the quantity brought to use but little exceeded 50,000 pounds. We now use more

than three times that quantity. It pays a duty on importation of 2*d.* per pound, and sells, including the duty, at, from 1*0d.* to 2*0d.* per pound, according to its quality. (*Ann. de Chimie*, tome 47; Berthollet, *Elémens de l'Art de la Teinture*, tome ii.; *Library of Entertaining Knowledge* (Vegetable Substances, Materials of Manufacture); *Government Statistical Tables*.)

ARNSBERG (or Aren-berg), the largest of the three circles, or governments, which form the Prussian province of Westphalia. In 1803, subsequently to the dissolution of the electorate of Cologne, it was united with the territory of Hesse Darmstadt, from which it was transferred to Prussia in the year 1813. It is bounded on the north-west by the circle of Münster, and on the north-east by that of Minden; on the east, by the principality of Waldeck, and Hesse Darmstadt; on the south-east and south, by the duchy of Nassau; on the south-west by the circle of Coblenz; and on the west, by those of Cologne and Düsseldorf. According to the latest measurement, its superficial extent is 2952 square miles; and its population, which the census of 1818 stated to be 383,105, amounted at the close of 1831 to 462,065 souls, of whom the majority are of the Protestant faith; the number of Catholics being in the proportion of 17 in 39 individuals. It contained, at that period, 38,147 horses and colts, 171,536 oxen and cows, and 160,938 sheep and goats. Arnberg comprehends the mediatised sovereignties of Witgenstein-Berleburg, Witgenstein-Witgenstein, and Hohen-Limbürg; and, according to Schlieben's statement, 55 towns, 3420 villages and hamlets, 60,120 houses, 854 churches, chapels, and synagogues, and 5129 manufactories, mills, &c.

ARNSBERG, a minor circle in the government of Aa, 252 square miles in superficial extent, which had a population of 27,397 souls at the close of 1831, and contains 7 towns and 122 market towns, villages, &c. The northern part of the circle, a considerable portion of which is occupied by the great forest of Arnberg, consists of valleys hemmed in by high hills and mountains; but its southerly districts have a more even surface. The soil is stony, but produces a sufficiency of grain, flax, and potatoes, for the consumption of the inhabitants; its more lucrative growth is the timber, which is felled in the forest of Arnberg, and exported in considerable quantities to the adjacent provinces, particularly the circle of the Mark, which has little wood of its own. The principal river in the circle of Aa, is the Ruhr, which rises at Winterberg, within its borders, and flows into the Rhine between Duisburg and Ruhrort. Its mineral resources consist of iron, marble, salt, and brick-earth; but its manufacturing industry is limited to the production of inconsiderable quantities of linens and woollens, together with utensils and articles of wool.

ARNSBERG, the capital both of the larger and lesser circle, is situated on a hill, surrounded on almost every side by the Ruhr; it commands a delightful prospect of the mountainous and picturesque scenery around it, in which the ruins of the ancient castle in the old town, where the Westphalian barons used to meet in secret tribunal, form a striking feature. Arnberg is ill provided with water, its whole supply being derived from an hydraulic work which forces it up to the town from the river. It was a more thriving place in former times, when it was associated with the Hanseatic League; at the present day its chief dependence is on the production of potatoes, and the manufacturing of brandy, beer, and a few linens and woollens. The principal buildings in the town are the government offices, two Catholic churches, a Protestant seminary for teachers, and a Catholic gymnasium; it has also an agricultural society. At the close of 1831, the number of inhabitants was 3805: which gives an increase of 1172 since the year 1817. 51° 22' N. lat. and 8° 2' E. long. of Greenwich: about forty miles in a direct line S.W. of Paderborn.

ARNSTADT, a seignior in Thuringia, forming part of the principality of Schwarzburg-Sonderhausen. It contains 216 square miles, two towns (Arnstadt and Plauen), forty-two villages, and 23,000 inhabitants. Arnstadt (in 50° 49' N. lat., and 10° 57' E. long.) is the chief town and seat of government of the seignior, and is situated on both banks of the Gera, in the heart of a highly picturesque country, eleven miles south of Erfurt. It was formerly the residence of the earls, afterwards princes of Schwarzburg-Anhalt, but upon the extinction of the last of that line in 1716 it fell into the hands of its present possessors. It is embellished with a palace, in which are a

valuable cabinet of porcelain and a small picture gallery. There are four churches in the town, the oldest of which goes by the name of the 'Early Church' (Früh-kirche), the service being performed in it at an earlier hour in the morning than in any other place of worship in the neighbourhood. The other public buildings consist of the ruins of a palace built in 1557, the government offices, a cemetery chapel, an orphan and a lunatic asylum, a gymnasium or grammar school, a seminary for the townsmen's sons, a house of correction, and several woollen and brass-ware manufactories. Its inhabitants, who are Lutherans, and in number nearly 5000, are actively engaged in trade: beer, leather, and linen are its staple. It is one of the most considerable marts for fruit, grain, and timber, in this quarter of Germany, and abounds in oil and flour mills, one of which, the 'Güthe mill,' has thirty sets of grindstones. A profusion of gardens and orchards lie scattered round the town; and the remains of two ancient burghs, the Käfernburg and Altenburg, are striking features in its environs. The latter, which stands upon a hill commanding the delightful valley that spreads from its base, is said to have been the spot on which a Thuringian nobleman erected a house for the residence of our fellow-countryman, St. Boniface, the 'Apostle of the Germans,' in the seventh century. Plauen is a small town lying on the Gera, in the bosom of a beautiful valley. Its population is under 800.

ARNSWALDE, in the New-Mark, one of the eighteen circles of the Prussian government of Frankfurt, in the province of Brandenburg. Its area is 487 square miles, and its population at the close of the year 1831 was 28,185 souls. At that period it possessed 3,515 horses, 10,014 horned cattle, and 78,939 sheep and goats. It is bounded on the north and north-west by Pomerania, is watered by the Drage and some smaller rivers, and contains several small lakes. It has an abundance of forests, and a sandy soil, the poverty of which has been overcome by the industry of its possessors, and yields much grain and timber, besides feeding numerous herds and flocks.

ARNSWALDE, the capital of this circle, lies about 120 miles N.E. of Berlin, contains 3,550 inhabitants, a parochial church and two hospitals; it manufactures linens and woollens. It stands between three lakes, which are well-stocked with fish.

AROI DELE, an order of monocotyledonous plants, which approach dicotyledons in the form and veining of their

Arisaema maculatum.

1. A spadix with the point of the spathe seen within it; 2. the spathe; 3. the ripe fruit; 4. an ovary; 5. the same cut perpendicularly; 6. one of the little fruit cut perpendicularly; 7. a seed.

leaves, but agree with the former in everything else of importance. They are readily known by their flowers being placed very closely upon a cylindrical, or lengthened, axis, called technically a *spadix* (fig. 2), which is itself enclosed in a leaf of a peculiar figure, the edges of which are curved inwards till they meet, forming a sort of hollow sheath, which botanists name *spatha* (see fig. 1 in the accompanying cut).

The fruit is generally a cluster of little berries, each of which contains a small number of seeds. The flowers themselves are extremely variable in structure; sometimes having neither calyx nor corolla, and sometimes possessing both those parts; sometimes furnished with anthers opening in a singular manner by little lobes, or having anthers of the commonest construction. Many of the species grow upon the trunks of trees, clinging to them, in tropical countries, like ivy; a very few are found in Europe, and those are always little stemless herbs; a small number are small erect shrubs. They are all acrid in a high degree, some of them so much so as to be dangerous poisons, as, for example, the dumb-cane of the West Indies, which paralyses the mouth if only chewed. Nevertheless this acrid principle is so far removed by roasting or boiling, that the underground stems may, in some cases, be used as food. The colocasia of the tropics, and some other species, are common articles of food among the negroes; but they are said not to agree very well with Europeans. In this country only one kind of arceidaceous plant, the *Arum maculatum*, represented in the wood-cut, is found wild. The root of that species, which is vulgarly named the cuckoo flower, is eatable when properly prepared, just as those which have already been mentioned; but it is never used except by the poor in times of famine.

Arceidæ are also remarkable for the heat which some of the species give out when flowering (see Lindley's *Introduction to Botany*, p. 259), and for the exceedingly offensive odour of others at that time.

AROLSEN, on the Aar, twenty-three miles S. of Cassel, is the residence of the princes of Waldeck, who are among the oldest constitutional sovereigns in Germany. The town is regularly built, possesses woollen, leather, and iron-ware manufactories, a grammar-school, three churches, and about 2000 inhabitants. The palace is a handsome structure of spacious dimensions; it contains a gallery of choice paintings (amongst which is West's 'Death of General Wolfe'), a numismatic cabinet, which is richer in the series of Greek coins than almost any other in Europe, a valuable museum of antiquities from Herculæum and Pompeii, collected in Italy by the uncle of the present prince, and a library of 30,000 volumes, besides some very rare MSS. The surrounding country is well-wooded, and there is a broad-cause avenue of six rows of anti-oaks, 2000 paces in length, close upon the town. Stein states the latitude to be 51° 25' 17" N.

AROMA is the supposed principle of odour in plants, formerly called by Boerhaave *Spiritus Rector*. This quality generally resides in the essential oil; but there are some vegetables that have a strong odour which yield but little or no essential oil, as the jessamine and the violet; or when an oil in small quantity is procured from them, it has not the powerful smell which, considering the smallness of its proportion compared with the fragrance of the plants, it might be expected to possess. As plants exhale their odour when exposed to the air, and communicate it to water at a lower temperature than that at which it could be distilled, it has been imagined that some principle of a more subtle nature exists, in which the odour resides, and that it is this which imparts smell to the oil. In fact, however, the property of odour belongs to proximate vegetable principles of different kinds, in which there is no reason to suppose the existence of any common principle: essential oil is unquestionably the most usual cause of its production, and it is capable of being volatilized in small quantity at a low temperature, and thus diffused through the atmosphere or communicated to water.

AROMATARI, JOSEPH OF, a learned physician and naturalist, was born about the year 1586 at Assisi, a town of the duchy of Spoleto, in the ecclesiastical states. His father was a physician, and was competent to determine, as well as eager to bestow on his son, the kind of education most suited to fit him for the same profession. His studies were begun at Perugia, and continued at Padua, where he studied successively logic, philosophy, and medicine. He

obtained his degree of doctor of medicine in his eighteenth year, and immediately afterwards established himself as a physician at Venice, where he remained practising for fifty years; nor could he be prevailed upon to quit it by the most tempting offers and solicitations made to him by the Duke of Mantua, the King of England, and Pope Urban VIII. He died at Venice on the 16th of July, 1660.

During this long period he devoted himself to his profession, to the study of the mode of generation or re-production of plants and animals, and to polite literature. He accumulated an immense library, extremely rich in manuscripts. His only publication connected with polite literature was, *Riposte alle Considerazioni di Alessandro Tassoni sopra le Rime del Petrarca*, Padua, 1611, 8vo. To which Tassoni having replied under the assumed name of Crescenzo Pepe, Aromatari answered under a fictitious name, in the following work: *Dialoghi di Palidino Melampodio in risposta agli Avvertimenti dati sotto nome di Crescenzo Pepe a Giuseppe degli Aromatari*, Venice, 1613, 8vo. His contributions to medicine and natural history consist in *De putatione de Rabie Canalicosa, cui preposita est Epistola de Generatione Plantarum ex Scambris*, Venice, 1625; and Frankfurt, 1626, 4to. The Epistle has been repeatedly reprinted: 1st, in *Epistolæ Selectæ* of Richt, Nuremberg, 1662; 2nd, in the *Philosophical Transactions*, vol. xxviii. p. 159, Lond. 1694; and at the end of Jungius's *Opuscula Botanico-Physica*, at Saxe-Cobourg, in 1747.

This Epistle, addressed to Dr. Bartholomew Nant, gave only the outline, or heads of chapters, of a large work which he intended to write on generation, but which his numerous professional engagements and delicate health prevented his accomplishing. The views, however imperfectly developed, are more in accordance with those held in the present day by our most distinguished vegetable anatomists and physiologists, than many of these entertained for a long period subsequent to the time in which he lived. He taught that the so-called seeds of plants were not, as a whole, the new plant, but that a very small portion of a seed possessed the principle of life, the rest being intended for the nourishment of this part. This corresponds to the embryo and albumen of modern writers. The existence of this embryo in a seed rendered it fertile; its absence caused it to be unfertile. The development of this embryo took place in a two-fold direction, a portion of it ascending, and constituting the *plumule*, the other descending, and constituting the *radicle*.

He asserted the analogy between seeds and the eggs of animals, and even designated seeds the *eggs of plants*: both in the early stage of their growth receive their nourishment from the albumen by which they are surrounded, but afterwards the chicken takes up its nourishment by its mouth, a plant by its roots. In both cases the young embryo existed previous to hatching or germination, being by these processes only developed, and not then formed.

His principles respecting the generation of animals were known to, and adopted, and promulgated at full length by Harvey in his treatise *De Generatione*. His views respecting seeds would appear to have been overlooked, except by a very few. It is right, therefore, that the well-founded claims of this learned physician should be brought fairly and distinctly forward.

AROMATICS are agents obtained from the vegetable kingdom, exercising a peculiar influence over the digestive powers, and possessed of more or less odour or fragrance. Of this odour, by which they can at all times be recognized, the most usual vehicle is an essential or volatile oil, as stated in the article **AROMA**. Indeed volatile oil exists in all aromatic plants, and in every part except the cotyledons, save in the nutmeg and a very few other seeds; but this aromatic oil does not reside in the same part in every kind of plant. In umbelliferous plants we find it mostly in the fruits (and chiefly in the *vitæ* of them), yet in angelica, celery, and parsley, it is diffused through the whole structure. Labiate plants, such as mint, balm, rosemary, and lavender, have it in the leaves and stem; cinnamon in the bark; all terebinthinate plants in their young branches. The iris florentina (*orris*) and others have it chiefly in the root; the scitamineæ equally in the root (ginger) and the seeds (cardamoms); the rose and chamomile have it in the petals; yet it is not equal in all the petals of the chamomile, being greatest in the yellow florets of the disk; hence, doubling the flowers of the chamomile, by which the yellow florets of the disk are diminished, and the white florets of the ray increased, lessens the virtues of the flowers.

The power of medicines is frequently judged of by their sensible qualities, that is, by the impression which they make on the organs of smell and taste: aromatics affect both of these senses in a very perceptible and sometimes extraordinary manner. Scarcely any one is insensible to the odour of particular flowers, and some are affected by them to an extraordinary degree. The approach to Ceylon can be determined by the fragrance of the air, at the distance of many miles: the *magnolia glauca* (heaven-tree or swamp magnolia) diffuses an odour, by which it can be recognized at the distance of three miles, among the swampy districts, and consequently moist atmosphere, in which it grows. This powerfully affects many persons while travelling or hunting; and the magnolia tripetala causes sickness, headache, and an aggravation of fevers or rheumatism, among those near it who are labouring under these complaints. The odour of the jonquils and other fragrant plants raised in Holland is so great, when brought into a room or close apartment, as to be quite overpowering. In such countries or places as have a very humid atmosphere, the odour of plants is most readily diffused as well as most potent: of this we may satisfy ourselves by calling to mind the greater fragrance of flowers early in the morning, in the evening, or after a shower. This accounts for the violent action of the plants in the countries just mentioned: but even many plants of Britain affect some individuals, endowed with a peculiar and excessive sensibility, to an extreme degree. The sweet scented violet has such an effect on certain persons as to occasion headache, convulsions, and apoplexy. (See Triller, *Dissertation de Morbo Subito ex modo Volucrium Odore*.)

Aromatics are seldom applied to the organ of smell for the purpose of influencing the system in a remedial manner, except in the form of aromatic vinegar, in threatened or actual fainting: we shall therefore proceed to consider their action upon the palate and stomach. As all aromatics contain volatile oil, their action is generally referred to this principle; but there cannot be a doubt that the more fixed principles which they contain contribute greatly to their effect. Volatile oils, when separated, act chiefly on the nervous system: but aromatics influence more particularly the digestive organs, the function of assimilation, and the generation of animal heat. They are themselves digested, but previous to this process commencing, or going any length, they produce, by direct contact with the internal surfaces, a peculiar effect, which we perceive beginning at the lips and palate, and accompanying them in their progress to the stomach. They scarcely excite any general action of the system, but expend their power chiefly upon the stomach, and, in a less degree, upon the intestinal canal: increasing the vital force of the former, and quickening the muscular action of the latter. They also communicate to the stomach a greater power of resistance to unpleasant sensations, as under their influence many articles can be borne by it which would otherwise be rejected: and this happens equally with regard to food and medicines.

The mixture of aromatics renders them more agreeable than when given singly: and this is exemplified both in their medical and culinary employment, as no good cook will use only one spice if she can procure more. The aromatic powder and aromatic conffection are compounded on this principle for medical use, and Dr. Kitchener's Zest for culinary purposes.

The necessity for the employment of aromatics is greater in warm climates and weather than in cold; and we find the plants which furnish them grow in the greatest abundance in hot countries. The pepper tribe (piperaceæ), for example, is confined to the hottest parts of the world; such as tropical America and the Indian Archipelago: forty species of pepper are met with in the island of Java alone. Throughout the East Indies the natives restore the powers of the stomach by chewing betel, which consists of slices of the areca nut, sprinkled with fresh lime, wrapped up along with some other aromatic in a leaf of the *piper betel*. The Indians of South America use the *erythrorhizon Peruvianum* (called *coca*) along with the leaves of the *chouy-diam Quinoa*, mixed with quick-lime, to stimulate the impaired powers of the stomach during their long and toilsome journeys over the heights of the Andes. (See Humboldt, *Tableau Physique de la Nouvelle Espagne*.) On the same principle, the Europeans who visit tropical countries use curry and other hot dishes. But in every quarter of the globe we find condiments used along with all articles difficult

of digestion, especially vegetables, fish, and young meats, such as veal. Aromatics are therefore employed both to prevent and cure diseased states of the stomach, and to assist the action of other remedies.

In simple loss of appetite, without any other obvious disease, or in slow digestion, they may be employed in the form of the warmer pickles during dinner, or preserved ginger after dinner.

In many cases of fever in warm climates, the stomach is so powerless that it cannot extract from much bark, or other febrifuge medicines, the principles fitted to cure the disease, unless aided by aromatics. Hence Cayenne pepper is added to them; and indeed Cayenne pepper will often cure the fever without any bark. Lately piperin (the active principle of pepper) has been recommended as a means of curing fevers in Europe: and certain it is that some lingering fevers, of the intermittent character, occurring in old or feeble persons, cannot be cured without the assistance of aromatics. [See ARUG.] It may be stated, however, that piperin when pure has no aromatic property.

The preparation of iron (carbonate) which is found to be so useful in curing the *doloureux*, can rarely be borne by the stomach for such a length of time, or in such large doses, as are necessary, without adding aromatics to it. They are also very beneficially added to all the purgatives, for the treatment of indigestion and constipation, occurring in nervous and sedentary persons. Aromatics are frequently used to disguise the unpleasant taste of many medicines. The disagreeable taste of aloes is concealed by adding the aromatic or compound spirit of lavender, and the intensely bitter taste of the sulphate of quina is nearly covered by mixing one part of it with ten or fifteen parts of powdered valerian, fennel, aniseed, or orange peel.

Aromatics are most suited to persons of a plethoric constitution, or those advanced in life: less so to the young, or those of very irritable constitutions. They are to be altogether prohibited in certain states of the stomach, or system generally. When there exists any inflammatory condition of the stomach, they would be very improper. And it is necessary to observe, that in all degrees and stages of inflammation of the stomach, debility more or less exists by the patient, which might seem to indicate the contrary; but under such circumstances they are extremely harmful. The same observations apply to the aromatic teas, such as balm and sage, in common use among the people.

In certain affections of the brain, such as when there is a tendency to apoplexy, they are improper. Cullen mentions the case of a gentleman, who having taken by mistake two drachms of powdered nutmeg, in about an hour became drowsy, and fell from his chair. Being laid in bed, he dropped asleep, but awoke from time to time, and was quite delirious. He thus continued alternately sleeping and delirious for several hours: even the following day he still complained of headache and drowsiness. In the East such cases are of frequent occurrence. Persons predisposed to affections of the brain should abstain from such articles, especially mulled wine at bed-time.

ARONA, a town of Piedmont, in the division of Novara, on the western shore of the Lago Maggiore, and near its southern extremity. It stands on the Simplon road from Switzerland to Milan, from which another post road branches out at Arona, leading to Novara, Verelli, and Turin. Diligences and mails are established on both roads. Arona is seven miles from Sesto Calende, which is the frontier town of Austrian Lombardy, on that side. The river Ticino forms the boundary between the Austrian and the Sardinian States. Arona is a neat and bustling little town, with a small harbour on the lake; it carries on a considerable transit trade between Piedmont and Switzerland. Goods coming from Geneva and Turin are embarked at Arona, and sent across the lake to the Swiss canton of Ticino, from whence they pass by the new road over Mount Bernardin into the Grisons, and thence into Germany. The population of Arona is between two and three thousand inhabitants. Its situation is delightful, just within the last range of hills above which the snowy Alps are seen towering, and at the opening of the wide plains of Lombardy. The country near Arona produces good wine. St. Charles Borromeo, the celebrated archbishop of Milan, was born in the castle adjoining Arona, which is now in ruins. An enormous colossal statue was raised to him, on a hill above the town, in 1697. It is sixty-six feet high, and stands on a granite pedestal, forty-six feet in height, and is a conspic-

eous object for miles around. The head, hands, and feet, are cast, the body is made of large stones, and is covered with sheets of hammered copper. (Bertolotti, *Viaggio da Milano à Ginevra*.) The proportions of the statue are very good. The Saint appears holding his breviary under his left arm: the right is extended, in the act of bestowing his benediction on the country. A staircase is made through the inside of the colossus leading into the head of the statue. Arona lies thirty-six miles N.W. of Milan, in $45^{\circ} 47'$ N. lat. and $8^{\circ} 28'$ E. long.

ARPEGGIO, in music (Ital. *to play on the harp*), is, when applied to keyed instruments, the striking the notes of a chord in rapid succession, as in the manner of touching the harp, instead of playing them simultaneously, the notes, when struck, being held out the full remainder of the time. Example:—

On the violin, flute, &c., where the notes cannot be held out, the *arpeggio* is commonly executed thus:—

ARPIÑO, the Roman **ARPINUM**. This very ancient city is situated near the confines of the Neapolitan kingdom, in the province of Terra di Lavoro, about sixty-eight miles S.E. of Rome, and sixty-five from Naples. It stands on a bold rugged eminence to the left of the river Garigliano, and near the confluence of the Fibreno, or Fiume della Posta (the ancient Fibrenus), with the Garigliano (the ancient Liris).

The old town, which before the extension of the power of the Roman republic formed part of the territory of the Volsci, was built on the summit of a steep rock. An ancient arch (constructed like the false arch of which a cut is given, p. 253), which is not circular, but acuminated, presenting a sharp arrow-head, in the style of the Gothic arch; a considerable extent of walls composed of large stones, put together without any kind of cement; an ancient cistern, four subterranean arches, and other traces, still remain. The place is called by the natives *Civita Vecchia* and *Arpino Vecchio*. Arpinum, in alliance with Rome, withstood the arms of the Samnites, for which it was rewarded with some of the privileges of a Roman municipium B. C. 302. (Liv., x. 1.) About B. C. 188 the inhabitants of Arpinum received the full privileges of Roman citizens, and were enrolled in the Cornelian tribe. (Liv., xxxvii. 36.) It afterwards became celebrated as the birth-place of Caius Marius and Cicero. Though Arpinum partook in the horrors consequent on the overthrow of the Roman power, and in the desolation of the middle ages, it was never wholly obliterated as a city, but has continued, like Aquinum (the birth-place of Juvenal and St. Thomas Aquinas), and like other ancient places in the neighbourhood, to be of comparative importance. It once owed its preservation to the fame of Cicero and Marius. In the wars between the houses of Aragon and Anjou for the possession of the Neapolitan kingdom, Arpinum took part with the French against the Aragonese and the pope. The pontiff (Pius II.) generously commanded Napoleone Orsini, his successful captain, to spare Arpinum, for the memory of Caius Marius and Marcus Tullius.

The town of Arpinum, like most others in Italy, gradually descended, as peace and tranquillity were established, from the lofty hill top to lower ground, and it now stands on an inferior ridge nearer to the Liris.

The present population rather exceeds 12,000; manufactures of the best cloth made in the kingdom of Naples, of parchment, paper, and leather, are briskly carried on in the town and its vicinity. From the mountainous nature of the district, and its contiguity to the great sheep and cattle breeding provinces of the Abruzzi, a pastoral air, however, prevails. The surrounding scenery, the picturesque beauty of which is scarcely surpassed in any part of Italy, is woodland and very mountainous. The soil in the valley of the Liris, or Garigliano, is alluvial and productive; and a rich, deep, and black loam, that gives nourishment to extensive woods of the large oak trees in the peninsula, with the

exception of those on Mount Garganus, extends far up the mountains' sides. The river Liris runs in a deep bed: its full, clear, rapid stream, very different from the muddy, sleepy character it assumes in the flat country nearer to its mouth, has formed some curious little islands, and a number of cascades, the soothing noise of which is constantly heard in the town of Arpino. The Fibrenus, a deep, rapid, pellucid, and excessively cold mountain stream, which has its sources in a part of the Apennine chain that separates the vale of the Liris from the Fucine lake (now the lake of Celano), joins the Liris by a gentle water fall, about three miles above Arpino. The banks of both rivers are shaded with poplar trees of exceedingly fine growth. Near its mouth the Fibrenus forks into two branches, between which and the Liris, whose waters wash its base, there is a beautiful little island of a triangular shape. This islet, now called 'L' Isola di San Paolo,' or, more frequently, simply 'L' Isola,' is supposed to be the 'Amalthæa' of Cicero, which was one of the orator's favourite retreats. (Cicero to Atticus, i. 16, ii. 1.) Opposite to the island, and in an angle formed by one of the branches of the Fibrenus and by the main stream of the Liris, there stands a building called La Vella di San Domenico, which was built for the accommodation of some monks of the Dominican order in the middle ages, on the site and mainly out of the ruins of the great orator's Arpine villa, and which, in its turn, is deserted, and almost a ruin.

The monks seem to have also occupied the site of the habitation of Marius. At the distance of a few miles from the town of Arpino, on the right bank of the Liris, there is a religious house occupied by Trappists (the only monks of that severe order in Italy) which has always borne the name of 'Casamari.'

The ancient remains, in addition to the already mentioned, existing in and about Arpino, are neither numerous nor very important. The most interesting are those of the cloaca, or common sewers of the city, which, like those of ancient Rome, are capacious, and built in the finest manner, and the ruins of a Roman bridge across the Liris, between Arpino and Sorci. This bridge, which the people, who finally assign almost every vestige of antiquity to their great countryman, have always called 'Il Ponte di Cicero,' was thrown over the Liris, not in a straight but in a very oblique line. This was evidently done in order to take advantage of several small islets, on which the piers of the bridge were built, and which lie across the bed of the river in that direction. Only one arch, which is of very good Roman construction, remains entire, but, as well as can be judged, there were three other arches.

Within the town there are some fragments of old Roman roads, or paved streets, and of some inscriptions and broken statue. Two rude and evidently modern busts of Marius and Cicero stand in the piazza, or market-place, where a town-hall has been built of late years, with niches for the statues of those two great ornaments of Arpino. The public school is called the Tullian College, and the humble play-house the Tullian Theatre. The initials (M. T. C.) of the orator's name are seen in all directions, and they alone form the insignia or arms of the city. The cloth manufacturers of the place, more especially, boast that Arpinum was famous in the time of the Roman republic for its woollen goods and the art of dyeing them, and that the father of the immortal Cicero was a fuller.

On each bank of the Liris, or Garigliano, there are numerous sources of mineral waters. Iron abounds in some and fine marble in all of the neighbouring Apennines. Breccia, white marble, *schizzato rosso*, or spotted red, and marble of a beautiful warm yellow hue, are found in inexhaustible quantities, but are very rarely quarried.

In modern times Arpino has given birth to a painter, who, though scarcely to be ranked in the third class of Italian artists, may deserve to be mentioned, because he enjoyed much celebrity in his day, filled many churches both in the Neapolitan and Roman states with his frescoes and pictures, and took his name from the place of his birth. This was Giuseppino di Cesare, always called 'Il Cavalier d'Arpino,' where he was born in 1660; he died at Rome in 1640.

ARQUEBUS. See **ARMS** (WEAPONS)

ARQUES, a small town in France, about four miles S.E. of Dieppe, in the department of Seine Inférieure. It is upon the little river Arques, or Bethune, which falls into the sea at Dieppe. The town is of little importance. It has a handsome parish church, and a castle now in ruins.

This spot was signalized by the battle fought here on St. Matthew's day, September 21, 1589, between the army of Henry IV. of France and that of the League under the Duke of Mayenne. The engagement was not remarkable either for its fierceness or for the heavy loss sustained by the defeated party; but Henry's success at so critical a period was of the greatest importance to him, and perhaps he might ascribe his subsequent settlement on the throne in no small degree to the victory at Arques.

ARRACACIA is a genus of umbelliferous plants which comprehends a species of as much importance in the tropical parts of America as the parsnip and carrot are in Europe. This plant, the *Arracacia esculenta* of botanists, is cultivated in great quantities in the neighbourhood of Santa Fé de Bogota, in the cooler districts among the mountains, and in other parts of the state of Colombia, where it is called Arracacha. It resembles the common hemlock in appearance, but the leaves are much broader, the stems are not spotted, and the flowers are of a dingy purple colour; it is also of smaller stature.

The root is of the same nature as the tuber of a potato, only it is forked, or divided into several lobes, each of which is about the size of a large carrot. These, when fit for eating, are boiled like the potato, and become of a firm but tender consistence, not at all mealy, and have a flavour intermediate between a chestnut and a parsnip. It appears that an immense produce of arracacha is obtained in the South American provinces, where it has long been as much the staple nutriment of the population as the potato or the yam in other places; and as it will only thrive in the colder districts, it was once expected to form an important agricultural plant in Europe. It has, however, been found upon trial unable to accommodate itself to our uncertain climate, and to perish as soon as the cold nights and damp weather of autumn approach, without having been able during the summer to perfect its tubers. It is therefore only cultivated now in botanical collections. For an excellent

account of this plant, see Hooker, in *Botanical Magazine* tab. 3092.

ARRACK. [See **ARACK.**]

ARRAGON. [See **ARAGON.**]

ARRAGONITE, called by Mohs the prismatic lime-haloide, is a mineral substance, admitting of cleavage in planes parallel to the faces of a right rhombic prism of $116^{\circ} 5'$ and $63^{\circ} 55'$, which may therefore be considered as its fundamental form (*fig. 1*). The most general modifications which occur, consist either in the removal of the four acute angles at **A** by planes *a* intersecting each other in the short diagonal **B B**, and inclined to each other at an angle of $108^{\circ} 18'$, by which the face **P** being entirely removed, the form of *fig. 2* is produced; or the change may be effected by the truncation of the acute lateral edges of the prism by planes parallel to the axis of the crystal, and therefore inclined to the faces, **L**, at $121^{\circ} 57'$, giving rise to the form seen in *fig. 3*. These modified forms usually present themselves in twin crystals, in which the short diagonals of the prism **B B** are placed at right angles to one another, when only two crystals are present, thus producing a very simple cross. It is usual, however, that three of the crystals of *fig. 3* cross each other, producing a crystal of the appearance of *fig. 4*, which, at first sight, may be mistaken for an hexagonal prism, but on a closer inspection it will be found that what appeared to be a single face, is really composed of two planes, making a re-entrant angle.

The intersections of the individual crystals with each other are visible both in the lateral and terminal face, and are indicated in *fig. 4* by the dotted lines. These crystals have been found abundantly in a ferruginous clay in Aragon in Spain, where they occur accompanied by sulphate of lime. From this circumstance the mineral has derived its name. It has also been found very beautifully crystallized in a vein of a massive variety of the same mineral traversing basalt at Bihm in Bohemia. (Mohs.) Fine specimens have been found at the following places in England: in the Dufon lead-mines; in a cavern of granwacke near Merridge, Somersetshire; and also in several parts of Devonshire, &c.

In an old coal mine six miles south-west of Cockfield, Durham, it is remarkable as occurring depending from a roof of clay-slate and accompanied by tubular calcareous stalactites. (Phillips.) Varieties of this mineral are also common in beds of iron-ore in the mines of Eisenerz in Styria, and in several other iron-mines of Hungary, of Transylvania, &c., consisting of numerous fibrous crystals, of a satin-like lustre, radiating from a centre, and to these the name of *flos ferri* has been applied.

In a chemical and crystallographical point of view, Arragonite is peculiarly interesting, as presenting to us carbonate of lime differing in its system of crystallization from that of the common Calc-spar, and thus affording us an instance of the influence of any difference in the aggregation of matter in changing its physical properties, as will be seen by comparing this substance with the rhombohedral Calc-spar, with which it agrees in chemical constitution. In the scale of Mohs, its hardness (see **HARDNESS**) varies from 3.5 to 4, while that of Calc-spar is 3. The specific gravity of

Arracacia.

1. A barren flower; 2. A fertile flower; 3. a stamen; 4. a pistil; 5. a ripe fruit; 6. the same cut across.

Arragonite is	27741
Cale-spar	27741

They act also differently on light, the index of ordinary refraction of

Arragonite being	1.693
Cale-spar	1.519

Attempts have been made to account for the differences by considering them the effects of small quantities of carbonate of strontia, which Professor Stromeyer first discovered to be contained in many specimens of Arragonite; but the conclusion is unfounded, as will be seen by the results of two analyses given by Stromeyer.

	First.	Second.
Carbonate of lime	95.2965	99.2322
Carbonate of strontia	0.5090	4.1013
Water	0.1544	0.5992

where the carbonate of strontia is in small and varying proportion, and must therefore be considered as an accidental impurity.

ARRAIGNMENT. This word is derived by Sir Matthew Hale from *arraisonner*, a French word, to call to account or answer, which, in ancient law French, would be *resumer*, or, abbreviated, *ar-resumer*. Conformably to this etymology, arraignment means nothing more than calling a person accused to the bar of a court of criminal judicature to answer formally to a charge made against him. The whole proceeding at present consists in calling upon the prisoner by his name, reading over to him the indictment upon which he is charged, and demanding of him whether he is guilty or not guilty. Until very lately, if the person accused pleaded that he was not guilty, he was asked how he would be tried; to which question the usual answer was, 'By God and my country.' But by a late statute (7 and 8 Geo. IV. c. 28, sec. 1) this useless form was abolished; and it was enacted, that 'if any person, not having privilege of peerage, being arraigned upon an indictment for treason, felony, or piracy, shall plead "Not guilty," he shall, without any further form, be deemed to have put himself upon the country for trial, and the court shall, in the usual manner, order a jury for the trial of such person accordingly.'

The arraignment of a prisoner is founded upon the plain principle of justice, that an accused person should be called upon for his answer to a charge before he is tried or punished for it. That this was a necessary form in English criminal law at a very early period appears from the reversal in parliament of the judgment given against the Mortimers in the reign of Edward II., which Sir Matthew Hale calls an 'excellent record.' One of the errors assigned in that judgment, and upon which its reversal was founded, was as follows: 'that if in this realm any subject of the king hath offended against the king or any other person, by reason of which offence he may lose life or limb, and be thereupon brought before the justices for judgment, he ought to be called to account (*pro ratione*), and his answers to the charge to be heard before proceeding to judgment against him; whereas in this record and proceedings it is contained that the prisoners were adjudged to be drawn and hanged, without having been arraigned (*arreati*) thereupon, or having an opportunity of answering to the charges made against them, contrary to the law and custom of this realm.' (Hale's *Pleas of the Crown*, book ii. c. 28.)

The ceremony of the prisoner holding up his hand upon arraignment is merely adopted for the purpose of pointing out to the court the person who is called upon to plead. As it is usual to place several prisoners at the bar at the same time, it is obviously a convenient mode of directing the eyes of the court to the individual who is addressed by the officer. In the case of Lord Stafford, who was tried for high treason in 1680, on the charge of being concerned in the Popish plot, the prisoner objected, in arrest of judgment, that he had not been called on to hold up his hand on his arraignment; but the judges declared the omission of this form to be no objection to the validity of the trial. (Howell's *State Trials*, vol. vii. p. 1555.)

ARRAN, an island of Scotland, forming part of the shire of Bute. It lies in the bay formed by the peninsula of Cantire [see ARGYLE] and the Ayrshire coast; and is separated from the former by the sound of Kilbrannan, and from the latter by the Firth of Clyde. The distance between the nearest points of Arran and of the island of Bute is above five miles; and from the nearest point in Arran to Skipnish Point in Cantire is about four. From the Ayr-

shire coast the least distance of the island is about eleven miles. (*Map of Scotland*, published by the Society for the Diffusion of Useful Knowledge.) The greatest length, measured from near Loch Ranza in the N.N.W. to Kildonan in the S.S.E., is more than twenty miles, and the greatest breadth from Drumodune Point to the headland between Brodieck and Lamash bays, about twelve*. The coast is less broken by lochs than that of most of the Hebrides. Loch Ranza on the north side, and on the east the bays of Brodieck and Lamash, are the chief inlets. Lamash Bay is sheltered by Lamash or Holy Island, which lies across the entrance, and is nearly two miles long from north to south, with an average breadth of half a mile. The cliffs of Lamash Island are chiefly basalt, in rude columns, resting on sandstone, and some parts of the island rise to the height of above 1000 feet. The harbour thus enclosed has good holding ground, sufficient depth for the largest vessels, and room enough for the largest navy to ride at anchor. Brodieck Bay is a little to the north of Lamash Bay (from which it is separated by a headland), and is of an irregular shape, having on the north side an old ruinous castle (Arran Castle) inhabited occasionally by the duke of Hamilton. Behind this castle rises Goatfell, the highest eminence on the island. The bay affords good anchorage-ground and has about five fathoms water; but it is only in moderate weather that vessels can ride in safety. Loch Ranza extends perhaps a mile inland, and has three fathoms water even at the lowest ebb. The approach to the island at this point is striking: at the extremity of a small point of land jutting into the loch are the ruins of a castle of some magnificence, said to have been inhabited by the kings of Scotland when they came to hunt in Arran; beyond is a little plain, or glen, embosomed in hills, watered by a stream, and inhabited by the people of a small village. Besides the island of Lamash already mentioned, another small island, called Pladda, lies off the south coast of Arran, about a mile distant; it is low and flat, about a mile long, with ten acres of excellent pasture. There is a lighthouse upon it.

The surface of Arran is in general high, particularly towards the north end, where the scenery is terrific and sublime. The mountains here present peaked summits, and are arranged in groups. Goatfell, the highest, is estimated by Professor Playfair to be 2945 feet high; but in the Society's *Map of Scotland* it is marked at 955 yards or 2865 feet; which is also Dr. Macculloch's statement. The lower part of the mountain is composed of red sandstone, but after an ascent of several hundred feet, mica-slate, separated from it by a bed of breccia, rises from under it, and continues till it reaches a kind of irregular plain, from which arises a mass of granite, different from that of the central highlands, in the form of an obtuse pyramid. The side of the mountain is covered with debris of mica-slate and granite, and towards the summit by large blocks of granite, which materially impede the ascent, and the rude appearance of which is increased by the absence of all vegetation, excepting a few lichens. The view from the summit is very extensive, comprehending the south part of Arran, the island of Bute and the Cambray islands, backed by the mainland of Scotland; the peninsula of Cantire; the mountains of the far-distant Isla, Jura, and Mull; and the coast of Ireland from Fairhead to Belfast Lough. The name of this mountain in Gaelic is *Gaoth Bheinn*, 'Mountain of Winds.' The name of Goatfell has been given by the strangers who have visited the island. It is sometimes incorrectly called Goatfield.

The geology of Arran, from its interesting character, has attracted much attention. The prevailing line of the coast is low, although it occasionally rises into precipitous cliffs. Red sandstone is the predominant rock, extending with little interruption from near Loch Ranza on the north side of the island, along the eastern and southern shore, to Slidery water, near the S.W. extremity of the island. From hence it occurs alternating with claystone and porphyry to Drumodune; and extends, with one interruption, from Drumodune to the river Iorsa, where it finally disappears. Schistose rocks, mica-slate on the west and clay-slate on the north coast, occupy the remainder of the circuit to the point where the sandstone commences.

* It is surprising to observe the difference in the statements given by different writers of the dimension of this island, an integral part of Great Britain, and a place which, from its geological features, has attracted much notice. The measurements given above are from the Society's *Map of Scotland*. In Hutton's *Theory of the Earth*, &c., of Arran, the length is given at 31 or 35 miles, and the breadth at from 15 to 20. Jameson's *Outline of the Mineralogy of the Shetland Islands and of the Island of Arran*, gives 32 miles and 12.

The interior of the island may be mineralogically divided into two parts, separated from each other by an irregular line drawn from Brodick Bay to the mouth of the river Iorsa. North of this line, mica-slate, clay-slate, and granite occur. The schistose rocks rise from beneath the sandstone on the eastern coast, and form, as already noticed, the western coast north of the Iorsa. The centre is occupied by the granite, which forms the lofty and craggy mountains of Goatfell and Kidvoe towards the east; of Cairne-na-Caillieh, Ben Hush, and Ben Breach, in the centre; and Ben Veiran on the west. The granite approaches the sea so nearly on each side as to reduce the space occupied by the clay-slate and red sandstone on the east, and the mica-slate on the west, to narrow belts. The granite rises into spiry forms, frequently bare of vegetation, and is intersected by deep and rugged hollows, through which mountain torrents, almost perennial, take their course.

The districts occupied by the different kinds of rock in the southern division of the interior are not so easily determined, owing to the nature of the rocks themselves, and the accumulation of soil on the surface, which renders it difficult to ascertain or lay down their position with any accuracy. All those which are not sandstone are varieties of trap, syenite, porphyry, and other unstratified rocks, of the same family, overlying the sandstone. Veins of clay-stone, chert, and, or porphyry, traverse the sandstone, and even in some places the granite. (McCulloch's *Description of the Western Islands of Scotland*.)

The island, from its small dimensions, cannot be supposed to have any extensive lake or important river. Loch Tana or Tanach or Tanach (the length of which is vaguely estimated at a mile or a mile and a half, and its breadth at a quarter or half a mile) is several hundred feet above the level of the sea. A small stream, the Iorsa (pronounced yorsa), flows from it into Machry Bay on the west coast. Other rivulets, some of them forming cascades, flow from the hills, and through the deep glens into the sea. These are more numerous and more permanent than the size of the island and their character of mountain torrents would lead us to expect. One, bursting from an orifice in the Dipping Rocks, which are finely columnar basaltic cliffs about 300 feet high, near the south east corner of the island, falls into the sea at some distance from the base of the rocks.

At Cory or Corry, on the north-east coast, are quarries of sandstone of a beautiful white colour, well suited for building. The stone from them was used in the construction of the Crinan Canal. [See ARGYLSHIRE.] Slates were once procured near 'the Crock of Arran' (an enormous mass of sandstone lying loose on the north shore of the island, and forming a well-known sea-mark), and some vain attempts to work coal were made many years ago in the same neighbourhood, and also near the bay of Lamulash. Transparent stones, known to the jewellers as Arran stones, Carnoems, and Scotch topazes, are found on Goatfell.

The climate of Arran is temperate. There is no sultry heat in summer, and the snow-forms in winter are not heavy. Snow lies long on the granite mountains, but only a few hours on the lower lands, and on the sea-shore it is speedily dissolved. The height of the mountains and the position of the island render it very subject to rain.

The island was originally a royal domain mostly clothed with wood; stocked with roes, red-deer, wild boars, and other animals of the chase, and used much by the kings for hunting. Macks of the ancient woods still remain, and extensive coppices of birch, ash, and oak, spring up amidst the cliffs. The earliest creations of private property were in favour of monastic establishments, from which, upon the dissolution of the religious houses, the lands came to the dukes of Hamilton as chiefs of the island, and have continued ever since in that family, by which the greater portion of the island is still possessed. The land which admits of cultivation is not fertile, and is of small extent compared with the surface of the island. Oats, bear or big, potatoes, peas, and beans, are grown. Till of late years the farmers were in a wretchedly depressed condition, owing to the nature of the tenure of land, and the consequent bad methods of farming.

The native breed of horses is small, patient of hunger and fatigue, and remarkably sure-footed. Horses of a larger size are imported from Argyshire. Hogs were only introduced about 1770. Of wild animals the island produces hares and rabbits: Mr. Pennant, in his *Tour to the Hebrides*, adds the otter and wild cat. The birds are blackcocks, grouse,

ptarmigans, plovers, &c. The red-deer and wild goat, formerly abundant, are now nearly if not quite extinct. The eagle and other birds of prey have been nearly extirpated, from the care taken to preserve the game. Serpents, including the common adder, and toads, are found in Arran.

Kelp, till of late, was made in considerable quantity. Most of the woollen cloth used in the island is made by the women. The herring fishery is the only one in which the natives engage. Shoals of these fish often frequent the coast, or the fishermen repair to Loch Fyne [see ARGYLSHIRE], or other places. The basking shark or sail-fish is occasionally taken; they are sometimes near forty feet in length, and yield a good quantity of oil. The roads in the island owe their origin to Ann, duchess of Hamilton, in the seventeenth century, and little seems to have been done from her time till about twenty years since, when roads were made, partly at the expense of government, from Lamulash to Brodick Bay, and from the last to Blackwater on the south-west coast.

The population of Arran, which contains two parishes, Kilmory and Kilbride, was, in 1831, 6127. It had rather declined during the preceding ten years. Most of the people understand English, though the spoken language is Gaelic. Arran, the island of Bute, and the Cumbray islands, make up the shire of Bute. It is in the presbytery of Cantire and the synod of Argyll. Brodick is the principal village.

This island was early subdued by the Norwegians, and it afterwards formed part of the domains of the Lords of the Isles, vassals of the Scotch king. It subsequently formed an earldom, which was held successively by the families of Boyd and Hamilton, and it was not till the reign of James V. (in the sixteenth century) that it was really reduced to obedience to the Scotch crown. It afforded a temporary asylum to Robert Bruce in his adversity, and there is a cave on the west side of the island in which he sought refuge.

Immense cairns, rough obelisks, monumental stones, and other antiquities, supposed to be Druidical, are found in different parts. There are two or three Danish forts, and the remains of a mound of doubtful origin at Drumodun, or Drumodune, on the west side. On Lamulash island are some vestiges of a religious house. Besides Arran Castle and Loch Ranza Castle, there are the ruins of another old castle (Kiddonard) on the south coast. A garrison of eighty men, which had been placed in Arran Castle by Oliver Cromwell, having provoked the indignation of the islanders, was massacred by them. (McCulloch's *Isles of the Minerva*, &c. of Arran; Jameson's *Outline of the Mineralogy of the Scottish Islands and the Island of Arran*; Pennant's *Voyage to the Hebrides*; *Transactions of the Geological Society*, &c.; Macculloch's *Highlands and Islands of Scotland*.)

ARRAN, ISLES OF, a cluster at the entrance of Galway Bay on the west coast of Ireland, sometimes called the South Isles of Arran, to distinguish them from the island of Arranmore off the coast of Donegal, which is sometimes called North Arran.

These islands are three in number, lying in a line N.W. and S.E.; Arranmore, the largest, being to the N.W., that of Inismain next to it, and then that of Inishere. Arranmore is between six and seven English miles long, and about two miles across in the broadest part. The N.E. coast of these islands presents a sloping shaggy bench; the opposite side has fine romantic cliffs, abounding with puffins, on whose eggs, in time of scarcity, the inhabitants subsist. They contain about 7000 acres, are very fertile, and produce a small kind of oat without any husk. The stoutest calves in the county of Galway (in which these islands are included) are reared here.

Each island is an ecclesiastical parish, and forms part of the extensive union of Ballinakill in the archdiocese of Tuam. The population, in the year 1821, was 3079. Many, or indeed most, of the inhabitants are engaged in fishing, and use a *corragh*, or boat made of a frame-work of willow covered with tanned linen, and provided with a rudder. In these rude vessels three or four hardy sailors embark, and trust themselves out far from the shore. A pier, nearly 215 feet long, and a landing quay, 326 feet in extent, have been erected under the direction of the late board of commissioners for the Irish fisheries, at Killeeny, in Arranmore, the largest village in this group of islands, which has a population of 974 persons. This has caused an extension of the number and an improvement in the class of the fishing vessels. A number of vessels rendezvous here during

the herring season. The number of pupils at school in the year 1821 in these islands was 214, viz. 161 boys and 53 girls.

Arranmore was also called *Arran a Naomh* or *Arran Naomh*, i.e. 'Arran of the Saints,' a number of churches having been erected in it, in which the bodies of many Irish saints repose. It is said that there were antiently on this island ten churches, and five on the two smaller ones. On a high cliff in Arranmore, over the sea, is Dun-Angus, a large circle of huge stones, formed without cement, and capable of holding two hundred cows. A Franciscan friary was founded on one of these islands in 1485.

The inhabitants long retained, and perhaps still retain, the persuasion, that, on a clear day, they can see from this coast *Ily Brasail*, or the Enchanted Island, the paradise of the pagan Irish.

In 1334, these islands, with the neighbouring island of Boffin, were plundered by Sir John D'Arcy, Lord Justice of Ireland. They give the title of earl to the family of Gore. (Seward's *Topographia Hibernica*; *Letters from the Irish Highlands*, &c.)

ARRAS, a strong and important town in France: the capital formerly of the province of Artois, and now of the department of Pas-de-Calais. It is on the south bank of the river Scarpe, 108 miles N. by E. of Paris through Senlis and Peronne, or 113 miles through Beauvais and Amiens. 50° 17' N. lat., 2° 45' E. long.

Arras may be regarded as consisting of three parts. The *Cité*, or what may be termed the old town; the *Ville*, or the new town; and the Citadel, which was erected by Vauban, and is one of the strongest in this part of France. Modern authorities separate the town into upper and lower, but it is not clear whether these divisions correspond respectively to the *Cité* and *Ville* of older writers, though it is probable they do. The *Cité* and *Ville* were formerly separated by a ditch and wall; there was also between them a narrow valley, through which the little stream, the *Crinchon*, flowed. The handsome stone houses and large *places* (squares) of Arras entitle it to rank among the finest cities in France, as far at least as regards the lower town, which is comparatively of modern erection. The cathedral, a Gothic edifice in a bold style of architecture; the town-hall, another Gothic building; and extensive barracks, contribute to adorn the city. The *Petite Place*, of which the town hall forms one side, is surrounded with a colonnade, as well as the *Grande Place*. In some of the highest spots in the city, chalk-pits have been excavated, some of the hollows of which serve as wine-cellar. Part of the surrounding country can be hid under water in case of need.

Arras appears in the Roman writers under the name of *Nemetacum*, but it afterwards took that of *Atrabates*, from the people who possessed the town with the surrounding territory. From this name *Atrabates*, both the town (Arras) and the country (Artois) receive their designation. It appears from the writings of St. Jerome, who lived during the close of the fourth century and the beginning of the fifth, that in his time it was a manufacturing town, and had been pillaged by the barbarians.

When the Franks first established themselves in the N.E. part of France, Arras formed part of their dominions; and, by the earlier kings of France, the lordship of the town was placed in the hands of the bishops of Arras, who retained it till the time of the Emperor Charles V., notwithstanding the power of the dukes of Burgundy, who were counts of Artois. Charles V., having compelled the kings of France to give up the right of sovereignty over that part of the Burgundian dominions which had come to him by inheritance, made them yield at the same time the city of Arras, which he then subjected to the temporal power. It came again under the dominion of France by the treaty of the Pyrenees, in 1659; and the bishops seem to have been re-established in their seigniorial rights. The magistrates of the *Cité* were still nominated by them in the early part of the eighteenth century.

Arras is the see of a bishop, whose diocese comprehends the department of Pas-de-Calais. The population, in 1826, was about 22,000. The Scarpe is navigable from this town; the trade consists both in the agricultural produce of the neighbourhood and in the manufactures of Arras itself, which are cottons and woollens, lace, soap, and beet-root sugar. There are also many oil-mills.

Among the literary and scientific institutions are the High

School, the Royal School of Fortification and Military Engineering (*École Royale du Génie*), the Drawing School, the Deaf and Dumb School, the Secondary School of Medicine, the Societies of Agriculture, Commerce, Science, and Arts, a public library of 31,000 volumes, a collection of paintings and antiquities, and a botanical garden.

Arras was the birth-place of Francis Baudouin, a writer of repute on politics, law, history, and divinity, who died in 1573; and of the two Robespierres and Joseph Lebon, of revolutionary notoriety. (Balbi; Malte-Brun; Martinière, *Dict. Universel de la France*.)

Two treaties were concluded at Arras in the fifteenth century: one in 1435, between France and Burgundy, by which several towns were annexed to the latter; and one in 1482, between Maximilian of Austria and Louis XI. of France, whereby Margaret, daughter of Maximilian, was to have been given to the dauphin, with Artois and Burgundy, as a dowry.

The arrondissement of Arras contains 218 communes, and 113,615 inhabitants.

ARREOY, a remarkable institution, which formerly subsisted in Otahente, and the other islands of the Society group. The first notice of the existence of this institution was brought to Europe by Cook, on his return from his first voyage in 1771. The account given in the narrative of the voyage published the following year was however generally supposed to have received a colouring from the florid pen of Hawkesworth, by whom the book was written. In the narrative of his second voyage, which he wrote himself, Cook appears inclined to soften down certain of the features of the former representation. Subsequent statements were given by Dr. Forster and others, for the most part differing from each other in important particulars. The fullest account, we believe, that has appeared, and at the same time the latest, is that given in Ellis's *Polynesian Researches*, vol. i. pp. 311-314.

Hawkesworth's account would lead us to suppose that the distinguishing characteristic of the Arrey societies was, a community of women among the members. Upon this point it appears clearly that he was mistaken. Forster thinks that a rigid celibacy was the original law of the institution; and this notion receives considerable countenance from the mythological tradition of its origin which is given by Mr. Ellis. To the last, according to Ellis, each member continued to have his own wife, who was watched with extreme jealousy. It is certain, however, that these societies sanctioned and encouraged the greatest licentiousness of manners.

It is now understood that the fundamental law of the Arrey institution was that no children born to any of the members should be suffered to live. Even upon this head, however, there is a great deal of contradiction in the various accounts, and the information we have is upon the whole very unsatisfactory. Forster states that it was a rare thing for a child ever to be born to a member of the Arrey, and that consequently infanticide was very seldom resorted to. They chose their wives, he intimates, from among a class of females whose habits rendered it unlikely that they should have families. This however does not appear to be very consistent with the statements of other authorities as to the jealousy with which they were accustomed to preserve the honour of their wives. It appears also that infanticide used to be commonly practised in these islands by all classes of the people, and quite as much by those who were not, as by those who were, members of the Arrey. Mr. Ellis gives it as his opinion, founded upon all the facts which he had been able to learn, that two-thirds of all the children born used to be thus sacrificed; and, according to his account, the murder was almost always committed by the parents themselves, neither of whom, as a general rule, evinced the least repugnance to the horrid act, or the least shame in acknowledging it. Forster, again, was told by Omai that the mother generally endeavoured to save her offspring, and that the deed was always perpetrated in such a manner as to show the general feeling to be, that it was one which ought to be hidden from the light of day. Without attempting to reconcile these contradictions, we may here merely remark that it seems at any rate difficult to understand how a practice, which thus appears to have prevailed universally, should have been at the same time, as we are told it was, the chief bond of the particular association we are now considering.

The persons who formed this society are described as having been held in the greatest honour by their countrymen, and as having been accustomed to spend their time in the enjoyment of all the abundance and luxury which the general admiration could shower upon them. They travelled about in companies consisting of many hundreds; and wherever they made their appearance, gaiety and dissipation became the order of the day. From some of the accounts it might almost be supposed that they were really an order of public players. They appear to have collected large audiences around them, whom they amused with dances and other exhibitions. Another conjecture, for it can scarcely be called more, is, that the members of the Arceoy were the body of the national soldiery, and that the privileges they enjoyed, and the high estimation in which they were held, were the inducements offered by the state to engage them to defend their country. In general these associated libertines certainly appear to have been among the most eminent warriors of the nation.

Some accounts make these societies to have consisted exclusively of members of the chief families in the country; but, according to Mr. Ellis, they comprehended persons of all classes. If so, there must have existed some barrier against indiscriminate intrusion, the nature of which has not been stated. For if we are to believe the descriptions given of the advantages enjoyed by the members of the Arceoy, it is plain that nothing but the impossibility of obtaining admission into the association could have induced any person to decline entering it. Besides the ease, enjoyment, and honour, which were the lot of its members in the present life, their religion, we are informed, promised them the continuance of the same superiority over their fellow-countrymen in the next. There is no reason to suppose that the necessity imposed upon the members of destroying their children would alone have operated with any material effect to deter persons from seeking the high and tempting privileges which the association conferred: for, as we have seen, infanticide was a custom of universal prevalence among the inhabitants of those islands. It is probable either that the number of the members and the description of the individuals eligible were regulated by some law of the state, or at least that there was some form of election which gave the power of admission and rejection to the society itself. A circumstance which favours this last supposition is, that there are known to have been different classes of the initiated, rising above each other in rank, from one to another of which an individual could only raise himself by his meritorious conduct, and after having belonged for a certain time to the inferior class. Mr. Ellis enumerates seven of these classes. It is not likely that, while each subsequent step was made the reward of service and exertion, the attainment of the first degree should have been a matter of course and open to all. It is stated that the more fatiguing work of the public exhibitions was usually left to the novices, or at least to the younger members.

Women as well as men were members of the Arceoy. When it happened, as it sometimes did, that a child born to any of the members was spared by the pity of its parents, both were expelled from the society, and the mother received the reproachful name of *uhameenou*, signifying 'bearer of children.' The children are said to have been commonly destroyed by suffocation; but various other methods were in use.

One of the happy consequences of the introduction of Christianity into the island of Otaheite has been the entire abolition of those profligate associations, as well as of the practice of infanticide generally. What effect this change may have upon the progress of population remains in great part still to be ascertained. Mr. Ellis states, that when the missionaries arrived at the islands, the natural proportion of the sexes had been so deranged, that there were four or five men to one woman. Mr. Malthus has given it as his opinion that the Arceoy was in all probability originally instituted with the view of preventing the inconvenient increase of population; and he seems to think that, from the unsparing rigour with which the fundamental law of the association appears to have been observed, it probably had that effect. But this opinion is in opposition to the general fact which, as he notices, had been before remarked by Mr. Hume, that the existence in any country of a law permitting infanticide had usually, from its tendency to promote marriages, by diminishing the fear of their consequences, been attended with the opposite result.

ARREST is the apprehending or restraining a man's person by authority of law.

In criminal matters the object of an arrest is to secure the person of one who has, or is supposed to have, committed an offence, in order that he may be brought before a magistrate; and then, if there appears sufficient ground of suspicion against the party to justify his being put upon trial, the magistrate takes measures for securing his presence before the proper court, either by committing him to prison, or by taking bail for his appearance.

An arrest may be made either by virtue of a warrant, or where the law authorizes it, without warrant. A warrant may be granted in extraordinary cases by the privy council, the secretaries of state, and some other public officers; but the only warrants which occur in the ordinary administration of the law are such as are issued by justices of the peace.

When a charge is made before a magistrate, it is his duty to examine the witnesses upon oath, and to take down their statement in writing; and then, if he see any probable ground of suspicion against the party charged, he issues a warrant for his apprehension. The person to whom the warrant is directed, generally some constable or other peace officer, is bound to execute it as far as the magistrate's jurisdiction and his own extends, but if the party to be arrested escapes into another county, the warrant cannot be executed without being *backed*, that is, signed by a justice of the peace for that county. [See WARRANT.]

But in many cases an arrest may be made without a warrant; particularly by officers connected with the administration of justice. A constable, for instance, may arrest, in case of felony, if there is reasonable ground of suspicion; and for any breach of the peace actually committed in his view.

An officer may, upon a criminal charge, break open doors, if, upon demand of admittance, it cannot be otherwise obtained; he may likewise, in apprehending a person charged with felony, use any degree of force that may be necessary; and if the person charged attempt to save himself by flight or resistance, and is killed by the officer (there being no other means of preventing an escape), the homicide is justifiable; but if he kill the officer with the intent to oppose him in the execution of his duty, it is murder.

Private persons also are not only authorized, but required, to apprehend any person who commits a felony in their presence; and in pursuing such felon, they will be justified in breaking open doors and in using force, as much as an officer. A private person may likewise arrest upon reasonable suspicion of felony; but inasmuch as this is not a duty enjoined by the law, he is not armed with the same privileges as where he saw the offence committed: he cannot justify breaking open doors, or using the same degree of force; if he kill the supposed offender, he will be guilty of manslaughter; and if he be killed, the offence will be the same, and not murder; besides this, he acts at his own peril, and is liable to an action unless he can show that a felony had been actually committed, and that there was reasonable ground to suspect the person whom he arrested.

There are also several cases where private persons have the power of arresting given them by act of parliament. Any person whatsoever is authorized to apprehend for any offence against the Vagrant Act, 4 and 5 Geo. IV. c. 84. And where persons are found committing any offence against the Larceny Act, or the Malicious Injuries Act, 7 and 8 Geo. IV. c. 29 and 30, they may be apprehended, without warrant, by any peace officer, or by the owner of the property, or by his servant, or any person authorised by him.

When an officer has arrested any one, he ought to take him before a magistrate to be examined as soon as possible. Where a private person has made the arrest, he will in general be justified either in taking the party arrested before a justice of the peace, or delivering him over to a constable of the place, and this alternative is expressly given him by the Vagrant Act; but the Larceny Act and the Malicious Injuries Act require that the person arrested should be forthwith taken before a justice of the peace. But if a person be apprehended in an attempt to commit a felony at night, he may lawfully be detained, even by a private person, till he can be carried before a magistrate.

There is likewise another mode of arrest for felony, and that is upon *hue and cry* raised; but though this was once

in ordinary practice, it has now fallen into disuse. [See *HUK and CRV.*] Hale's *Pleas of the Crown*, vol. i. p. 575, vol. ii. p. 72-120; Stephen's *Summary of the Criminal Law*, p. 239-244.

Arrest in civil cases is of two kinds: 1. that which takes place before trial, and is called arrest on *mesne* process; 2. that which takes place after trial and judgment, and is called arrest on final process, or arrest in execution. [See *PROCKS.*]

The primary object of arrest on *mesne* process is to secure the defendant's appearance in court, so as to enable the plaintiff to proceed with his action against him. This compulsory mode of proceeding, being penal in its nature, was originally allowed by our law in such injuries only as are accompanied by force: its use, however, was gradually extended, partly by Acts of Parliament, partly by the fictitious proceedings of the courts, to almost every species of complaint; and by later regulations it has nearly been confined to cases of debt.

When it is intended to proceed by arrest, the plaintiff, after making an affidavit that the cause of action amounts to 20*l.*, which by stat. 7 and 8 Geo. IV. c. 71, is now the lowest sum for which a party can be held to bail, commences his action by suing out a writ, called a *capias*, directed to the sheriff, who, on its being delivered to him, grants a warrant to his inferior officers or bailiffs to execute it on the defendant. Upon making the arrest, the officer is required forthwith to deliver to the defendant a copy of the writ and is not allowed to take him to gaol within twenty-four hours, unless, upon request made, he refuses to go to any place of safe custody. He is in general taken to the house of the officer (vulgarly called a 'spunging-house'), where (if not sooner lawfully discharged) he may be confined until the expiration of the eight days limited for the putting in of special bail.

When arrested, the defendant is in custody of the sheriff: but by stat. 43 Geo. III. c. 46, s. 2, he may obtain his discharge by depositing with the sheriff or his officer the sum sworn to, together with 10*l.* to answer for the costs, or by giving bail for his appearance to defend the action: this being what most commonly occurs, the process upon which an arrest is founded is called *bailable* process. For further information on this subject, see *BAIL*.

Arrest on final process, or arrest in execution, is one of the means by which a party who has succeeded in an action may compel performance of the judgment.

Arrest in execution may in general be resorted to in any case where, before trial, bailable process might issue: when execution has been taken out against the property, and there is not enough to satisfy the judgment, execution against the person may afterwards be resorted to; but if the person has once been taken in execution, no process can in his lifetime issue afterwards against the property. [See *EXECUTION.*]

An arrest is made by seizing or touching the defendant's person. The officer is not justified in breaking open the defendant's house in order to arrest him: but, when once the arrest is made, he may break into any house in pursuit of him.

In France, imprisonment seems to have existed from the earliest ages as a means of execution to compel the payment of a debt, though its application was originally restricted to cases where the property of the debtor had been previously seized and found insufficient. In the reign of Louis XIV. a principle was introduced, which at the present day constitutes one of the characteristics of French jurisprudence; debts of a commercial nature being distinguished from debts purely civil, and arrest being allowed as of course in the former, but, in the latter, only in a few specified cases.

An arrest, by the law of France, cannot take place without being authorized by the sentence of a court. The cases in which this authority is exercised in matters not of a criminal nature may be classed under four heads:

I. In all cases of commercial debt to the amount of 200 francs (8*l.* sterling), arrest forms part of the sentence as a matter of course. The object of imprisonment is to compel the debtor to give up any property which he may be supposed to have concealed; after a certain length of confinement, it may be presumed that, if he has given nothing up, it was because he had nothing to give; and thus the reason for detaining him ceases to operate. The debtor is, therefore, in all cases discharged from prison, after a certain length of time, varying according to the amount of the debt.

In commercial cases, the length of imprisonment varies from one year to five.

II. In actions of a purely civil nature, arrest takes place only in those cases which are specified by the laws. The civil code (*Arts.* 2059, 2060) contains an enumeration of the cases in which it is pronounced as a matter of course. They are chiefly such as imply either gross fraud, or a breach of official duty. The length of imprisonment varies from one year to ten.

There are other cases in which the court have a discretionary power to pronounce sentence of imprisonment if they think fit; the length of confinement varies in this instance from one year to five. In all civil cases, 300 francs, or 12*l.* sterling, is the lowest sum for which a person can be arrested.

III. All public servants are liable to arrest in respect of any sum of money to the amount of 300 francs, 12*l.* sterling, due, by virtue of their office to the state, or any public establishment. The duration of imprisonment varies from one year to ten.

IV. With respect to foreigners not domiciled in France the law is peculiarly severe. As their property is presumed to be in their own country, the confinement of their persons is considered to be the only means by which they can be compelled to satisfy their creditors; they are, therefore, liable to arrest for all debts, whether civil or commercial, provided the sum amounts to 150 francs, or 6*l.* sterling. And for this sum a foreigner may be arrested, not only after final judgment, but as soon as the cause of action has arisen. In the latter case, however, he may obtain his discharge by finding sureties, or by proving that he is possessed of sufficient property in France to pay the debt: when arrested on final judgment, the duration of his imprisonment varies from two years to ten.

A debtor who has entered his 70th year cannot be arrested on final process, except in the case *stellionatus*, the *stellionatus* of the Roman law, a fraud committed by a party in falsely representing property as being his own or as being free from incumbrance. And with the same exception, a debtor who is in prison is, on entering his 70th year, entitled to be discharged. The debtor likewise obtains his discharge in the following cases: 1. If the creditor give his consent thereto; or 2. If he neglect to advance the sum which the law requires him to pay for the support of the debtor. This sum is now fixed at 25 francs, 1*l.* sterling per month, except in Paris, where it is 30 francs; 3. By payment of the debt, costs and expenses; or, in cases not commercial, by payment of one third thereof, and finding sureties for the remainder; or 4. By being allowed the benefit of cession, answering to a discharge under the Insolvent Act in English Law. [See *CESSIO BONORUM.*]

See *Code Civile*, *Arts.* 2059-2070; *Code de Procédure Civile*, *Arts.* 780-805; law of 17th of April, 1832; Faelix, *Commentaire sur la Contrainte par Corps*.

ARRHIID.EUS, a bastard son of Philip III. of Macedonia, who, on the death of his half brother Alexander (B.C. 323) was named his successor by acclamation of the Macedonian troops (Diod. xviii. 2) and consent of Alexander's generals. His title was strengthened by marrying Eurydice, grand-daughter of Perdicas, Philip's elder brother. Being of weak intellect, he was a mere tool in the hands first of Perdicas, then Antipater, and finally of Polysperchon, who, in conjunction with Olympias, set up as a rival to him Alexander, son of Alexander the Great by Roxana, who was born after Alexander's death. Eurydice called in the assistance of Cassander: but falling into the hands of Olympias, was, with her husband Archidaus, put to death, B. C. 317. [See *ANTIGONUS*, p. 102. *ANTIPATER*, *PERDICCAS.*]

ARRIANUS, FLAVIUS, a native of Nicomedia in Bithynia, and one of the most prolific Greek writers of the second century. The date of his birth is unknown, though it was probably during the reign of Domitian, or of Nerva, but we can only infer it generally from the following fact. In the twentieth year of the reign of Hadrian B.C. 136, the successor of Trajan, Arrian was governor of Cappadocia, and in this capacity he addressed a letter to the emperor, containing an account of his voyage from Trapezus (Trebisond) on the Black Sea, along its eastern coast as far as Dioscurias or Sebastopolis. The chief object of the voyage was to inspect the garrisons on this coast. The letter of Arrian to Hadrian is written in Greek, and contains, besides an account of the governor's own voyage, a complete Periplus, or description of the chief places all round the coast of the Black Sea.

(See Hudson's *Minor Geographers*, vol. i.) We cannot well suppose Arrian to have been under forty years of age at this time. Dodwell is inclined, for various reasons, to suppose that he might have been more than fifty when he was governor of Cappadocia. (See his *Dissertation*.) This is the only date in his life that can be fixed with any probability, and such as it is, must be used for his previous and subsequent life. In his youth Arrian was a pupil of Epictetus, who then resided at Nicopolis in Epirus, having been banished from Rome in the reign of Domitian, together with the whole body of philosophers. Epictetus died probably in the earlier part of Hadrian's reign, and Arrian commenced his career as a writer by publishing the *Encheiridion*, or 'Manual,' which is still extant, and contains the moral doctrines of his master. [See EPICTETUS.] He wrote also eight books, of which four are extant, entitled 'The Philosophical Disquisitions of Epictetus,' which, as he tells us in his preface, addressed to L. Gellius, contain the very words of his master. In addition to these he wrote a work entitled 'Dialogues of Epictetus,' and another, 'On the Life and Death of Epictetus,' both now lost. Hadrian, who aspired to the character of a philosopher, was on terms of intimacy with Epictetus, and probably saw him during his stay at Athens in A.D. 123 and 124; and it is not an unlikely conjecture that Arrian, the favourite pupil of Epictetus, was introduced by him to the emperor. Arrian, in his 'Life of Alexander,' seems to attribute his own rise in the world to his literary reputation. After the death of Epictetus and the publication of his philosophical works, Arrian acquired the privileges of a Roman citizen and the Roman name of Flavius; we may presume also the rank of senator, as he was the governor of so important a province as Cappadocia; whether he ever enjoyed the consular dignity does not appear quite certain. Suidas (*Ἀρριανός*) says, on the authority of Heliconius, that he attained the consulship. That he was governor of Cappadocia with full powers is evident from the *Periplus* of the Euxine Sea and other authorities. Honours and emoluments in his native city of Nicomedia were also conferred upon him, for we learn from Photius, that he held the priesthood of Ceres and Proserpine, a function to which, no doubt, considerable profits were attached, as we may see from other similar examples.

In A.D. 137 a disturbance broke out in the neighbourhood of Trapezus, Arrian's head quarters, headed by a chief called Pharasmanes. (Dion. Cassius, lib. 69, cap. 15.) The activity of the governor appears to have checked this rising without any further measures than a vigorous display of force; and the war, such as it was, is only curious from the name of the people headed by Pharasmanes. They are called Alani, possibly a mistake for Albani. (See Dion.) We still possess a fragment by Arrian, entitled 'The Order of Battle against the Alani,' probably a part of a larger work on the Alan war; and also a Treatise on 'Military Tactics,' written in the 20th year of Hadrian. (See the conclusion of the *Tactike*.) Gibbon's remark (note, chap. i), 'that with the true partiality of a Greek, Arrian rather chose to describe the phalanx of which he had read, than the legions which he had commanded,' is not correct, if the fragment on the Alan war was written by him.

After the death of Hadrian (B.C. 135), Arrian probably retired from public life, but he was by no means idle. He wrote a history of 'Trajan's Parthian wars,' in seventeen books; the 'History of Dion of Syracuse'; the 'History of Bithynia,' his native province, in eight books; and, to give a little variety to his occupations, he favoured the public with the biography of the robber Tilliborus, a fellow who for some time annoyed the neighbourhood of Mount Ida. (Lucian, *Alexander*.) A work on comets and meteors, known only by some extracts in Stobæus, is attributed to an Arrian; but whether the author was Arrian of Nicomedia cannot be determined. The work by which he is now best known to us is the 'History of Alexander's Campaigns in Asia,' in seven books, founded principally on the histories of Ptolemy the son of Lagnus, King of Egypt, and Aristobulus the son of Aristobulus, both of them the companions of Alexander in his wars. This is almost the only source for the history of Alexander's conquests that we can now use with any confidence, and, indeed, without it we should be utterly unable to form any judgment at all on the military operations of the Macedonian king. Arrian's narrative, however, is often incomplete, and occasionally obscure; the obscurity sometimes, though rarely, arises from the language of the writer, but mainly from the

difficulties which he must have experienced in reconciling conflicting authorities (see Arrian's *Preface*). Arrian's history, however, is often the best source that we can appeal to for illustration of the comparative geography of Asia. A general tone of good sense is found all through, but, as was usual with those who undertook to write the Life of Alexander, the faults and vices of his hero are touched with a lenient hand. There is no absolute proof to show at what period Arrian wrote this work. St. Croix tells us, on the authority of Photius, that he wrote it when very young. Dodwell believes it was one of his later productions, written during his retirement and the decline of his life. The following passage in his History of Alexander may help to decide:—he speaks of himself as well known (i. 12), and makes allusion to his honours; but he prides himself still more on his literary labours, which he had prosecuted from his youth upwards. He concludes by telling us, that as Alexander was the best captain, so he himself was the best master of the Greek language, and the fittest person to write about him.—All this savours more of an old than a young author.

As a continuation to his History of Alexander, he wrote a little work, still extant, entitled 'On India,' which contains a great deal of curious matter on the natural productions of that country, and the manners of its inhabitants. It contains also an extract from the 'Voyage of Nearchus,' (cap. 20, &c.) who conducted the fleet of Alexander from the Delta of the Indus to the Euphrates. Arrian's work on the History of Alexander's successors, in ten books, would have formed a valuable commentary on that busy but obscure period; it is now only known by an extract from Photius.

Another valuable little treatise, which bears the name of Arrian, is entitled 'The Periplus of the Erythrean Sea,' that is, the coast description of part of eastern Africa, Arabia, Persia and India; it is by some critics assigned to a period somewhat later than that to which Arrian's life can with reasonable probability be extended. This interesting monument of the early commerce of the Indian Ocean has been illustrated by Dr. Vincent. (*Periplus of the Erythrean Sea*.)

Arrian in general affected to imitate the Attic Greek of Xenophon, but the little treatise on India is written in a kind of Ionic dialect.

Arrian, as we may see from his letter to Hadrian, was no unskilful courtier, and from the rest of his works we may judge him to have possessed a large share of vanity. The model that he proposed to himself was Xenophon the Athenian, and certainly the pains which he took to assimilate himself to his prototype are not a little curious and amusing. Xenophon was an Athenian by birth; Arrian contrived to get himself made one. Xenophon wrote on the philosophical doctrines of his master, Socrates; so did Arrian on those of Epictetus. Xenophon wrote an account of the Expedition of the younger Cyrus, and gave it the appropriate name of the Anabasis or Ascent; Arrian also gave to his History of Alexander, the less appropriate name of the Anabasis of Alexander. Xenophon wrote his Hellenica, or History of Grecian Affairs, a kind of supplement to the Peloponnesian War; Arrian wrote a History of Alexander's successors. Xenophon wrote a Treatise on Hunting; so did Arrian. Both works still remain. Finally, Arrian very modestly calls himself the younger Xenophon, and sometimes simply Xenophon. It is unnecessary to pursue the parallel farther; the following quotation from his book on Hunting will show his character:—'This I shall say, being of the same city with Xenophon, and having the same name, and from my youth up having had the same pursuits—hunting, military science, and philosophy.' Xenophon was a good judge of a horse and a dog, and Arrian also shows by his remarks that he was a true lover of field-sports, and had practical knowledge on these matters. He endeavours to supply some of Xenophon's omissions, which he says 'were not caused through any negligence on the part of Xenophon, but from his being unacquainted with the Celtic breed of dogs, and with the Seythian and Libyan breeds of horses.' Arrian's description of his favourite dog Horne (*Ὀρνίς*), his constant companion and friend, is written with the feeling of a sportsman, and gives us also a favourable opinion of his character. How long the second Xenophon, huntsman, general, historian, and philosopher lived we do not know; it is possible that he lived till the beginning of the reign of Marcus Aurelius, A.C. 161, which would fail to complete the parallel between him and Xenophon, who

lived to be above ninety years old. (Lucian, *Macrobii*.) Dion Cassius (see *Stodius*) is said to have written a life of Arrian. (See *St. Croix*, *Examen Critique*, &c.; Dodwell's *Dissertations* in vol. i. of Hudson's *Minor Geographers*.)

There are many editions of separate parts of Arrian, but only one, as far as we know, of all his works; that by Borheck, 3 vols. 8vo. Lemgo, which is very incorrect. The latest edition of Arrian's History of Alexander and his India that we have seen, is by Schmieder, Leipzig, 1798. The Periplus of the Euxine and Erythrean seas is in Hudson's *Minor Greek Geographers*, vol. i. A translation of Arrian's book on Coursing was published by J. Bolm, London, 1831, with classical and practical annotations, and with an appendix and twenty-four embellishments from the antique; only 250 copies were printed. Dr. Dibdin calls this book a 'dear delight.' An English translation was published in 1729, in 2 vols. 8vo., by Mr. John Rook, of the History of Alexander's Expedition, with notes, historical, geographical, and critical. To this translation is prefixed, M. Le Clerc's Criticism upon Quintus Curtius; Arrian's Indian History; his Account of the Division of the Empire after Alexander's Death; Raderus' Tables; a Catalogue of the Authors who have written upon his History; a Chronology of the whole; and a complete Index. There is also a translation of the Periplus of the Euxine Sea, by Dr. William Falconer, published in London, in 4to. in 1805. The latest translation of the Anabasis that we have seen noticed is, *Histoire des Expéditions d'Alexandre*, par P. Chausseard, 3 tom. 8vo., Paris, 1802.

ARRIÈGE, or **ARIEGE**, a river in France, one of the tributaries of the Garonne. It rises deep in the recesses of the Pyrenees, in the ridge which separates France from the valley of Andorra in Spain. It flows N.E., N., and N.W., forming an arc, to the town of Tarascon, receiving on both sides a number of streams, which descend from the lofty ridges, and drain the secluded valleys of the Pyrenees. From Tarascon, which is thirty-one miles from its source, it flows due N. about thirty-one miles farther, by Foix and Pamiers, to near Saverdun; from thence its course is N.N.W., by Cintegabelle (where it receives the Lers, its principal tributary, which falls into it on the right bank), to Anterive, about eleven miles. Here the navigation commences, and the stream flows, still in the same direction, about twelve miles, to its junction with the Garonne, about six miles above Toulouse. Its whole course is about eighty-five miles.

This stream is noted for the excellence of its fish, especially salmon-trout; and also for the gold which is found in its bed. This first occurs at Crampagnac, about four miles and a half N. of Foix, in small quantity; but, following the course of the stream towards the north, it becomes more abundant, and the village of Varilhès, which is nearly two miles below Crampagnac, serves as the southern limit of the gold-searchers; Pamiers may be considered the centre. It is between Varilhès and Pamiers that the largest grains are found; these have, in some very rare instances, weighed half an ounce troy. The gold-district continues as far down as Saverdun, fourteen or fifteen miles below Crampagnac, at which it commenced. The subsoil of the neighbourhood and the banks of the river in this district consist of pebbles of all sorts and sizes, more or less firmly united by a softish, easily crumbled, calcareous cement. The gold, however, is found detached from the pebbles with which it is intermingled. The soil above the pebbly stratum produces excellent crops.

The brooks which fall into the Arriège within the limits above described have gold in their channels, but the whole quantity gathered, whether in the river itself or its feeders, is at present inconsiderable.

Some have supposed that this stream derived its name from the gold found in it, asserting that it was antiently called *Aurigera* (gold-bearing); but we are not aware that any antient author gives support to this assertion, and the etymology itself is disputed. (*Encyclopédie Méthodique*; Piganiol's *Descript. de la France*; Malte-Brun.)

ARRIÈGE, a department of France on the Spanish frontier, comprehending the former county of Foix, and parts of the province of Languedoc, and of the district of Couserans in the province of Gascony. It includes a considerable part of the range of the Pyrenees, which form its southern boundary. On the N. and W. it is bounded by the department of Haute Garonne (Upper Garonne), on the N.E. and E. by that of Aude, and on the S.E. by that of

Pyrenées Orientales (Eastern Pyrenees). Its greatest length is, from W.N.W. to E.S.E., 67 miles, and its greatest breadth is 48 miles. Its superficial contents are 2169 square miles, according to M. Balbi; or 2193, according to M. Malte-Brun. The population is 248,000, giving 114 inhabitants to the square mile, according to the first-mentioned calculation of surface; or 113, according to the second.

This department is traversed by numerous streams which descend from the Pyrenees, and which flow northward, forming by their union the Salat, the Volp, the Arize, and the Arriège, which fall successively into the Garonne. Of these the Arize is remarkable for its waters passing under ground in two places. The Leze and the Lers, streams of considerable length, are feeders of the Arriège. Several of the brooks westward from the Arriège yield gold; they traverse a soil similar in its nature to that through which the Arriège flows in the gold district.

The mountains are very lofty. The following are the principal summits, with their altitude in English feet. Montcaumon, 10,663. Peak of Estats, 10,611; both near the head of the valley of the Vic-de-Sos, a feeder of the Arriège. Peak of Serrere, 9646; Peak of the Port (or Pass) de Signier, 9613; Peak Pedrons, or Pedrons, 9511; Peak of Montouton, 9192; Peak of Foute Argente, 9370; Peak Lanoux, 9370; Peak of Monvallier, 9249; Prigue, or Peyrie, 9121; Mount Carbere, 8655; and Roc-Blanc, 8320. The Port de-Rat, at the head of the valley of Vic-de-Sos, is 7173 feet high; that of Puy Moreins, to the east of the last, is 6299 feet.

The mineral wealth of the department is considerable. Iron, lead, copper, and silver, are procured; the last, however, not in any great quantity. There are mineral waters at Ax, a little town on the Arriège near its source; and coal, slates, marble, and jasper are wrought. Turquoises are found in some places.

The southern part of this department is of great elevation, and therefore very cold. It affords fire-wood and pasturage. A considerable quantity of cattle is reared. Medicinal plants are numerous, and the vivid colours of the flowers add to the beauty of the country; a century ago the tulips were in high esteem with the florist. The northern and lower part of the department has a far higher temperature, and great fertility of soil; suited, however, for corn rather than for the vine. The fruit is excellent.

The chief trade of the department is in iron—which is wrought in considerable quantity, especially in the valley of Vic-de-Sos—cork, resin, and wool; and in mules, which are in estimation for their strength. Some manufactures are carried on, as of hats and hosiery, at Foix and Pamiers; of cottons, woollens, and linens, in the latter town; and of woollens, hats, leather, and paper, at St. Giron. The inequality of the ground forms a great obstacle to the transport of goods, which is chiefly effected by means of horses and mules.

The chief towns are Foix, the capital, on the Arriège (population 5000); Pamiers, also on the Arriège below Foix (population 6000); and St. Giron on the Salat (population 4500). Pamiers is a bishopric, and comprehends the whole department in its diocese. It is under the jurisdiction of the archbishop of Toulouse and Narbonne. [See FOIX, GIRON, ST., and PAMIERS.] Ax, on the Arriège, near its source, has a lead-mine (in the town), and some warm springs, much recommended in some diseases. The population of Ax, at the beginning of the present century, was about 1500. Mirepoix, on the Lers, about fifteen miles east of Pamiers, and Tarascon on the Arriège, had each nearly double the population of Ax at the same period.

The department sends three deputies to the chamber. It is judicially subject to the *cour royale* (assize court) of Toulouse.

ARRIS, in French *Arête* and *Arête*, is a term employed in building. It may be defined as the intersection or line in which the two straight or curved surfaces of a body, forming an exterior angle, meet each other. The term *arris*, synonymous with edge, is constantly employed by workmen engaged in buildings, especially in the formation of mouldings, whether of stone, wood, or plaster. In parallelopipedal bodies, on which the length and thickness may be measured, as in planks, bond timbers, shutters, &c., the term edge only is used. In Gothic architecture, owing to the numerous lines and angles, the *arris* is of frequent occurrence; for example, in the mouldings and transoms (see MULLION and TRANSOM) of windows, where there are many mouldings, every

edge is an arris, whether formed by square mouldings or by the intersection of curves. In Grecian architecture, the raised edge between two flutes of a Doric column, and in both Grecian and Roman architecture, the lines bounding every flat moulding are so many examples of the arris.

ARRIS FILLET, a small triangular piece of wood, used to raise the slates of a roof against the shaft of a chimney or a wall, to throw off the rain more effectually; it is used for the same purpose also in forming gutters round skylights, which have the same inclination as the roof, and are slightly raised above it.

ARROBA, a Spanish measure, both of weight and of capacity, and used as one or other both in Portugal and the Canaries. It exists in Morocco, under the name of Kroba, but with great local variations of value. It is also found to be different in different parts of Spain.

Weight Arroba in Pounds Avordupois.

Spanish standard	•	25.36
Alicant	•	27.38
Valencia	•	28.25
Aragon	•	27.76
Majorea	•	22.93
Lisbon	•	32.38

Measure Arroba in Imperial Gallons.

Spanish standard	{ Greater Arroba	3.51
	{ Lesser Arroba	2.78
Malaga	•	3.49
Valencia	•	2.59
Canaries	•	2.51

The standard greater arroba (used for wine) is also 981 cubic inches, and the lesser (used for oil) is 771 cubic inches.

ARROE is a Danish island off the eastern coast of Schleswig, due south of the island of Finen, and at the southern entrance into the Little Belt, from which it extends in an oblong form about fourteen miles from N.W. to S.E. Its superficial area is thirty-two square miles: it is divided into five parishes, contains a town and market-village, and has between 7000 and 7600 inhabitants. The surface of the island is a continued level, interrupted only by a lake called the 'Wilt-See'; the soil is very rich and productive, but has no wood. The inhabitants breed considerable quantities of cattle, and raise grain, peas and beans, vegetables, aniseed, and cummin seed: they are actively engaged likewise in fishery and navigation. The landvoigt, or bailiff, exercises the executive and judicial powers in all but civil causes, the latter of which are under the cognizance of a local tribunal. Arröeskiöbing, at the eastern side of the island, in 54° 53' N. lat. and 10° 35' E. long., is the capital; it has a convenient harbour, formed by the opposite shore of the island of Deyerbe, with which Arröe is connected by a bridge. The town consists but of four streets, and has a church, three schools, two of which are for the education of navigators, and 1400 inhabitants, who are the owners of above fifty vessels, and depend chiefly upon trade and shipping for their maintenance. The market-village is called Marstall; it is situated on the western side of the island, and contains about 1180 inhabitants, wholly mariners and fishermen. The island itself forms part of the Duchy of Schleswig.

ARROO, a large island, or, more strictly speaking, a group of islands, in the eastern seas, situated to the south and west of Papua or New Guinea, and north-east from Timor-laut island. The cluster consists of five islands, divided from each other by such narrow channels that the whole have been sometimes considered as one island. The centre lies nearly in 6° S. lat. and 135° E. long. The length of the whole from north to south is about 140 miles, and the average breadth about one-fourth of that measure.

Arroo has never been explored by Europeans, and little or nothing is known of either the interior of the country or the character of the inhabitants. What little knowledge we have of the place has been obtained through the report of Chinese merchants settled at Banda, who carry on a traffic between the islands, procuring from Arroo pearls, tortoise-shell, edible birds'-nests, and an aromatic bark named missoy, which resembles cinnamon, and is much used among the Eastern islands, although never, or but very rarely, imported into Europe.

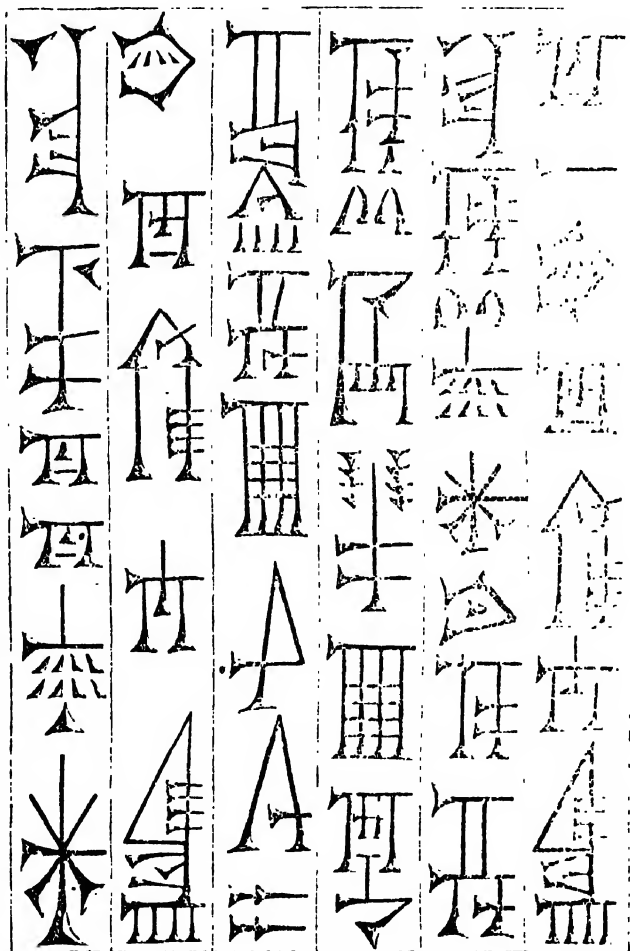

This cluster of islands is likewise remarkable as being much resorted to by birds of Paradise which breed here in

large numbers. These birds are caught for the sake of their beautiful plumage by the natives, who first cut off their legs, and then drawing their entrails, preserve the remainder by means of fumigation. Valentyn has described seven varieties of these birds, of one of which specimens are sometimes found thirty inches in length. In this dried state these birds likewise form an article of commerce between the natives and the Chinese traders. (See Malham's *Naval Gazetteer*, and Hamilton's *East India Gazetteer*.)

ARROW, see ARCHERY and ARMS (Weapons).

ARROW-HEAD. [See SAGITTARI, Constellation.]

ARROW HEADED CHARACTERS, a name particularly given to those marks which have been found stamped on the bricks of Babylon, and cut upon the marble monuments at Persepolis. They have been found also at Nineveh, on some rocks near Argish on the Lake Van in Armenia, at Shus (the site of the ancient Susa), and more rarely in Egypt. The arrow-headed characters have also been called in Latin *cuneiformes*, and in German *keil-förmig*, or *die Keilschrift*; meaning wedge-shaped, and wedge-shaped characters. The arrow-headed character is formed from a very simple element, an isosceles triangle or wedge. Two of these are sometimes joined so as to form a figure not unlike an extended pair of compasses, or very open barbed arrow-head. Some writers on this subject have considered that the characters of Babylon differ essentially from those of Persepolis; but more accurate observation has led others to the conclusion that the cause of the variation lies merely in the difference of the materials on which they occur. Those of Babylon are coarsely stamped upon brick; the Persepolitan inscriptions are

sculptured upon marble. The Babylonian characters, on account of their ruder shape, are often called nail-headed.

The Persepolitan have a more distinct form, and therefore the term arrow-headed more peculiarly applies to them.

The tablet given in p. 397 is a copy, somewhat reduced, of one of the bricks brought from Babylon, and now in the museum of the East India House. Beneath is a representation very much diminished of one of the bricks: the inscription is on the upper side, and surrounded by a broad plain margin.

It is remarkable that neither the Greek nor Latin classical writers make any very distinct mention of the arrow-headed character, though it has been conjectured that the *Ἀσσιρία γράμματα* of Herodotus, iv. 87, and of Thucydides, lib. iv. 50, as well as the *Litteræ Assyriæ* of Plinius, lib. vii. c. 56, refer to Babylonian inscriptions in this character.

Sir William Ouseley, in his *Oriental Collections*, has communicated from a Mohammedan manuscript what professes to be a Persepolitan alphabet: but, like other alphabets which that manuscript contains, it is a mere fiction.

Della Valle saw the supposed ruins of the tower of Babel in the year A.D. 1616. Pietro Della Valle (*Voyage*, Paris, 1747, tome v. p. 320, &c.) and Figueroa, ambassador to the court of Spain, were the first European travellers who are known to have formed any conjecture respecting the interpretation of the arrow-headed characters. They supposed that the direction of the wedges and angles on the Persepolitan monuments favours the conclusion that the inscriptions are to be read from left to right. Chardin inclined to the same view, but added, that they might also be read perpendicularly.

Mandelslo, one of the most intelligent early travellers, who visited the ruins of Persepolis about A.D. 1638, describes the characters which he found there as *triangular, pyramidal, or like obelisks* (i. p. 11, Leyden ed.)

Chardin, Le Brun, and Kämpfer, towards the close of the seventeenth century, visited the magnificent ruins of Tchilminâr or Tehehminâr, which is the modern name of Persepolis. But the travellers of that age seldom took the trouble to copy inscriptions which they did not understand: or, if they attempted a transcript, it was generally inaccurate.

Hyde (*de Relig. Vet. Pers.* pp. 527, 528) and others supposed that the arrow-headed characters at Persepolis owed their origin merely to the capricious whim of the architect, and were placed as mere ornaments round the doors and windows. Others took them for talismans and charms.

In the *Archæologia* (vol. xiv. p. 55) of the London Society of Antiquarians, there is an account, by Dr. Hulme, of a sun-baked Babylonian brick which has the figure of a lion impressed upon it, with an inscription in a different, probably a later, character, of which Mr. Henly, in the same volume, p. 206, discovered the meaning to be *אֶל עֵינֵי הַשֶּׁמֶשׁ*, a brick baked in the sun.

Niebuhr, after his return from the East, published the earliest exact copies of the arrow-headed inscriptions: and thus gave rise to some attempts to explain them: although, owing to the silence of ancient writers, little or no external help could be obtained.

Olaus Gerhard Tychsen of Rostock published in 1798, his *Lucubratio de Cuneatis Inscriptionibus Persæpolitanis*, and was followed by Münter at Copenhagen (who lately died Archbishop of Zealand) in an Essay published in Danish in the year 1800, and in German in 1802. Tychsen and Münter thought they had ascertained that the arrow-headed characters are alphabetical, that the words are separated by a character placed obliquely, and that they are to be read from right to left, like the Indian and European alphabets. They endeavoured to prove that a certain group of arrow-headed characters frequently recurring must signify 'king.'

Dr. Joseph Hager published in the *Monthly Magazine* for August, 1801, a fac-simile of one of the bricks stamped with arrow-headed characters, which had been sent to the East India Company; and, in the same year, a dissertation on the newly-discovered Babylonian inscriptions. Dr. Hager supposed the characters to be monograms, formed and combined arbitrarily, and designed to express, not letters or syllables, but either whole sentences or whole words. (Dr. Hager, *Dissertation on the Babylonian Inscriptions*, London, 1801, 4to.) He was of opinion that the characters on the bricks indicated the brick-maker's name. The fac-simile published by Hager excited the inquiries of Lichtenstein. Lichtenstein maintained these characters to be a variety of the ancient Arabic or Cufic character, which is derived from the Syriac Estrangelo, and is, with few alterations and modifications, still used in Africa, principally in the

empire of Morocco. Led by this supposition, Lichtenstein read, or fancied that he read, some passages of the Koran, or at least imitations of the Koran. He then proceeded to form an alphabet from the fac-simile, which he applied to some Persepolitan inscriptions given by Niebuhr on plate xxiv. under C. E. and L.; and he produced as the result some Persian words, the Persian characters being, he believed, exchanged for the corresponding signs in the Persepolitan alphabet. Several other arrow-headed inscriptions he has declared to be convertible, by the substitution of the Persepolitan signs for the alphabetic letters which they represent, into pure Arabic words. One inscription he considers to be, by a similar process, reducible into words in the Chaldee, or rather in the Aramaic language. Several other arrow-headed inscriptions he has declared to be in pure Arabic, and one in Chaldee, or rather in Aramaic. This writer asserts that the arrow-headed characters are to be read from left to right. He refers the inscriptions in the ruins of Babylon to the seventh or eighth century after Christ.

The interpretations of Lichtenstein are made upon the supposition that in the various combinations of arrow-headed characters one only is essential, and that the rest are added without either necessity or rule. Thus various groups of characters, however different, obtain the same value, according to his interpretation. The resemblance of some strokes of the arrow-headed characters to the Cufic is the only ground for the interpretation which he has offered.

The present director of the gymnasium at Hanover, Dr. Grotefend, has published several treatises on cuneiform characters. It is said that he was led to make it the object of his peculiar attention in consequence of a trifling dispute with one of his friends: in the course of which he laid a wager that he would decipher one of the Persepolitan inscriptions. His dissertation under the title *Præcis de Cuneatis, quas vocant, Inscriptionibus Persæpolitanis legendis et explicandis Relatio*, was read before the Royal Society of Göttingen in the year 1800; it was reviewed by Tychsen in the forty-ninth number of the *Göttingischen Gelehrten Anzeigen*, September 18, 1802; and the manuscript, revised and improved by the author, is now in the possession of the London Asiatic Society, and will soon appear in an English translation. Grotefend has also published dissertations on the same subject in various numbers of the *Fundgruben des Orients*.

The leading points of Grotefend's views are,

1. That the arrow-headed characters are not simple ornaments or numerical figures, but real alphabetic characters.
2. That there are on the inscriptions of Persepolis three different systems of arrow-headed or cuneiform writing; that every inscription is triple, so that whosoever is able to decipher one will know the sense of the two others. This triplication of inscription Grotefend finds also on a vase belonging to the National or Royal Library at Paris. In this opinion the late Professor Tychsen of Rostock agreed.
3. That the arrow-headed characters are not syllabic; otherwise there would be words of ten syllables.
4. That all the Persepolitan arrow-headed inscriptions are to be read from left to right.
5. That in the first of the arrow-headed systems there are forty signs; that among these signs are included separate characters representing both the long and the short related vowels. This opinion Grotefend supports by the analogy of the Zend. Tychsen and Münter say nearly the same.
6. That the inscriptions of Persepolis are in Zend.
7. That these inscriptions belong to the period between Cyrus and Alexander. Grotefend thinks that he has discovered in every inscription which he has examined the name of either Darius Hystaspis or Xerxes.

In the *Lettre de M. Silvestre de Sacy à M. Millin sur les Inscriptions des Monumens Persæpolitanis, extraite du Magazine Encyclopédique, Année VIII.* (1803), tome v. p. 438, this great orientalist points out the inconsistencies in Lichtenstein's statements published in the *Braunschweigischem Magazin*. De Sacy expressed his doubts if Lichtenstein would be able to substantiate his assertions in the more elaborate work which he had promised. This work appeared in quarto under the title *Tentamen Paleographiæ Assyriæ*, 1803, and fully confirmed the predictions of De Sacy. Though De Sacy was more inclined to favour the system of Grotefend, he objects to the grounds on which he maintains that the characters are not syllabic; for De Sacy observes, that in the Sanscrit, Basque, and Greenland languages there are words of more than ten syllables. To the opinion of

Grotendorf that the forty signs must contain long and short vowels, because there would otherwise be too many for the purposes of an alphabet, De Saey objects that the Sanscrit has more than forty consonants, and that in various Shemitic alphabets the shape of the characters is altered according to their position, so that there seem to be more consonants than actually exist. Compare the Arabic and Syriac alphabets.

Dr. Hager, professor of Oriental languages in the University of Padua, published at Milan in 1811, his *Illustrazione d'un Zodiaco Orientale*, which contains matter bearing upon our present subject. The work of Maurice on the *Ruins of Babylon and Persepolis*, London, 1816, contains some observations which coincide with those lately published in the *Morning Watch*, which will be noticed at the conclusion of this article. Proceeding in chronological order, we have next to notice an 'Account of the Progress made in Deciphering Cuneiform Inscriptions,' by Mr. C. Bellino, read on the 13th June, 1818, and published in the *Transactions of the Literary Society of Bombay*. Sir William Ouseley's *Travels*, 1819-1823, as well as the second volume of Ker Porter's *Travels*, 1822, p. 418-126, contain remarks on cuneiform characters, and several fac-similes of them. Several arrow-headed inscriptions are exhibited and explained in *A Dissertation upon the Antiquities of Persepolis*, by William Price, F.R.S.L., Assistant Secretary to Sir Gore Ouseley, Ambassador to the Court of Persia, London, 1825. One of these inscriptions contains a combination of hieroglyphics and arrow-headed characters on a scroll, found in the case of an Egyptian mummy. The *Mémoire relatif aux Antiques Inscriptions de Persépolis lu à l'Académie des Inscriptions et Belles Lettres*, by M. J. St. Martin, 1823, contains some modifications of the opinions of Grotendorf. Kenrick's treatise on the 'Ancient Inscriptions of Persépolis,' in the *Philosophical Magazine*, 1829, gives an historical survey of the explanations attempted up to that time, and communicates the fact of Schulze having found more than forty arrow-headed inscriptions near the lake Van in Armenia. Thus has been confirmed by Colonel Monteith's tour through Azerdibijan, &c. (*London Geog. Journ.* 1833). He remarks, that five miles from the fortress of Argish, on the banks of the lake Van, are some remarkable rocks covered with arrow-headed inscriptions. This place is frequented by pilgrims of all religions. The Mohammedans even consider them sacred, though they allow their date to be anterior to the existence of their religion. Colonel Monteith procured an impression of some of the arrow-headed characters on the rock, but they are not given in the *Geographical Journal*.

In each of the last four numbers of the *Morning Watch* there is a dissertation by the editor, on the 'Records and Science of Babylon' in general, and on the arrow-headed characters in particular. These dissertations treat principally of the Babylonian inscriptions, and of the bricks found in the ruined buildings more especially; but we understand that the writer has since directed his attention to the Persepolitan remains; and proposes to give a further development of his system. He considers that the arrow-headed characters were first used to symbolise the heavenly bodies; that they are neither alphabetic nor syllabic in their nature, or primary application, though there are instances of their occasional employment to express proper names, as they would be written by an alphabet; that they are not intended, like the Egyptian hieroglyphics, as representations, but simply as symbols.

The editor of the *Morning Watch* believes that the specimens of cuneiform writing found at Nineveh, Persepolis, and Babylon, differ from each other in the individual characters; the elementary characters in the Ninevite inscriptions being different from those of Persepolis; and the Babylonian writing, including the characters of the two others, with some in addition peculiar to itself; that they differ also in the modes of combination; the characters of Persepolis always stand detached and never come into contact, being grouped by juxta-position only; while the Babylonian characters are scarcely ever combined without contact, forming stars, crosses, squares, and triangles in great variety.

This writer divides the Babylonian inscriptions into four classes—calendal, astronomical, genealogical, and magical, or talismanic; noticing a difference either in the elements, or the use, according to the class. He considers that the first two classes have the same elements, but that they differ

in the length and arrangement of the series; the calendal inscriptions, containing at the most thirty-five, and usually only thirty groups, arranged in either ten, seven, six, four, or three lines, and that the astronomical series contain an indefinite number both of lines, and of groups in each line and in the whole. The inscription on the stone in the museum of the East India Company, which was obtained by Sir Harford Jones, and presented to the Company by Sir Hugh Inglis, contains nearly 600 lines, and more than 680 varieties of grouping. The calendars, for such he has been led to consider the bricks to be by arguments deduced from the order and recurrence of the signs, he states to have contained inscriptions corresponding to the periods of solar and lunar time, so arranged as to admit of a ready comparison of the two; the character employed for these two classes of inscription nearly resembled a straight horn.

'The genealogical character,' he says, 'avoids the horn-shape, and is made up of combinations of two elementary characters; one of which is very narrow, the other very broad; one like a mace or the handle of a lance, the other like a funnel or a pyramid hollowed out to make its point more taper. A series of such combinations runs along the top of these inscriptions in regular order as long as a dynasty lasts, and clusters of such characters hang down to indicate the descent or passage to another dynasty; indications of the date or period seem to occur at the bottom.' The talismanic, or magical character, he states to be 'very uniform, though very abundant, and never designed to have a meaning, being merely a confused medley of forms somewhat similar to those which were known, but so arranged as to be wholly unintelligible. The form of known characters was so far preserved as to have the appearance of a meaning in order to keep alive interest and induce the belief of hidden mystery; while the disorderly clustering and crowding of random forms and the monotonous repetitions of the same form from the very same stamp, demonstrate the design to mystify and deceive by opposite means. The talismans or amulets themselves are found in great abundance, and are of two descriptions; one kind has *indented* characters, the other *raised* characters. These,' he says, 'must not be confounded with the seals, whether cylindrical or flat, as these last contain seal characters which throw light on the other inscriptions.'

This writer entertains expectations that the interpretation of the Babylonian inscriptions according to his system will throw much light both on the history of astronomical science and on the dates of ancient chronology.

ARROW-ROOT. An article of commerce, which is imported in considerable quantities from both the West and the East Indies. It is a farinaceous substance, prepared from the roots of certain plants. That which is brought from America is made from the root of the *Maranta Arundinacea*; the arrow-root imported from Asia is extracted from the tubers of the *Curcuma Angustifolia*. [For the botanical descriptions of these plants, see MARANTA and CURCUMA.]

The English name of this preparation is derived from the use to which the Indians of South America were accustomed to apply the juice extracted from another species of *Maranta*—the *Maranta galanga*, which was employed as an antidote to the poison in which the arrows of hostile tribes were dipped.

The method of preparing the arrow-root of commerce is the same from whichever of the two plants it is extracted. The root, or tuber, as the case may be, must first be carefully washed, in order to remove the adhering particles of earth, and then it is either grated or beaten to a pulpy consistence in a mortar, which should be formed of wood. The pulp is next intimately mixed with a considerable quantity of pure water, by which operation the fibrous portion is separated from the farina, which remains mechanically suspended in the water. This fibrous portion is then removed, the larger parts by the hand and the minuter parts by straining through a hair-sieve. The remaining milk-like fluid is then left for subsidence, after which the water is drawn off. A second and sometimes a third washing in fresh water, and straining through finer sieves of the pulpy residuum, are then employed; after which the starchy matter is collected in a state of purity, and its moisture thoroughly evaporated by exposure to the sun and air. When perfectly dry it is packed in casks or boxes, and will retain its nourishing property unimpaired for many years.

Arrow-root may be used with advantage as the food of

edge is an arris, whether formed by square mouldings or by the intersection of curves. In Grecian architecture, the raised edge between two flutes of a Doric column, and in both Grecian and Roman architecture, the lines bounding every flat moulding are so many examples of the arris.

ARRIS FILLER, a small triangular piece of wood, used to raise the slates of a roof against the shaft of a chimney or a wall, to throw off the rain more effectually; it is used for the same purpose also in forming gutters round skylights, which have the same inclination as the roof, and are slightly raised above it.

ARROBA, a Spanish measure, both of weight and of capacity, and used as one or other both in Portugal and the Canaries. It exists in Morocco, under the name of Kroba, but with great local variations of value. It is also found to be different in different parts of Spain.

Weight Arroba in Pounds Avoirdupois.

Spanish standard	25.36
Alicant	27.38
Valencia	28.25
Aragon	27.76
Majorea	22.93
Lisbon	32.38

Measure Arroba in Imperial Gallons.

Spanish standard	Greater Arroba	3.54
	Lesser Arroba	2.78
Malaga		3.49
Valencia		2.59
Canaries		3.54

The standard greater arroba (used for wine) is also 981 cubic inches, and the lesser (used for oil) is 771 cubic inches.

ARROE is a Danish island off the eastern coast of Schleswig, due south of the island of Funen, and at the southern entrance into the Little Belt, from which it extends in an oblong form about fourteen miles from N.W. to S.E. Its superficial area is thirty-two square miles; it is divided into five parishes, contains a town and market-village, and has between 7000 and 7600 inhabitants. The surface of the island is a continued level, interrupted only by a lake called the 'Wilt-See'; the soil is very rich and productive, but has no wood. The inhabitants breed considerable quantities of cattle, and raise grain, peas and beans, vegetables, aniseed, and cummin seed; they are actively engaged likewise in fishery and navigation. The landvogt, or bailiff, exercises the executive and judicial powers in all but civil causes, the latter of which are under the cognizance of a local tribunal. Arröeskiöbing, at the eastern side of the island, in 54° 53' N. lat. and 10° 35' E. long., is the capital; it has a convenient harbour, formed by the opposite shore of the island of Deyerbe, with which Arröe is connected by a bridge. The town consists but of four streets, and has a church, three schools, two of which are for the education of navigators, and 1400 inhabitants, who are the owners of above fifty vessels, and depend chiefly upon trade and shipping for their maintenance. The market-village is called Marstall; it is situated on the western side of the island, and contains about 1480 inhabitants, wholly mariners and fishermen. The island itself forms part of the Duchy of Schleswig.

ARROO, a large island, or, more strictly speaking, a group of islands, in the eastern seas, situated to the south and west of Papua or New Guinea, and north-east from Timor-laut island. The cluster consists of five islands, divided from each other by such narrow channels that the whole have been sometimes considered as one island. The centre lies nearly in 6° S. lat. and 135° E. long. The length of the whole from north to south is about 140 miles, and the average breadth about one-fourth of that measure.

Arroo has never been explored by Europeans, and little or nothing is known of either the interior of the country or the character of the inhabitants. What little knowledge we have of the place has been obtained through the report of Chinese merchants settled at Banda, who carry on a traffic between the islands, procuring from Arroo pearls, tortoise-shell, edible birds'-nests, and an aromatic bark named missoy, which resembles cinnamon, and is much used among the Eastern islands, although never, or but very rarely, imported into Europe.

This cluster of islands is likewise remarkable as being much resorted to by birds of Paradise, which breed here in

large numbers. These birds are caught for the sake of their beautiful plumage by the natives, who first cut off their legs, and then drawing their entrails, preserve the remainder by means of fumigation. Valentyn has described seven varieties of these birds, of one of which specimens are sometimes found thirty inches in length. In this dried state these birds likewise form an article of commerce between the natives and the Chinese traders. (See Malham's *Natal Gazetteer*, and Hamilton's *East India Gazetteer*.)

ARROW, see **ARCHERY** and **ARMS** (Weapons).

ARROW-HEAD. [See **SAGITTARI**, Constellation.]

ARROW-HEADED CHARACTERS, a name particularly given to those marks which have been found stamped on the bricks of Babylon, and cut upon the marble monuments at Persepolis. They have been found also at Nineveh, on some rocks near Argish on the lake Van in Armenia, at Shus (the site of the ancient Susa), and more rarely in Egypt. The arrow-headed characters have also been called in Latin *cuneiformes*, and in German *keilschrift*, or *die Keilschrift*; meaning wedge-shaped, and wedge-shaped characters. The arrow-headed character is formed from a very simple element, an isosceles triangle or wedge. Two of these are sometimes joined so as to form a figure not unlike an extended pair of compasses, or very open barbed arrow-head. Some writers on this subject have considered that the characters of Babylon differ essentially from those of Persepolis; but more accurate observation has led others to the conclusion that the cause of the variation lies merely in the difference of the materials on which they occur. Those of Babylon are coarsely stamped upon brick; the Persepolitan inscriptions are

sculptured upon marble. The Babylonian characters, on account of their ruder shape, are often called **nail-headed**.

it may be artificially prepared by heating the metal in atmospheric air, when, being very combustible, it burns and combines with oxygen; the white vapour of arsenious acid formed, speedily condenses, and frequently in the form of the regular octahedron; this acid may also be procured by heating the metal in very dilute nitric acid, which being decomposed yields oxygen. These processes are, however, needless, for arsenious acid is met with abundantly, and very pure, as an article of commerce; being formed and volatilized during the roasting of cobalt ores, it is first condensed in an impure state, and purified by a second sublimation in an iron vessel. Arsenious acid (oxide of arsenic, the white arsenic of the shops, and of the *London Pharmacopœia*) has the following properties: it occurs in compact masses of various sizes, which are externally colourless and opaque, but internally, when recently broken, frequently yellowish and transparent, and of a glassy appearance and fracture; by exposure to the air the transparency is lost; the density of the opaque kind is 3.706, and that of the glassy 3.699. Arsenious acid is volatilized at 380° Fahrenheit; the vapour has not the garlic smell, like that of metallic arsenic. According to Dr. Christison, arsenious acid has little or no taste; it is well known as a most virulent poison, which does not appear to be the case with the metal. Arsenious acid is soluble in water; at about 60° Fahrenheit it probably dissolves about 1-100th of its weight, and when boiling nearly 1-13th; on cooling to 60°, a considerable portion is deposited in octahedral crystals, so that only about 3-8ths of that taken up remains dissolved; the solution reddens litmus paper but slightly, and though it acts feebly as an acid in this respect, and does not decompose the alkaline carbonates when cold, yet it expels their carbonic acid when they are heated together in solution. The nature of the saline compounds will be presently mentioned.

Arsonic acid, that containing the larger quantity of oxygen, exists in nature much more commonly than the arsenious acid; sometimes it is found combined with lime, and frequently with various metallic oxides, as those of copper, iron, and lead; the arseniates of copper constitute, indeed, a most beautiful and extensive variety of the ores of that metal. Arsonic acid consists of, very nearly, according to Berzelius —

2 atoms of arsenic	$38 \times 2 = 76$	or 1 atom	$= 38$
5 atoms of oxygen	$8 \times 5 = 40$	or $2\frac{1}{2}$ atoms	$= 20$
atomic weight	$= 116$	combining weight	$= 58$

Arsonic acid may be formed artificially by heating either the metal or arsenious acid in nitric acid, or, which is preferred, in a mixture of nitric and muriatic acid: the mixture is to be distilled in a glass retort until it has acquired the consistence of a syrup; afterwards it is to be heated nearly to redness in a platina crucible, until all the nitric acid is expelled. The properties of arsonic acid thus prepared are—that it is of a milk-white colour; it contains no water, but when exposed to the air attracts it until a solution of specific gravity 1.935 is obtained; when water is added to the anhydrous acid it dissolves only a part of it for a long time, leaving a white powder, which is, however, eventually taken up; by evaporation a syrupy liquid of specific gravity 2.55 is obtained, which, when concentrated till the temperature rises to 248°, begins to deposit solid matter. The anhydrous acid has not a very strong taste, but the aqueous solution is extremely sour, acts strongly as an acid on litmus paper, and decomposes alkaline carbonates when cold. It is extremely poisonous. Its salts, termed arseniates, will be mentioned hereafter.

Arsonic and azote do not unite.

Arsonic and hydrogen combine; indeed it is one of the few metals which forms a permanent compound with this gas. Arsenuretted hydrogen may be prepared by fusing equal weights of arsenic and zinc, and dissolving the alloy in muriatic acid; the gas may be received in air jars filled with and inverted in water, in which it is insoluble. The properties of this compound are—that it is gaseous at the usual temperature of the air; but when subjected to intense cold, it is condensed into a limpid liquid resembling ether. The gas has an extremely fetid smell; its specific gravity is 2.695; it is fatal to animals when it forms only 1-10th of the air which they breathe. When exposed to atmospheric air, it is decomposed; metallic arsenic, mixed with some arsenious acid, is deposited, and water is formed. It is composed of 3 volumes of hydrogen gas, and 2 of the vapour of arsenic, condensed into 2 volumes, or

3 atoms of hydrogen	$= 3$
2 atoms of arsenic	$= 76$
atomic weight	$= 79$

There is also a solid compound of arsenic and hydrogen; it is obtained by employing arsenic as the negative conductor, when water is decomposed by electricity; the hydrogen of the water, instead of being evolved, combines with the arsenic, and the compound is detached from the metal in brown-coloured floes. It is probably composed of 1 atom of hydrogen = 1 + 1 atom of arsenic = 38: its atomic weight is therefore 39.

Arsonic and chlorine combine to form chloride of arsenic. When the metal in powder is thrown into chlorine gas, it burns, owing to the rapidity of the combination; when also a mixture of 1 part of arsenic and 6 parts of perchloride of mercury is distilled, a thick, smoking, colourless liquid condenses in the receiver; it is very volatile, and does not become solid at a low temperature. If water and chloride of arsenic are mixed, both are decomposed, and arsenious and muriatic acids are formed. When heated, chloride of arsenic dissolves sulphur and phosphorus, but they separate on cooling; it combines with oil of turpentine and of olives. Chloride of arsenic is probably composed of —

3 atoms of chlorine	$36 \times 3 = 108$
2 atoms of arsenic	$38 \times 2 = 76$
atomic weight	$= 184$

Another method of preparing chloride of arsenic is, to put 1 part of arsenious acid and 12 parts of sulphuric acid into a retort, heat the mixture nearly to 212°, and then gradually add small fragments of fused common salt; pure chloride of arsenic, which is to be condensed by artificial cold, passes over into the receiver. A little water frequently comes over with the chloride towards the end of the operation, and this hydrated chloride does not mix with, but floats on, the anhydrous chloride first distilled.

Arsonic does not appear to unite with carbon; it combines with bromine, iodine, fluorine, selenium, and phosphorus; but the resulting compounds are not important.

Arsonic and sulphur may be made to combine in four different proportions; two of these sulphurets, and the more important, exist in nature, and these only will be described at any length. The first is the red sulphuret of arsenic, commonly called *realgar*; this is found native in several parts of Europe, and sometimes crystallized. It is of a deep-red colour, brittle, easily reduced to powder, inodorous, tasteless, and insoluble in water: its specific gravity is about 3.338. It may be artificially formed by melting a mixture of arsenic and sulphur in a covered crucible, or the arsenious or arsonic acid may be used. In the latter cases, sulphurous acid is formed and evolved, owing to the oxygen of the acid combining with a portion of the sulphur. In close vessels, it sublimes unchanged. It appears to be poisonous, but less so than arsenious acid. It is sometimes used as a paint, and is composed of—

1 atom of sulphur	$= 16$
1 atom of arsenic	$= 38$
atomic weight	$= 54$

The second is the yellow sulphuret of arsenic, usually called *orpiment*. This sulphuret is also a natural product, occurring rarely crystallized: it is commonly composed of thin plates, which are of a very fine yellow colour, and flexible to a considerable degree: its specific gravity is 3.452. It is insoluble in water, and inodorous. Acids do not dissolve it, but nitric acid and chlorine decompose it. When heated in close vessels, it melts, and then sublimes; when heated in the air, it burns with a pale blue flame, and gives a white smoke, and a smell of sulphurous acid. It may be formed artificially by passing a current of sulphuretted hydrogen gas into a solution of arsenious acid. It is sometimes used as a pigment, and is a sesquisulphuret composed of—

3 atoms of sulphur	$16 \times 3 = 48$
2 atoms of arsenic	$38 \times 2 = 76$
atomic weight	$= 124$

The two other sulphurets of arsenic are unimportant.

Arsonic and metals in general combine with great facility: those which are malleable it renders brittle, and those which are difficult to melt, it renders fusible.

The combination of arsenic with potassium and sodium is attended with the disengagement of much heat. The

resulting arseniurets are decomposed by water, the potassium and sodium are oxidized, while the hydrogen of the water converts the arsenic into the brown arseniuret of hydrogen already noticed.

The metallic arseniurets are not of sufficient importance to require a more minute description.

We have now to notice the salts that contain the arsenious acid, and which are termed *arsenites*.

Arsenite of ammonia may be prepared by dissolving arsenious acid in solution of ammonia. It cannot be obtained in a solid form, for by evaporation the salt is decomposed, ammonia is evolved, and octahedral crystals are obtained, which are mere arsenious acid, without a trace of ammonia.

Arsenite of potash is procured by digesting the acid in a solution of the alkali. By evaporation, a saline mass is left, but no crystals of the salt are formed. This compound is employed in the preparation of arsenite of copper, sometimes called *mineral green*. It is also the basis of the *liquor arsenicalis* of the *London Pharmacopœia*.

Arsenite of soda is prepared as the last mentioned. By evaporation, a viscid mass is obtained; and when the evaporation has been continued till the solution has acquired the consistence of a syrup, small granular crystals are obtained as it cools.

Arsenite of lime may be readily procured by mixing an aqueous solution of the acid with lime water: the arsenite being nearly insoluble in water, is precipitated in the state of a white powder: it contains water, is soluble in acids, and even in some saline solutions.

Arsenite of barytes is a white powder, slightly soluble in water.

Arsenite of strontia is soluble in water.

The *metallic arsenites*, strictly so termed, are not in general an important class of salts. We shall notice only two of them.

Arsenite of copper.—This compound was first prepared by Scheele, and by him proposed as a pigment; and it has been long and extensively used as such, under the name of *mineral green*. It is formed by adding a solution of arsenite of potash to one of bisulphate of copper (blue vitriol). By double decomposition, arsenite of copper is formed, and is precipitated of a fine green colour. The exact composition has not been determined: indeed, it is probable that more than one compound may be formed, or one may be mixed with variable quantities of hydrate of copper.

Arsenite of silver may be made by mixing a solution of nitrate of silver with one of arsenite of ammonia, potash, or soda. It is of a fine yellow colour: and the soluble salts of silver, like those of copper, are occasionally used to afford corroborative evidence in cases of poisoning by arsenic.

The *arsenites* are in several cases presented to us by nature. Thus, in Cornwall, arseniate of iron occurs in small green cubic crystals, and also several beautiful varieties of arseniate of copper. Arseniate of lime, called *pharmacolite* by mineralogists, is sometimes, though rarely, met with.

The alkaline and earthy arseniates are generally procured either by direct combination or by double decomposition; and the metallic arseniates usually, if not always, by the latter method. We shall describe the arseniates in the same order as the arsenites.

Arseniate of ammonia.—This salt is prepared by adding the alkali to a rather concentrated solution of the acid, until a precipitate appears. If this and the solution be exposed to spontaneous evaporation, large rhombic crystals are obtained. These crystals, when exposed to the air, lose some of their base, and are converted into *biarseniate of ammonia*. When subjected to distillation, the arseniate of ammonia decomposes as it becomes dry, ammonia, water, and azotic gas, are obtained, and the arsenic is reduced.

The *biarseniate of ammonia* may not only be obtained, as above-mentioned, by exposing the neutral salt to the air, but also by adding acid to it. By slow evaporation, large octahedral crystals are formed: when heated, it yields arsenious acid, but no ammonia.

Arseniate of potash.—It may be procured by saturating the acid with the alkali. It is an uncrystallizable deliquescent mass, and may also be obtained by fusing a mixture of arsenious acid and hydrate of potash. The arsenious acid requires oxygen from the decomposed water, hydrogen gas is evolved, and sometimes a portion of the arsenious acid is reduced.

Arseniate of potash may be formed by adding arsenious

acid to the neutral arseniate. It is usually prepared by heating a mixture of arsenious acid and nitrate of potash. The nitric acid yields oxygen to the arsenious, so as to convert it into arsenic acid, which uniting with the potash, the biarseniate is formed. The mass, when dissolved in hot water, yields transparent crystals of the salt. The solution reddens litmus paper, showing the excess of acid. The salt suffers no change by exposure to the air: its taste is cooling and saline, somewhat like that of nitrate of potash. It consists of two atoms of arsenic acid, and one atom of potash. The crystals contain water.

The *arseniate* and *biarseniate of soda* are crystallizable salts, but which do not require any particular notice. The *earthy arseniates* are not of importance.

Arseniate of barytes and *arseniate of strontia* are both soluble salts: they are entirely artificial compounds, and applied to no use. With respect to the metallic arseniates, we have already stated that the arseniates of iron and copper occur in Cornwall: they may also be formed artificially. The *arseniate of silver* is of a brick-red colour, while, as already noticed, the *arsenite* is yellow. Some use is made of this difference in processes for detecting the presence of arsenic. Most metallic arseniates are insoluble in water, but dissolved by acids. As to the general properties of arsenical acids and salts, we shall merely remark that both the acids are precipitated yellow by sulphuretted hydrogen; the arsenites are precipitated yellow by the salts of silver, and green by those of copper: while the arseniates are thrown down red by the silver salts, and blue by the copper ones.

ARSENIC, DETECTION OF. Of all substances, arsenic is that which has most frequently occasioned death by poisoning, both by accident and design: we shall therefore briefly state the methods of ascertaining its presence.

Supposing a white powder to have been found under suspicious circumstances, the process to which it is to be subjected is that of reduction to the metallic state and sublimation, and for this purpose we employ a small glass tube, a spirit lamp and black flux, or fresh burnt and powdered charcoal. The tube should be thin, closed at one end, about one-fourth of an inch in diameter, and three to four inches long; those known by the name of *test tubes* answer the purpose extremely well. Black flux is a mixture of charcoal and carbonate of potash, prepared by deflagrating two parts of bitartrate of potash and one part of nitrate in a crucible. It is to be powdered, and immediately put into a well-stopped bottle to prevent its acquiring moisture from the air; the charcoal which it contains is derived from the decomposition of the tartaric acid, and the potash from that of the bitartrate and nitrate. Mix a small portion, a grain or two, or even less, of the suspected powder with twice its quantity of the black flux, and convey the mixture to the bottom of the tube by means of a trough of smooth writing paper, taking care that none remain adhering to the sides of the tube. Put a paper plug loosely into the tube, and twist a piece of paper round the upper end of it, to serve as a handle; then expose the mixture to the flame of the spirit lamp. The potash of the flux retains the arsenious acid until it is sufficiently heated to be decomposed by the charcoal. If the quantity of arsenious acid be extremely small, then it is better to drop it into the tube, and to let fall a little powdered charcoal upon it. In a very short time the charcoal combining with the oxygen of the arsenious acid, the reduced metal rises in vapour, and condenses in the upper and cool part of the tube; it has a metallic appearance, and is of a brilliant dark steel-grey colour.

Although this effect may be regarded as evidence of the presence of arsenic, Dr. Turner has improved upon it by showing that the metal may be easily re-converted to arsenious acid, and exhibit the characteristic form and properties of that substance, although its weight may not exceed one-hundredth of a grain. This change is effected by holding that part of the tube which contains the arsenic about three-fourths of an inch above a very small flame of the spirit lamp; the metal again sublimates, re-combines with the oxygen of the air in the tube, and well-defined crystals of arsenious acid are formed.

If no solid arsenious acid should be found, but is suspected to exist in solution, either in the food or in the contents of the stomach, then a solution of sulphuretted hydrogen should be added to the suspected fluid, or a current of the gas should be passed into it. This gas is very easily procured by heating powdered sulphuret of antimony and

muriatic acid in a flask furnished with a bent tube; or sulphuret of iron may be formed by melting in a crucible a mixture of equal weights of sulphur and iron filings; this sulphuret may be decomposed by diluted sulphuric acid, without heating the mixture. By the action of sulphuretted hydrogen on the arsenious acid a yellow solution is first formed, and by heat, or after exposure to the air, the excess of sulphuretted hydrogen is got rid of, and yellow sulphuret of arsenic is thrown down; this is to be collected, dried, heated in the tube with black flux, and metallic arsenic will sublime, as already described. The same treatment may be adopted with any substance which may be suspected to be either yellow or red sulphuret of arsenic (orpiment or realgar), supposing them to have occasioned poisoning.

If the suspected liquid be tolerably free from colour, then various fluid tests may be used to prove the presence of arsenic previous to the process of reduction just described; many of these tests have been proposed, but there are two only which require particular notice: these are the ammoniuret of copper and the ammoniuret of silver. The former is prepared by adding a solution of biper sulphate of copper (blue vitriol) to one of ammonia, nearly as long as the alkali continues to re-dissolve the oxide of copper at first precipitated; this compound is of a well-known azure-blue colour, and when mixed with a solution of arsenious acid, a green precipitate is formed, which is arsenite of copper. It is to be observed that arsenious acid, added to a solution of biper sulphate of copper, occasions no precipitate: it is requisite either that the arsenious acid should be combined with an alkali, or the oxide of copper with ammonia, and the use of the latter, which is in fact the ammoniuret of copper, is probably the best process.

Ammoniuret of silver is prepared by adding a pretty strong solution of nitrate of silver to a solution of ammonia, taking care that the ammonia is but slightly in excess: this ammoniuret is colourless, and when added to a solution of arsenious acid in water, a yellow precipitate is formed, which is arsenite of silver, and which becomes dark brown by exposure to light.

In the above methods of using sulphuretted hydrogen and the copper and silver tests, but little ambiguity can arise. It is, however, well known that the salts of cadmium give a yellow precipitate with sulphuretted hydrogen: but these can scarcely be confounded with or mistaken for a mere aqueous solution of arsenious acid. The ammoniuret of copper will also turn green when added to a yellow solution of most substances; there are, however, but few bodies which, when merely dissolved in water, will give a green precipitate with this test; the silver test may, under peculiar circumstances, give a precipitate with muriatic acid and muriatic salts; this, however, is colourless, and insoluble in nitric acid. If, therefore, any chloride of silver should have been thrown down with the arsenite, so as to mask the properties of the latter by diluting its yellow tint, add nitric acid to the suspected mixture of chloride and arsenite of silver; the former will remain unacted upon, while the latter will be dissolved, and may, by the cautious addition of ammonia to the nitric solution, be precipitated of its characteristic yellow colour.

It is to be understood that the arsenite of copper and of silver, obtained in the above-mentioned experiments, may, after drying, be reduced by the black flux in the mode already described.

It is to be observed that sulphuretted hydrogen does not precipitate arsenious acid when it is dissolved in alkali, as potash or soda; but on adding a little acetic acid, so as to saturate or supersaturate the alkali, precipitation readily occurs.

Arsenic acid and arseniates have been but rarely taken either by accident or design: sulphuretted hydrogen throws down from a solution of the former yellow sulphuret of arsenic, as with arsenious acid; but with ammoniuret of silver it gives a peculiar reddish precipitate of arseniate of silver, which may be reduced in the tube already mentioned, by means of black flux. The biarsenates give immediately arseniate of silver on the addition of the ammoniuret of silver; but the neutral arseniates require a little acetic acid to produce this effect.

ARSENIC, MEDICAL USES OF. As metallic arsenic has no effect upon the human system, we will confine our observations to the employment and mode of action of the white oxide or arsenious acid, and its compound, the

arsenite of potash. The characters of arsenious acid have been given above, but one remarkable circumstance connected with these requires to be noticed here: the degree of solubility depends on the degree of transparency or opacity of the specimen or portion employed. For example, 1000 parts of boiling water dissolve 97 parts of the transparent acid, retaining only 18 parts when cold: but an equal quantity of water will dissolve 115 parts of the opaque variety, and retain 29 parts when cold, the remaining parts being precipitated. It is manifest, therefore, that the strength of a solution must vary with the kind of specimen employed.

The precise character of the taste of white arsenic is a matter of dispute; it is generally said to be acrid and corrosive, followed by an impression of sweetness: but Dr. Gordon states, that it is *at first* always sweet, but afterwards somewhat acid. (Gordon, *Dissert. Inaug. de Arsenico*, Edinb. 1814, p. 9; *Edinburgh Medical and Surgical Journal*, vol. xi. p. 131.)

The white oxide of arsenic being so often employed for the destruction of human life, a dread of it exists not only among the unprofessional part of the community, but even among medical men, which has caused it to be less tried, and its modes of action less studied, than most other medicinal agents of the *Materia Medica*. That it labours under a most unjust opprobrium cannot be doubted, for it is not so poisonous as many other articles frequently used, such as prussic acid and strychnia, while its curative influence is certainly very great. If a small quantity, such as $\frac{1}{100}$ th or $\frac{1}{1000}$ th of a grain be swallowed, in about a quarter of an hour the individual experiences an agreeable sensation of comfort and warmth about the stomach, which gradually extends itself over the whole of the abdomen. The appetite and thirst are moderately increased, the secretion of urine becomes more abundant, and the evacuations from the intestines often more frequent, and of a pulpy or pappy character. From the intestinal canal the peculiar action propagates itself over the whole system. The heat of the surface is augmented, and the increased temperature is experienced particularly about the forehead and eyebrows, and the skin is bedewed with a breathing perspiration. At the same time an increased strength and frequency of pulse is felt. The whole muscular system acquires energy and elasticity; the involuntary muscles especially become more powerful and vigorous in their action: the respiration is gently accelerated. The nervous system partakes of the impulse communicated to the frame, and the spirits as well as the courage of the individual rise, liveliness and regularity characterizing the whole functions of the system.

That the white oxide of arsenic is a tonic, therefore, is sufficiently clear; and that its employment in such doses as we have stated is not only safe but beneficial, may be satisfactorily proved. Not only are old worn-out horses endowed with new vigour, improved appetite, &c. by its use, but pigeons to which this article is given show greater appetite and liveliness than others without it; and in Upper Styria the peasantry use it as a seasoning with many articles of food, such as cheese.

It will not, we trust, be supposed that, by bringing forward these facts and statements, we desire to lead any one to make a hasty or inconsiderate use of this very powerful agent. We only wish to show that much prejudice exists against it, in order that, when circumstances seem to require its use, medical men may not be deterred from employing it, from ignorance of its qualities, nor have to encounter unnecessary difficulties from the objections of others. That oxide of arsenic may accumulate in the system, or may give rise to slow poisoning, cannot be questioned; but if exhibited in appropriate cases, the morbid state of the system seems to act as an antidote to it, just as it acts as an antidote to the disease, health being the result of their neutralizing power. Every medical practitioner knows what large doses of opium may be given with safety and benefit in tetanus and some other diseases: it has been stated, under ANTIMONY, that very large doses of tartarite of antimony can be borne in certain states of the system; and in the West Indies, during the state of insensibility following the bite of a snake called the *coluber carinatus*, eight grains of the white oxide of arsenic and eighty drops of tincture of opium have been given in the course of four hours, that is, one grain every half hour, with the best effect. (See Paper by Mr. Ireland, in *Medico-Chir. Trans.*, vol. ii. p. 393.)

White oxide of arsenic is not often given in the solid form, nor, owing to its variable solubility, is the solution frequently employed: the form most generally chosen is that of its combination with potass, or arsenite of potass; which is the basis of the *liquor arsenicalis* of the London Pharmacopœia, in the preparation of which the quantity of potass is scarcely sufficient to saturate the whole of the acid, some of which must consequently remain free in solution, or be deposited. Before the regular introduction of this into medical practice, it had long been employed in Lincolnshire for the cure of intermittents, under the name of the *Tasteless Ague Drops*; and from having been introduced into practice by Dr. Fowler, it is frequently called *Fowler's Solution*. It is never given in larger quantity than three or five drops, and should always be taken about half an hour after a meal, to prevent it coming into direct or immediate contact with the inner coat of the stomach.

Being considered eminently an anti-periodic [see AGUE, vol. i. p. 226], it has been used in most diseases which partake of a periodic character; the chief of these we shall here notice, along with two or three others not possessed of a periodic character. It is most frequently employed in intermittent fevers: the greatest advantage is derived from it in the tertian and quartan forms, the quotidian often resisting this and all other remedies. Its beneficial effects may be increased by giving calomel first; cinchona bark may be given also during the employment of arsenical medicines, but it should rather be alternated with them than given at the same time: certainly they should not be given in the same formula or prescription, though, if the patient be very weak, other tonics may be given along with them. Opium is sometimes advantageously given along with them, but it should be employed in very small quantity.

It has sometimes been given in remittents, which approached nearly to the character of intermittents.

In rheumatic cases it has been used, and is most successful when the pains are markedly periodic, or true to a particular hour in their return. It is equally applicable whether these be general or local, as in some rheumatic affections of the eye. (See Travers *On Diseases of the Eye*.) In nodosities of the bones from rheumatism it is also very valuable.

In some affections, more especially of the nervous system, such as *tic doloureux*, and other neuralgic pains, it is useful. In *cardialgia*, or heartburn, when chronic, if combined with belladonna, it often affords speedy and lasting relief. It has sometimes been advantageously employed in *hooping-cough*, *angina pectoris*, *epilepsy*, and *chorea*, when tonics were required. In some chronic nervous affections of the mental faculties it has been found useful, such as *melancholia* and *hypocondriasis*. And in *hydrophobia*, *tetanus*, and the bites of serpents, it is certainly more valuable than any other means we are acquainted with.

In cancer it has been employed both internally and externally; the form generally used in the latter way is the *pâte arsenicale*, but it is not free from danger, and requires great caution. Its internal employment has been mostly in cases where it depends upon constitutional rather than local causes; but if hectic fever be present, it will do more harm than good. It seems to be of more service in cancer of the lip and face than in affections of the glands, as the mammae or testicles. In cutaneous diseases, such as *lepra* and *elephantiasis*, it is often serviceable, and its beneficial action may be increased by giving *liquor potassæ* along with it.

We hold that the previous failure of other and more common remedies is a sufficient justification of the employment, with due caution, of arsenic in any of these diseases.

In case of an over-dose, or of intentional poisoning by arsenic, it is proper that we should indicate an antidote, and point out the mode of treating such a casualty. Both these are difficult. First then, in the case of a substance so sparingly soluble, we cannot see how the stomach-pump is likely to be of service; more especially as the white oxide either adheres firmly to the inner coat of the stomach, or gets imbedded in its substance. A more rational plan is to give a large quantity of lime-water, cold, as the arsenite of lime is almost insoluble, and nearly inert. After that, an emetic of sulphate of zinc (3i in a pint of distilled water); then copious draughts of oil (castor oil if possible) or milk. After which the case must be treated on general principles. [See ANTIDOTES, POISONS.]

ARSENICAL MINERALS. Those minerals in which arsenic acts the part of the electro-negative element may be

considered as forming a mineralogical family or class, according to the new chemical arrangement of Berzelius. This family comprehends four genera, a tabular view of the principal species of each of which is here given:—

First genus.

Species. Metallic, or native arsenic.

Second genus (metallic arsenurets).

First species. Octahedral cobalt pyrites: speiskobalt of the Germans.

Second species. Hexahedral cobalt pyrites: kobaltglanz.

Third species. Copper nickel: arsenuret of nickel: prismatic nickel pyrites.

Fourth species. Arsenical silver: octahedral antimony of Jameson: silberspeisglanz of Hausmann: antimonial silver of Phillips.

Fifth species. Arsenuret of bismuth.

Sixth species. Axotomous arsenical pyrites (Mohs).

Seventh species. Prismatic arsenical pyrites (Mohs) mispickel (Phillips): arsenikkies.

Third genus.

Species. White arsenic, or arsenious acid.

Fourth genus (compounds of arsenic acid).

First species. Pharmacolite: arseniate of lime.

Second species. Cobalt bloom.

Third species. Nickel ochre.

Fourth species. Scorodite: martial arseniate of copper from Cornwall.

Fifth species. Olivenite: of this there are two species, the one crystallized in the right, the other in the oblique, prismatic system.

Sixth species. Euchlore mica (Mohs): rhombohedral arseniate of copper (Phillips): kupferglimmer.

Seventh species. Cube ore: hexahedral lirconite: arseniate of iron.

Eighth species. Rhombohedral lead spar.

In addition to the minerals classed in the above genera, several other substances contain arsenic, acting, however, as the electro positive element; consequently such compounds do not obtain a place here: of these there are but two particularly worthy of our attention, namely, orpiment and realgar, both of which are sulphurets of arsenic in definite, but different proportions. These minerals, a more particular description of which will be found in their proper place, are obtained of great purity from China and Persia, and afford a valuable and beautiful pigment.

The geological position of arsenical minerals is confined to primitive districts, where they occur in metalliferous veins, usually associated with metallic sulphurets, to which the arsenurets have considerable analogy. The only genus which has been found in any quantity is the second, the most abundant species of which are the arsenurets of cobalt, nickel, and iron, which are found both in veins and beds. The fourth genus appears to owe its origin to the action of the atmosphere on the arsenurets; they occur frequently in union with the phosphates, with which they are isomorphous; consequently the phosphoric acid is frequently more or less replaced by the arsenic, or the reverse.

The arsenic contained in any mineral may, in general, be readily detected by the blow-pipe, owing to the characteristic odour of the vapour of metallic arsenic. In performing this operation it is necessary to be careful to submit the mineral to the interior or deoxidizing flame, or, in order to ensure the reduction of the metal more completely, it is advisable to add a small quantity of the powder of charcoal; this reduction to the metallic state is essential, for it is the vapour not of the white, but only of the metallic arsenic, which possesses the peculiar smell of garlic. If the mineral be from its colour suspected to be orpiment or realgar, it must be mixed with a small quantity of black flux in a glass matrass and heated in the flame of a spirit lamp, by which the arsenic will be liberated, and a sulphuret of potassium formed.

Native arsenic is usually found in veins, accompanied by sulphur and sulphurets; it occurs massive, also in reticulated and stalactitic shapes, and of a curved lamellar composition, exceedingly like the layers of an onion. When fractured, the new surface presents a metallic lustre and a tin-white colour, which, however, soon tarnishes, becoming a very dark gray. It is brittle, has the specific gravity 5.766, and its hardness is 3.5.

According to Mohs, it is frequently met with in the mines of Annaberg, Schneeberg, Marienberg, and Freiberg in Saxony; at Joachimsthal in Bohemia, at Andreasberg

in the Harz, in the Black Forest, in Alsace, at Allemont in Dauphiny, at Kongsberg in Norway, at Kapnik in Transylvania, and in beds at Orawitza in the Banat of Temeswar.

The second genus presents us with a very valuable series of minerals, owing to properties of the metals with which the arsenic is combined. The first three species will be described under the heads of COBALT PYRITES and COPPER NICKEL. The arsenical silver, which constitutes the fourth species, has not been sufficiently investigated. Professor Hausmann considers it as a more or less intimate mixture of prismatic arsenical pyrites with antimonial silver, a compound, according to Klaproth, of 16 to 24 parts of antimony and 84 to 76 of silver. The same chemist states 96 parts of arsenical silver to contain of

Arsenic	35
Antimony	4
Silver	12.75
Iron	44.25

Many mineralogists, on the other hand, consider the antimonial and the arsenical silver varieties of the same species. The first of these occurs in crystals and in granular masses; the latter possesses a curved lamellar composition of thin crystalline plates. They both readily tarnish, and assume a dark gray colour. The specific gravity has been stated by Haüy at 9.446, by Klaproth at 9.82. The antimonial silver is found in veins at Altwolfach in Fürstenberg, and at Andreasberg in the Harz; the arsenical in various mines in the Harz, at Guadalecanal in Spain, and also in Herland mine, Cornwall, &c. It is scarcely necessary to mention that this mineral, when found in sufficient quantity, is highly valuable for metallurgic purposes.

Axotomous arsenical pyrites is a compound of arsenic and iron, occurring in beds of prismatic iron, and also in primitive mountains, accompanied by cobalt and nickel, at Schladning in Styria. Its specific gravity is 7.228.

Prismatic arsenical pyrites, described by some mineralogists under the name of mispickel, is composed, according to the analysis of Stromeyer, of

Iron	36.01
Arsenic	42.88
Sulphur	21.08

Berzelius considers it to be a definite chemical compound, expressed by the following formula:—

on the supposition that the atomic weight of arsenic is 37.7, and in his own notation.

This mineral possesses a tin-white colour and a metallic lustre. The specific gravity is 6.127, and its hardness 6. It occurs massive, and also crystallized in the system of the right rhombic prism; crystals are seen in many modifications of this system; they admit of cleavage in planes parallel to the faces of a prism, whose angles are $111^{\circ} 12'$ and $68^{\circ} 48'$, which may, therefore, be considered as the fundamental form.

This mineral is found commonly in most of the localities of arsenical minerals, associated with ores of silver, lead, and tin, both in veins and beds. It is a product of almost every mine of Cornwall, as well as those of Saxony, &c. Some specimens contain silver, of which the principal are found at Braunsdorf near Freiberg, in veins of quartz, traversing mica-slate.

White arsenic, which constitutes the third genus, is found crystallized in octahedrons, and also in botryoidal and stalactitic forms, frequently pulverulent. It occurs in metallic veins, and probably is the product of the decomposition of other minerals. The lustre is vitreous, and colour white, with a slight degree of transparency. Its specific gravity is 3.698. It is readily recognised by its behaviour in the blow-pipe: if alone, being volatilized; if on charcoal, being volatilized with the production of the garlic odour.

The general characters of the fourth genus have already been given; the species will be described in their alphabetical order.

ARSENIUS, the son of Michael Apostolius, a Greek man of letters of the fifteenth century, who, being exiled from Greece, fled to Italy, where he enjoyed for some time the patronage of Cardinal Bessarion. Having lost his favour, he went to Crete, and gained his livelihood as a transcriber of manuscripts. Arsenius was born in that island towards the close of the fifteenth century. He lived at Rome in the pontificate of Leo X., who made him archbishop of Malvasia, or Monembasia, a town on the eastern coast of the

Morea, not very far from the promontory of St. Angelo. He published a collection of Greek apophthegms of remarkable men. (*Præclara Dicta Philosophorum, Imperatorum, ac Poetarum, ab Arsenio Monembasie Archiepiscopo collecta*. Rom. 1523. Calliergi.) He also published Scholia on the first seven plays of Euripides, taken partly from Moschopolus, Lascaris, and Thomas Magister—partly from earlier sources. Venet. 1534. This work was dedicated to Pope Paul III., whose friendship he possessed. The dates of his birth and death do not appear to be known. Having become a member of the Roman, he was excommunicated by the Greek church, and his credulous countrymen believed that his dead body was taken possession of and animated by a demon. [Fabrie. *Bibl. Gr.*, vol. i., p. 655, 6; vol. x., p. 222 and 491, &c. See Bayle also.]

ARSINOË, a daughter of Ptolemy I., son of Lagus, king of Egypt, and of Berenice, was married to Lysimachus, king of Thrace, then so far advanced in years that his eldest son, Agathocles, had already espoused Lysandria, the half sister of Arsinoë. This marriage was by no means a source of happiness to Lysimachus. Arsinoë, fearing lest her children should be exposed to the violence of Agathocles on the death of her husband, prevailed on him to consent to the death of Agathocles, and Lysimachus found himself involved in war with Seleucus in consequence of this atrocious proceeding. One report was, that Arsinoë caused Agathocles to be put to death, because he had declined her proposals. (Pausan. i. 10. Justin. xvii. 1.) Lysimachus fell in battle in Asia, and his kingdom of Macedonia was taken possession of by Seleucus. Seven months afterwards Seleucus was assassinated by Ptolemy Ceraunus, the elder brother of Ptolemy Philadelphus, who also treacherously put to death the two children of his half-sister, Arsinoë, after he had inveigled her into a marriage with him. Their mother he banished to the island of Samothrace. (Justin. xxiv. 3.) So far is Justin's story. Arsinoë would appear to have remained at Samothrace till she was summoned to Egypt, to become the second wife of her brother, Ptolemy II. Philadelphus, king of that country, who reigned from B.C. 284 to 246. This was the first example of an unnatural custom which prevailed among the Greek kings of Egypt, the origin of which it is difficult to account for. Though Arsinoë was now far advanced in years, she was much beloved

[Brit. Mus. Gold.]

by her brother, and he called one of the districts of Egypt by her name. The architect Dinocrates was employed by Ptolemy to erect a temple to her honour, and he intended it should be arched with loadstones, so that her statue, made of iron, might have the appearance of being suspended in the air. The death of the architect prevented its completion. We thus find that the Mohammedans of Medina were not the first to whom this strange idea had occurred. (Plin. xxxiv. 14.)

Strabo (x. 460) attributes to this Arsinoë the founding of a city called by her own name on the banks of the Achelous, in Ætolia. (See Steph. Byzant.) This fact, if true, will tend to confirm the opinion of the Arsinoë, the wife of Lysimachus, being afterwards the wife of Ptolemy Philadelphus; the strange adventures of her life, and the confusion in this period of history, render it very difficult to believe all the history of Arsinoë, as it is given by the various authorities.

A statue of Arsinoë existed at Athens in the time of Pausanias (i. 8). The beautiful medal of Arsinoë, which we have given, with a cornucopia on the reverse, confirms what Athenæus says (xi. chap. 13), 'that the kind of cup or drinking vessel called Rhuton (ῥυτόν) was first devised by Ptolemy Philadelphus as an ornament for the statues of Arsinoë; which had in the left hand a cup of this kind filled with the fruits of the earth, by which was indicated that this horn is more fertile than that of Amalthæa.'

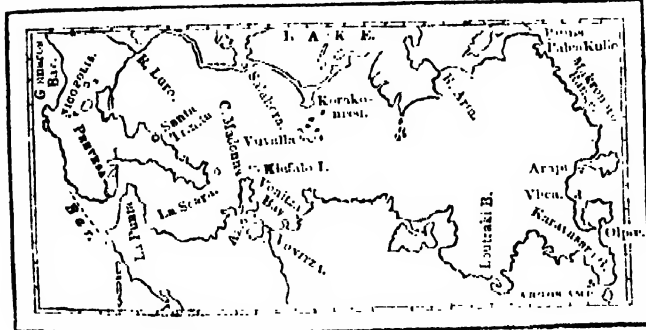

ARSINOË, a daughter of Lysimachus, king of Thrace, was the first wife of Ptolemy Philadelphus (according to the opinion of some critics), by whom she had three children,

ARSON (from *ardere*, to burn), in the technical meaning of the term, at common law, signified the offence of voluntarily and maliciously burning the house of another. This offence always amounted to felony by the law of England, and was punishable with death. But in order to constitute burning a felony at common law, it was necessary that the building destroyed should be a dwelling-house, or a part of it, or at least some of the buildings attached to it. The property destroyed must also have been in the possession (*suo jure*) of some other person than the supposed offender at the time of the fact committed. On these grounds, and on account of the obscure phraseology of several statutes, nice and doubtful questions constantly arose upon the trial of persons charged with arson, both with respect to the nature of the buildings destroyed, and the character of the possession of the proprietor. These ambiguities were removed by a recent statute (7 and 8 Geo. IV. c. 30, sec. 2.), by which it is declared, 'That if any person shall unlawfully and maliciously set fire to any church or chapel, or to any dissenting chapel duly registered, or to any house, stable, coach-house, outhouse, warehouse, office, shop, mill, malt-house, hop-oast, barn, or granary, or to any building or erection used in carrying on any trade or manufacture, or any branch thereof, whether the same, or any of them respectively, shall then be in the possession of the offender, or in the possession of any other person, with intent thereby to injure or defraud any person, every such offender shall be guilty of a capital felony.' By the 5th

section of the same statute, setting fire to coal-mines is also declared to be a capital felony; and by the 17th section it is further enacted, 'That if any person shall unlawfully and maliciously set fire to any stack of corn, grain, pulse, straw, hay, or wood, every such offender shall be guilty of a capital felony; and if any person shall unlawfully and maliciously set fire to any crop of corn, grain, or pulse, whether standing or cut down, or to any part of a wood, coppice, or plantation of trees, or to any heath, gorse, furze, or fern, wheresoever the same may be growing, every such offender shall be guilty of felony, and be liable to be transported for the term of seven years, or to be imprisoned for any term not exceeding two years, and, if a male, to be whipped, in addition to such punishment.' The firing must in all cases be wilful and malicious, in order to constitute the crime of arson; but it is not necessary that an intent to injure or defraud should be expressly proved by evidence, as the malicious design may be inferred from such circumstances as obviously point to such an intention; nor is it any defence to a charge of arson to show that the accused had no particular malice towards the owner of the property. The burning of a man's own house, if it be situate in a town, or so near to other houses as to endanger them, is a misdemeanor at common law, punishable with fine and imprisonment.

ART AND PART is a term used in Scotch law to denote the charge of contriving a criminal design, as well as that of participating in the actual perpetration of the criminal fact. The derivation of the phrase is uncertain: Sir George Mackenzie, in his *Discourse upon the Laws and Customs of Scotland in matters Criminal*, says, that 'by art is meant that the crime was contrived by the art or skill of the accused (*eorum arte*); and that by part is meant, that they were sharers in the crime committed, et quorum pars magna fui.' By other writers it has been considered as an abbreviation of the Latin phrase of *artificer et participes*. It is a charge of very extensive meaning, comprehending not only the offence of accessories before and after the fact according to the English law, and the *ope et consilio* of the Roman law, but also all interference and assistance at the time of the commission of the criminal act. By an ancient Scotch statute, passed in 1592, it is required that in all criminal libels or indictments, the offenders shall be charged as having committed the imputed offence 'art and part.' This enactment was occasioned, as its preamble intimates, by the frequent instances of failure of justice in criminal trials, in consequence of a variance between the evidence and the particulars detailed in the libel or indictment. Thus, previously to the statute, if A and B were charged with murder, and the indictment stated that A held the deceased while B stabbed him, and it appeared in evidence that the facts were reversed, and that B held him while A stabbed him, neither of the accused persons could be convicted. But by the insertion of the charge of 'art and part,' such a failure of justice could not occur; for, in fact, both the parties, or prisoners, are substantially guilty 'art and part,' and are therefore comprehended in the general charge of the indictment. This subject is very copiously discussed in Hume's *Commentaries on the Law of Scotland respecting the Description and Punishment of Crimes*.

ARTA, GULF OF (the Ἀρτακικός κόλπος of the Greek and the Ambracius Sinus of Latin authors), is an arm of the Ionian Sea, between the ancient Epirus and Acarnania, and now the boundary between the Turkish province of Albania and the kingdom of Greece. It is twenty-five miles long and ten wide, and is contained between the parallels of 38° 52' and 39° 3' N., and the meridians of 20° 43' and 21° 10' E. of Greenwich.

Across the entrance is a bar composed of soft sand and sea-weed, over which the greatest depth of water is fifteen feet, and the channel is intricate. Having passed this, the gulf is navigable for vessels of the largest size, and is perfectly free from danger, except off the low shores, where flats extend in some places nearly a mile: but these may be distinguished by the light colour of the water: the banks being of white sand, while in the rest of the gulf the bottom is of black mud. The deepest water is thirty-six fathoms, which is towards the head of the gulf. The narrowest part of the entrance is only 700 yards, and half a mile is its general width in the direction of N.E.; it then turns sharply round a low point to the S.E., and opens out much wider for about four miles, the western shore being low and the eastern high. A second entrance is then formed by the two high capes of La Scara and Madonna to the large basin of the gulf, the northern shore of which consists of low sandy ribands, separating large lakes and marshes from the gulf. At the distance of eight or nine miles to the northward of the gulf, a sharp and uneven range of hills runs about east and west; the westernmost part of which, overlooking the Ionian Sea, called Mount Zalunga, is about 1500 feet in height, and continues its undulating descent to the ruins of Nicopolis, three miles north of Prevesa. After a considerable depression, the eastern part of the range rises again to a remarkable three peaked mountain, called from its colour *Mayro Vouno* (Black Mountain), which has about the same elevation as Zalunga, but its sides are rugged and precipitous. Between its foot and the lakes before-mentioned, lie the plains of Arta, rich and fertile; but, from the thinness of population and want of commerce, they are little cultivated, and principally devoted to pasture. Farther to the N.E. are ranges of hills connected with the chain of Pindus. To the eastward, and directly on the coast of the gulf, rises the Makronoro ridge, about 250 feet in height, along which runs the road from Albania into Greece: this road is capable of being strongly defended, and particularly at the bottom of Karavasara Bay, where the hills scarcely admit a passage between their bases and the gulf. The southern shore is generally rocky except at the bottom of the bays formed by its irregular line: the hills are round-topped, insulated, and barren, composed principally of limestone and schist, with occasional broad veins of quartz: they descend steeply to the shore. One of these, to the eastward of Vonitza, called *Anuthero*, rises to the height of 1500 feet. The western shore, from Cape La Scara northwards towards Lake Mazoma, is first rocky and steep; then come grassy cliffs, with a narrow shingle beach at the foot, and lastly, the hills slope gradually down to a low shore.

The only towns on the shores of the gulf are, Prevesa, on the northern side of the entrance, and Vonitza, at the bottom of a bay of the same name on the southern shore. The town of Arta, whence the Gulf derives its appellation, is seven miles from the north coast. At Salahora, which is the port of Arta, there is a custom-house, and there is, one also in Karavasara and Loutraki bays. The only village is that of Korakonissi: at Vlica, Arapi, and Karavasara, there are also a few huts.

The ruins of Argos Amphilocheium are now visible at the bottom of Karavasara Bay, in the Gulf of Arta. They are of Cyclopiam masonry, situated on a steep acclivity 350 feet high, near the sea. The town which occupied the summit was encircled by walls, and these were tangented by two others, descending the hill and meeting at an angle within a few feet of the beach. The high road from Albania into Greece winds round this angle through a deep ravine commanded by the town, which thus offers a very strong military position.

There is a custom-house, and a few huts near the ruins, known by the name Karavasara. 38° 51' N. lat., 21° 10' long. East of Greenwich.

Two rivers, the Luro (ancient Charadrus) and the Arta (ancient Arachthus), flow into the gulf on its northern shores: both are navigable for boats, seven or eight miles from their mouths. A small stream also flows through the town of Vonitza, affording an abundant supply of excellent water.

The gulf abounds in fish of the finest quality, particularly of the mullet kind; there are also soles, eels, and sardines, and very large prawns. The sardine fishing is generally farmed from the Greek government of Vonitza, whose only right, however, is their naval superiority, by parties of Sic

lians, who salt them down in barrels from the nets; but the other fish are taken in fishe-les constructed of reeds closely placed in the ground, forming a sort of labyrinth, which terminates in a death-chamber, whence they are taken at pleasure by a hand-net.

The commerce of the gulf is very unimportant and all carried on in small vessels; occasional cargoes of corn and cattle to the Ionian Islands, the vallona, an acorn used for dyeing articles of dress and leather manufactured at Arta, with the exchange of market supplies, constitute the whole trade.

Small veins of coal have been discovered near the convent of Santi Apostoli, on the western side of the gulf, and the rocks bear strong indication of the presence of copper.

There is a rise and fall of about two feet; but this, with the velocity and direction of the current, are much influenced by the wind, so that it cannot be considered as a regular tide. This remark, indeed, applies to the entrance of the gulf more immediately; with the sea-breeze which blows from the westward the current sets to the eastward into the gulf, and in the night, when that power fails, the water returns out of the gulf.

ARTA, the ancient Ambracia, a town of Albania, is situated on the left bank of the river of the same name, and seven miles in a direct line from the north shore of the Gulf of Arta. It is governed by a bey under the pachalick of Yanina, and prior to the struggle for Grecian freedom was a very large and populous city, but having been stormed in 1828 by the Greeks, under Marco Botzaris, was reduced to a ruinous state.

Hellenic remains of considerable extent may still be seen forming the base of the present walls of the castle, which is situated close to the river in the northern quarter of the town. There are also remains of the lower empire in the convent built by the empress Theodosia, about the year 845 of the Christian era, and another convent, or cathedral, of the same style, but more recent date. Arta is a bishop's see, and has several Greek churches. In the quarter more particularly set apart for trade, each art has its separate street or bazaar, and articles of dress manufactured here are held in high estimation. The floccatas, or shaggy capotes of Arta, are considered the finest; woollens, coarse cottons, and an inferior though strong description of Russia leather, are also manufactured, and this town derives some commercial benefit as the entrepôt between Yanina and the gulf. Butchers kill and vend their meat outside the town; the market is abundantly supplied with fruit and vegetables from the neighbouring country which is fertile and well cultivated, and the plains abound in cattle and sheep.

Distance is reckoned by time at the average rate of three miles to the hour and eight hours to the day. Arta is two days (or thirty-six miles direct distance) S. $\frac{3}{4}$ E. from Yanina, ten hours (sixteen miles direct) N.E. from Prevesa, and three and a half hours (nine miles direct) N.E. $\frac{1}{2}$ N. from Salahora. The road to the latter place is very good, as it is the more frequent channel of conveyance for merchandise even to Prevesa. The land transportation of goods is by means of horses, as the people have very few camels, and it is not uncommon to meet a cavalcade of fifty to eighty horses thus laden. There is a bridge of Venetian construction over the river Arta, at the town.

prosperity until the Emperor Septimius Severus suddenly invaded his dominions and sacked Ctesiphon, his capital, A.D. 199. Caracalla, the son of Severus, injured him more deeply; for having asked and obtained in marriage the daughter of Artabanus, he entered the country with a Roman army, and in the middle of the festivities gave orders for a massacre, A.D. 216, in which numbers of the Parthians perished, and the king himself escaped with difficulty. Indignant at this gross treachery, Artabanus took the field with a numerous army. Caracalla was now dead, having been assassinated on his march between Carrhæ and Edessa, and was succeeded by Macrinus. After a hard-fought and indecisive battle of two days, the Romans came to terms, by informing the Parthian king of the death of Caracalla, against whom he was chiefly incensed, and by restoring the prisoners and booty taken at Ctesiphon. This satisfaction, however, was dearly bought; for it led to the overthrow of the Parthian monarchy. Artaxerxes, otherwise called Ardeshir, took advantage of the losses sustained by the Parthians to incite the Persians to revolt. [See SASSANIDÆ.] After the revolt had been maintained three years, the king and his rebel subject met, each at the head of a powerful army, and after three days' hard fighting the former was beaten, taken, and put to death, A.D. 229. The Parthians in consequence became subject to the Persians, after having been their masters for 475 years. (Herodian, iii. c. 9)

10 to 15; Lives of S. Severus, Caracalla, and Op. Macrinus, in the *Historia Augusta*; Bayle, *Anc. Univ. Hist.* v. xi.)

ARTAXERXES, or ARTOXERXES, a Persian name, and evidently a compound word, *Arta-Xerxes*. Herodotus (vi. 98) interprets it to signify 'a great warrior.' *Arta* very commonly occurs as the first part of many ancient Persian names, such as Arta-banus, Arta-pates, &c. Ammianus Marcellinus (xix. p. 147, ed. Lindenbr. 1603) interprets it as 'conqueror of wars.' We are inclined to consider the root as the syllable *ar*, which appears in many different languages under the form of *er*, *ir*, and *art*, with the addition of *t*, which is not elementary: in all of them it has the idea of courage or strength. *ἄρτις*, *Mars*, *vīr*, and *Art*, in this Persian word, seem to have the same root. For various opinions on this point, see Herder, *Persopolis*, p. 127; Grottefend, *Beilage zu Heeren's Ideen*, i. p. 589; Creuzer, *Symbolik*, i. p. 734; and Pott, *Etymologische Forschungen*, &c. Lemgo, 1833.

I. ARTAXERNES, or ARTOXERXES, surnamed Longimanus (in Greek Macrocheir), from his right hand being larger than his left (Plut. *Artaxerxes*), was the second son of Xerxes I., and succeeded to the throne on the murder of his father and elder brother Darius by Artabanus B.C. 465 or 464. He afterwards narrowly escaped assassination from the same hand, but his superior strength saved him in the struggle, and Artabanus fell by a blow from his dagger. (Compare Ctesias and Diodorus.) During the civil commotions that followed this event, and while the king was engaged in reducing the rebellious province of Bactria, the Egyptians, thinking this a favourable opportunity to recover their independence, of which they had been deprived by Cambyzes, rose in arms under Inaros B.C. 460, and nearly freed their country from the yoke of the Persians. They at the same time received a numerous body of Athenian auxiliaries. Artaxerxes employed his uncle Achæmenes or brother (Ctes.) to reduce them to obedience, but he was defeated and slain. (Herodot. iii. 12; vii. 7.) In a second expedition which he sent under Artabazus and Megabyzus he was more successful, and the Athenians found themselves obliged to evacuate the country, B.C. 455, leaving Egypt in the hands of the Persians after an obstinate resistance of six years, during part of which time the Athenians were absolutely in possession of Lower Egypt. The Athenians, however, still continued the war, and sent a body of troops under Cimon to take possession of Cyprus. Cimon defeated the Persians several times, and had nearly reduced the whole of the island when he was cut off by disease B.C. 449. Peace was then concluded on the following conditions:—1. That all the Greek cities of Asia should enjoy full independence. 2. That no Persian ships of war should enter the sea extending from the coasts of Pamphylia as far as the entrance to the Black Sea. 3. That no Persian army should approach within a horseman's day's journey of the Grecian seas (Plut. *Cim.* 13), or three days' journey, (Diod.) 4. That the Athenians should attack none of the possessions of the king of Persia. This peace was con-

[Bridge at Arta.]

Its whole length is about 200 yards, and the height of the centre angle about 100 feet above the river, which is here divided into numerous streams by sand-banks. Arta lies in 39° 8' N. lat. and 20° 59' E. long.

ARTABANUS, the last of the Parthian dynasty of the Arsacids. He succeeded his brother, and reigned in

cluded the same year that Cimon died (Diod. xii. 4), though some writers have placed it immediately subsequent to the battle at the river Eurymedon, B.C. 466 (Plut. *Cim.* 13.) (See the subject discussed in a note on Diodor. xii. 4, by Wesselingius.) Artaxerxes seems to have spent the remainder of his life in peace: he died after a reign of forty years, B.C. 425 (forty-two, Ctes.), and was succeeded by his son, Xerxes II.

Themistocles, who was obliged to fly from Greece, found safety and an honourable reception at the court of this Artaxerxes in the beginning of his reign. The date commonly assigned to this event (B.C. 466) is either incorrect, or we must place the commencement of Artaxerxes' reign a little earlier. [See THEMISTOCLES.] (See Thucyd. i. 104-110; Diodorus, lib. xi. xii.; Ctesio *Persica in Phot. Bibl.* p. 119; or, Baehr's ed. of Ctesias, 1821.)

II. ARTAXERXES, surnamed Mnemon (*Μνημων*) from the excellence of his memory, was the eldest son of Darius II. and Parysatis, and succeeded to the throne on his father's death B.C. 405. His original name was Arsaces, or Arsicas. His younger brother, Cyrus, who founded his right to the crown on his being the first born after the accession of his father (Plut.), conspired against him, and would have been put to death but for the intercession of his mother, who obtained his pardon, and even his continuation in the command of the maritime provinces of Asia Minor. At Sardis he collected a large force with the intention of usurping the throne, and proceeded with these troops and a body of above ten thousand Greek mercenaries to attack the king. This is the celebrated expedition of which Xenophon has left us so interesting an account. [See ANABASIS.] A decisive engagement took place at Cunaxa, about forty miles from Babylon, and the result was the death of Cyrus and the complete establishment of Artaxerxes on the throne, B.C. 401. The part which the Spartans had taken in this expedition was not likely to be overlooked by the king, and a war arose between them. The Lacedæmonians, indeed, were encouraged to enter Asia by the weakness of the Persian monarchy, which the expedition of the 10,000 had revealed to all Greece. After several Spartans had been sent out, Agesilaus was at last appointed to command the Spartan troops in Asia Minor, and his success was equal to the high reputation which he had already acquired. He overran the greater part of the western provinces of Asia Minor, and would probably have reduced the whole of the peninsula, if Artaxerxes by bribery had not succeeded in exciting a Grecian war against Sparta. Agesilaus was recalled to the defence of his country, and the Persians soon afterwards gained a naval victory near Cnidus, principally by the assistance of Conon the Athenian, B.C. 394. The Spartans were at last induced to sign a treaty which gave up everything for which they had been contending, and is known in history as the peace of Antalcidas, from the name of the person who was employed by the Spartans to conclude it, B.C. 387. [See AGESILAUS.] It was to the following effect:—that the Greek cities in Asia and the island of Cyprus should be subject to the king; that all the other Greek states, except Lemnos, Imbros, and Seyros, should be independent. Cyprus, however, did not submit [see EVAGORAS], and it required more than ten years to reduce it to subjection. The only war which Artaxerxes conducted in person was that against the Cadusii, a people inhabiting the mountains on the west and south-west side of the Caspian sea, and in it he exhibited a patience under fatigue which excited the astonishment of his courtiers. The expedition was not successful. He married his own daughters, Amestris and Atossa, the first example that we have in Persian history of such an unnatural alliance. Towards the latter years of his life he put his son Darius to death in consequence of a conspiracy which he had formed against him. Artaxerxes was unsuccessful in his attempts to reduce Egypt. [See AGESILAUS.] He died from grief on account of the bad conduct of Ochus, the youngest of his sons, B.C. 359, at the age of ninety-four (Plut.), and was succeeded by Ochus. (Plutarch's *Life of Artaxerxes*; Diodorus, lib. xiii. xiv.; Ctesias; Xenophon's *Anabasis*.)

III. ARTAXERXES, called Ochus before he ascended the throne, was the third son of Artaxerxes Mnemon. All accounts concur in making him one of the most cruel and sanguinary of the Persian princes. He began his reign by putting to death all those of the royal family from whom he thought himself likely to incur danger. Egypt, which never quietly submitted to the sway of the Persians, was at this

time in revolt, and governed by the last of its native princes, Neectanebus II. Artaxerxes led a powerful army against him, and completely broke the strength of Egypt, B.C. 351. His treatment of the Egyptian god, Apis, is said to have proved his destruction, for it excited so much indignation in the mind of Bagoas, his favourite eunuch, an Egyptian by birth, that on the king's return to Persia he murdered him, B.C. 338, and placed on the throne his youngest son, Arses. If, however, the date of the Egyptian war, B.C. 354, and the death of Ochus, B.C. 338, are both correct, this story seems to have little foundation. (Diodorus, lib. xvi. xvii.; Justin. x. 3.; Plutarch's *Agessilaus*.)

ARTEDI, PETER, a distinguished naturalist, the second son of Olaus Artedi, was born 22nd February, 1713, at Anund, in Angermanland, a province of Sweden. Possessing excellent talents and a good memory, he was destined for the church, but after beginning his studies at Normaling, where his father officiated as clergyman, the secret inclination of his heart led him to visit the men shores of the Bothnian Gulf to study fishes: he also examined plants, chiefly those used in agriculture and domestic economy.

In 1716 he was sent to the school of Hernösand, where, while others spent their hours of relaxation in play, he devoted himself to the study of fishes and the collecting of plants. During his residence here he read many works on alchemy. In 1721 he went to the University of Upsal to study philosophy and theology, but he gradually abandoned these, and at last gave himself up to natural history: from alchemy he turned to chemistry, and ultimately to medicine.

In 1728 Linnaeus likewise went to Upsal to study medicine, and on inquiring who among the students was pre-eminent, all answered, Peter Artedi; on which Linnaeus sought his acquaintance.

At this time, according to Linnaeus's description of him, he was tall, thin, with long black hair, and a countenance resembling that of John Ray, judging by the portrait of the English naturalist. Their friendship continued the whole period of their residence at Upsal, which was seven years, during which time an honourable rivalry subsisted between them, each abandoning to the other the department of natural history in which he seemed to excel: in this way the study of fishes and the amphibia was assigned to Artedi, while Linnaeus surpassed him in a knowledge of birds and insects. In testimony of their friendship, before the departure of Linnaeus for Lapland and of Artedi for England, they mutually constituted each other heir of their papers and collections of natural history, the survivor pledging himself to publish whatever manuscripts might seem worthy of the public eye.

In September, 1731, Artedi sailed from Stockholm to London, where he met with the most courteous reception, particularly from Sir Hans Sloane. During his stay in London he wrote the preface to his *Ichthyologia*.

In 1735 Linnaeus, after his Lapland tour, went to London, where, after residing a few weeks, he returned to Sweden to find himself joined by his friend Artedi. The manner of Artedi being now almost exhausted, he meditated a return to his native land; but a very different fate awaited him. Albert Seba, an old and wealthy apothecary of Amsterdam, who had collected an unrivalled museum of objects of natural history, had published two volumes descriptive of quadrupeds and serpents, and when about to publish the third concerning fishes, he requested the assistance of Linnaeus; but he, being occupied with other matters, and moreover engaged with Dr. Gilbert of Leyden, declined Seba's offer. Linnaeus, however, recommended his friend Artedi. Previous to this Artedi assisted Linnaeus in his great *Systema Naturæ*, particularly in the departments of fishes, and in the umbelliferous plants, in the arrangement and construction of the genera of which, he recommended the adoption of the involucrum as furnishing a good character. Indeed it was the intention of Artedi, after his work on fishes should have been finished, to devote himself entirely to the study of umbelliferous plants. Having entered upon his new office, he drew up for the work of Seba, the descriptions, the synonyms, the genera, and species of nearly all that remained.

About this time, Linnaeus, having finished his *Famula menta Botanica*, hastened to Amsterdam to show it to Artedi, who on his part showed Linnaeus his *Philosophia Ichthyologica*, which had been the work of several years' labour.

This delightful and advantageous interchange of ideas soon experienced a melancholy interruption: Artedi, on the 21st September, 1735, when returning to his lodgings from the house of Seba, fell into one of the canals of Amsterdam, and no assistance being at hand, he was not discovered till morning. Thus, in the thirtieth year of his age, perished one whom Linnæus justly pronounced an honour and ornament to his country.

Linnæus, in conformity with their testamentary arrangement, claimed his manuscripts; but the landlord, on account of some small debts, refused to give them up, and even threatened to sell them by auction. They were purchased by Dr. Clifford, and by him presented to Linnæus. Among them he found the *Philosophia Ichthyologica* alone finished; the *Synonymologica*, a work of immense labour, complete, but confused; the *Descriptions*, good; the *Bibliotheca*, unfinished; and the *Systema* nearly complete.

Linnæus devoted more than a year to render these works complete, and then gave them to the world, preceded by a well-written life of the author, in 1 vol. 8vo, Leyd. 1738. Linnæus had previously availed himself of them, for the department of fishes, in his *Systema Naturæ*, published at Leyden in 1735.

Cuvier and Valenciennes, in their history of ichthyology, prefixed to their *Histoire Naturelle des Poissons*, Paris, 1828, pronounce this the first work which gave a truly scientific character to the natural history of fishes, completing that which had been so well begun by Willoughby and Ray.

Artedi founded his orders solely upon the consistence of the skeleton, upon the opercula of the gills (branchiæ), and the nature of the rays of the fins. Of these there are four, (for we do not admit the cetacea,) denominated the malacopterygii, the acanthopterygii, the branchiostegii, and the chondropterygii. The branchiostegii, being badly constructed and badly defined, cannot be retained, but the other three are strictly natural, and nothing superior to them has yet been proposed. The genera were sixty-eight, but of these fifty-five only were defined, thirteen being merely indicated in the supplements to the *Genera* and the *Synonymologica*.

Genera of Artedi.

I. Malacopterygii.	II. Acanthopterygii.	IV. Chondropterygii.
Sargassum.	Blenius.	Petromyzon.
Gobiis.	Gobiis.	Acipenser.
Cyprinus.	Xiphias.	Squalus.
Clupea.	Scorpa.	Rana.
Argentea.	Mugil.	
Exocoetus.	Salpis.	Genera indicated in the
Coelacanthus.	Spirus.	Supplements.
Osmia.	Seriola.	I. <i>In the Genera.</i>
Salmo.	Perc.	Tenia.
Esoc.	Trachinus.	Silurus.
Lichius.	Tegus.	Mastax, physic.
Coryphæa.	Scomber.	Sphyræna.
Ammodytes.	Cottus.	Cicla.
Platichthys.	Zon.	II. <i>In the Synonymologica.</i>
Stenopterus.	Clupeoides.	Hypoclin.
Gadus.	Gasterosteus.	Copistius.
Anchoa.	Baliste.	Pleur.
Muraena.	Gobion.	Citharus.
Ophichth.	Cyclopterus.	Atherina.
Anableps.	Sphius.	Sparus.
Gymnotus.		Chelon.

In his botanical labours he was not so successful. The involucrem of the general umbel and the involucrellum of the partial umbel (in other words, the general and partial involucra) are merely *bractee*, on which, in no other case, has it ever been attempted to found generic characters. These parts, indeed, furnish very secondary characters, and an arrangement of umbelliferous plants according to them must be at all times bad, and cannot be retained in the present day, especially since the labours of Koch and Decandolle have furnished one so much superior. (See *Nova Acta Academiae Caesaræ Naturæ Curiosorum*, 1824, vol. vi, part 1, p. 55, and Decandolle, *Mémoire sur la Famille des Umbellifères*, Paris, 1824. Decandolle, *Prodromus Systematis Naturalis Regni Vegetabilis*, vol. iv. Umbelliferae, p. 55. Paris, 1830.

Linnæus called a genus of umbelliferous plants after his friend, *Artedia*, of which only one species is known, *A. squarrosa*. Artedi's *Ichthyologia* was reprinted and enlarged by J. Walbaum, three volumes quarto, Lubeck, 1788, 1789, 1792.

ARTEMIDORUS of Ephesus wrote a treatise on general Geography, in eleven books, besides some other works. His *æra* is not precisely known, but he wrote probably about one

century n.c. His geographical work is very often quoted by Strabo as authority, by Pliny in his *Natural History*, by Stephanus of Byzantium in his *Dictionary*, and by other writers. The passages thus quoted are collected in Hudson's *Minor Greek Geographers*, vol. i. We can collect from Strabo that Artemidorus visited Spain, Rome, and Alexandria. He was sent by his citizens on an embassy to Rome in order to recover two valuable salt lakes near the mouth of the Cayster which belonged to the temple of Diana, but had been seized by the Roman *publicani* (farmers of the taxes). Artemidorus was successful, and was rewarded with a golden statue. (Strabo, xiv. p. 642.)

ARTEMIDORUS, surnamed Daldianus, from Daldis, a city of Lydia, which was his birth place, is the author of a work in five books, entitled *Ὀνειροκριτικά*, or, *The Interpretation of Dreams*. He lived in the time of the Antonines; and collected his materials by travelling in Greece, Asia, Italy, and various other countries, and registering such communications as he was favoured with by those who studied the interpretation of dreams. (See Lib. I. cap. i.) The value of the work, which is written in very fair Greek, consists in the strange stories, and in the view which it gives of the superstition about dreams in that age: it is also useful for the explanation of several mythological allusions and symbols. The fifth book, entitled *Ἀποκρίσεις*, or 'Results,' is addressed to the author's son: it contains ninety-five short dreams that occurred to different individuals, and the events which followed. Some of the dreams are remarkable as samples of what people's dreams were seventeen centuries ago. The first edition was by Aldus, 1518, 8vo.: the last by Reiff, Leipzig, 1805, 2 vols. 8vo., one of text and the other of notes. An English translation was published in 1644, in 12mo, under the title of '*The Interpretation of Dreams*, digested into five books, by that ancient philosopher Artemidorus.' Of this work a tenth edition was published in 1690.

Artemidorus wrote other works besides that which we now have. See Suidas (*Ἀρτεμίδωρος*), and the author's work, Lib. II. cap. i.

ARTEMIS, one of the ancient Greek divinities, known to the Romans as Diana, whose attributes were so numerous and of such opposite kinds, that it is difficult to imagine how they should have been assembled in the same deity, if we did not know that the imaginative spirit of the Greeks loved to invest their gods with the most opposite characters. In the poetry of Homer and Hesiod she appears as the daughter of Jupiter and Leto (Latona), sister of Apollo, and the goddess who presided over hunting. She traverses the woods, armed with the bow and arrow, and attended by numerous nymphs. Her bow is employed, not only against the beasts of the forests, but also against man; and in those early poems she is represented as never yielding to the allurements of love. She is a chaste and pure virgin. In the *Orphic Hymns* (35, 36) we find her invested with other attributes. There she assists at child-birth, is the assuager of pain, looks with benignant eye on the labours of man, and is the author to him of abundant harvests, of peace, and of health. In this she seems to have appropriated to herself part of the duties of Ceres, and indeed, according to Æschylus, she was daughter of that goddess. In a temple at Megalopolis in Arcadia her statue stood by the side of that of Ceres, and she was clothed with the skin of a hind; a quiver hung from her shoulder; she had a lamp in one hand and two serpents in the other. (Pausan. viii. 37.) In the Greek tragic poets she appears under another character, according to which the favour of the goddess must be obtained by the sacrifice of human victims. Iphigenia, daughter of Agamemnon, on her return from the Tauri, introduced this barbarous feature in the worship of Artemis. At Sparta there was a temple of Artemis Orthia, where they exhibited an old wooden statue, said to be that brought by Iphigenia from the Tauri; and though in later times human victims were not offered, the thirst for blood, which the goddess was supposed to feel, was satisfied by the severe scourging of the Spartan youths before her statue. (Pausan. iii. 16.) All these various fables were collected by the Alexandrian poets of later times, and fitted to one another so as to form a whole.

The worship of Artemis was very general throughout Greece and the colonies, but she was more particularly the goddess of the Arcadians, if we may judge from the numerous temples found in that district. There almost every height, fountain, and river, supplied her with a distinctive

epithet, so that the poet Aleman (who flourished probably B.C. 672) says, that she derives names from ten thousand mountains, cities, and rivers. She is Lycoatis on Mount Mœnalus (Paus. viii. 36), Chalcantis at Tegea (viii. 53), Stymphalia on Stymphalus (22), Chacalesia and Condyleatis at Caplysæ (23); and it is curious to observe that this old Peloponnesian divinity is frequently found in connection with streams and rivers. She is *amniun dominia*, 'mistress of rivers,' in Catullus (34, 12); *Ἀρτεμιῶν ἐπισκοπός*, *inspector* or *superintendent of ports*, in Callimachus (iii. 40).

Artemis was a favourite subject with the artists of Greece, and they have generally represented her as a huntress. They endeavoured to invest her with all the freshness and vigour of youth: in the old style, where she is generally clad in the stola, the artist still contrived to indicate her full and well-formed figure. In the works of Scopas, Praxiteles, and Timotheus, Artemis was, like Apollo, represented of a slender form: her hips and breasts without the fullness of womanhood. The countenance is that of Apollo, only with a softer expression and more full; the hair is sometimes bound over the forehead, but more frequently in a bunch behind or on the top of the head in the manner peculiar to the Dorians. The dress is a Dorian vest (*χiton*), either tucked up high, or reaching to the feet: and the shoes are Cretan. Sometimes a dead or dying stag lies at her feet. See Filhol, *Galérie Napoléon*, v. 366; Visconti, *Iconographie*, xiii. 1; *Diana Locheca in Millin, Monuments inédits*, ii. 34. (See this subject treated fully in Müller, *Archæologie der Kunst*, Breslau, 1830.) We have not entered into the question whether there were several goddesses of this name distinct from each other in their character and attributes, but we think that this opinion is by no means improbable. She is considered the same as the Bubastis (Herod. ii. 59) of the Egyptians. (See Barth, *Geschichte des alten Egypten*, Leipzig, 1833; Müller, *Die Dörfer* (translation) vol. i.; Voss, *Mythol. Br.* in 1. See DIANA, SELENE, and HECATE.)

ARTEMISIA, the daughter of Lygdamis, became queen of Halicarnassus, a city on the coast of Asia Minor, when her husband died. She was one of the most distinguished women of antiquity, if we may credit the account given by her countryman Herodotus. She attended Xerxes in his expedition against Greece B.C. 480, and furnished five ships, which were second only to those of the Sidonians. In the council of war before the battle of Salamis, she strongly represented to Xerxes the folly of risking a naval engagement, and the event justified her opinion. In the battle she displayed so much courage, that it called forth from Xerxes the exclamation, 'that the men behaved like women, and the women like men.' To her Xerxes intrusted the care of his children, that they might be transported in safety to his kingdom. (Herodot. vii. 99, viii. 87-103.) She was represented in the Persian portico (*πύλος Περσική*, as it was called at Sparta) which was erected to commemorate the great defeat of the Persians. (Paus. iii. 11.)

ARTEMISIA, daughter of Hecatomnus, king of Caria in Asia Minor, and wife of Mausolus, whom she succeeded on his death B.C. 353. From all the accounts transmitted to us respecting her, she seems to have been strongly attached to her husband; but that she should have drunk the ashes of his body mixed with water, as Pliny tells us, is a statement rather extraordinary. (See also Valerius Max. lib. iv.) She proposed two prizes, one in tragedy, and another in oratory, to those who should pronounce the best panegyric on her husband: and among those who came forward, according to Aulus Gellius (x. 18), were Theopompus, Theodectes, and Nauerates: some have even added Isocrates. The successful competitors were Theopompus and Theodectes. She caused a monument to be erected to the memory of Mausolus, which, for its grandeur and magnificence, was considered one of the seven wonders of the world. It was called 'mausoleum' from the name of her husband, and hence the name mausoleum is often applied to funeral monuments. It seems to have existed in the time of Strabo (p. 656). She died after a reign of two years, and was succeeded by her brother, Idrieus, B.C. 351. (Diod. xvi. 45.)

ARTEMISIA, an extensive genus of plants belonging to the natural order *compositæ*, and remarkable for the intense bitterness of many of its species. It is easily recognized by the multitude of fine divisions into which its leaves are usually separated, and the numerous clusters of small, round,

drooping, greenish-yellow, or brownish flower-heads, with which its branches are loaded. The florets are all tubular, but those in the circumference of each head are very imperfect.

The most interesting species are wormwood, tarragon, and southernwood: the former (*Artemisia absinthium*) is met with frequently in waste places all over Europe and the northern parts of Asia. Its leaves have a silky or hoary aspect, in consequence of a thick covering of exceedingly delicate hairs, and they are deeply lobed. The flower-heads are very numerous, and of a light buff colour. Wormwood is celebrated for its intensely bitter, tonic, and stimulating qualities, which have caused it to be an ingredient in various medicinal preparations, and even in the preparation of liqueurs. It derives its name from its use in destroying worms in children.

Tarragon (*Artemisia dracunculid*) is a Siberian species, the stems of which grow two or three feet high, are perfectly smooth, and of a bright green. Its leaves are undivided, very narrow, smooth, and rather succulent: when bruised they emit a stimulating odour, and if chewed produce a peculiarly pungent moisture in the mouth, which is so generally considered agreeable that the leaves are employed as a pickle, and as an ingredient in some kinds of vinegar. The flower-heads are small, round, and smooth, and contain seven or eight florets.

Southernwood (*Artemisia abrotanum*), an odorous herb found all over the south of Europe from Portugal to the Dardanelles, and thence through Palestine, Persia, and the middle of Asia into China, is frequently seen in old-fashioned gardens where it was cultivated for its peculiar aromatic scent. It is a hoary plant, becoming in warm countries a shrub, and even with us acquiring a woody stem after a few years: its branches bear loose panicles of nodding yellow flower-heads, which are externally grey with down; the leaves belonging to the panicles are much longer and narrower than those of the stem.

All these are increased either by division of the crown of the root or by what are technically called *ships*, that is to say, cuttings rudely torn from the woody part of the stem as near as possible to the ground; these strike root readily and make young plants in a month or two.

ARTERY, from the Greek *αἰματιὰ* (*arteria*), signifying an air vessel: because the ancients, ignorant of the circulation, and finding the arteries always empty after death, supposed they were tubes containing air. Why after death the arteries are empty and the blood accumulated in the veins will be explained hereafter. By the term artery is meant a vessel which conveys blood from the heart to the different parts of the body: a vein, on the contrary, is a vessel which conveys blood from the different parts of the body to the heart. [See VEIN.] All the arteries of the system proceed from two great trunks immediately connected with the cavities of the heart, namely, the pulmonary artery, which arises from the right, and the aorta, which springs from the left ventricle. [See HEART.] The pulmonary artery conveys blood from the right ventricle of the heart to the lungs: the aorta carries blood from the left ventricle of the heart to all the parts of the system, and consequently is the common source of all the arteries of the body, with the exception of those which circulate through the lungs. [See ANA. V.] The arteries derived from the aorta contain arterial, those derived from the pulmonary artery contain venous blood, and this latter vessel is the only artery in the system which does not contain arterial, that is, decarbonized or proper nutrient blood. [See BLOOD.]

The arterial system is arborescent, that is, the branches which spring from the aorta successively increase in number and diminish in size as they proceed from the heart towards their ultimate terminations in the system. Each trunk commonly ends by dividing into two or more branches, the combined area of which is always greater than that of the trunk from which they spring. The capacity of the branches is estimated to exceed that of the trunks in the proportion of one and a half to one. The arterial trunk always dividing into branches, and the larger branches into branches more and more minute, it is obvious that the blood in the arterial system is always flowing from larger into smaller tubes.

The organization of the arteries is peculiar, and differs considerably from that of the veins. [See VEIN.] They are of a yellowish-white colour, loose and flocculent on their external surface, but their internal surface is smooth and

polished. They are composed of three distinct membranes, which are superimposed one upon the other, and which are intimately united by delicate cellular tissue. Each of these membranes is called a tunic, or coat, and each possesses a peculiar structure, and performs a separate function in the circulation of the blood.

1. The internal tunic consists of a membrane, colourless, transparent, and thin, yet so firm and strong that it is supposed to resist more than any of the others the bursting of the artery by the current of the blood; for if, in a living animal, the other coats be entirely removed, this alone is found capable of sustaining the impetus of the circulation, and of preventing rupture from the dilatation of the artery.

2. The middle tunic, called also the fibrous and the muscular, is composed of yellowish fibres, which pass in an oblique direction around the calibre of the vessel, forming segments of circles which are so joined as to produce complete rings. In the larger trunks, several layers of these fibres can be raised in succession by the forceps, so that this coat is of considerable thickness, and it is proportionally thicker in the small branches than in the large trunks. This coat is firm, solid, and highly elastic. It is the main tunic by which the artery resists dilatation in the transverse direction, which it does so effectually, that when the left ventricle of the heart propels a fresh current of blood into the aorta, little or no dilatation of the vessel is perceptible. The characteristic property of the fibrous coat is contractility. If it be mechanically irritated, or if a chemical stimulant, such as ardent spirit or ammonia, be applied to it, the vessel contracts forcibly upon its contents. This contractile power, which properly belongs to the muscular fibre, induced anatomists to believe that the fibrous tunic consists of muscular fibres; but careful examination has shown that its organization possesses nothing in common with that of the muscular tissue, while chemical analysis has demonstrated that it contains no fibrin, which is the basis of muscle.

3. The external tunic, called also the cellular, consists of small whitish fibres, very dense and tough, interlaced together in every direction. It is much thicker in the large trunks than in the small branches, the reverse of the fibrous coat. Its outer surface is covered by a loose and flocculent cellular substance, which connects the artery with the surrounding parts, and particularly with the sheath of the vessel. Its firmness and resistance are so great, that it is not divided however firmly a ligature may be placed around the artery; and its elasticity, especially in the longitudinal direction, is so remarkable that it has been called, by way of eminence, the elastic coat.

Arteries are themselves abundantly supplied with arteries, constituting their nutrient vessels, and called *vasa vasorum*; but these nutrient vessels of the artery form but few anastomoses, that is, but few communications with any other arteries. It is essential, in tying an arterial trunk, to disturb it as little as possible, and only to expose just so much of it as is indispensable for the proper application of the ligature. In the first cases treated by Mr. Hunter for aneurism [see ANEURISM], four ligatures were placed around the diseased artery, which was divided in the intervening space. Two of these were called safety-ligatures, being intended to be drawn tight if the others gave way; but the application of these ligatures disturbed the nutrient arteries of the vessel to such a degree, that inflammation, ulceration, mortification, and hæmorrhage ensued, so that those so called safety were really danger ligatures, producing the very evils which they were intended to avert. The careful observation of the functions of these vessels has corrected this and several other errors, and led to most important improvements in surgical practice.

The principal nerves of arteries are derived from the ganglionic or the organic system, but with these are mingled branches derived from the sentient or the animal system. [See NERVE.] Accordingly, under ordinary circumstances, arteries carry on their functions independently of any influence derived from the brain and spinal cord, but they are capable of being affected by agents applied to those organs. Under ordinary circumstances, and in a state of health, arteries are but little sensible; they may be irritated in living animals by the scalpel, or by the application of chemical stimulants, without affording any indication of pain. Nevertheless, in certain states of disease, there cannot be a question, that they become exquisitely sensible.

Among the physical properties of arteries, the most important are their extensibility and their elasticity. Their

extensibility is chiefly in the direction of their length. If an artery be tied in two places, and divided between the ligatures, the portion which is next the heart is sensibly elongated at each contraction of the ventricle; but their extensibility in the circular or transverse direction is not great.

After an artery has been extended, either lengthwise or transversely, it suddenly retracts on itself when the extending force is removed. If the finger be forcibly introduced into the section of a large artery, the sides of the vessel re-act on the finger, and proportionally compress it. If an artery be divided in the dead body, though emptied of its contents, it maintains its cylindrical form, and preserves its capacity unimpaired. The elastic property on which these phenomena depend is common to all the coats, but it is greatest in the external, and least in the internal tunic; and it is also much greater in the large trunks than in the small branches. Elasticity, in the longitudinal direction, restores the artery to its original state after it has been elongated in the various motions of the body; in the transverse direction, it keeps the artery open, and thus maintains a free channel for the passage of the blood through the vessel, while it also assists the fibrous tunic in resisting the over-distension of the artery by the impulse of the circulating current.

The most important vital property of the artery is its contractility, that is, its power of diminishing its capacity, or approximating its parietes, and thus proportionally acting upon its contents. Even the large trunks possess this property in some degree; but it resides chiefly in the ultimate divisions of the arterial branches, that is, the capillary vessels. The main purpose of the trunks and large branches of the arteries is to receive the blood from the heart, and to transmit it to the capillary vessels in the organs. The purpose of the capillary vessels is as various as the actions of the organs in which they terminate, and of which actions, indeed, they are the great instruments. Between the trunks and large branches of the arteries, and their ultimate divisions, there is such a total difference in structure and function, that they must be regarded as two distinct sets of vessels, and the latter require a separate consideration. [See CAPILLARY VESSELS.]

Arteries, besides capillary vessels, terminate also in veins, in exhalant vessels, that is, colourless vessels, which are supposed to open by minute orifices on various membranous surfaces, perhaps in lymphatic vessels (which see), and in excretory ducts. [See GLAND.]

The principal diseases to which arteries are liable, are inflammation, ossification (deposition of bony matter), calcareous deposition (deposition of chalky matter), and aneurism.

ARTESIAN WELLS are perpendicular perforations or borings into the ground, through which water rises from various depths, according to circumstance, above the surface of the soil, producing a constant flow or stream; they are highly useful in districts where springs or rivers are scarce, or where the usual surface water is of indifferent quality. These perforations have been named Artesian wells (*Puits Artésiens*) from the opinion that they were first used in the district of Artois in France. They are seldom more than a few inches in diameter, and are made by means of the usual boring instruments. Their action is due to the constant endeavour of water to seek its level, as will be readily understood by means of the accompanying diagram, representing a geological section of a country in which Artesian wells may be established.

Let *h, l, w, l, h*, be the surface of a country upon which stands the town *T*: *a, a*, a bed or thick mass of rock, either impervious to water, or through which it percolates with difficulty: *b, b*, a sandy rock, or one through which water easily percolates among the strata that occur beneath the rock *a, a*, and are concealed by the latter in the plain on which the town, *T*, stands, but crop out, as it is geologically termed, or rise to the surface from beneath the rock *a, a*, at the heights, *h, h*, on each side: *c, c, c*, a rock through which water either cannot pass, or percolates with difficulty. It will be obvious that the rain-water, falling on the heights, *h, h*, and which may not run off into the

drainage depressions, will be absorbed by the exposed part of the rock, *b, b*. From the action of gravity the water would pass downwards upon the rock, *c, c, c*, which being impervious, or nearly so, to the passage of water, it will be checked, and take a direction under the other impervious, or nearly impervious, rock, *a, a*, percolating through all parts of *b, b*. From its endeavour to seek its own level, the water will strive to force its way through the superincumbent rock; but being unable to do so, it will, in the natural order of things, remain beneath, free from evaporation. If, under these conditions, a perforation be made at *w*, near the town *T*, through the rock *a*, into the rock *b, b*, the water in the latter will rise over the surface of *a, a*, at *w*, in proportion to the height of *h, h*, above the level of *w*, and to the checks, from various causes, which it receives while percolating through the rock *b, b*. It might be supposed that these checks would be sufficient to prevent any other than a very slow rise of water in the Artesian well, but it should be recollected that the quantity of water locked up beneath a mass of impervious rock of large area, such, for instance, as the London clay, is considerable, and that the hole or perforation is very small.

The rock *b b* may, in fact, be considered as the inside of a great pipe, into the two ends of which water is poured; so that when a hole is pierced in the upper side of the pipe, as at *w*, the water will spring up, and endeavour to attain the level of the water at the ends.

Artesian wells can be formed under circumstances which appear to the general observer somewhat different, though, in point of fact, they are much the same. Let *a, b, c, d, e, f,*

in the annexed diagram, represent a section of a country, several miles in length, and *h, i, k, l,* four different kinds of stratified rocks, resting conformably upon each other, among which the rock *k* is of a structure to permit the comparative free passage of water, entering it at *f*, while through the other rocks water either percolates with difficulty, or is unable to pass. In this case, the rock *k* merely performs the office of a longer pipe, not indeed so obviously to those unacquainted with geology on the large scale, as in a plain between heights; yet the principle of action is the same, for when the series of rocks, *h, i, k, l,* again rises to the surface on the side now truncated by the section, the same general facts are represented as in the first diagram, though on a much larger scale. Thus when a perforation is made at *w*, in the valley between the hills *a* and *b*, the water rises to the surface, and an Artesian well is established. The Artesian wells at Rouen exist under similar conditions.

In nature, great areas or sheets of stratified rocks, particularly those of a certain relative antiquity, are seldom unbroken; but are, on the contrary, fractured in various directions in consequence of disturbing forces which have acted upon them. Even in these cases, perforations for Artesian wells have sometimes been succeeded, the hole being pierced between the fracture or fissure and the point where the porous bed receives the rain-water.

Let the line *a, b, c*, in the above wood-cut, represent the surface of a country; *d, d*, a porous bed, or one through which water, received at *e*, easily percolates, but can neither pass nor down from the nature of the rocks above or beneath. Let *f* be a fracture or dislocation, geologically termed a fault, from the effect of which the bed *d* is suddenly thrown down to a lower level, on the left of our figure, and the continuity of *d* on the one side and *d* on the other is destroyed. If we tap, as it were, the bed or rock *d*, at *w*, the water in it would rise but a short height upwards, if *d* could be regarded as a hollow pipe, which, receiving its water at *e*, lets it pass freely out at *f*. The rapid percolation of the water is, however, checked by its friction among the particles of sand or against the sides of the strata, so that

when a perforation is made at *w*, and a free vent given to the water, it rises, and an Artesian well is established.

It will be evident that, if we regard the above section without reference to the artificial boring at *w*, we have a natural Artesian well, the fissure or fault *f* serving the same office as the artificial perforation; with this difference, that the latter may be considered as a mere puncture, while the effects of the former are felt along a more extended line, occasionally a few miles in length. Without such fissures, which permit the escape of water from beneath, many districts would be comparatively destitute of this great necessary of life, more particularly during droughts. Springs from fissures or faults are more permanent than others. This arises from the mechanical arrangement of the reservoir, if we may so term it, by which a vast quantity of water is accumulated, and can only escape by slow degrees; and thus severe droughts, which dry up the more superficial springs, are comparatively little felt in those from fissures.

It must be apparent from these considerations that extreme caution is necessary in the choice of situations for sinking to obtain Artesian wells, and that a general geological knowledge of the country, in which the attempt is to be made, should precede any borings for this purpose, otherwise much useless expense may be incurred, without a chance of success. Indeed, the power of pointing out those situations where Artesian wells may, in all probability, be successfully established, is one of the practical applications of geology to the useful purposes of life.

Water percolating through, or among the strata of rock, becomes impregnated with various substances, some of which are injurious to animal or vegetable life, and to various useful processes in the arts. Now it sometimes happens, in sinking Artesian wells, that one or more of the lines of water, which may be tapped, are of this description; it therefore becomes advisable to get rid of such water, if possible, in order that it may not injure, by combining with it, any pure water afterwards met with. Let, in the annexed figure, *a, b, c, d, e, f, g, h, i, j, m, n,*

represent various beds of rock bored through in the process of sinking an Artesian well, a supply of bad water being obtained at *d*, while purer water is discovered at *n*, both waters rising to *a* and *b* above, the surface. To prevent the mixture of these waters, the diameter of the boring is increased from the surface to the bed, or interstices between the strata, where the bad water is supplied, and a hollow cylinder is passed down through its centre to the continuation of the boring

beneath the line of bad water at *d*, in such a manner that the latter cannot mix with the column of good water, *h, h*, rising from *n*, but passes up round the interior cylinder, and delivers itself on the surface at *k, k*. It by no means follows, because the first supply of water met with in a boring will not rise to the surface, that all other lines of water in the same boring will also refuse to rise, for it frequently happens that small supplies are first cut through which do not elevate themselves above a few feet in the pipe or perforation. These smaller springs are due to the more local percolation of water, and though they obey the same laws, rising to their respective levels, they do not reach the surface, because they are not connected with a system of supply which will enable them to do so. Numerous common wells are so far Artesian, that when a particular bed is cut (and there is generally one or more known to well sinkers in every district), the water will sometimes rise in them so suddenly as to render an immediate escape by the workmen necessary. In such cases the water in these particular lines does but seek its level; its rapidity in effecting this is proportioned to the freedom with which it can percolate or flow through the beds or fissures of strata containing it.

Artesian wells are necessarily of various depths, and it has been observed by M. Arago and others that the temperature of the water in them increases with their depth, due regard being paid to the mean temperature of the climate in which they may be established. This fact has been considered an argument in favour of the interior heat of the earth.

Artesian wells are now established in various parts of the old and new world; many have been made in the United States; and, notwithstanding their name, appear to have been known as well in Italy as in Artois from time immemorial.

monial. It is also probable that they were known to the antients, for, according to M. Passy (*Description Géol. de la Seine Inférieure*), Niebuhr cites the following passage from Olympiodorus:—“Wells are sunk in the oases from 200 and 300 to 400 yards in depth (the yard being equal to half a foot), whence water rises and flows over.”

ARTEVELD, JACOB, a brewer of Ghent, and a great popular leader in the early part of the fourteenth century.

Louis, then count of Flanders, had married a niece of Charles le Bel, king of France. He was grandson of Robert de Bethune, on whose death a dispute arose between Louis and Robert de Cassel, his uncle, about the succession, which was decided by the parliament of Paris, supported by the king of France's power, in favour of Louis. This measure did not gain for Louis the affection of his subjects, and his violent conduct tended to alienate them still more. The great towns of Flanders had charters and privileges, and could not be taxed without their consent. Their wealth consisted in their manufactures and commerce, by which they had been long connected with England, from which country they drew the wool required for their cloth fabrics. The chief proprietors in the country were nobles, who generally took the part of the count and of his French patron, for the king of France was then suzerain of Flanders. The four principal chartered communes, or municipalities, of the county of Flanders were Ghent, Ypres, Bruges, and the country or district of Bruges, which was called *le Franc*, or ‘free country.’ Bruges during this period repeatedly revolted against Count Louis, and at last took him prisoner, and kept him till the people of Ghent, who were then jealous of their neighbours of Bruges, rescued the count. Another and a more general insurrection of the Flemish was put down by Philip de Valois, who had succeeded Charles le Bel: he defeated the Flemish in a great battle at Mount Cassel in 1328, and obliged them to surrender at discretion. The leaders were put to death, and the towns were heavily taxed.

The war which broke out some years after, between Philip de Valois and Edward III. of England gave occasion to another revolt of the Flemish towns. This time Ghent took the lead, and the burghers elected for their captain Jacob Arteveld, a brewer, who superseded the authority of the count, and was in fact the ruler of Ghent. Jacob had the great qualities, as well as the vices, frequently found united in the character of a demagogue. He was active, eloquent, and bold, but violent, overbearing, and tyrannical. He flattered the people, proscribed the nobles, and divided their spoils amongst those of his own party. Edward of England having sent messengers to Flanders, for the purpose of bringing the Flemings to act with him against Philip of France, Arteveld declared for him, and induced the people of Ghent to form an alliance with the English. In order to remove the scruples of the Flemings on account of their allegiance to the French crown, he advised Edward to assume the title of King of France. Count Louis, who was attached to King Philip, opposed Arteveld's intrigues, and in a diet held in the town of Bruges, he caused one of the promoters of the English alliance to be seized and beheaded at Ruppelmonde. The people of Ghent, infuriated at this proceeding, marched to Bruges, and compelled its burghers to join the English alliance; and the insurgents, strengthened by the assistance of the English, defeated the count and his nobles, who were obliged to evacuate Bruges. The count withdrew to France, but returned again in 1338, and made an attempt to conciliate his refractory subjects. Having entered Ghent, he tried to persuade the popular leaders to side with him and with Philip of France, but the burghers shut the gates, made the count prisoner, and compelled him to sign a treaty of alliance offensive and defensive with King Edward (Dec. 1339). Louis soon after found means to escape from Ghent, and again withdrew to Paris. The war now raged between the French on one side and the Flemings and the English on the other. The latter besieged Tournay, but were defeated by the French near St. Omer in 1341. A truce being agreed upon between the hostile parties, King Edward went to Ghent to meet Count Louis, whom he tried to win over to his side, but without success. After Edward's departure from Ghent on his return to England, Count Louis, seeing his subjects wholly estranged from him, and his authority openly set at naught by Arteveld, once more withdrew to Paris. Arteveld now proposed that Edward's son, the young Prince of Wales, afterwards called the Black Prince, should be elected governor of Flanders, on the under-

standing that the country was to be made by Edward a sovereign duchy. But the Flemings, although they wished to humble their count, were not prepared to disinherit him and his line altogether; and they began to mistrust Arteveld's intentions. A dispute broke out at Ghent between the various trades, in which the fullers were arrayed against the weavers, and a battle was fought in the great market-place between the two factions, which lasted all day; 1500 fullers were killed, and the weavers, being victorious, drove the rest of the fullers out of the city, and utterly destroyed that trade. Arteveld had not taken an open part in the contest, but being jealous of the rising authority of Gerrard Denys, the dean of the weavers, he secretly introduced into Ghent 500 English soldiers, whom he lodged in his premises. Denys and the weavers cried out treason, attacked Arteveld, and killed him, with many of his English soldiers, in July, 1344. The Flemish, however, continued in their hostility to Count Louis, who fell at the battle of Crecy in 1346, fighting in the French ranks. He was succeeded by his son Louis II., called *de Male*, from the castle of Male, his favourite residence. Arteveld's authority in Flanders lasted seven years, during which, in spite of many acts of violence and injustice, the cities prospered in their trade, and enjoyed great respect among their neighbours. (*Oudegherst, Chroniques et Annales de Flandre*.)

ARTEVELD, PHILIP VAN, was the son of Jacob Arteveld. Philippa, Edward III.'s queen, held him at the baptismal font, and from her he received his Christian name. His father left him wealth, and his mother, a woman of a prudent character, watched over his youth. She negotiated an early marriage for him with a lady of good family, after which Philip lived quiet and happy with his wife and mother, keeping aloof from all public affairs. But he had a name which was connected with party feelings and recollections. A fresh revolt broke out at Ghent in 1379 against Count Louis de Male, and after several engagements and many atrocities perpetrated on both sides, the count succeeded in intercepting all supplies to the insurgent city, which was reduced to great distress. Van der Bosch and the other leaders of the Ghentese, finding that the people were impatient of their assumed authority, thought of strengthening themselves by engaging Arteveld as the nominal chief of their party. They proposed him to the people, and he was elected Captain by acclamation. After some desultory negotiations with the count, in the course of which two deputies of Ghent who had agreed to surrender the town were stabbed in the market place by

an der Bosch, Arteveld, seeing that it was impossible to hold out any longer for want of provisions, conceived the bold resolution of marching out with a chosen body of men and attacking the count, who was then at Bruges. He left Ghent on the 2d of May, 1382, with 5000 men, determined to conquer or die, and halted in a good position, within three miles of Bruges. The next day was a great festival in that city. In the midst of the processions and rejoicings, news came of the Ghentese being at hand. The count went out to encounter them with a body of 800 knights and squires, followed by a numerous but disorderly multitude of the people of Bruges, especially of the butchers, glaziers, cordwainers, and boatmen, who thought they were marching to certain victory over a few half-starved Ghentese. The Ghentese had a marsh in front of their position, and their flanks were protected by a line of carts: they commenced with a brisk fire of artillery upon the assailants, which checked their ardour. Arteveld, by a skilful movement, having succeeded in drawing the enemy into the marsh, the men of Bruges fell into confusion, many of the knights were killed, and the rest carried along by the flying multitude. The count re-entered Bruges with only forty horsemen, and the Ghentese poured in at the same time. It was now night, and before the citizens of Bruges had time to recover from their panic, the city was given up to plunder. All the count's people, as well as the butchers and other trades favourable to him, were hunted out and killed. The rabble of the town, as well as many of the servants and apprentices, joined the Ghentese in this horrible carnage. Arteveld succeeded in stopping the indiscriminate slaughter in the morning; but the magistrates and nobles were deliberately sought after and led to execution as traitors to their country. The commerce of Bruges was annihilated for a time by this catastrophe. The count remained concealed that night and the following day in the

house of a poor woman, who had often received charity at his palace gate.

After the capture of Bruges, the other towns of Flanders, with the exception of Oudenarde, opened their gates to Arteveld. He now assumed the state and pomp of a sovereign prince, taxed at will the country people, but took care to keep the city of Ghent well supplied with provisions at a low price. His camp abounded not only with all necessaries, but also luxuries. He began the siege of Oudenarde, in which, however, he was unsuccessful. Meantime the people of the neighbouring states, Hainault, Brabant, Liege, &c., showed a disposition to make common cause with the Flemings, and the spirit of revolt spread also into France, where the people were dissatisfied with the exactions and oppressions of their nobles. The feudal nobility at that time had lost much of its old chivalrous spirit, as well as of its independent power, which had been curtailed by the crown, but it still retained all its vexatious and tyrannical demeanour towards the burghers and peasants. It was still, in fact, above the laws. The duke of Burgundy,

son of France, easily induced the young king, Charles VI., to assist Count Louis in putting down the Flemish insurgents, before the English had time to join them. A large force was collected under the command of Olivier de Clisson, a skilful but merciless commander: the oriflamme was displayed, and the campaign began in November, 1382. The French advanced to Roosebeke, between Courtray and Ghent. Arteveld rashly advanced to attack them: his men, equal in numbers, but inferior in military skill, were arrayed too closely, so that the greater part of them had not room to wield their weapons. The battle lasted only half an hour, and 25,000 Flemings were killed, most of them in the pursuit. The body of Arteveld, being found under a heap of slain, was suspended on a gibbet. The battle of Roosebeke has been compared, for the importance of its results, to those of Ætius against Attila, and of Charles Martel against the Moors. 'Had the Flemings been successful,' observes Froissart, 'the insurrection which had already begun at Paris, would have spread all over France, and would have proved more horrible than the Jacqueries; the whole of the nobility and gentry would have been destroyed.' The troubles of Flanders continued for some years longer, until, after the death of Count Louis in 1384, Philip the Bold, duke of Burgundy, who had married Margaret, Count's only daughter, succeeded him in the possession of Flanders, and at last restored it to peace. (Barante, *Histoire des Ducs de Bourgogne de la Maison de Valois*.)

ARTHRITIS. [See Gout.]

ARTHUR. We shall divide this article into two heads: the first, comprising those particulars of the life of this celebrated British chief which appear to rest on historical evidence: the second, giving a short account of that mass of fictions concerning him which forms the earliest portion of our national literature. Truth, indeed, has been so overlaid by fiction, that some writers (Milton among them) have denied that such a person as Arthur ever existed. Of this there seems no more reason to doubt, than of the existence of Hengist, Cerdic, or any other men of note of that time. Beside the later works of Nennius and Geoffrey, the most ancient specimens of Welch poetry, the Triads, the poems of Llywarch Hen, and of Taliesin, speak of him, not as the fabulous prodigy described by later romancers, but as a prince and captain of eminence, yet not distinguished by a marked superiority over others his contemporaries. The following are the incidents of his life which appear to be best attested.

He was a prince of the tribe of Britons called Silures: according to some accounts, the son of Mairic ap Tewdrig (Owen, *Camb. Biog.*); according to the common story of Uther, named Pendragon (Dragon's Head), a title given to an elective sovereign, paramount (at least nominally) over the many kings of Britain. The date of Arthur's birth, or even of his accession to his paternal inheritance, it is vain to inquire. He appears to have commenced his martial career about the year 500, and was raised to the Pendragonship, according to Owen, in 517; according to Whitaker, in 508. Nennius asserts that he gained twelve victories over the Saxons. Of these, eleven have been determined by Mr. Whitaker (*Hist. of Manchester*, vol. ii. chap. 2), with great neatness and plausibility, to have been fought in Lancashire, or still further to the north, at a period anterior to his election to the Pendragonship. For the ground of that writer's belief we must refer to his work: the

reader will at least be repaid by seeing how connected, circumstantial, and plausible a story, may be made out of a meagre string of corrupt or unknown names, assisted by scattered notices in ancient chronicles, and local knowledge, and popular tradition. All this early history of Arthur is placed in the north, whither he is said to have been sent by Ambrosius, his predecessor in the Pendragonship; but after he became Pendragon, all his exertions were devoted to stopping the progress of the Saxons in the south, led by the active and successful Cerdic. He was commander-in-chief at the battle of Llŷnborrh (literally the 'haven of ships,' supposed by Mr. Turner to be Portsmouth), on the authority of Llywarch Hen, a well-known Welch bard, who fought in that battle, and composed an elegy, still extant, on the death of his friend Geraint ap Erbin, who fell in it. He mentions elsewhere another battle, in which 'Arthur did not recede,' fought on the river Llawen. The next and the most important battle is that of Badon (placed by Whitaker at Badby in Wiltshire; by Camden and Turner at Bath; by Carte, in Berkshire), the twelfth battle in the list of Nennius, mentioned also by Gildas, Bede, and others, which checked the progress of Cerdic, and compelled him to content himself with those provinces along the south coast which he had already gained: from which Arthur is not recorded to have tried to expel him. The date of this is variously placed. Whitaker, following Matt. West., says 520, which a doubtful passage in Gildas seems to confirm. From this time we hear no more of Arthur, until the revolt of his nephew, Modred, or Medrod, which led to the fatal battle of Camlann in Cornwall, in 542. Modred was slain, and Arthur, mortally wounded, was conveyed by sea to Glastonbury, where he died and was buried. Tradition preserved the memory of the place of his interment within the abbey, as we are told by Geraldus Cambrensis, who was present when the grave was opened by command of Henry II., and saw the bones and sword of the monarch, and a leaden cross let into his tombstone, with the inscription in rude Roman letters, *He jacet sepultus incitus Rex Arturus, in insula Avalonia*, as seen by Leland, and copied from an attested copy by Camden. This story has been elegantly versified by Mr. Warton. A popular traditional belief was long entertained among the Britons that he was not dead, but had been carried off to be healed of his wounds in Fairy land, and that he would reappear to avenge his countrymen, and reinstate them in the sovereignty of Britain.

The Arthur of romance is a very different person. He is the son of Uther Pendragon by Igraine, wife of Gorlois, Duke of Cornwall, and owed his birth to a magical device by which Uther assumed the form of the lady's husband. He succeeded to his father when fifteen years old, and immediately prosecuted hostilities against the Saxons in the north of England. He defeated them on the banks of the river Douglas, which, according to Geoffrey, was near York, but Whitaker has placed it in Lancashire. (See his very ingenious sketch of this first campaign, vol. ii. chap. 2, sect. 1, 2.) He again defeated them under the walls of Lincoln, and compelled them to quit England and abandon their booty, as the price of their safety. Breaking this agreement, they sailed round the island, and landed at Totness in Devonshire. Arthur hastened by forced marches to punish this new aggression, and routed them with immense slaughter at the great battle of Mount Badon, in which he slew 170 men with his good sword Caliburn and his lance Ron. Again he hastened with all speed to Scotland, to relieve Dunbarton (Acluyd), besieged by the Scots and Picts. Having done this, and pursued those barbarians into the fastnesses of Loch Lomond, where he fitted out a fleet and obliged them to surrender, he returned southwards, kept his Christmas at York, and employed himself in destroying the Pagan temples of the Saxons, and restoring the Christian churches. The following summer he conquered Ireland and Iceland, and then returned to Britain, where he spent twelve years in peace. We need not dwell on his foreign conquests of Norway and Gaul, which occupied ten years more. He then returned to England, and held a great festival at Caerleon in Monmouthshire, where he was solemnly crowned, a multitude of tributary kings attending him. Not long after the Romans demanded tribute: on which he collected a mighty army, and passed into Gaul. There he defeated the Romans, and was preparing to cross the Alps, when he received intelligence of the revolt of Modred, who had allied himself with the Saxons, Scots, and Picts. Arthur gained two victories, one on the coast of Kent and one

near Winchester, and forced Modred to fly into Cornwall, where a third engagement, fatal to both, was fought on the river Camlan.

Such is the story told by Geoffrey of Monmouth, and much later by Buchanan (*Historia Scoticæ*), and adopted with all manner of additional fiction by the romancers. The reader will see how widely it differs from the particulars above related on earlier British authorities. Yet Geoffrey professed to draw his account from an Armorican or Breton original. Whether he indulged in these amplifications himself, or whether tradition had already so transformed the British hero, has been disputed: we think it clear, however, that Geoffrey is not entitled either to the credit or discredit of having invented the preposterous story which he has told. (See Ellis's *Specimens of Metrical Romances*, v. i. p. 85, &c.) It is remarkable, however, that in these Armorican tales, if such they are, we find more mention of the Picts, Scots, and Irish, than of the Saxons; more traces of Arthur's presence in the north than in the south of the island, though the southern districts may be supposed to have been most familiar to the Breton bards. So in the romances founded on those tales, *Merlin*, *Morte Arthur*, *Lancelot*, and others, the scene is more frequently laid in the north than the south; and York and Carlisle occur more frequently than Caerleon or Caer-gwent (Winchester). Cornwall, however, is a favourite country in romance, and this may point to an Armorican original. On the other hand, our British authorities, Taliessin, Gildas, Aneurin (Gildas and Aneurin, however, have been thought to be the same person), and Llywarch Hen, were all connected with the north of England; yet they are silent as to Arthur's exploits there, and only mention his resistance to the Saxons in the south. This inversion of what might have been expected has not, as far as we are aware, been noticed by any writer on this subject. There is an ancient collection of Welsh stories for children, called *Mabinogion*, which invests Arthur with certain mythological attributes of romance, which have led Mr. Owen, above quoted, into some very mystical speculations. The island abounds with memorials of the fame of Arthur, whether he be a real or imaginary person: we have Arthur's Seat; Arthur's Round Table, in more than one place; Arthur's Castle; the Welch call the constellation Lyra Arthur's Harp (*Tolyn Arthur*); and the Principality abounds in monuments of art or nature which bear his name. The industry of the topographer would soon multiply references.

For the genuine history of Arthur, see the *History of the Anglo-Saxons*, by Sharon Turner, and Whitaker's *History of Manchester*. The work of Geoffrey, and the early romances which relate to Arthur, will be found fully treated of in Warton's *History of English Poetry*, vol. i.; Ellis's *Specimens of Early English Metrical Romances*, and Dunlop's *History of Fiction*.

ARTHUR, DUKE OF BRETAGNE. [See JOHN.]

ARTHUR'S SEAT. [See EDINBURGH.]

ARTICHOKE. [See CYNARA.]

ARTICLE, the name given by modern grammarians to the two little adjectives *the* and *an* in the English language, and to words of like import in other modern languages, the former being called the definite, the latter the indefinite article. We do not attempt a more philosophical definition, because the separation of these words from the other adjectives of language, whether pronouns or not, appears to depend upon no very accurate principle; and the distribution of the parts of speech would perhaps not be the less philosophical, if the so called articles were restored to their proper place. The indefinite article *an* is only a corruption of the adjective *one*, or, as our ancestors wrote it, *one*; and *a* is a still more violent corruption of the same word. Thus in German *ein* is at once equivalent to our *one* and to *an*. In the same way the French *un*, Italian *uno*, Spanish *uno*, &c., are evidently derived from the Latin *unus*. On the other hand, the definite article will appear, on the slightest consideration, to be a corrupted demonstrative pronoun. The term article or ἄρθρον (a joint) was invented by the Greek grammarians, but as used by them it is only applied to the definite article, and also to what, by modern grammarians, is called emphatically the relative (who). Nor is there any inconsistency in applying the same term to these two notions, which will be found on examination to have a common origin. The element *to* (το) of the Greek language, corresponding in power to our word *this*, was employed perhaps originally to denote a physical object pointed out at the

time by some action of the body: secondly to an object mentioned just before, and thus mentally present both to speaker and hearer; or, lastly, to an object forthwith to be brought before the hearer's mind. In the last case we are likely to have a repetition of the defining particle, as: 'I gave you the book which you asked for,' or, what is equally good, except in rhythm, 'I gave you that book that you asked for.' It was from the contemplation of such a sentence as this that the Greeks considered the defining particles as performing the office of joints which connect the two propositions together; and to distinguish the one article from the other, that which precedes the noun (the) was called the *prepositive* article, and that which follows it, viz: the relative, the *postpositive* article. The qualifying terms are perhaps not very well chosen, but undoubtedly the term article is very expressive of these relative particles, which in all cases, or nearly so, do perform the duty of connecting two propositions together; and hence we ought not to be surprised that a large proportion of the conjunctions have their origin in the relatives or demonstratives. But the repetition of the defining, demonstrative, or relative particle is no way necessary. Whether we say 'I gave you that book' (pointing to it), or, 'You asked for a book that (or that book) I gave you,' or, lastly, 'I gave you that book you asked for,' the word *that* performs in all cases the same duty. The two ideas thus logically connected in the expression—'I gave you the book that or which you asked for,' are—'You asked for the book: I gave you the book.' It is only a luxury in language to vary the forms according to the mere place in a sentence that a word may occupy; and if, in the more polished forms of the Greek language, we find the demonstrative, the definite article, and the relative distinguished, yet they are all evidently derived from a common parent, *to*, and its dialectic varieties. In Homer, the article does not yet appear; in Herodotus, the same element performs at times all the three offices. As we descend chronologically we find the tragedians still confounding the diverging forms of the relative and article, and even in certain phrases, retained by the later writers, traces of the same confusion arising from a common origin were yet to be seen. Matthiæ in his *Grammar* has so fully acknowledged this triple power of the Greek pronoun, that he treats of the article under the three heads: 1. of the article; 2. of the article as a pronoun (he means a demonstrative pronoun); 3. of the article for the pronoun relative.

The Latin language had but an imperfect definite article in its pronouns *hic*, *ille*, *is*; but besides these we find the relative at times employed where the English idiom at least requires the demonstrative *this*; and what is called the conjunction *quod* (that), like the corresponding Greek *ὅτι*, or French *que*, has the form of a relative, and the meaning of a demonstrative. To trace the same analogy in the Teutonic languages, the German *der*, of which *de* only is radical, is at once demonstrative, relative, and definite article. So completely does the German agree with the Greek, that, when *der* throws off much of its demonstrative power to play the part of the mere article, a kind of doubled form, *dieser*, was adopted for the pure demonstrative, on the same principle of formation as *ὁτιος*, from *ὅς*, with the same meaning in Greek. And lastly, the English philologist will find the same threefold power among the derivatives from the English allied root *the*, viz. among the forms *this*, *that*, *then*, *thence* (compare the Latin *quoniam*), *there*, *thence*, *the*, &c. The form *that* is still retained, as was before observed, with the power of the relative: but in the older writers, *there*, *thence*, &c., were freely used where we now only employ *where*, *whence*, &c.

Horne Tooke, whose views of etymology were neither extensive nor accurate, has fancied that the English article *the* is the imperative of an Anglo-Saxon verb *dean*, *to take*. (*Divisions of Parley*, Taylor's edition, ii. 63.) We need not repeat that it is allied to the German *der*, or rather the Dutch *de*, for the *r* is merely the characteristic of a masculine nominative, to the Gothic *sa* or *tha*, and through these to the Greek element *to*, a form which actually occurs in the English *to-day* (ho die), and no etymology for the English article will be satisfactory which does not equally apply to all these languages. In the same way the definite articles of the modern languages derived from the Latin are all referable to the Latin demonstrative *ille*, *illa*, &c. [See RELATIVE, PRONOUN DEMONSTRATIVE.]

ARTICLES OF FAITH. [See CONFESSIONS.]

ARTICLES OF WAR. [See MUTINY ACT.]

ARTICULATA, or ARTICULATED ANIMALS, form the third great section of the animal kingdom, according to the arrangement of Cuvier. They are so called because the different portions of their body are composed of moveable pieces *articulated* to each other. They differ from molluscous animals in generally possessing a skeleton, and from vertebrated animals, by their skeleton being external, while that of the vertebrated is internal. Though presenting considerable diversity of character among themselves, they are generally provided with a skin, which is either soft (as in the leech), or horny and crustaceous (as in the crab and craw-fish). Certain families are destitute of feet, but the greater number are provided with these members, which, when present, are never fewer than six. The connexion of the joints of the members is so close as to permit only a very limited range of motion to each; which is, however, compensated by the greater number of pieces which constitute each member or limb.

The point in which there exists the greatest degree of accordance or resemblance among articulated animals, is the nervous system. Their brain is extremely small, and two nervous cords, surrounding the œsophagus, or gullet, and continued along the abdomen, unite here and there into knots, or ganglia: in some *crustacea* it is still more simple, consisting merely of two knots, one placed at the head, the other in the thorax, united by slender threads. The organs of sense are very imperfectly developed, and in some cases are altogether wanting, except the organ of sight. No organ of smell has yet been discovered, unless the *antennæ* of insects be considered such. The eye presents considerable diversity of structure, being sometimes one and single, or three united in a triangle; in other cases composed of a considerable number of little plates, or facettes (as in the fly), each of which receives a branch from the optic nerve.

The mouth is sometimes destitute of jaws, but when these are present, they are never one above the other, but always lateral; and frequently there exist several of these ranged in succession, the two anterior of which are termed *mandibles*.

The respiration is effected either by branchiæ, as in those which habitually live in water, such as the *crustacea*, or by tracheæ, *i. e.* by air tubes formed of three parts, one membrane internal and one membrane external, both of which are cellular; and a sort of cartilaginous elastic tube, rolled spirally, and placed between the two membranes. These tracheæ receive air by certain lateral openings termed *stigmata*. More rarely, there exist cellular cavities analogous to lungs.

The organs of the circulation vary very much. Sometimes there is a distinct heart, whence proceed blood-vessels, which differ in number in the different orders. (See *Recherches sur la Circulation dans les Crustacés*, par MM. Audouin et Edwards, quarto, Paris, 1827; also, *Annales des Sciences Naturelles*, 1827.) In other instances there is no distinct heart, and the vessels which carry on the circulation are not yet well ascertained: this is more particularly the case in those articulated animals which respire by tracheæ, and in which these organs seem in a certain degree to perform the functions of blood-vessels.

The *Articulata* have been divided by Cuvier into four classes: viz., 1. *Annelida*. 2. *Crustacea*. 3. *Arachnida*. 4. *Insecta*. Of these, the general characters have been given under the subject **ANATOMY (COMPARATIVE)**; and the orders, and necessary details, under the heads *ANNELIDA*, *ARACHNIDA*; to which we refer, as well as to *CRUSTACEA* and *INSECTA*.

ARTICULATION, the term by which anatomists express the union of the different bones of the skeleton. The junction of any two bones, however firmly or loosely connected, or in whatever mode the union may be effected, is designated by the name of articulation. Commonly two substances are employed as the media by which the connexion is established, namely, a firm and strong membranous tissue termed *ligament* [see **LIGAMENT**], which may be considered as the band by which the bones are tied together, and a peculiar substance termed *cartilage* or *gristle* [see **CARTILAGE**], which is often interposed between the surfaces of the bones to be united, and which, besides serving as the bond of union, accomplishes other purposes.

Of all the parts of the animal fabric, there is none in which mechanism is more clearly or beautifully shown than in

the connexions of the bones with each other, and more especially in the structure of joints. There is no part of the human body which deserves or which receives on the part of the intelligent surgeon more careful study. The manifold and serious injuries to which joints are exposed, such as the various modifications of dislocation and fracture, afford him an opportunity of exemplifying the inestimable value of his art, in the sure and speedy reparation of such injuries which it enables him to effect, and especially when viewed in contrast with the suffering and deformity which result from neglect or from want of skill.

The objects to be obtained in the economy by the union of the several bones of the body are various and even opposite, requiring almost every conceivable variety in the mode of their connexion. And such variety actually exists; but still these varieties admit of classification, and they may all be arranged under three heads, namely, those which form immovable, moveable, and mixed articulations.

1. One object to be accomplished by the union of bones is, to form a secure situation for tender and delicate structures. Accordingly the bones are often so disposed as to enclose cavities in which the organs that need protection are placed; such, for example, is the cavity of the head which encloses the delicate substance of the brain; the cavity of the spinal column, which encloses the no less delicate substance called the *spinal marrow*; and the cavities of the chest and abdomen, which enclose soft and tender organs, on the security of which life depends. Bones forming cavities of this class are generally so firmly united that they admit either of no motion whatever, or only of a very slight degree of it, the union being effected sometimes by the apposition of the surfaces of strong and flat bones; at other times by the formation of numerous prominences and depressions which mutually receive each other: examples of both these modes of union are found in the articulation of the bones of the head and face. The firmness of the union is sometimes increased by alternate indentations and projections, like the teeth of a saw, formed on the surfaces of bones, the surface of the one bone being precisely adapted to that of the other; by this mechanism the bones become firmly impacted, and deficiency in extent of contact is compensated by what may be truly called (and it is an admirable example) *dove-tailing*. *Suture* is the term given to this mode of union, and the bones of the cranium are nicely adjusted and firmly united to each other in this manner. At other times a ridge is formed in one bone which is received into a groove fissured in another. The bony part of the septum which divides the nostrils affords a specimen of this mode of union, while the teeth are secured in their sockets, that is, a conical surface is firmly impacted in a cavity, very much as a nail is fixed in a board.

2. The moveable articulations are those in which the bones are in contact, but not continuous with each other; such, for example, is the union of the arm with the shoulder, the forearm with the arm, the wrist with the hand, the lower jaw with the head, the head with the trunk, and so on. In these cases the articulating surfaces are mutually adapted to each other, in general one being convex and the other concave, and the bones are maintained in their situation by the firm and strong membranes termed *ligaments*. Sometimes the union is assisted by the muscles which surround the joint, as is strikingly exemplified in the shoulder-joint, in which the head of the humerus is kept in contact with the cavity which receives it, partly, without doubt, by ligamentous substance, but partly also by the surrounding muscles. This is proved by the effect of disease; for if by paralysis, or any other cause, the neighbouring muscles become very much weakened, dislocation of the joint readily takes place. Both the strength of the joint and the range of its motion depend mainly on the extent of its articulating surface, and on the arrangement of the ligamentous substance by which the bones are held in their situations. The extent of contact, and the strength and adjustment of the uniting band, are different in every different joint, the diversity being regulated in every case by the kind and degree of motion which it is intended that the joint should exercise.

3. The mixed form of articulation resembles the *immovable*, in having the bones connected by an intermediate substance (cartilage), and the *moveable* in admitting some degree of motion between the surfaces. The articulations between the several bones that form the spinal column afford examples of this mode of union. There are numerous modifications of these several kinds of articulation, which

are described with great minuteness in anatomical books, and most of which are distinguished by specific names.

ARTICULATION. [See VOICE.]

ARTILLERY, a word believed to be of French origin. *Ménage* derives it from the old word *artiller*, to fortify. Vossius (*De Vitis Sermontis*, lib. iii. cap. 1) says the ancient word, instead of Artilleria, was *Arctalia*, from *arcus*, a bow: the earliest military engines of this description having arisen out of improvements upon the bow and arrow. Artillery, in its most general signification, implies all kinds of missiles with the engines used in propelling them. Since the application of gunpowder to projectiles, it has chiefly been confined to large ordnance, or cannon, mortars, howitzers, &c., to which rockets are now to be added; and includes their ammunition and appurtenances.

It was long after the nations of the East had formed war into a science, that military engines, such as are comprised in the term artillery, were invented. The earliest were, in all probability, those for casting stones of prodigious weight. Of Uzziah (B.C. 1000), in 2 Chron. ch. xxvi. v. 15, it is said, 'And he made in Jerusalem engines, invented by cunning men, to be upon the towers and upon the bulwarks, to shoot arrows and great stones withal. And his name spread far abroad; for he was marvellously helped till he was strong.'

The names Balista, or Ballista, and Catapulta imply a Greek origin. The balista was for throwing stones, the catapulta for propelling darts and arrows. The invention of the latter of these instruments, or rather its re-invention, is ascribed by Pliny (lib. vii. 56) to the Syrians; but Diodorus (lib. xiv.) and Plutarch (*Apophth.* edit. Wyttenb. 4to, Oxf. i. 533) say they were contrived in Sicily, about the same time with the battering-ram, alluding to a period not more than 300 B.C. Alian (*Var. Hist.* vi. 12) ascribes the invention to Dionysius the Elder himself in Sicily. The balista is attributed by Pliny to the Phœnicians. Both instruments were unquestionably much used in the Roman times: they are mentioned in Cæsar, Cicero, Livy, Seneca, Tacitus, and other writers; and were employed in great numbers by Titus at the siege of Jerusalem. Two thousand machines for throwing darts and stones were surrendered to the Consul L. M. Censorinus when he marched against Carthage. (Appian, lib. viii. *De Rebus Punicis*, § 80.) Ammianus and Vegetius are both particular in describing the construction of the balista. Vegetius, who lived in the fourth century, under Valentinian, speaks of balista, onagri, scorpiões, areubalistæ, fustibuli, and fundæ, as engines of artillery (lib. iv. c. 22).

We have no evidence that machines of this description were known in England previous to the arrival of the Normans. According to the testimony of William of Poitou, machines of wood (exclusive of the cross-bow) were used for pouring forth showers of arrows even at the battle of Hastings; so early were they introduced in the Norman time. It is worthy of notice, that among the tenants *in capite* in the Domesday Survey, *balistarii* occur as well as *arcubalistarii*. Artillery, however, in the Norman period, was most frequently used in sea-fights, when not only stones and darts were discharged from the machines, but pots of Greek fire, quick-lime, and other combustible materials. Robert of Bruce (in Peter Langtoft's *Chronicle*), speaking of Richard I.'s wars against the Saracens, says, that in his barges and galleys he had mills, which were turned by the wind, and by force of the sails threw not only fire, but stones which were taken from the Rhine.

It would be tedious to enumerate all the arts and all the machines which were employed in the middle ages in assaulting and defending towns and castles. Indeed few sieges of great importance occurred without the invention of some new engine. Grose, in the preface to his *Antiquities of England and Wales*, has given the names and figures of a considerable number. Some of these were distinguished by the appellations balista, catapulta, espringal, trebuchet, mangona, mangonel, brieilla, petrari, matafunda, berfrey, and war-wolf. Père Daniel, also, mentions a machine called engine-a-virge, used by the English in France, as late as the reign of Charles VII. Of the vast force of these machines surprising stories are related in our chronicles. The engines used by Edward I. at the siege of Stirling Castle in 1303, according to Hemmingford, threw stones of 300 pounds weight.

This ancient artillery continued to be used in sieges for a considerable time, in some instances for two centuries,

after the invention of gunpowder and cannon. (See Père Daniel, *Histoire de la Milice Française*, tom. i. p. 319.) Greek fire continued also to be employed in war long after the introduction of fire-arms; particularly in the attack and defence of strong places: as at Ypres and Burburgh in France, in 1383. (Walsingh. edit. Camd. pp. 302, 303.)

The invention of gunpowder, however, by slow degrees brought about a total alteration in the art of war. Barbour, in his *Metrical Life of Robert Bruce*, tells us that cannon (which he calls 'crakys of war') were used by Edward III. in his first campaign against the Scots, A.D. 1327. Du Cange, in the article *Bombarda*, shows that the French used cannon at the siege of Puy Guillaume in 1338; and that Edward III. used them at the battle of Crecy, as well as at the siege of Calais in 1346, seems agreed. Four pieces planted on a little hill at the battle of Crecy did great execution among the French troops, and having been before unheard of in France, contributed as much by the surprise as the slaughter to the success of the day. (See Rapin, vol. i. p. 425.) By degrees, the use of cannon became more and more common. Petrarch, in his *Dialogues on the Remedies of Good and Bad Fortune*, written in 1358, describes cannon as no longer rare, or as viewed with astonishment and admiration.

Cannon, or, as they were then called, bombards, were the most ancient fire-arms. The first cannon were clumsy and ill-contrived, wider at the mouth than at the chamber, and so like a mortar, that Dr. Henry supposed the idea of them might have been suggested by that in which Schwartz, a chemist of the beginning of the fourteenth century, who is said by the Germans to have discovered gunpowder, pounded his materials. They were all made of iron, without any mixture of other metals; and consisted usually of bars or pieces of iron fitted together lengthways, and hooped with iron rings. Some of them were too long, and others of them too short. In a word, the art of making cannon was still imperfect.

Both gunpowder and cannon were made in England in the fourteenth century. This appears from a commission given to Sir Thomas Norwich by Richard II., A.D. 1378, to buy two great and two small cannon in London, or in any other place, and also to buy certain quantities of saltpetre, sulphur, and charcoal, for making gunpowder. (Rym. *Fœd.* tom. vii. p. 187.) From the same commission, as well as from other evidence, it appears that cannon-balls were at first made of stone: for the same person is therein commanded to purchase six hundred balls of stone, for cannon, and for other engines.

Beside great guns, which are still named cannon, a smaller kind of ordnance called *hand-cannon* came into use at this period. They were so small and light that one of them was carried by two men, and fired from a rest fixed in the ground. (Père Daniel, tom. i. lib. 6, p. 321.) The 400 cannon, or the greatest part of them, with which an English army besieged St. Malo, A.D. 1378, mentioned by Froissart (Lord Berners's *Transl.* chap. cccxxii.), must have been of this kind: though Dr. Henry conjectures that these hand-cannon were first brought into Britain by the Flemings who accompanied Edward IV. in his return to England, A.D. 1471. The Scots, he adds, had a kind of artillery at this period peculiar to themselves, called *carts of war*. They are thus described in an act of parliament, A.D. 1456. 'It is thocht speidfull, that the king mak request to certain of the great barrons of the land that are of ony myght, to mak carts of weir, and in ilk cart twa gunnis, and ilk ane to have twa chalmers, with the remanent of the graith that effeirs thereto, and an cunnand man to shute thame.' By another act, A.D. 1471, the prelates and barons are commanded to provide such carts of war against their old enemies the English. (Henry, *Hist. Brit.* from Black Acts, James II. act 52, James III. act 55.)

The instruments of artillery of the middle of the fifteenth century, though all called by the general name of cannon, were of very different kinds, shapes, and sizes; and distinguished from each other by particular names. The letters which Edward IV. addressed to different persons in 1481 for the resistance to invasion from Scotland speak of 'bombardos, canones, culverynes, fowlers, serpentynes, et alios canones quoscumque, ac pulveres sulphureos, saltpetre, petras, ferrum, plumbum, et omnimodas alias stufuras pro eisdem canonibus necessarias et oportunas.' (Rym. *Fœd.* tom. xii. p. 140.)

A French translation of *Quintus Curtius* by Vasqua de Lucene, a Portuguese, written in 1468, preserved in the

British Museum, and which formerly belonged to Philip de Cluys, a Knight and Commander of the order of St. John of Jerusalem, has one or two early representations of the larger sort of cannon, which are here exhibited.

Monstrelet illustrates the clumsy form as well as the clumsy management of ancient cannon. Under the year 1459 he says, 'while King James (of Scotland) was observing the effect of his artillery (at the siege of Roxburgh Castle), one of the rudely-contrived cannons of that age, consisting of bars of iron, girded with circles of metal, suddenly burst: a fragment struck his thigh, and the great effusion of blood produced a death almost instantaneous. The Earl of Angus, who stood next to James, was wounded.' Under 1478 he says, 'a great bombard, that had been cast at Tours, was brought to Paris the Monday before Epiphany to be proved, and was for this purpose drawn out into the fields in front of the bastille of St. Anthony. It was pointed towards Charenton, and when first fired threw the ball as far as the gallows on the bridge of Charenton; but as those present did not think it had discharged all the powder that had been put into the chamber, they ordered it to be re-charged and the chamber perfectly cleaned of all that remained within it, which was done, and an iron ball, weighing five hundred weight, put into its mouth, before which stood John Maugué, the founder of it. As the ball rolled down the bombard, by some unknown accident the powder in the chamber took fire before the match was put to it, and by its discharge tore in pieces John Maugué and fourteen other persons, whose heads, legs, arms and bodies were blown into the air. The ball killed a poor innocent bird-catcher that was attending his nets in the fields, and the bursting of the bombard

mained fifteen or sixteen others, several of whom died; so that by this accident twenty two or twenty-three persons lost their lives. The remains of John Maugué were collected, put on a bier, and carried to St. Merry for interment; and proclamation was made through the streets of Paris that all people should pray for the soul of John Maugué, who had lost his life in the king's service.' (*Johnes's Monstrelet*, 4to., vol. iv. p. 402-403.) In 1477, when Louis XI. made his attack upon different towns of Flanders and Picardy, he ordered bombards of prodigious length and weight to be cast at Paris, Tours, Orleans and Amiens. His iron bullets were cast at the foundries at Creil, and his stone bullets made at the same time in the quarries near to Peronne.

From one or two of the preceding passages, it will be observed that the ancient method of constructing cannon had been changed about the middle of the fifteenth century for that of casting. Père Daniel (*Hist. de Milice Franc.* i. 150) tells us, that about the close of that period a hard and mixed metal was invented for this purpose, called *font-metal*, or *bronze*. Cannon, it should seem, were now cast in one solid piece.

It is probably this same metal that Stowe alludes to in a passage of his Annals. He says, 'this year, 1535, John Owen began to make brass ordnance, as cannons, culverines, and such like. He was the first Englishman, that ever made that kind of artillery in England; his issue of his name and the name of Pitt have continued unto the days of King James most ready and exquisite gun makers for the general service of the kingdom.' A beautiful specimen of this sort of ordnance, cast at Utrecht in 1541, and presented by the States of Holland to Queen Elizabeth, is still preserved at Dover Castle. Other specimens, both English and foreign, a little later in period, may be seen at the Tower of London and in the Royal Arsenal at Woolwich, as well as in many of the foreign arsenals. The sizes of cannon, generally speaking, in the sixteenth century, were considerably diminished, and forms of greater elegance were given to their exterior.

Robert Borthwick, an artist in the service of King James IV. of Scotland, had attempted the establishment of a foundry at Edinburgh a short time previously. Some of his guns, which remained in Lesly's time, had this inscription: 'Machina sum Scoto Borthuik fabricata Roberto.'

The largest cast cannon now existing is a brass one at Bejapoor, called Malick 6 Meidān, 'the lord of the plain;' it was cast in commemoration of the capture of that place by the Emperor Akbar, in 1685. Its extreme length is 14 feet 1 inch; the diameter of its bore 2 feet 4 inches. An iron shot for this gun of proper size would weigh 1600 pounds.

For Mortars we are indebted to workmen who were employed by Henry VIII., and for cast iron ordnance to the reign of Edward VI. Under the year 1543, Stowe says, 'King Henry, minding wars with France, made great preparation and provision, as well of munitions and artillery, as also of brass ordnances, amongst which, at that time, by one Peter Bawd, a Frenchman born, a gun-founder, or maker of great ordnance, and one other alien, called Peter Van Collen, a gunsmith, both the king's feed men, who conferring together, devised and caused to be made certain mortar-pieces, being at the mouth from eleven inches to nineteen inches wide; for the use whereof the said Peter and Peter caused to be made certain hollow shot of cast-iron, to be stuffed with fire-work or wild-fire, whereof the bigger sort for the same had screws of iron to receive a match to carry fire kindled, that the fire-work might be set on fire, for to break in small pieces the same hollow shot, whereof the smallest piece hitting any man would kill or spoil him. And after the king's return from Boulogne, the said Peter Bawd by himself, in the first of Edward the Sixth, did also make certain ordnance of cast iron, of divers sorts and forms, as fawconet, fawcons, munnions, sakers, and other pieces. Unto this Bawd, John Johnson, his covenant servant, surviving his master, did likewise make and cast iron ordnance cleaner and to better perfection, to the great use of this land. His son Thomas Johnson is yet living, a special workman. In the year 1595 he made forty-two cast pieces of great ordnance of iron for the Earl of Cumberland, demy cannons, weighing 6000, or three ton the piece.' (*Annals*, edit. 1631, p. 584.)

It appears from Sir William Monson's *Naval Tracts*, that the *Falcon* was a species of ordnance of two inches and a

half bore; weight of shot two pounds: that the *Demi-Culverin* was another kind, of four inches bore; weight of the shot nine pounds and a half: and that the *Mynion* was another of three inches and a half bore; weight of the shot four pounds. The *Culverin* was a species of ordnance of five inches and a half bore; weight of the shot seventeen pounds and a half. The *Fowler* is not described by Monson, but is mentioned by Lodge in his *Illustrations of British History*, vol. i. p. 4, as in use in the time of James I. The *Sacar* or *Saker*, according to Monson, was a piece of ordnance of three inches and a half bore; weight of shot five pounds and a half.

The invention of *Petards* is due to the French civil wars. They were first used by the Huguenots in 1580, at the siege of Cahors in Quercy. (Du Thou, tom. viii. p. 376.) Montelimar and Embrun in Dauphiné were taken by Lesdigéres in 1585, principally by means of petards. (*Ibid.* tom. ix. pp. 404, 405.) According to Père Daniel (cited in *L'Art de Vérifier les Dates*, tom. i. p. 655), red-hot balls, revived in 1782 at Gibraltar, were used by Marshal Matignon during the siege of La Fère in 1580. But we learn from Elmhams's *Life of Hen. V.*, p. 155, that they had an earlier origin. He says, that when an English army, commanded by the Duke of Gloucester, besieged Cherbourg in 1418, the besieged discharged red-hot balls of iron from their cannon ('massas ferreas rotundas, igneis candentes fervoribus a saxivomorum faucibus studuerunt emittere') into the English camp, to burn the huts in which the soldiers were lodged.

The *Howitzer*, an improvement upon the mortar, is said to have been invented by Belidor, and was first used at the siege of Ath in 1697. The *Carrouade*, a sort of short cannon, or rather long howitzer, was invented by General Robert Melville, about the year 1779.

Iron Rockets of different sizes, varying in weight from sixteen to more than forty pounds, were invented during the last war by Sir William Congreve, and are now called Congreve Rockets. They were first used at the bombardment of Copenhagen, afterwards against the Boulogne flotilla, then at Flushing, and subsequently at the battle of Leipzig. A rocket establishment now forms a regular branch of the British military service.

Besides the different works already quoted, Grose's *History of the Army of England*; Glorie's *History of Gunnery*; Henry's *History of Britain in the different Periods*; and Wrexall's *History of France*, have been consulted for the present article.

Among ancient engines of artillery the *Battering-ram* has been usually included, though it certainly is not embraced in the ordinary or in any other definition of that word. Pliny, whose authority in such a matter is small, says it was invented at the siege of Troy: but Homer makes no mention of it. The first notice of this engine is probably in Ezekiel, where the prophet speaks of a feigned siege of Jerusalem as a sign for the Jews, ch. iv. v. 2: 'set battering-rams against it round about;' and again, ch. xxi. v. 22, 'appoint battering-rams against the gate.' Ezekiel lived about 590 years B.C. The next mention of the battering-ram is in the Peloponnesian war, B.C. 429 (Thucyd. ii. 76): and we are certain that it was used a century afterwards at the siege of Motya by Dionysius the Elder. The ram was sometimes used, but not commonly, in the middle ages. (For the present mode of making Cannon see that article, and for the mode of using them see GUNNERY.)

ARTOCARPEÆ (or the Bread-fruit Tribe), a natural order of plants, nearly related to *Urticæ* (the Nettle Tribe), from which it is so difficult to separate them by any precise character, that there are many who consider them nothing more than a section of *Urticæ*. This opinion has been adopted by Dr. Lindley in his *Nixus Plantarum*.

Whether a distinct order, or a section only of *Urticæ*, the group of *Artocarpeæ* is known by its having flowers with a very imperfectly formed calyx, no corolla, leaves with conspicuous stipules, a rough foliage, and an acrid milky juice, which often contains caoutchouc in abundance; the flowers are collected into round heads, and the ovules are suspended singly from the upper part of the solitary cavity of the ovarium. They are thus distinguished from true *Urticæ* by the position of their ovules, the manner in which their flowers are arranged, and by their yielding a milky juice; the juice of *Urticæ* is watery.

The species are all found in the warmer parts of the

world, and many of them are natives of the tropics only. Their milk, which is always acrid, renders some of them intensely poisonous, as the Upas tree of Java, and certain Indian species of fig; nevertheless, if the milk is naturally absent from any particular part of an *Artocarpeous* plant, that part becomes eatable and even wholesome. Thus the fruit of the cultivated fig, up to a short period before its maturity, remains milky, and at that time it would prove exceedingly unwholesome, but when ripe the milk disappears, is replaced by sugar, and the fruit becomes, as we all know, extremely wholesome. The same explanation is probably applicable to the case of the bread-fruit, which forms an article of food with the South Sea islanders.

With those writers who are too little acquainted with botany to understand the philosophical views which prevail at the present day, it is a favourite argument against the natural relations of plants being really represented by what are called natural orders, that the nettle and the fig are both arranged in the same order; and such persons appeal to what they call common sense, whether any relationship between a fig and a nettle can be seriously believed to exist in nature. If, however, they were capable of investigating the matter carefully, they would find that in structure of stem, leaves, stipules, calyx, stamens, and fruit, these two plants are so like each other, that it is impossible to discover more than one solitary essential character, namely, that of the position of the young seeds, by which they can be distinguished: and that the differences which meet the unpractised eye are entirely connected with the size and manner in which the flowers are arranged: we shall easily show this to be so. The nettle, that is to say, the wild English nettle, is an herb, the fig is a tree; but many species of the genus *Urtica*, of which the common nettle is one, are trees also; consequently, in an extended point of view, the nettle and the fig are not essentially distinct in regard to their general habit. But if it were otherwise, the nettle would not be the less allied to the fig; for a tree is nothing but an herb which continues to grow many years; and longevity does not interfere in any degree with relationship. This disposes of the distinction which consists in size. Next, as to the manner in which the flowers are arranged. In the nettle the flowers are disposed in loose branched clusters; in the fig they are collected within a fleshy receptacle, which is so much contracted to a point as to form a hollow case. These are extremes of structural difference in regard to arrangement; but intermediate forms of arrangement occur which reduce these differences to nothing. It is true that in the common nettle the flowers are disposed in loose branched clusters; but in the *Rouan* nettle (*Urtica pulchra*) they are collected into round heads; a loose arrangement of the flowers is, consequently, not a character of even the nettle itself. In the genus *Procris*, which is closely related to the nettles, the flowers are also collected into heads, and, in addition, the part which bears the flowers is pulpy. Here is one step towards the formation of the receptacle of a fig. In the genus *Dorstenia*, the part which bears the flowers is also fleshy, but so much extended horizontally as to form a sort of saucer, the edges of which are curved inwards. This brings us so exceedingly near the receptacle of the fig, that if the edges of the saucer-shaped receptacle of *Dorstenia* were only curved inwards till they met, its *apparent* fruit would actually be a fig: we say *apparent*, because, however strange it may seem to make such an assertion, there is, in fact, very little difference between the true fruit of the nettle and the fig; in both it consists of minute lenticular grains, each containing a single seed; but in the nettle it lies among the dry chaff of the calyx and bracts, while in the fig it is buried among the flesh of the receptacle and succulent calyxes.

The essential differences between a nettle and a fig are thus demonstrated to be much more apparent than real. We do not usually enter so much into arguments touching speculative opinions as we have on this occasion; but the objection, which we have thought it worth answering, is a popular one, which it appears desirable to set at rest in a popular work.

ARTOCARPUS, or the Bread-fruit, is the genus which has given its name to the preceding natural order. It consists of trees having stems of very considerable size, large leaves, which are exceedingly rough with little points; stipules like those of the fig, and monœcious flowers, of which the stamen-bearing ones are disposed in long club-shaped spikes (fig. A 3), and the pistil-bearing ones in round heads

(fig. A 2), which become the fruit and often arrive at a very considerable size (fig. A 4.)

A Bread-fruit is a fig turned inside out, and much larger in all its parts; that is to say, the flowers which form the Bread-fruit and fig grow, in both cases, upon a fleshy receptacle; but in the former the receptacle is solid and bears its flowers externally, while in the latter it is hollow and bears its flowers internally.

The stamen-bearing flowers of *Artocarpus* (fig. B, C) consist of a tubular calyx containing a single stamen; the pistil-bearing flowers (fig. D), consist of two or three fleshy sepals grown closely together and meeting at the points, between which passes a long slender style with two stigmas, which are hairy and curved downwards. The ovary is simple, and contains but one ovule. At a very early period their flowers grow firmly together into a solid fleshy mass, which finally becomes the fruit. The seeds are large nut-like bodies, which lie beneath the rind of the fruit.

Many species are known, some of which, as *Artocarpus Chaplasha* and *hirsuta*, are large trees, and yield valuable timber in the forests of Bengal and Malabar. The only two, however, we propose to notice here are the Bread-fruit and the Jack.

but it must be eaten new, or it becomes hard and choky. Others compare the flavour to that of a roasted potato; what we have tasted has been in thin slices which had been thoroughly dried, and it was very like a piece of dried biscuit. In Anson's voyages it is said to be delicious when ripe, and, when mixed with lime or orange juice, to have a grateful tart flavour, not unlike apple-sauce.

It forms so important a part of the support of the South-Sea islanders that it was introduced by the British Government into the West Indies, where it is still cultivated, and whence it has been carried to the continent of America. It does not appear, however, equal to the Plantain as an article of human food.

The Jack (*Artocarpus integrifolia*) is also a native of the islands of the Indian Archipelago, and is in its general appearance like the Bread-fruit, but its leaves are totally destitute of all laceration, and its fruit, which is very prickly, weighs 60 or 70 lb. This latter is yellow, and constitutes the principal part of the diet of the natives in some parts of India; but it is said to have an offensive odour, and to be little esteemed by Europeans: all, however, concur in attesting the excellence of the nuts when roasted.

Like all other Artocarpeous plants, this exudes a great quantity of a viscid milky juice, from which the best bird-lime of India is prepared. See the 2d volume of the new series of the *Botanical Magazine* for an excellent account of both the Jack and the Bread fruit, illustrated by figures, by Dr. Hooker.

ARTOIS, a former province of France, now comprehended in the department of Pas-de-Calais. While the old divisions of France existed, Artois was bounded on the N.E. by French Flanders, on the E. by French Hainault and by Cambresis, and on all other sides by Picardie. Former authorities give its length as twenty-five leagues, or sixty-nine miles, and its breadth as about half that distance; but, measured on the *Map of France in Provinces*, published by the Society for diffusing Useful Knowledge, it is eighty miles long N.W. and S.E., and forty broad.

Artois is a flat country. The line of greatest elevation, as determined by the course of the waters, is from S.E. to N.W. On one side of this line, the Aas, and the Scarpe and Sensée (two tributaries of the Scheldt), flow to the N.E.; and on the other side the Canche and Authie flow, parallel to each other, into the English Channel. The soil is admirably suited for grain, in which it is very productive; but fruit trees do not succeed. Wood is scarce, and is used as fuel only by persons in easy circumstances. The poor burn coal or peat. The population, as given in the *Encyclop. Methodique*, Paris, 1782, was 300,000. That of the department of Pas de Calais, which comprehends Artois and a small part of Picardie, was, in 1826, 613,000.

The capital was Arras, and among the other chief towns were St. Omer, Bethune, Aire, St. Pol, Lens, and Bapaume. [For which see the articles AIRE, ARRAS, BETHUNE, OMER, ST., PAS DE CALAIS, and POL, ST.]

Artois takes its name from the people who formerly inhabited it, the Atrebatæ (from whose designation, also, the capital was called Arras): although the limits of this tribe were hardly so extensive as those of the modern province. It was one of the early acquisitions of the Franks; in whose time the name Atrebatæ, applied to the city Arras, was corrupted into Adertæ or Adratæ, and the province seems to have got the name of Pagus Adertisus. Charles the Bald gave it, in 863, as a dowry with his daughter Judith to Baldwin, Count of Flanders, surnamed *Bras de Fer*, or the iron arm. It reverted to the crown on the marriage of Philip Augustus with Isabel of Hainault in 1180. In 1236 it was made a county by Louis IX. (St. Louis), in favour of his brother Robert. After coming to the house of Burgundy, and forming part of the dominions of those powerful princes, it was seized by Louis XI. of France. Charles VIII., son of Louis, ceded it to the Emperor Maximilian, reserving however the feudal sovereignty; and it remained in the house of Austria till 1659, when it was yielded by Spain (for it had gone with the Spanish branch of that race) to France, with which it has been united ever since.

The ex-King of France, Charles X., was known in the early part of his life by the title of Count d'Artois. (*Ency. Methodique*; *Diction. de Martinière*, &c.)

Previous to the revolution, Artois appears to have enjoyed several privileges and immunities. It had its council for the management of civil affairs, consisting of three constituent bodies, the clergy, the nobility, and the commons

[*Artocarpus incisa*]

A, a shoot very much less than the natural size with stamen-bearing flowers 3; pistil-bearing flowers 2; fruit 4; and its stipules 1; B, a stamen-bearing flower; C, the same opened; D, three pistil-bearing flowers, showing the ovaries; E, a portion of the fruit showing the seeds.

The Bread-fruit (*Artocarpus incisa*) is a native of the South Sea islands, and of many parts of the Indian Archipelago; it inhabits only such places as are both hot and damp; Dr. Roxburgh complains that the winters of Bengal are much too cold for it. It there forms a moderate-sized tree, rarely exceeding forty feet in height, with leaves deeply divided into sharp lobes, and sometimes as much as three feet long. The fruit is green and of considerable size, equalling a melon of the larger kind in dimensions, and is of many different forms: one variety produces it free from all spines on the surface or from seeds internally; this is the best sort: others are split into deep lobes, or covered all over with the sharp-pointed fleshy tips of the calyxes. The nuts, when roasted, are said to be as excellent as the best chestnuts; but it is principally for the fleshy receptacle that it is valued. When roasted it becomes soft, tender, and white, resembling the crumb of a loaf;

tiers état). This council seems to have regulated the levying of the taxes which were imposed by the king, and to have granted exemptions in cases where the pressure was very heavy.

ARTOTYRITES. [See **HERETICS.**]

ARTS, DEGREES IN. Dr. Brett, in a Dissertation on Degrees in the Universities, published in 1722, in the first Number of the *Bibliotheca Literaria*, states his belief that degrees, such as are now given in our universities, originated with the incorporation of those bodies in the eleventh and twelfth centuries. Previous to this period, the distinctions were for the most part of masters and scholars only, as in our grammar-schools of the present day.

The term *master* is believed to be the oldest among those of graduation. Eugenius II. by the 34th canon of a council held at Rome in 826, mentions the appointment of magistri and doctores in the same sentence: "ut magistri et doctores constituantur, qui studia literarum, liberaliumque artium, ac sancta habentes dogmata assidue doceant" (that masters and doctors be appointed who may continually teach the knowledge of learning and the liberal arts, and the received opinions in religion). This was confirmed by a decree of Leo IV. in another synod at Rome, in 853. (Muratori, *Antiq. Ital.* tom. iii. col. 830.)

Du Pin (*Nouvelle Bibliothèque des Auteurs Ecclesiastiques*, 1to. Paris, 1790, tom. x., p. 171) is of the same opinion with Dr. Brett. He states that the academies or universities which were originally established, were in the thirteenth century reduced to form. That of Paris, which had begun to be formed in the preceding century, had grown famous from the number of its scholars, and for the masters with which it furnished all Europe. In its origin, he adds, it was composed of *artists*, who taught the sciences and philosophy; and of *Dynnes*, who made commentaries on Peter Lombard's *Book of Sentences*, and explained the Holy Scriptures. Mention of these two faculties only occurs in the constitutions made for the university by the Cardinal di S. Stefano, legate of Pope Innocent III., in 1215. The whole number of arts was originally seven, and these were distributed into the *trivium*, comprehending grammar, logic, rhetoric; and all the *quadrivium*, comprehending music, arithmetic, geometry, astronomy. *Artidoctor* and *artista* are ancient names for masters of arts, mentioned by Du Cange.

Gregory IX., whose pontificate continued from 1227 to 1241, is said first to have instituted the inferior rank of *bachelors*; whose name was derived from *bacilla* (little staves), either because they were admitted by receiving a little wand, or because as following the title adopted for the novices of the soldiery, who exercised with sticks, in order to learn to fight with arms. The bachelors were exercised in disputations, of which the masters were the moderators. Much upon the etymology of the names of bachelor and master may be seen in Baumeister's *Antiquitates Rostochienses*, in the third volume of the *Monumenta Inedita Rerum Germanicarum*, fol. Lips. 1743, col. 953. The honours conferred upon learned men, in the form of these degrees, greatly increased the number of scholars in all the universities of Europe.

From several passages in Wood's *History and Antiquities of the University of Oxford*, there can be little doubt but that the degrees both of bachelor and master of arts were conferred there in the time of Henry III. and the degree of master of arts probably much earlier. The *Luces* are said to have come into the university in 1149. (Gutch's edit. of Wood, vol. i. p. 52.)

Wood, quoting the commentaries of one Whetley upon Boethius, written in the time of Edward the First, says, "When the said bachelor was created master, the chancellor gave him the badges with very great solemnity, and admitted him into the fraternity with a kiss on his left cheek, using these words, 'En tibi insignia honoris tui, en librum, en cucullum, en pileum, en demque amoris mei pignus, osculum: in nomine Patris, et Filii, et Spiritus Sancti.'" (Ibid., p. 59.)

The examination for the degree of B.A. (bachelor of arts) in *Oxford* at present consists—

I. In a public examination called *responsions*, that is, the answering of questions publicly proposed by the masters of the schools. This exercise consists of an examination in the Greek and Latin languages (chiefly with a view to their grammatical construction), in the rudiments of logic, or a portion of Euclid's *Elements of Geometry*.

This examination is undergone by those students who have been matriculated not less than six, and not more than nine terms: it is a kind of preliminary examination, which, in the opinion of some persons, would be more appropriate if enforced at the time of the student's admission into the university.

II. In a *final examination*, comprising—1. The rudiments of religion, under which head is required a competent knowledge of the gospels in the original Greek—of the history of the Old and New Testament—of the thirty-nine articles of the Church of England—and of the evidences of religion natural and revealed. 2. The *Literæ Humaniores*, under which head is comprised a sufficient acquaintance with the Greek and Latin languages and ancient history—with rhetoric and poetry—with moral and political science, as derived from the ancient Greek and Roman writers, and illustrated, if need be, from modern authors; with logic (which is indispensably required from all candidates for the first, second, or third classes), and with the art of composition. 3. The elements of the mathematical sciences and of physic.

With regard to the examination in some parts of the *Literæ Humaniores*, and in the elements of the mathematical sciences, and of physics, the examiners have a discretionary power. No knowledge of mathematics or of physical science is indispensable; and a man may obtain the highest honours and still be totally ignorant of these branches of learning. They are however bound to examine all candidates in at least three Greek and Latin classical writers, in logic, or the first four books of Euclid, and to ascertain their proficiency in translating from the English into the Latin language. With respect to the rudiments of religion, they possess no discretionary power; and any failure in this part of the examination must preclude the candidate from his degree, without any regard to his other attainments.

After the candidates have been examined, the names of those who have honourably distinguished themselves by passing a good examination in a wider range than that necessary for the mere degree, are distributed, in alphabetical order, into four classes, together with the names of their colleges, under the two divisions of *Literæ Humaniores* and *Disciplina Mathematicæ et Physicæ*. A fifth class gives the *number*, without mentioning the names of those who, having obtained their *testimonium*, are not deemed worthy of any honourable distinction. Printed copies of the schedule containing these classes are sent to the chancellor, to the vice-chancellor, to the heads of houses, to the proctors, and to the refectory and common room of each college and hall.

In *Cambridge*, those who proceed to the degree of B.A. also undergo a previous examination (known in ordinary conversation by the name of the *little go*), in the second year of their undergraduate course, the subjects of which are, one of the four Gospels or the Acts of the Apostles, in the original Greek; Paley's *Evidences of Christianity*; and one of the Greek, and one of the Latin classics, or a part of such books.

The next step is termed the keeping of an act, under a moderator. [See **ACT.**]

The *Senate-House Examination*, which follows in the fourth year, is conducted under other regulations. This examination is now extended to eight days.

The examination of those who contend for *Honors* is conducted according to regulations confirmed by a grace of the senate, April 6th, 1832, and which were brought into use in January, 1833. It consists in five days of examination in mathematics, commencing on the Thursday preceding the first Monday in Lent Term; the time of examination each day being five hours and a half, and the candidates being arranged in four classes, determined by the public exercises in the schools, and sometimes by the report of their college tutors. [See **ACT.**] The examination on the first day extends only to such parts of pure mathematics and natural philosophy, as do not require the methods of the *differential calculus*. On the second and third days, the questions from books include, in addition to the above subjects, the parts of natural philosophy somewhat more advanced, and the simpler applications of the *calculus*. The fourth day the examination extends to subjects of greater difficulty, care however being taken that there be some questions suitable for the lower classes. On the fifth day the classes are arranged for examination according to a settled plan, when the questions proposed to all the classes

are fixed upon by the moderators and examiners in common: but the duty of examining the answers to the questions is apportioned amongst the moderators and examiners as the plan directs. The result of the examination is published in the senate-house on the morning of the following Friday, at eight o'clock, when the names of all those who have obtained honours are arranged in *brackets*, as it is termed, the first bracket of course containing the names of those who occupy the highest place. If more than one name is in a bracket, which is nearly always the case, the places of such candidates are finally determined by a fresh examination on that day.

The examination of the other candidates for degrees, viz., the fifth and sixth classes who are *not candidates for honours*, takes place according to another plan, confirmed by grace of the senate, May 21, 1828.

Of the six examiners of these candidates, two confine themselves to the mathematical subjects; two to Homer and Virgil; and two to Paley's *Evidences*, Paley's *Moral Philosophy*, and Locke's *Essay on the Human Understanding*.

The examination is conducted entirely by printed papers. Each of the Euclid papers contains twelve propositions, selected from the first four books, with additional questions in the fifth, sixth, and eleventh books, and in trigonometry, at the discretion of the examiners. Each paper in arithmetic and algebra consists of questions entirely elementary: to which are annexed questions in the elementary parts of natural philosophy, at the discretion of the examiners. The papers in Homer and Virgil consist of passages to be translated, which may be accompanied with such plain questions in grammar, history, and geography, as arise immediately out of those passages. The examiners are strictly enjoined to take care that the number of questions to be answered, and the length of the passages to be translated, in any one paper, do not exceed what a person well prepared may be expected to answer and translate in the time allowed.

Upon the completion of the examinations both of those who contend for honours and of the others, a select number, thirty at least, of those who have most distinguished themselves in the first four classes, are recommended to the proctors for their approbation, and their names are set down according to merit, and classed in three divisions, viz., wranglers, senior optimes, and junior optimes, which constitute the three orders of honour: the fifth and sixth classes are also arranged numerically according to merit, but are not published in the Calendar. The candidates, having separately taken the oaths of allegiance and supremacy, and to observe the statutes of the university, and having also subscribed that they are *bona fide* members of the Church of England, are admitted to their degrees.

In addition to the examination thus described, an examination in classical learning of such persons as shall voluntarily offer themselves to be examined, follows on the fourth Monday after the general admission to the bachelor's degree. This continues four days. Translations are required of passages selected from the best Greek and Latin authors, as well as written answers to questions arising out of such passages; together with other exercises, but no original composition. The names of those bachelors who pass this examination with credit are arranged in three classes according to their respective merits.

Sixteen terms are required for the degree of bachelor of arts in *Oxford* from all except the sons, and eldest sons of the eldest sons of English, Scotch, and Irish peers, and of peeresses in their own right, as well as baronets, and the eldest sons of baronets and knights, when matriculated as such, and not on the foundation of any college: all such persons are allowed to be candidates for the degree after having completed three years. But of these sixteen terms, the day of matriculation, if it be in term, counts for one, and the day of admission to a bachelor's degree for another, and two more are dispensed with by congregation: so that, in point of fact, residence for twelve terms only is necessary.

In *Cambridge*, a bachelor of arts must also reside the greater part of twelve several terms, the first and last excepted.

In both Universities, the degree of M.A. is conferred without further examination. In *Oxford*, twelve terms are computed before the bachelor can be admitted M.A., though he is required to be actually resident for one term only. In *Cambridge*, a master of arts must be a bachelor of three

years' standing, reckoned from the second Tripos Day following his admission to the bachelor's degree.

Bachelors of arts in both Universities, though graduates, are considered to be *in statu pupillari*, that is, they are still under nearly the same discipline and control as the under-graduates, except attendance on college lectures. The legislative bodies of the Universities consist of those who are masters of arts or who have taken a higher degree.

Masters of arts, in both Universities, wear a gown of Prince's stuff, with a semicircular cut at the bottom of the sleeves. The Oxford hood, for a master, is of black silk lined with crimson. At Cambridge, if the master is a non-regent, he wears a silk hood entirely black: if regent, it is black lined with white.

The Bachelors of both Universities wear black gowns of Prince's stuff: that of Oxford is with a full sleeve, looped up at the elbow, and terminating in a point. At Oxford, the bachelor's hood is edged with fur: at Cambridge, it is lined with lamb's wool. Representations of the dresses may be seen in Aekermann's *Hist. of the Univ. of Oxford*, 4to. Lond. 1811, vol. ii. p. 261; *Hist. of Camb.* 4to. Lond. 1813, vol. ii. p. 310.

For further information on the education of Oxford and Cambridge, particularly with reference to the degree of B.A., the fees, &c., see *Journal of Education*, Nos. I. III. IV. VIII. X. XIII. XV.; on that of Dublin, Nos. XI. XII.; and on the Scotch Universities, Nos. VII. VIII. IX.; and also the Oxford, Cambridge, and Dublin *Calendars*.

ARTS, FINE. The fine arts are generally understood to comprehend those productions of human genius and skill which are more or less addressed to the sentiment of taste. They were first employed in embellishing objects of mere utility, but their highest office is to meet our impressions of beauty or sublimity, however acquired, by imitative or adequate representation. The capacity of the human mind for receiving such impressions, whether directly from nature or through the medium of the arts, depends greatly on civilization, and that leisure which supposes that first wants are satisfied; but there exists no state of society, however ignorant, in which some symptoms of taste and some attempts to arrest the beautiful are not to be met with: the difference between such efforts and the most refined productions is a difference only in degree; the fact of the existence of the arts in some form may be always taken for granted, and it would only remain to regulate their influence and direct their capabilities aright.

The arts are peculiarly interesting as human creations. They are composed of nature operating on human sympathies, and reflected through a human medium; and as nations, like individuals, present ever-varying modifications, so the free growth of the fine arts partakes of all these varieties, and may be compared to the bloom of a plant, true to its developing causes whatever they may be, and nurtured in the first instance by the soil from which it springs. In barbarous or degenerate nations, the sentiment of the beautiful has ever been attained only in the lowest degree, while a false excitement, founded on the suppression of the feelings of nature, may be said to have usurped the place of the sublime. We smile at the simple attempt of the savage to excite admiration by the gaudiness of his attire; but we should shudder to contemplate the scenes which his fortitude or obduracy can invest with the attributes of sublimity. The just value of life, the characteristic of that civilization which reduces the defensive passions to their due limits, at the same time naturally elevates the sources of gratification by pointing out the pleasures of the mind as distinguished from those of sense; and the perception of the beautiful is in its turn the cause, as it is in some degree the result, of the rational enjoyment of life.

The great use of the arts is thus to humanize and refine, to purify enjoyment, and, when duly appreciated, to connect the perception of physical beauty with that of moral excellence; but it will at once be seen that this idea of usefulness is in a great measure distinct from the ordinary meaning of the term as applicable to the productions of human ingenuity. A positive use results, indeed, indirectly from the cultivation of the formative arts, precisely in proportion as their highest powers are developed: for it will be found that at all times when the grandest style of design has been practised with success, and particularly when the human figure has been duly studied, the taste thus acquired from the source of the beautiful has gradually influenced all kinds

of manufactures. Again, as illustrating science, the fine arts may be directly useful in the stricter sense, but this is not the application which best displays their nature and value. The essence of the fine arts, in short, begins where utility in its narrower acceptation ends. The abstract character of ornament is to be useless. That this principle exists in nature we immediately feel, in calling to mind the merely beautiful appearances of the visible world, and particularly the colours of flowers. In every case in nature, where fitness or utility can be traced, the characteristic quality or *relative* beauty of the object is found to be identified with that fitness;—a union imitated as far as possible in the less decorative parts of architecture, furniture, &c.; but where no utility save that of conveying delight (perhaps the highest of all) exists, we recognise the principle of *absolute* beauty. The fine arts in general may be considered the human reproduction of this principle. The question of their utility therefore resolves itself into the inquiry as to the intention of the beauties of nature. The agreeable facts of the external world have not *only* the general effect of adding a charm to existence, but they appeal to those susceptibilities which are peculiarly human, and it becomes necessary to separate the instinctive feelings which we possess in common with the rest of the creation, from that undefinable union of sensibility and reflection which constitutes taste, and which, while it enlists the imagination as the auxiliary of beauty, is, in its highest influence, less allied to love than admiration. It is this last feeling which the noblest efforts of the arts aspire to kindle, which not only elevates the beautiful, but reduces ideas of fear and danger to the lofty sentiment of the sublime, which, as its objects become worthier, is the link between matter and mind, and which tends to enable sympathy and increase self respect.

With regard to the classification of the arts, these are generally considered the most worthy in which the mental labour employed and the mental pleasure produced are greatest, and in which the manual labour, or labour of whatever kind, is least apparent. This test would justly place poetry first; but the criterion should not be incautiously applied: for in architecture, where human ingenuity is most apparent, and even where the design is very simple, a powerful impression on the imagination may be excited from magnitude, proportion, or other causes. In such cases, however, it will still be evident that we lose sight of the laborious means in the absorbing impression of the effect, and the art thus regains its dignity. It would be an invidious as well as a very difficult task to assign the precise order in which painting, sculpture, architecture and music, would follow poetry and its sister, eloquence; but it may be remarked, that the union of the arts is a hazardous experiment, and is often destructive of their effect. This is most observable in the attempts to combine the principles of sculpture and painting. The drama itself, which unites poetry with many characteristics of the formative arts, and with music, is in constant danger of violating the first principles of style, viz., the consistency of its conventions; and in the more intimate union of poetry and music, the latter, though the inferior art, is too independent and too attractive to be a mere vehicle, and accordingly usurps the first place. [See the Arts above-mentioned under their respective heads.]

ARUM. [See AROIDEÆ.]

ARUNDEL, a borough town in the rape of Arundel, in the county of Sussex, on the river Arun, a short distance from the sea; 55 miles S.S.W. from London, and 10 E. by N. from Chichester. It stands on a declivity on the N.W. bank of the river, the course of which is very winding in this neighbourhood: 50° 51' N. lat., 0° 33' W. long.

The houses are tolerably well built, and the streets paved. The trade of the place is not very great, though vessels of 150 tons can come up to the town, and a canal unites the river on which it stands with the Wey, a feeder of the Thames. There is, however, a good deal of bark shipped, as well as much timber for the use of the dock-yards. The custom-house being at Arundel keeps up the business of the place, which might otherwise be drawn away to Little Hampton, about four miles distant, on the east bank of the Arun, at its mouth. The population of Arundel in 1831 was 2803. The number of houses rated to the house tax at 10*l.* and upwards was, at the same time, 120: the whole number of houses was 537, twenty of which were uninhabited. There are two weekly markets (Wednesday and Saturday), and four annual fairs (May 11,

August 21, September 25, and December 17), chiefly for cattle. There is also a theatre.

A neat stone bridge, of three arches, over the Arun, unites the main part of the town with a smaller portion which lies on the opposite bank of the river. The church is a handsome Gothic structure, built partly of flint and stone, in the form of a cross, and mostly in the perpendicular style. From the intersection of the cross rises a low tower. The chancel has a north aisle, and contains many monuments of the former owners of the castle and others. It is now shut up, and in a very dirty, dilapidated state; but the nave and transepts, which are used for divine service, are kept in good repair and clean. A pulpit of stone, supported on wood, standing against the south-west pier of the cross, was till lately used in divine service. This church belonged originally to a priory of Benedictines, subject to the abbey of Secz in Normandy; but the priory was suppressed in the time of Richard II., and a chantry, or college, for a master and twelve secular canons, with other officers, was founded in its place. Southward from the church is a range of buildings, seemingly founded on the ruins of an ancient structure, which was perhaps the habitation of the above-mentioned canons. A hospital, called 'Maison Dieu' (God's House), was founded in the time of Richard II., by one of the Fitz Alans, for the maintenance of as many poor as its revenues would permit. It was suppressed at the Reformation, when its income was estimated at 42*l.* 3*s.* 8*d.* per annum.

The most striking feature in Arundel is the ancient castle, which gives to its possessor (now the Duke of Norfolk) the title of Earl of Arundel. This instance of a peerage attached to the tenure of a house is now an anomaly. In 11 Henry VI. it was decided, that the tenure of the Castle of Arundel alone, without any creation, patent, or investiture, constituted its possessor Earl of Arundel. (Nicolas's *Synopsis of the Peerage*, 27; Cruise's *Digest*, 3 vols. 152; Report of the Lords' Committee respecting Peerage, 1820.) In 3 Charles I. the Earl of Arundel obtained an Act of Parliament, intitled, 'An Act concerning the title, name, and dignity, of Earl of Arundel, and for annexing of the castle, honor, manor, and lordship, of Arundel, in the county of Sussex, with the titles and dignities of the baronies of Fitzallan, Clun, and Oswaldestre, and Maltravers, with divers other lands, tenements, and hereditaments, in the Act mentioned, being then parcel of the possessions of Thomas, Earl of Arundel and Surrey, Earl Marshal of England, to the same title, name, and dignity, of Earl of Arundel.' (Report of the Lords' Committee respecting Peerage, p. 374.)

The castle stands high, on a steep circular knoll, partly natural, partly artificial, close to the town, and commands an extensive prospect over the low flat country towards the sea as far as the Isle of Wight. It has been supposed that the sea once washed the castle walls, as anchors and other marine implements have been found near it. Arundel castle is mentioned as early as the time of King Alfred, who bequeathed it by his will to his nephew Adhelm. After the Norman Conquest, it was given by William I. to his kinsman Roger de Montgomery, created Earl of Arundel and Shrewsbury. Robert, one of the successors of this earl, supported Robert Duke of Normandy, the eldest son of William I., against Henry I., the youngest son of the Conqueror. Afterwards the castle passed into the family of Albini, from them to the Fitz-Alans, and at last, by the marriage of the heiress of this race with Thomas Duke of Norfolk (in the reign of Elizabeth), into the family of the Howards, by whom it is still retained.

In the civil war between Charles I. and his parliament, Arundel castle was held and garrisoned by the latter. It was, however, taken by Lord Hopton in 1643, surrendering to him at the first summons; and two months after was as suddenly retaken by Sir William Waller. From that time it continued little better than a mass of ruins, until it was restored by the late Duke of Norfolk to its ancient magnificence. A considerable portion of the old building was demolished on this occasion. The modern parts are in the Gothic style, built of free-stone; and stones of a brown cast were selected, in order to accord better with the remains of the ancient fabric.

The castle is surrounded on the N. and W. sides by a deep ditch. The entrance gateway, antiently defended by a drawbridge and a portcullis, was built by Richard Fitzalan

in the reign of Edward I., and repaired and restored by one of his successors. This, with some of the walls and the keep, is all that remains of the antient castle. The keep is a circular stone tower 68 feet in diameter, and the most perfect in England. In the middle of it is the dungeon, a vault about 10 feet high, accessible by a flight of steps, and about 15½ feet by 9½ in extent. The keep has been long tenanted by some owls of large size and beautiful plumage, sent over from America, as a present to the late duke. Among the interior apartments of the castle may be mentioned the magnificent library, calculated to contain 10,000 volumes, and built in imitation of the aisle of a Gothic cathedral; the ornamental parts are in imitation of the cloisters at Gloucester, and St. George's, Windsor. It is 122 feet long, and 30 feet wide. The ceiling, columns, &c., are entirely of mahogany. The great hall, called 'the Barons' Hall,' was begun in 1806; it is 70 feet by 31, and 36 feet high. The roof is of Spanish chestnut, curiously wrought, and the plan is taken from Westminster, Eltham, and Crosby Halls. There is at one end a window of stained glass, representing King John signing Magna Charta. In a series of thirteen stained glass windows are portrayed the figures of some of the barons from whom the late Duke was descended; and there are also portraits of his family. In the dining-room is a handsome stained glass window, representing the late duke and duchess as King Solomon and the Queen of Sheba at a banquet; and a painting by Le Brun, of Adam and Eve in paradise, in imitation of *basso rilievo*.

The park is very extensive and finely wooded, including a great variety of picturesque scenery. In the *Museum Rusticum*, i, 85, we are informed, that the country round Arundel was covered with vineyards, from which wine was made; and that, in 1763, there were sixty pipes of excellent wine, resembling Burgundy, in the cellar of the castle, the produce of one vineyard attached to it.

The town was incorporated by Queen Elizabeth, and the corporation consists of a mayor, twelve burgesses, a steward, and other officers. The mayor is chosen annually at the court leet of the lord of the manor, and is a justice of the peace within the borough. The town has been represented in parliament ever since the 30th of Edward I. The franchise was in the inhabitants paying scot and lot; and up to the passing of the Reform Bill they returned two members. The Duke of Norfolk having fixed his residence at the castle, and made considerable purchases in the town, acquired the power of influencing the return of both members. By the Reform Bill the number of representatives was reduced to one; but the boundaries of the borough (which are coincident with those of the parish) remained unaltered, though it had been proposed by the commissioners of boundaries, in their report, to add the parishes of Leominster and Little Hampton, which would have swelled the population to 5039 persons. The proposal of the commissioners met, however, with violent opposition; a committee of the house was appointed to consider their report, and a surveyor sent down from London to make a fresh examination. Upon his report the house acted, and abstained from any alteration in the boundary. The living is a discharged vicarage, in the diocese of Chichester. Arundel is the seat of a deanery, and gives name to one of the *rapes** into which Sussex is divided. This division is of Saxon origin, and the name is peculiar to Sussex.

The river Arun, on which the town stands, rises in St. Leonard's Forest, in the northern part of the county. Its course is not less than forty miles. It is famous for the grey mullets (which, in the summer, come up to Arundel in large shoals in quest of a particular weed, the feeding on which renders them a great delicacy); and also for eels.

See *Beauties of England and Wales*; Neale's *Views of the Seats of Noblemen and Gentlemen*; Pennant's *Tour from London to the Isle of Wight*; Rickman's *Gothic Architecture*; Dallaway's *History of the Western Division of Sussex*.

ARUNDEL MARBLES, certain pieces of sculpture, consisting of antient statues, busts, mutilated figures, altars, inscriptions, &c., the remains of a more extensive collection, formed in the early part of the seventeenth century by Thomas Howard, Earl of Arundel, and presented, at the suggestion of John Evelyn, in 1667, to the University of Ox-

ford, by Mr. Henry Howard (afterwards Duke of Norfolk), the Earl of Arundel's grandson.

Thomas Howard, Earl of Arundel and Surrey, the founder of this collection, was the only son of Philip, first Earl of Arundel of his family, by Anne, sister and co-heir of Thomas, the last Lord Dacre of Gillesland. The year of his birth is fixed by Sir Edward Walker, in his *Historical Discourses*, to 1586. He received his education at home, under the eye of his mother, with whom he lived, in the latter years of Elizabeth's reign, in privacy. He had at that time, by courtesy, the title of Lord Maltravers, a barony derived from his great ancestors, the Fitzalans.

In 1603, soon after James's accession, he was restored in blood by act of parliament, and to such honours as he had lost by his father's attainder, as well as to the earldom of Surrey, and to most of the baronies which had been forfeited by the attainder of his grandfather, Thomas, fourth Duke of Norfolk. The dukedom itself was detained from him. Lodge conjectures that the Earl of Suffolk, Lord Arundel's uncle, who was then in favour, might have prevented that grace, with the hope of obtaining a revival of it in his own line, in the event of the young earl's death without issue.

When Lord Arundel came of age, he married Alatheia, third daughter and co-heir of Gilbert Talbot, Earl of Shrewsbury; a match of great advantage, as her two elder sisters, the countesses of Pembroke and Kent, dying childless, she ultimately inherited the most part of her father's noble revenues.

In 1607 the Earl of Arundel was sworn of the privy council; and on the 17th of June that year, the king stood godfather in person to his first-born son. He soon after travelled into France and Italy, a journey which his untoward family circumstances had hitherto prevented; and during his stay in those countries he imbibed that love for the fine arts by which he was afterwards distinguished.

He remained abroad till 1611, and on his return was made K.G. The marriage of the Princess Elizabeth to the Elector Palatine happening soon after, he was appointed to escort them to their dominions. Finding himself once more on the continent, he went again into Italy, and at that time began to form his celebrated collection. When he returned to his own country, in 1614, he embraced the communion of the Church of England; for he had been bred a Roman Catholic in the strictest austerities of that persuasion. In 1621, upon Bacon's removal, he was made one of the commissioners for holding the great seal; and, in the same year, appointed, or rather restored, to the place of Earl Marshal of England.

King Charles I., upon his accession, continued him in this last office, and showed him several other indications of favour; but the earl's eldest surviving son, Henry Lord Maltravers, having married the Lady Elizabeth Stuart, sister of the Duke of Lennox, who was related to Charles, the king showed his resentment by an act of violence, which drew a remonstrance from the House of Peers. It had been the king's intention to marry this lady to Lord Lorne, the son of the Earl of Argyle, and so to reconcile the antient feuds between those two powerful Scottish houses. Lord Arundel was committed, together with his lady, to the Tower, solely by the authority of a royal warrant, in which his offence was not stated. The Lords, however, continued firm in his defence, and after a contest which lasted nearly three months, he was set at liberty June 8, 1626.

After the assassination of the Duke of Buckingham, the Earl of Arundel, who had been the duke's enemy, came again to court, and soon acquired a considerable share of favour and confidence. In 1631 he was appointed a commissioner to examine into the extravagant fees exacted in courts of justice and public offices, and in 1633 attended the king at his coronation in Scotland; in the same year he was deputed ambassador extraordinary to the States-general, and was made chief-justice of the forests north of Trent. But his most important public service about that period was in an embassy, in 1636, to the Emperor Ferdinand II. and the Imperial Diet, on the subject of the restoration of the palatinate to the elector, Charles's nephew; a measure which the king had so entirely at heart, that he could not have given a stronger proof of his confidence in the earl's wisdom and fidelity, than by intrusting it to his management. The mission, however, proved unsuccessful, and the earl, having passed nine months in Germany, during which he expended not less than 40,000*l.* from his own private fortune in augmenting his already

* The rape is a division between a county and a hundred, containing commonly several of the latter, similar to the *talvas* of Kent. The term *rape* is peculiar to Sussex. Its etymology is uncertain.

splendid library and cabinet, returned to London, and was received by the king with peculiar marks of favour. A Journal, or *Relation*, as it was called, of the occurrences which took place in this voyage, was published in the succeeding year by William Crowne, gent., a book now of extreme rarity: a copy is preserved in the Royal Library at the British Museum.

In 1637 the Earl of Arundel was appointed commander-in-chief of the forces raised for the reduction of those who opposed the liturgy and hierarchy in Scotland, and afterwards first commissioner for a new treaty. He was soon after appointed steward of the royal household; and in 1640 nominated general-in-chief of the country south of Trent. The violence, however, which marked the meeting of the Long Parliament gave a sudden turn to all public affairs, and prevented the effect of both his civil and military commissions. One of its first measures was the impeachment of the Earl of Strafford, at whose trial Arundel presided as Lord High Steward, with a judgment and impartiality which was admired by all parties. It fell also to his lot to be deputed to give the royal assent to those two fatal bills which cost Charles his crown and his life, and deluged the country in blood; the bill of attainder against Strafford, and that by which it was enacted that the parliament should not be dissolved but by its own consent.

In June, 1641, he presented a petition, supported by another from several peers of great influence, beseeching the king to restore him to the dukedom; but Charles, for some unknown reasons, would favour him no further than by the grant of a patent creating him Earl of Norfolk. Disgusted by this half measure, and foreseeing the dreadful storm which was then gathering, he determined to quit his country, and the king favoured his design by appointing him to escort the queen's mother, Mary de' Medici, queen dowager of France, to end there her sorrowful days in security. His family accompanied him, and he returned alone early in the following winter, and remained in England till February, when the king gave him another opportunity of leaving it, by deputing him to attend to Holland Henrietta Maria, and her daughter, the Princess Mary, who had been married in the preceding summer to William, Prince of Orange. He returned no more. After a short stay in the United Provinces, he went to Antwerp; and from thence, leaving there his countess, whom he never met again, to Spa. He wandered slowly over most parts of Italy, and at last settled at Padua, where he died October the 4th, 1646. His body was brought to England, and buried at Arundel.

The Earl of Arundel's character has been drawn at considerable length by two writers, one at least of eminence, the Earl of Clarendon and Sir Edward Walker. Both agree that he wished to be thought a scholar, but that he was more learned in men and manners than in books. Clarendon says, his expenses were without any measure, and always exceeded his revenue.

Sir Edward Walker remarks, 'He was the greatest favourer of arts, especially painting, sculpture, designs, carving, building, and the like, that this age hath produced; his collections of designs being more than of any person living, and his statues equal in number, value, and antiquity, to those in the houses of most princes: to gain which he had persons many years employed both in Italy, Greece, and so generally in any part of Europe where rarities were to be had. His paintings, likewise, were numerous, and of the most excellent masters, having more of that exquisite painter, Hans Holbein, than are in the world besides; and he had the honour to be the first person of quality that set a value on them in our nation; and so, the first person that brought in uniformity in building, and was chief commissioner to see it performed in London, which, since that time, has added exceedingly to the beauty of that city.'

Upon his return to England in 1614, the Earl of Arundel's palace in the Strand, near London, and his country retreat at Albury in Surrey, were resorted to by men of talents. He maintained Francisus Junius and Oughtred the mathematician; he patronized Inigo Jones and Vandyke; and brought over Wenceslaus Hollar, the first engraver of merit, and encouraged him in England; and he employed Nicholas Stone, Le Seur, and Fanelli, the first who practised their art of sculpture in this kingdom. It was from the example and recommendation of Lord Arundel, and encouraged by Villiers, who was glad to make the king a competitor in purchases, that Charles I. was originally induced to study and encourage the arts.

When Lord Arundel determined to collect a gallery of statuary, he retained two men of letters for that purpose. The well-known John Evelyn was sent to Rome, and Mr. (afterwards Sir William) Petty undertook a hazardous journey to the Greek islands and the Morea. In the islands of Paros and Delos, Petty's indefatigable researches had been rewarded with ample success, when, on his voyage to Smyrna, he was shipwrecked on the coast of Asia opposite Samos, and escaped only with his life. At Smyrna he acquired many marbles of great value, particularly the celebrated Parian Chronicle. Still the jealousy of Villiers was active in interrupting Lord Arundel's pursuit, and the delight of his retired hours. Sir Thomas Roe, then ambassador at the Porte, and consequently obedient to the minister, was directed to purchase beyond Petty's ability, and to withhold from him every assistance in his diplomatic capacity which he dared not openly refuse.

Lord Arundel having assembled in his gallery his various acquisitions from Greece and Rome, adopted the following arrangement of his marbles: the statues and busts were placed in the gallery; the inscribed marbles were inserted into the wall of the garden of Arundel House; and the inferior and mutilated statues decorated the garden itself. We learn from catalogues, that the Arundelian collection, when entire, contained 37 statues, 128 busts, and 250 inscribed marbles, exclusive of sarcophagi, altars, and fragments, and the inestimable gems.

Penehan, in his *Complete Gentleman* (the second edition of which was published in 1634), says, 'I cannot but with much reverence mention the every way right honourable Thomas Howard, lord high marshal of England, as great for his noble patronage of arts and ancient learning, as for his birth and place; to whose liberal charges and magnificence this angle of the world oweth the first sight of Greek and Roman statues, with whose admired presence he began to honour the gardens and galleries of Arundel House, and hath ever since continued to transplant old Greece into England.'

In 1642, when Lord Arundel left his country, Lord Orford says he transported him and his collection to Antwerp: Dallaway says (what was no doubt the truth) that his gems, cabinet pictures, and curiosities, only were removed. He adds, 'In the general confiscation made by the parliament, the pictures and statues remaining at Arundel House were in some measure included. Many were obtained by Don Alonzo de Cardenas, the Spanish ambassador to Cromwell, and sent into Spain, with the wrecks of the royal collection.'

When Lord Arundel died, he divided his personal estate between his eldest and second surviving sons, Henry Frederick Lord Maltravers, and William, afterwards Viscount Stafford. Henry, second son of the former and sixth Duke of Norfolk, succeeded to the elder share, and in 1667, influenced by the previous recommendations of Selden as well as Evelyn, gave a part of his moiety (the inscribed marbles) to the University of Oxford; the remainder descended to his son Henry, the seventh duke, and were afterwards mostly possessed by his seventh wife.

Arundel House and gardens were converted into streets about the year 1678, when it was determined to dispose of the statues by sale. It was proposed by the agents to sell the whole collectively, but no purchaser could be found. A division was in consequence made. One portion, consisting principally of busts, was purchased by Lord Pembroke; these are now at Wilton. A second was purchased by Sir William Fermor (the father of the first Earl of Pomfret), who removed them to his seat at Easton Neston in Northamptonshire, where such as were capable of being repaired had their defects amended and supplied by one Guelfi, an artist who misconceived the character and attitude of almost every statue he attempted to make perfect, and ruined the greater number of those which he was permitted to touch. Henrietta Louisa, countess dowager of Pomfret, in 1755, transferred these marbles also to the University of Oxford, where they became again united to the inscribed marbles. Mr. Theobald, in a communication to the Society of Antiquaries, made in 1758, says that many of the broken statues, which were thought not worth repairing, were begged by one Boyden Cuper, who had been a servant in the family, and removed by him to decorate a piece of garden-ground which he had taken opposite Somerset Water-gate, in the parish of Lambeth; a place of resort for citizens and others in holiday-time, and long afterwards known by the name of

Cuper's Gardens. Here they continued till about the year 1717, when Mr. John Freeman, of Fawley Court, near Henley, in Oxfordshire, and Mr. Edmund Waller, of Beaconsfield, in Buckinghamshire, happening to see them, and observing something masterly in the designs and drapery of several, and that they were fragments of very curious pieces of sculpture, agreed for the purchase of them at the price of 75*l*. One moiety of these went to Beaconsfield, and the other to Fawley Court. A few statues and broken fragments were given to a Mr. Arundel, a relation of the Duke of Norfolk, who rented a waste piece of ground on the opposite shore of the river, which afterwards became a timber-yard; one or two of these were subsequently given to the Earl of Burlington, and went to Chiswick House. A few elegant remains were carried to Mrs. Temple's seat at Moor Park, near Farnham, in Surrey. Various other fragments, which were not thought worth removing, were buried in the rubbish and foundations of the houses in the lower parts of Norfolk Street, and the other buildings on the gardens. Several of these, including a few trunks of statues, dug up at a later time, were sent down to the Duke of Norfolk's seat at Worksop Manor.

The divorced Duchess of Norfolk, by whom the busts and statues were sold, also possessed the cameos and intaglios, and bequeathed them, at her death, to her second husband, Sir John Germaine. His widow, Lady Elizabeth Germaine, who valued them at 10,000*l*., offered them, about 1755, for that price to the curators of the British Museum, who were not in a situation to bestow so large a sum upon the purchase; and finally gave them to her niece, Miss Beaucherk, upon her marriage with Lord Charles Spencer, from whom they passed to his brother the Duke of Marlborough; and are now known by the name of the Marlborough Gems.

Sir William Howard, when afterwards Lord Stafford, succeeded to a house built for his mother, the Countess of Arundel, by Nicholas Stone, in 1638. It stood near Buckingham Gate, and was called Tart Hall. The second share of Lord Arundel's curiosities was deposited there, and produced, at a sale in 1720, 835*l*. 19*s*. 11*d*., and the house was soon after levelled with the ground. This information appears upon the minutes of the Society of Antiquaries.

A single article, an ebony cabinet, painted by Polenberg and Van Bassan, was purchased by the Earl of Oxford for 310*l*.

Dr. Mead bought at this sale Lord Arundel's favourite bronze head of Homer, which is introduced into his portrait by Vandyke; at Dr. Mead's sale it was purchased for 136*l*. by Lord Exeter, who gave it to the British Museum, where it is now considered as a head of Pindar.

Lord Orford says, the coins and medals of the Arundel collection came into the possession of Thomas, Earl of Winchelsea, and in 1696 were sold by his executors to Mr. Thomas Hall.

The greater part of the Greek inscriptions in the Arundel Collection now at Oxford were obtained, as has been already noticed, at Smyrna, where Gassendi says the celebrated Peiresc, who was engaged in similar pursuits, had first discovered them. According to this account, one Samson, Peiresc's factor, had paid fifty crowns for the curiosities, but the Turks having seized on Samson and his collection, with a view to obtain a higher price, the Earl of Arundel commissioned Mr. Petty to redeem the whole. They arrived in England in 1627, soon after which, at the suggestion of Sir Robert Cotton, they were carefully examined by the learned Selden, in conjunction with two other eminent scholars. Selden, in 1628, published his *Marmora Arundelliana*, a thin quarto volume, in which twenty-nine Greek and ten Latin inscriptions of this collection are deciphered and illustrated. The Arundel inscriptions were, at first, let into the wall which surrounds the Sheldonian theatre, each marked with the initial of the name of Howard. They were, however, soon increased by the accession of Selden's private collection, and some other donations; so that the whole amounted to 150 inscribed marbles, including tablets, altars, pedestals, stelæ, and sepulchral monuments. An edition of the whole was now undertaken, at the desire of Doan Fell, by Mr. Humphrey Prideaux, then student of Christ Church, but afterwards dean of Norwich, which appeared under the title of *Marmora Oxoniensia, ex Arundellianis, Seldenianis, aliisque conflata*; fol. 1676. They were edited with great care, and illustrated by the annotations of the editor, Selden, Lydiat, and others. This work was republished fifty-six years afterwards by Michael Maittaire, under the title of *Marmorum Arundellianorum, Seldeniano-*

rum, aliorumque Academicæ Oxoniensis donatorum; cum variis Commentariis et Indice, Secunda Editio, fol. Lond. 1732; with great augmentations as to comment. An Appendix, consisting of three Greek inscriptions, subsequently given to the University, was published in 1733, fol. In 1763, the *Marmora Oxoniensia* were again published in a new and splendid form, under the auspices of the University, by Dr. Richard Chandler of Magdalen College; including the ancient inscriptions collected by Sir George Wheler and Messieurs Dawkins, Bouverie, and Wood, during their travels, some which Dr. Richard Rawlinson possessed, and a few others; with engravings of statues, busts, and other marbles, to the number of 167 articles, 103 of which belonged to that part of the Arundel Collection which the countess dowager of Pomfret had given to the University. The Greek inscriptions of this collection, '*Ad Chandleri exemplar editæ*,' were separately published at Oxford in 1791, in a small octavo volume.

The Arundel and Pomfret marbles are at present preserved at Oxford in two rooms belonging to the public schools, beneath the picture gallery. Of the Arundel portion, that which the University places at the head of its collection is the Greek inscription known by the name of the *PARIAN CHRONICLE*, so called from the supposition of its having been made in the isle of Paros about B.C. 263. Another inscription of interest is a treaty concluded between Smyrna and Magnesia, for the protection of Seleucus Callinicus, engraved on a pillar in the temple of Venus Stratoniceis, at Smyrna, about B.C. 241.

Among the more important marbles of the Pomfret donation are the colossal torso (for that part only is antique) of a Minerva galeata, restored as a statue by Guelfi; a Venus Vestita, or Leda; Terpsichore; a young Hercules; an Athleta, which has been called Antinous; a female figure, unrestored, of early Greek work; and three statues of senators, one of which is usually considered as Cicero. This last was etched by Woolbridge.

Some of the statues in this collection, which have been restored, as far as the ancient portions go, have no positive attributes of the characters of gods, heroes, &c., which Guelfi, who restored them, made them represent. (See Dugdale's *Baronage*, tom. ii. p. 277; Lodge's *Portraits of Illustrious Personages*; Selden's *Marmora Arundelliana*, and the *Marmora Oxoniensia* of Prideaux, Maittaire, and Dr. Chandler; Gassendi's *Life of Peiresc*; Gough's *British Topogr.*, vol. ii. p. 127; Lord Orford's *Anecd. of Painting*, edit. 1786, vol. ii. p. 124; and Dallaway's *Anecd. of the Arts in England*.)

ARUNDO, a genus of grasses, in which a number of useful species was once comprehended; but in consequence of the altered views of botanists regarding the limits of genera, it is now confined to the *Arundo Donax*, and the species most nearly agreeing with it. These are grasses of considerable size, sometimes acquiring a woody stem, and found only in the warmer parts of the world. Mr. Kunth defines the genus, as now limited, by the following characters:—Spikelets, each containing from two to five flowerets, which are distant from each other, arranged in two ranks, hermaphrodite, the uppermost being withered; glumes two, sharp-pointed, channelled, and keeled, nearly equal, membranous, as long as the flowerets, and at some distance from each other; paleæ two, membranous; the lowermost slit at the end, with a very short beard between the sides of the slit, covered externally, especially at the lower end and rachis, with very long silky hairs.

Arundo Donax, a native of the south of Europe, the Caucasus, Egypt, and Siberia, is one of the largest grasses that we have in cultivation; it is not unusual to see it, in rich soil, nine or ten feet high, with leaves as broad and as long as the blade of a small sword. A beautifully variegated variety is that which is usually seen in gardens.

Arundo arvensis, the sea-reed, or marrum grass, a dwarf plant which pierces the sand-banks on the shores of the north of Europe with its tough subterranean stems, and which thus converts them into living barriers against the inroads of the ocean, differs a little from the exact character of *Arundo*, and is called by modern botanists *Amphiphila arundinacea*. It is a very rigid plant, with bluish rolled-up leaves, and a stem two or three feet high, terminated by a dense tuft of flowers.

Arundo phragmites, the common reed, now forms the genus PHRAGMITES, which see.

ARUSPEX. [See HARUSPEX.]

ARVA, the most northern circle of the kingdom of Hungary, and one of the thirteen which compose the province of the Citerior-Danube. It is situated between the 49th and 50th degrees of N. latitude, and bounded on the east, north, and north-west by Galicia. It has a surface of 782 square miles; contains five market-towns and ninety-two villages, and 87,000 inhabitants, of whom 1200 are Jews. It occupies higher ground than any other circle in Hungary, of which it is one of the most unproductive portions, being intersected in all directions by offsets of the great Carpathian range, which forms its northern frontier. Of the fifty-two rivers and rivulets, which rise in this circle, the principal are the White and Black Arvas; the former flows into the latter, which has a fall of eighty-four feet in every five miles, and consequently a very rapid current. Arva produces little grain besides oats, on which the inhabitants wholly depend for their bread; but its soil is extremely favourable for the cultivation of potatoes, which are esteemed the finest flavoured in all the kingdom; and sufficient flax is grown to render linen an article of export. Its chief resource is its extensive forests, which afford large supplies of timber and fuel, and abound in bears, wolves, foxes, wild cats, &c. The whole population, excepting about 100 Jews, is of Bohemian-Slavonic, or Slowachian extraction. The capital of the district, Alsó-Kubin, is situated in the S.E. part of the circle, on the left bank of the Arva, and has 1100 inhabitants. It lies in 49° 14' N. lat., and 19° 19' E. long. It has a Catholic and a Lutheran church, as well as a synagogue.

ARVE, a river which rises in the mountains of Savoy, flows to the N.W., and falls into the Rhône just below Geneva. Its whole course is about sixty miles.

The source of the Arve is on the Col de Balme, at the N.E. extremity of the valley of Chamouni; but its waters are chiefly derived from the glaciers which cover the northern face of the chain of Mont Blanc. This circumstance causes a difference in the temperature of the river, at different distances from its source, the water growing warmer the farther it flows; and leads also to a daily alteration in the temperature at the same place. The melting of the snow goes on faster during the day, and so produces a more abundant flow of water, which is less affected by the warmth of the atmosphere than when the current is smaller, and, besides, this water traverses the lower country during the coldness of the night. These two causes produce a sensible difference in the temperature of the river near the mouth. From day-break in the month of August the waters near the mouth have been observed to grow colder till nine or ten o'clock in the morning (the difference being about 2° of Reaumur, or 4° 5 of Fahrenheit); the alteration is effected by the arrival at this spot of the waters formed the preceding day by the melting of the snow. From nine or ten in the morning the temperature rises till ten at night, and then, after remaining stationary for a time, it falls again.

The current of the Arve is so rapid, that, for some time after it enters the Rhône, its waters do not mingle with those of that river; and at times, so great has been its violence, that it has impeded the course of the Rhône, caused the waters of the latter to flow back into the lake of Geneva, and given to the water-wheels of the mills on its banks a direction contrary to that in which they commonly move. (*Encyclopédie Méthodique*.)

ARVICOLA, in zoology, a genus of Rodentia. [See CAMPAGNOL.]

ARZAMAS, the chief town of a circle in the Russian province of Nijni or Nishni, Novgorod, lies at the confluence of the Arsha and Tesha, seventy-two miles south of N. Novgorod, the principal capital. Though the population scarcely exceeds 5000 souls, the town contains twenty churches, besides a monastery and convent. It is dirty and ill-built; the inhabitants are, however, an industrious and thriving race of men, and independently of manufacturing large quantities of soap, Russia leather, and silver and iron wares, are extensively concerned in weaving and dyeing the krashennina, or blue cloth, which is so great a favourite with the Russian women. They likewise export linen, sail-cloth, and other domestic products to Moscow and St. Petersburg; and the crown has a large manufactory of potashes in the town. It contains between 1400 and 1500 houses, and lies in 57° 37' N. lat., and 43° 12' E. long. Arzamas is connected with the small town of Veshna by means of a bridge across the Tesha, and their united population amounts to between 7000 and 8000.

AS, among the antient Romans, was a weight, consisting of twelve *uncie* or ounces; it was also called *libra*, *libella*, and *pondo*, or the pound. Pitiscus (*Lexicon Antiq. Rom.*) gives its etymology from the Greek *ās*, used in the Doric dialect for *εἷς*, signifying an integer or whole, one entire thing; but we can find no authority for this word *ās*. Others, as we learn from Budæus (*De Asse et partibus ejus*. lib. v. 8vo. Lugd. 1551, p. 146), have more correctly considered *As* to be equivalent to *Æs*, a piece of copper or brass. (Varro L. L. v. 36, Spengel.)

As, *Assis*, or *Assarius* (Eckhel, *Doctrina Num. Vet.* tom. v. p. 2) was likewise the name of a Roman coin of copper, or rather of mixed metal, which varied both in weight and composition at different periods of the Commonwealth; but which originally actually weighed a pound, whence it was called *As libralis*, and sometimes also *Æs grave*.

[This *As* weighs 3672 grains.]

The first coinage of this description, according to Pliny (lib. xviii. c. 3; xxxiii. c. 13), took place in the reign of Servius Tullus, which, if Sir Isaac Newton's chronology of Rome is adopted, would be about the year *n.c.* 460, or 587 on other authority. The first Asses of Tullus had the figure of a bull, ram, boar, or sow upon them.

Varro (*De Re Rustica*, lib. ii. c. 1), Pliny, and Plutarch, (*Poplicola*, edit. Bryan. tom. i. p. 226) assert that the most antient Asses were so marked. This, in fact, according to the two last writers, was the origin of the term *pecunia*, as used for money, a word derived from *pecus*, cattle; and also of the term *peculium*.

The next in point of antiquity to the *As* which bore the figure of an animal, is considered by Pinkerton to be the *As* which was stamped with the two faced head of Janus on one

side, and the prow of a ship on the other. See Pinkerton's *Essay on Medals*, vol. i. p. 100, who adopts his opinion of this being the second As in point of antiquity, from a manuscript *Dissertation on the Etruscan and Roman early Coins*, written by the late Dr. Charles Combe. Ovid, in his *Fasti*, expressly alludes to the As thus marked; and it is described by Pliny (xxxiii. 3). The head of Janus was usually so accompanied, because, according to an old fable, Saturn arrived in Italy by sea.

"Multa quidem didici: sed cur navalis in aera
Altera signata est, altera forma bipoca?
Noscere me duplici posces in imagine, dixit,
Ni vetus ipsa dies extenuasset opus
Causa ratis superest: Tuscanum rate venit in amnem
Aut pererrato falceis orbe Dens."
Ov. *Fasti*, lib. i. 229-234.

[Weight

4000 grains.]

The figures on this coin will explain the expression used by the Roman boys in tossing up—*capita aut naevum*, 'heads or ship.' (Macrob. *Sat.* i. 7.)

The earliest Asses were cast, probably in imitation of the Etruscan coins, which the Romans, in this instance, appear to have copied. In the British Museum there are even four Asses united together, as they were taken from the mould or matrix, in which many were cast at once. In most of the Asses preserved in our cabinets, the edge shows evidently where they were severed from each other, and where the piece at the mouth of the mould was cut off. From being cast, it will be judged that they are not very correctly sized. As the As fell in weight, the smaller divisions were not cast, but struck.

According to Pliny, the As continued of its original weight till the first Punic war, when, the treasury of the state being exhausted, it was reduced to two ounces. This, however, is improbable, and is confuted by the coins themselves; since we find Asses of all weights, from the pound downward to Pliny's two ounces. The As must, therefore, he says, have gradually diminished

to ten ounces, to eight, to six, to four; and when the size was so much reduced, still more gradual diminutions must have taken place to three, and to two ounces. One or two of the pieces which remain might even imply that the decrease was more slow, to eleven, to ten, to nine, &c., but it is to be observed that neither the As nor its parts were ever correctly adjusted as to size, so that the marks upon them only, not their comparative magnitude, distinguish the divisions.

The middle of the first Punic war being about the year of Rome 502, or B.C. 250, supposing Pliny to be correct, would be the time of the reduction of the As to two ounces.

Pliny adds, that in the second Punic war, when Q. Fabius was dictator, and the Romans were pressed by Hannibal, the As was further reduced to one ounce. This event is ascribed to the 537th year of Rome, or B.C. 215, being thirty-six years after the former change. He adds, again, that, by the Papirian law, Asses of half an ounce were coined. *Mox* is the word which Pliny uses to indicate the time of this change. A. Papirius Turdus, who was tribune B.C. 178, is suggested by Pighius (ii. 343) as possibly the author of this law: but Eckhel (*Doctr. Num.* *Vet.* vol. v. p. 5) considers the time uncertain. This weight of the As, however, continued till Pliny's time, and long after.

Pinkerton offers the following sketch of a plan to determine the aces of the different sorts of Asses from their weight:—The As libralis, coined by Tullus, with the figures of oxen, &c., about 167 years after Rome was built, according to Sir Isaac Newton, or B.C. 460; As libralis, with Janus and prow, 400; the As of ten ounces, 300; eight, 290; six, 280; four, 270; three, 260; two, according to Pliny, 250; one, also from Pliny, 211. But this scheme is conjectural, at least down to B.C. 250, and may be considered as intended rather for the amusement of the collector, than as instruction to the sober inquirer.

The As libralis with the head of Janus is the most common form now found of the As, previous to its being reduced to two ounces: a circumstance which shows that form to have been of long duration.

The exact period when the parts of the As were first given, in their proportions of weight and value, is not ascertainable: but the best authors on numismatic science agree that the time was not very far removed from that of the first coinage of the As.

The coined divisions of the As were the *semis*, *quincunx*, *triens*, *quadrans* or *teruncius*, *sextans*, and *uncia*. There were other divisions of the As by weight, which it may be proper to enumerate concisely. These were the *denarii* of eleven ounces, the *dextans* of ten, the *doctrans* of nine, the *bes* of eight, the *septunx* of seven, the *sestuncia* of an ounce and a half, and the *semuncia* of half an ounce. But none of these have been found in a coined form in numismatic cabinets; they are therefore universally considered to have been nominal sums. Indeed it is clear they would not be wanted, for $6 + 5 = 11$; $6 + 4 = 10$; $6 + 3 = 9$: so that these nominal sums were made up of the real coins by adding them.*

The *Semis*, *Semissis*, or *Semi-As*, half the As, or six unciae, was of various types, but always marked with an S. The one here engraved represents a female head on one side, with a strigil behind, or perhaps a hook for reaping or other agricultural purposes, and a head of Pallas on the other: the S, at length, occurs on both sides. Monnet (*De la Rareté et du Prix des Médailles Romaines*, tom. i. p. 5); and Akerman (*Descr. Cat. of Rare and unedited Roman Coins*, vol. i. pp. 6, 7) have enumerated many different varieties. See also Rasche (*Lexicon Rei Num.* v. *Semissis*).

The *Quincunx*, the division of five ounces or portions of the As, is of very rare occurrence. All the other portions of the As have been copied for the present work from original coins in the British Museum; but the *Quincunx*, it is believed, exists in no cabinet at present in this country.

Our present representation of it has been copied from a work entitled *De Nummis aliquot ceteris uncialibus Epistola*, by the Cardinal de Zelada, 4to. Rom. 1778, a volume

* Tacitus (*Ann. Poet.* l. 32) says, the Roman youth learn to divide the As into a hundred parts:

"Romani pueri longis rationibus Asses
Discunt in partes centum dividere."

Possibly this passage has a reference to a centesimal division of the As, then

[Weight

2191 grains.]

of extreme rarity, written for the express purpose of illustrating the passages already quoted from Pliny.

The Quincunx here given represents, on one side, a bearded head; and, on the other, a buckler, or shield, bearing five globules on the dexter half, which indicate its value. Another type is said to represent a sort of cross on both sides; and a third kind has the head of Apollo, with the Dioscuri on horseback, on the reverse, and the word ROMA; both these also bear the globules. The last-mentioned type is preserved in the Imperial Cabinet at Vienna.

It is possible, however, that this which we have engraved may not be a genuine Roman Quincunx; other cities in Italy and Magna Græcia had their own Asses, and their divisions, marked in the same manner as those of Rome herself. (Compare Eckhel, *ut sup.* p. 11—13.) These are usually called, in contradistinction, Italian Asses. Such were those of Velitræ, Tudertia, Luceria, Populonia, Panormus, Præstum, &c.

The Triens was the third of the As, or piece of four uncie. The type here engraved bears a dolphin on one side with the strigil above: on the other is a thunderbolt.

[Weight 1571 grains.]

Four globules, or pellets, to indicate its value, occur on both sides. Other types will be found enumerated in Mionnet (*ut sup.* pp. 7, 8); and Akerman (pp. 10, 11). Eckhel says, the head of Pallas was very frequent upon the Trientes (*Doctr. Vet. Num.* tom. v. p. 15). Pliny says (xxxiii. 3) that both the Triens and the Quadrans bore the type of a ship.

The Quadrans was the fourth of the As, or piece of three uncie. The types of this were various also (Rasche, *Lex. Rei Num.* v. Quadrans); but the value of the coin was uniformly denoted by three globules. On the Quadrans here represented, an open hand and strigil occur on both sides.

[Weight 1100 grains.]

Others have a dolphin, grains of corn, a star, heads of Hercules, Ceres, &c., on the obverse.

The *Sextans* was the sixth of the As, or piece of two ounces. The coin here engraved

[Weight 779 grains.]

bears on one side a caduceus and strigil, on the other a cockle shell. The value is denoted on each side by two globules. On some *Sextantes* the value is designated on one side only.

The *Unctia*, twelfth of the As, or piece of one ounce, is marked by a single globule. The type we have selected

[Weight 186 grains.]

bears on one side an ear of barley, and on the other a frog. For the varieties of type, compare Mionnet (p. 13); Akerman (p. 17). Eckhel describes one with the head of Pallas on one side, and on the other the prow of a ship: a globule by the side of each.

As the As fell in weight, larger denominations of coin were struck, bearing names relative to the As. The As was latterly marked I. The *Dupondius*, or double As, was marked II. The *Tressis* III. The *Quadrussis* IV. There were even *Decusses*, or pieces of ten Ases, in copper, marked X. Olivieri mentions one in his own cabinet weighing upwards of twenty-five Roman ounces, which must have been cast when the As was about three ounces; for, as has been mentioned, they are far from being correctly sized. In the *Museum Etruscum* is a *Decussis* of forty Roman ounces, cast when the As was four ounces. The *Denarius*, *Quinarius*, and *Sestertius* were silver coins. According to Pliny, when the As was reduced to one *uncia* in the second Punic war, the *Denarius*, which was originally equivalent to 10, the *Quinarius* to 5, and the *Sestertius* to 2½ Ases, were respectively made equivalent to 16, 8, and 4 Ases. On this subject see *SESTERTIUS*.

Notwithstanding that the As fell, it still continued to be called *libra*; and in fines of estates, and in other old customs, was, nevertheless, held to be a pound weight of copper. See Cornutus on Persius: that annotator lived in the reign of Domitian. The word *As* was also used in accounts for the whole of any heritage, &c., to late times. *Heredes ex asse* was the phrase used by the juriconsults for an heir to a whole estate. (Pitisci, *Lex. v. As.*) It is thus used by Martial (vii. 65), and elsewhere. The word *As*, indeed, with its subdivisions and multiples, was used generally as the representative of number, both in defining measures of length, the proportions of an inheritance, &c.

The Ases drawn for this article, from specimens in the British Museum, have been carefully weighed. A comparison of the weights will show that the parts do not correspond accurately with one another, or with the integer As. Our specimens may probably not all belong to one epoch, nor all to the city of Rome.

ASAM, or TAEKHA, a country of Asia, commonly included among the countries belonging to India beyond the Ganges, because it lies to the east of them; it should, however, rather be considered as an appendage of India on the west side of the Ganges, as the only easy access to it from Bengal is along the Brahmapootra. Asam is a valley of great extent, stretching from the meridian of 90° 30' E. to

that of 97° 30', or upwards of 440 miles, between two elevated mountain-ranges; the slopes of which, as far as they belong to this valley, advance on the north to the parallel of 28° 30' N. lat., and on the south to 25° 30'.

Along the north side of this valley, the most eastern chain of the Himalaya mountains extends. Following the boundaries of India within the Ganges, this gigantic mountain-range lies in the direction from N. W. to S. E. or W. N. W. to E. S. E., but near 28° N. lat. 89° 30' E. long., a change takes place. At this point of change near Tassisdun, the capital of Bhotan, stands the Chamalari, one of the highest pinnacles of the Himalaya-range, which, being visible from a distance of 180 miles, must attain a height of at least 25,000 to 26,000 feet above the level of the sea. From the Chamalari, the range extends nearly due east for about 3° of long., but near the meridian of 92° 30' it begins to decline a little to the north, and thus continues up to the source of the Brahmapootra, where one of its pinnacles is called Thathuthoya. This chain, which, with its numerous ridges, occupies in breadth probably 2° of lat., and perhaps in some places much more, contains a great number of peaks covered with snow, especially between the meridians of 92° and 93°, and of 94° and 95°. Toward the source of the Brahmapootra it seems to decrease in height, and here it is connected with that extensive mountain-region which contains the sources of all the large rivers that drain the peninsula beyond the Ganges and the southern provinces of China, and which has not yet been explored by Europeans. The mountains from which the Brahmapootra rises, lying between 97° and 98° E. long., may still be considered as belonging to the Himalaya range, and as forming the most eastern extremity of that extensive chain. The height of these mountains is not precisely known, but probably it is not much short of 20,000 feet; they bound the valley of Asam on the east. The mountain-range which extends along the southern side of the valley is much less elevated, and varies in height. Where it skirts the upper course of the Brahmapootra and its numerous sources, it may attain an elevation of from 13,000 to 14,000 feet, and may be compared in height, if not in extent, to the Alps of Switzerland. Farther to the south-west, where it takes the name of Patkoi mountains, it seems to be much lower and more accessible; and to the west of the Patkoi are the Naga mountains, still lower than the former, and extending to about 93° 30', where they are succeeded by the Garrow hills, which rarely rise to more than 6000 feet, and terminate the valley of Asam on the west, opposite the mountain-ridges which surround the southern declivity of the Chamalari. Between these ridges and the Garrow hills lies the wide opening by which the valley of Asam is connected with the plains extending along the Ganges.

Asam, with the bordering districts, including all the countries from the meridian of 90° 30' to the heads of the sacred Brahmapootra on the east, and from the crest of the Himalaya-range on the north, to the chain of mountains separating on the south the sources of the rivers contributing to the Brahmapootra from those flowing in the opposite direction, comprehends an area of about 70,000 square miles, and exceeds the reputed area of England and Wales by about 12,000 square miles. But about one half of its surface is occupied by the offsets of the Himalaya mountains, which are inhabited by independent nations, or subject to the Deb Raja, or sovereign of Bhotan: the nations residing in the mountains which skirt the valley on the south are also in a state bordering on absolute independence. Only the level and in some places hilly country which extends along the banks of the Brahmapootra, between 90° 30' and 96° E. long., with an average breadth of from forty to sixty miles, forms what may be properly called the kingdom of Asam, which boundaries may comprehend an area of from 23,000 to 24,000 square miles, or less than half the surface of England.

The Brahmapootra, whose sources however have not yet been visited by any European, rises in the Himalaya range, or some mountains connected with it, between the parallels of 28° and 29°, and the meridians of 97° and 98°. The upper part of its course is first from N. E. to S. W., and then from S. E. to N. W., between high mountains, in a narrow valley, till changing its direction to nearly due south it passes the sacred pool called the Brahmakoond, and soon afterwards leaves the mountain-region and enters the plains of Asam, between 96° and 97° E. long. The general direction of its course in the plain is nearly due west up to the

mouth of the Dihong, which joins it from the north between 95° and 96° E. long.; and from that point till it leaves Asam at Goyalpara (Goalpara) the river is called Lohit, and runs for about 120 miles nearly due south-west, and afterwards to the south of west. Before it takes the latter direction it divides into two branches, which afterwards by re-uniting enclose an island called Majholi, which is upwards of twenty miles in length, with an average breadth of from four to five. After its branches have re-united, the river, running W. by S. for upwards of eighty miles, divides again, and here its branches enclose a much larger island, extending, according to report, five days' journey in length and one in breadth, which, however, seems not to be distinguished by any peculiar name, and terminates at no great distance to the east of Gowahat (Gowhatti, or Gohati), about 80 miles from the boundary of Bengal. Having entered Bengal at Goyalpara, it bears the name of Brahmapootra to its junction with the eastern branch of the Ganges, after which the united river is called Megna. In the valley of Asam it may run upwards of five hundred miles, and is navigable for vessels of considerable burden, or for large boats, as far as Sonpura, twelve miles above Sadiya, or about the 96th meridian.

The tributary rivers which descend from the mountains on the north and south sides of the valley are only navigable as far as their courses lie in the plains, and only in the rainy season, and for a short time afterwards. None of those which join the Brahmapootra from the south have a long course; the most considerable, as the Noa (Little) Dihing, Buri (Great) Dihing, and the Deyong run little more than a hundred or a hundred and twenty miles. But many of those which issue from the Himalaya range are very considerable and bring down a great volume of water, especially the Dihong, which joins the Brahmapootra between 95° and 96° of long., and is not without reason supposed to be the same river which in the table land of Tibet is called the Sampoo or Yarou-Zangbo-tsui, and not a remote branch of the Irrawaddy, as we see it represented in some maps. [See BRAHMAPOOTRA.] Farther to the west it is joined by another large river, the Suban Shiri, whose sources, however, like those of the Manas or Bonash, which falls into it near Goyalpara, are unknown to Europeans.

Asam, though not situated within the tropics, partakes of the tropical climate, the seasons being distinguished by the abundance of rain, or the continuance of dry weather. Three or four months of the year, or from the 15th of October to the month of February, may be calculated on as clear and dry, the sky during all this period being free from clouds; but the remainder of the year is perfectly uncertain. The heavy rains set in about the 15th of June, and continue to the 15th of September, when nearly the whole extent of the valley is inundated. These inundations are chiefly caused by the quantity of water brought down by the rivers from the northern mountains, which is so immense as not only to fill the wide bed of the Brahmapootra, but even the channels of the southern rivers up to the place where they issue from the mountains; these latter rivers themselves contribute little to the inundation. When the inundations begin to decrease, the climate is for some time unhealthy, especially for foreigners, but otherwise it seems not to be worse than the climate of Bengal. At the time of the inundation the inhabited places would be isolated, if they were not connected by causeways, eight feet high and about eighteen feet broad. These causeways are almost the only lasting monuments of human industry in this country, but they have in the late unsettled times partly gone to decay.

The soil all over the valley, except some hilly districts, is alluvial, and the result of the annual inundations: it is perhaps not exceeded in fertility by that of any other country, and would doubtless maintain twenty and perhaps a hundred times the number of its present inhabitants, were it not that the comparatively narrow breadth of the valley and its position between two very extensive mountain ranges, inhabited by warlike and barbarous mountaineers, expose its inhabitants to the continual incursions of their neighbours. To some of them, as to the Abors, the inhabitants of the plains are obliged to pay an annual tribute, and persons are sent down every season to collect it. In other places, especially along the upper Brahmapootra, the mountaineers, as the Miris and the Khamtis, have driven out the Asamese, and settled in the plains. To these causes it must be attributed, that only a very small portion of this

fine valley, certainly not more than a hundredth part, is under cultivation. But since 1826 the English have undertaken to protect the inhabitants of the lowlands; and as they have shown the mountaineers their superiority in arms in different encounters, a speedy change may soon be expected.

The rural economy of Asam resembles that of Bengal, three-fourths of the cultivated land being appropriated to the production of rice, which yields annually two abundant crops; but they are not always sufficient to save the inhabitants from famine. A kind of mustard-seed is extensively cultivated, and chiefly used for making oil; the quantity of sesamum raised is inconsiderable. Wheat, barley, and millet, though they succeed well in the more elevated and drier districts, are not much used. The *Cytisus cajan* was formerly only cultivated for the rearing of the lac insect, but now it is grown for its pulse, other plants being employed as food for the insect. The most common pulse is the hairy-podded kidney-bean. Black pepper is indigenous, and large quantities of it are gathered without cultivation. Other vegetables, such as long chilies, are raised, with choyies, ginger, turmeric, capsicums, onions, and garlic. Cocoa-nuts are rare, and no palm-wine is made: but oranges abound, and are indigenous in the neighbourhood of Sadiya; the fruit is acid, but not disagreeable, and the pulp of a pale yellow, like that of the lime. Cotton is only cultivated by the mountaineers in the southern hills, but silk is produced in great quantities, and seems to succeed exceedingly well. Four kinds of silk-worms are raised, of which that which feeds on mulberry-leaves is not very common. One kind, called *muga*, which is more abundant, lives on a species of *laurus* in the open air, and the cocoons are gathered twice in each year, once at the beginning of the dry season of a red, and again towards the end of the spring of a white colour. The white is reckoned the best, and entirely used by the rich people of the country. The worms which give the silk called *medungori* are reared on a tree, the botanical character of which has not yet been determined, but which is planted for that purpose. The worst kind of silk, called *erendi*, is reared on the ricinus in large quantities, especially about Rungpoor.

The botanical wealth of the valley, and that of the contiguous hill, has not been examined by any botanist. The tea-tree is said to grow in the vicinity of Sadiya, and the gum-copal tree in the Naga hills. The caoutchouc tree is indigenous throughout the country. The sugar-cane succeeds well, but is only cultivated for eating. Betel-leaf, areca-nut, opium, and tobacco, are plentifully produced in every district, and even in the mountains, which in some parts are covered with timber trees.

Oxen and buffaloes are reared, but only for the plough, as the inhabitants do not eat beef. Horses are not numerous, and asses are not reared at all, which is also the case in some other parts of the peninsula beyond the Ganges. The sheep are rare, and covered with hair instead of wool; goats are not numerous, but poultry abounds in every district.

The buffalo is found also in a wild state. The elephant and bear are only met with in the forests and mountains of the eastern and southern districts, but deer, tigers, and leopards abound in the numerous tree jungles. In some parts the small black long-armed apes are frequent, and in some rivers otters and river-turtle of a very large size. Fish and wild ducks are every where plentiful. From the mountains wax is brought down in considerable quantity.

Little is known of the metallic wealth of this country. Gold is found in and collected from the rivers flowing from the north, and a gold-mine is said to exist at the junction of the Deyong with the Brahmapootra, about thirty-two miles in a direct line east from Gowahat. Iron mines are found in the Naga mountains, and coal has been discovered in some of the lower hills; among which also salt-springs are found.

Garnets, seven-tenths of an inch in diameter, are found in syenitic granite rock, in the mountains near the sources of the Brahmapootra.

Asam is divided into three provinces, Camroop, Asam Proper, and Sadiya, of which the first occupies the western districts, from the boundary of Bengal to the 93d meridian; Asam Proper is in the middle, and extends to the junction of the Brahmapootra with the Dihong; and Sadiya lies to the east of it, and stretches to the heads of the sacred river. Asam Proper contains the best-cultivated districts; and the

few places which deserve to be called towns; Jorhath, the residence of the sovereign or *raj*, and Rungpoor, the most industrious place, the ancient capital Gerghong being almost entirely abandoned; but these places exhibit only a collection of huts, and contain no shops, the inhabitants of the country supplying all their necessities by domestic industry.

The Asamese, or inhabitants of the plains, are doubtless of Hindu extraction, which appears from their physical constitution, their language, and their religion. The language differs so little from the Bengalee, that the latter has lately been adopted as the common medium of instruction in their schools. Their religion is Brahmanism, but many of the inhabitants belong to impure tribes. In the parts adjacent to Bengal, there are many Mohammedans, but their religion has degenerated into a heathen superstition.

The better classes dress pretty well: the women are always clothed in silk, and even three-fourths of the male population, especially of the middling classes. Cotton, not being grown in the country, is only used by the rich people, and mostly imported from Dacca, in Bengal. Their habitations are miserable constructions, consisting only of thatched huts, with walls of bamboo-mats, and supported by posts of saul (the *Shorea robusta*, a valuable timber tree), with arched roofs and mud floors. Each apartment forms a separate hut. In such huts are lodged the king and the nobility, as well as the poorest man in the country.

Though they have some skill in spinning and weaving silk cloth, even in this respect they have still much to learn from their neighbours in Bengal; and it seems that they know how to profit by the opportunity now offered to them, some spinning establishments having been lately erected. They have also made some progress in working iron, which is brought from the southern mountains; and in making ornaments of ivory.

The sovereign is considered as the only proprietor of the land, and the cultivators, who are called *pykes*, have only a temporary interest. For the privilege of cultivating the soil and enjoying its fruits, they are bound to work four months of the year for the king, or to pay him a compensation. It would seem that this constitutes the only tax they have to pay.

The mountaineers, who inhabit the ranges to the north, east and south of the valley, are mostly Buddhists, and some of the valleys occupied by them are better cultivated than the plain, chiefly perhaps from not being exposed to hostile invasions. They do not raise much rice, but great quantities of Indian corn, and a small grain named *bubessia*. They cultivate also yams, mustard, pepper, cotton, and tobacco, and rear a great number of animals, especially of the cow kind; for besides the cattle, which are proper to their hills, they keep the small oxen of Asam Proper, and the chowry-tailed cattle of Tibet. Swine, as well as dogs, are numerous among them, and the latter used as food. Their habitations are commonly much larger and more convenient than those of the inhabitants of the plains. These mountaineers speak languages altogether differing from that of the Asamese, and which do not appear to have much affinity to one another.

The Miris occupy the hilly country on both sides of the Suban Shiri, and partly also the plain: the valleys in the Himalaya range, lying farther west, are subject to the Deb-Raja, or sovereign of Bhotan, and on the east of the Miris the mountains on both sides of the Dihong are inhabited by the Abors, whose neighbours on the east are the Mishmis, up to the source of the Brahmapootra. The heights skirting the upper course of this river on the south are occupied by the numerous and powerful tribe of the Sinh-fos; and the adjacent low country is inhabited by the Khamtis, up to Sadiya. The small tribes of the Mowamaras, or Moras, divide the Sinh-fos from the Nagas, who occupy by far the greatest extent of the southern range, and extend to the Cassya and Garrows, on the boundary of Bengal.

We shall not enter into a detail of the manners and customs of these savage nations, but we cannot help noticing the very singular coincidence of the political institutions of the Abors with those of the inhabitants of the Alps in the country of the Grisons. Every village forms a democratical republic by itself, and is governed by the laws enacted by all the inhabitants in a formal meeting. This meeting is called *Raj*, which evidently signifies the *sovereignty*. It is held in the morning, and every male inhabitant has an equal

vote. It appears, though it is not acknowledged by them, that among the Abors, as among the Grisons, some few, either by their superior wealth, hereditary reputation, or real ability, exert a very strong influence over the rest, and can readily sway them to any measure they like. The Raj, however, is extremely jealous, and very vigilant in preserving their democratical rights. Hence they have laws which make the public burdens fall equally on all. In the middle of the village is the *morung*, a large building, which serves as a hall of audience and debate, as a place of reception for strangers, and as a dwelling for the bachelors of the village generally, who by their laws are not entitled to the aid of the community for the construction of a separate house. Their orators seem to have studied rhetoric and to have considered its effects on the minds of their countrymen; they speak in a remarkably emphatic style, dwelling upon each word and syllable. They are wonderfully fond of holding their palavers, at which they are heard with the utmost patience, and without any interruption, and in this particular they are certainly much superior to many more civilized nations. If in an affair of importance the assistance of their neighbours is required, they send ambassadors to the other republics, who are charged to make proposals or to accept what has been proposed by another community.

Before Asam was visited by Europeans, the number of its inhabitants was thought to amount to a million or even a million and a half; but now that most of its districts have been surveyed, it is supposed that the population is not more than 150,000 or 200,000. But this estimate seems rather too low, when we consider the great extent of the country, though it is true that very large tracts are covered with jungle, and show no signs of cultivation nor any traces of inhabitants.

The ancient history of Asam is entirely fabulous. It seems for a long time to have been under the sway of sovereigns of Hindu origin, and to have undergone many revolutions. In the seventeenth century the Mogul emperors of Hindustan sent a numerous army to subject Asam: the conquest succeeded almost without any resistance on the part of the inhabitants and their sovereign, and was effected in the course of one dry season; but no sooner had the rains set in than the whole army was destroyed by disease, and by the Asamese, who returned from the mountain fastnesses, to which, at the time of the invasion, they had retired for security. Very few of this Indian army regained Bengal. In modern times the continual discords and intrigues in the royal family brought it under the dominion of the Burmese, who are said to have treated the people and the sovereign with much severity. The Burmese were expelled almost without a struggle by the English in 1824, and obliged by the peace of 1826 to leave this country and its sovereign under the protection of the East India Company.

The commerce of Asam is of very little importance. The mountains which surround it on all sides, except on the west, are of such a description as to preclude almost entirely

the possibility of conveying commodities to the contiguous countries. The attempts made by the English to penetrate the Himalaya range and to enter Tibet from this side have hitherto not succeeded, nor have they yet discovered a route leading to that country, though it is certain that such a road must exist, as the mountaineers, especially the Abors, are dressed in cloths of Tibet woollens, and possess other articles of the manufactures of that country. It is, however, known that to the north of the Brahmakoond there is a pass over the mountains which are inhabited by the Mishmis, and this pass conducts to a country inhabited by a nation called the Lamas. But it is a journey of twenty days from the river, through an extremely mountainous region, to the country of the Lamas. The Mishmis seem to be an enterprising and commercial tribe. They cross this range, and likewise the mountains which surround the sources of the Brahmapootra, and bring articles of Tibet manufacture to the Khamtis inhabiting the plains on the upper course of the Irawaddy. Two mountain passes lead from the valley of the Brahmapootra eastward to the Irawaddy; but they pass through a sterile mountain region, in which, for ten days' journey, no habitation is seen. From the town of Rungpoor a road leads over the Nuga mountains and descends into the valley of the Ky-an-du-ayn river in the Burmese empire, and this road is even passable for beasts of burden; but since Asam has been withdrawn

from the dominion of the court of Ava, all intercourse with that country seems to have ceased. Two passes across the Garrow Hills connect Camrup with Silhit, a province of Bengal, and one of these passes near the sanatorium (or invalid station) of Churra Punje. The commercial intercourse of Asam at present seems to be almost entirely confined to that with Bengal, which is indeed of very little importance. Asam exports the coarsest kinds of silk, but not in great quantity, and receives in return salt and cotton goods made at Dacca; having few things to give in exchange, the people of Asam pay for some of these imported commodities in gold. (Buchanan, Bedford, Neufville, and Wilcox, in the *Asiatic Researches*; *Asiatic Journal*; *Map of India East of the Ganges* by Berghaus.)

ASAPH, ST., a city in Wales, near the western extremity of the county of Flint, on the road from Holyhead to Chester. It is twenty-eight miles and a half from Chester, and 217 from London.

St Asaph stands on the slope of a small hill between the rivers Clwyd and Elwy, of which the former is to the east of the city and at some distance; the latter (a turbulent stream, which falls into the Clwyd a little farther down) is close to the western side of the city, at the bottom of the grounds of the bishop's palace. From its situation on the banks of this stream, St. Asaph had formerly the title of Llan Elwy, or the town or city of Elwy. The main street of the city, which is built with tolerable uniformity, runs up the slope of the hill from the bridge over the Elwy (which has five arches) to the cathedral, which is on the summit of the hill. There has been some increase of building on the west side of the town on the Holyhead road, and on the north side, or rather north-west, where a road runs parallel to the course of the Elwy towards Rhuddlan. The place is, however, altogether very small; the whole parish, which is extensive, having in 1831 only 3114 inhabitants. There is not any particular branch of trade or manufacture established here; the town contains very few good houses; and, excepting the cathedral, there is little in it to claim attention. There is a parish church at the bottom of the hill near the bridge; and the bishop has a palace, large and convenient though not magnificent, rebuilt by Bishop Bagot, who held the see about the close of the last or beginning of the present century, and enlarged by the present bishop, Carey. The deanery is on the farther side of the Elwy, and nearly opposite the bridge. It is quite new, having been rebuilt by the present dean.

The cathedral is small, but plain and neat. The original structure was of wood, but was replaced by a building of stone. This having been, in 1282, burnt by the English in their wars with the Welch, an attempt was made to transfer the see from St. Asaph, then an open and defenceless village, to Rhyddlan or Rhuddlan, which was fortified. From some cause or other, not well ascertained, the attempt failed, and in 1284 the cathedral was rebuilt; and this may be considered as the present edifice, for the walls have remained ever since. In 1402 the cathedral was burnt by Owen Glyndwr, and only the walls left standing. After having lain nearly eighty years in ruins, it was restored by Bishop Redman, who repaired the walls and put on a new roof. Further improvements or repairs were made by Bishop Owens, who filled the see in the time of Charles I.; but the predominance of the puritan party put a stop to them, and subjected the cathedral and its furniture to some injury. Further repairs were made by Bishops Glemham and Barrow, who successively filled the see after the Restoration (especially by the latter); and also by Bishops Fleetwood (from 1708 to 1714) and Wynne (1714 to 1723). The choir was rebuilt in the time of Bishop Shipley (who was bishop from 1769 to 1787), out of a fund vested in the dean and chapter for the purpose.

This edifice stands on the south side of the main street of the city, in a churchyard of sufficient size to afford a good view of each side. It is a plain cross church, with a square embattled tower in the centre, having a square turret staircase at the north-eastern angle. The dimensions are as follows:—

Length of the church from E. to W.	178 ft. in.
from the west door to the choir	84 4
of the choir	93 8
of the pinnacles, cross aisles or transepts N. to S.	108
of the Asapher nave and side aisles	68
of the nave from the pavement to	60

These dimensions differ from those given in Brown's *Survey of St. Asaph*, and in the *Beauties of England and Wales*, especially in the length assigned to the choir, which has been very much enlarged, while the length from the west door to the choir has been diminished by the alteration in an equal degree. The alteration took place in the spring of the year 1833; and the space taken into the choir is that between the arches that support the square embattled tower, 34 feet 8 inches in length, by 29 feet 9 inches in width. A new organ was put up at the same time. The choir and transepts have no side aisles.

The nave and transepts are of the age when the decorated style of English architecture prevailed, which was, according to Rickman (*Essay on Gothic Architecture*), during the reigns of Edward II. and III. A.D. 1307 to 1377: but this style must have been in use before, as we have seen that the walls were raised in 1281. The architecture of these parts contains some singularities and beauties, among which may be reckoned the west window, and the painted window at the east end of the choir, from a picture by Albano, representing our Saviour about twelve years old, surrounded by angels, and the various instruments of torture, such as the cross, the nails, and crown of thorns. The belfry windows appear to have been altered. The piers and arches of the nave, as also the western door, have plain but bold mouldings. The clerestory windows of this part are small square apertures with portions of tracery, which appears to be ancient. The windows of the transepts, though not remarkable for their tracery, are of decorated character. The choir, which, as noticed above, was nearly rebuilt in the time of Bishop Shipley, is an attempted imitation of ancient work, but has no real resemblance to any style, though apparently intended to imitate the perpendicular. The tower and some other parts have partially undergone a similar renewal to that of the choir. A portion of the transepts is cut off to form the chapter house and vestry, and there are neither additional buildings, nor, according to Rickman, any trace of any; but the older plans and drawings of the cathedral, which we have seen, represent the chapter-house as built out from the north side of the choir, and having a door opening into it from the choir. The buttresses about the church are few. The tower is ninety three feet high, and commands a fine view of the rich and extensive vale of Clwyd. It has only one bell in it, though there are frames for eight. It is built of squared stone, of which some is red, intermixed with a harder sort of a brown or grey colour. The stone used in the choir, and in most of the windows of the church, is soft, red, and mouldering. None of the monuments call for notice except one, supposed to be that of Bishop David Owen (ob. 1512), which was moved from the choir on the repair of the latter; another, lately erected by subscription to the memory of Dean Shipley; and a third, a heavy pile, erected to the memory of Bishop Luxmoore.

The see of St. Asaph is said to have been founded by Kentigern, or, as the Scottish historians call him, St. Mungo, who was bishop of Glasgow. Having been driven from his see about the middle of the sixth century, he took refuge in North Wales, established a monastery, and erected a bishopric near the river Elwy. Upon his recall to Glasgow, he left this charge to his disciple Asaph or Husaph, a native of Wales, from whom the cathedral and the diocese got their designation. In the wars between the English and Welch, in which the frontier situation of St. Asaph was very disadvantageous to it, the early records of the see perished, and there is a long hiatus in the list of bishops. In modern times the bishopric has been held by men of eminence for talent, piety, and learning. Among these may be mentioned Bishop Lloyd, one of the seven committed to the Tower by James II., Bishops Beveridge, Tanner, Shipley, and Horsley.

The bishop's revenue was valued in 26 Hen. VIII. at 202*l.* 10*s.* 6*d.* in the whole, and 187*l.* 11*s.* 6*d.* clear. We have no data for ascertaining its present value.

The diocese comprehends Flintshire, Denbighshire, and Montgomeryshire (with the exception of a few parishes), and parts of Merionethshire and Shropshire. There were in it, at the beginning of the present century, 130 benefices, viz.

55 rectories,
48 vicarages,
13 parochial curacies,
14 chapels,
130

all of which, except seven, are, together with the deanery, in the gift of the bishop. It is divided into eight deaneries, viz. Rhos, Tegengle, Bromfield and Yale, Marchia, Penllyn and Idernion, Pool, Caedewen, and Cyfeiliog and Mowdd

a dean (who has a house west of the town beyond the river Elwy), six prebendaries, seven canons curial, four vicars choral, an organist, six lay clerks, and six choristers. The archdeaconry has been held *in commendam* with the bishoprick ever since 1573, for the better maintenance of the latter.

The parish church is a small building, of two aisles parallel to each other, and has no steeple.

St. Asaph has a weekly market, viz. on Friday; and four fairs in the year, on Tuesday in Easter week, July 15, October 16, and December 26. The petty sessions for the division of Rhuddlan are held here. There is an almshouse for eight poor widows, founded by Bishop Barrow (uncle to the celebrated Dr. Isaac Barrow), a prelate of eminent benevolence and goodness; and an endowed school for boys.

The parish is large, and contains many townships. It extends into Denbighshire, and is five miles from east to west, and four from north to south. By the late reform bill St. Asaph has been added as a contributory borough to Flint. The boundary of the borough comprehends a considerable portion of land beyond the town, but is not by any means so extensive as the parish. The number of houses valued at ten pounds and upwards yearly value, within the limits, is ninety-three.

The country around the city is very beautiful. Within the parish is Capel Ffynnon Vair (Chapel of our Lady's Well), a picturesque ruin, near a spring, from which it takes its name, once much resorted to by devotees.

From the name of the eminence on which the city stands, *Bryg Paulin*, it has been conjectured that the Roman general Suetonius Paulinus encamped here on his way to or from Anglesey. [See *Anglessey*.] (Browne Willis's *Survey of St. Asaph*; Pennant's *Tour in Wales*; Bingley's *Tour round North Wales*; Rickman's *Essay on Gothic Architecture*, &c.)

ASARIUM (in botany), a genus of plants, belonging to the family of the Aristolochaceæ, distinguished by having the calyx bell-shaped and three lobed; the stamens placed upon the ovary, the anthers adnate to the middle of the filaments, the style short, stigma stellate, and six-lobed; the fruit capsular, and six-celled. The *A. europæum* is known by having two obtuse kidney-shaped leaves on each stem. It is a perennial plant, found in woods in different parts of Britain. The root, which is employed under the name of *asarabacca*, contains a camphor-like principle, and a bitter principle, called asarin, which is combined with gallic acid. To these it is indebted for its action on the human system. Taken into the stomach in a state of very fine powder, it causes vomiting; in coarser powder, it generally purges. It was formerly employed as an emetic instead of ipecacuanha; but, from the violence of its effects, it is now properly laid aside in medical practice: it is still, however, used in veterinary medicine, to vomit and purge. The fine powder applied to the nostrils causes sneezing, and a flow of mucus from the membrane which lines those parts. It is therefore extensively employed as an errhine, and is the basis, or chief ingredient, of many cephalic snuffs. It is used in chronic inflammations and some other diseases of the eye, and in headaches. Where these last arise from disorders of the digestive function, such means can be of no avail: where they are connected with congestion or fulness of the vessels of the head, the increased discharge from the Schneiderian membrane may give temporary relief in the same way as a few drops of blood, flowing spontaneously from the nose, or obtained by puncturing the membrane. When taken into the stomach in considerable quantity, it acts as a poison.

ASBESTUS must be considered, in mineralogy, rather as a term implying a peculiar form sometimes assumed by several minerals, than as a name denoting a particular species; it is in fact applied to varieties of the amphibolite minerals, such as actinolite, tremolite, &c., which occur in long capillary crystals, placed side by side in parallel position, and thus giving rise to a fibrous mass. As might be expected, the above conditions are fulfilled in various degrees, and there are accordingly various kinds of asbestos. Those varieties, the fibres of which are very delicate and regularly arranged, are called amianthus, a Greek term signifying *unpol-*

lated, unstained: the individual crystals are here readily separated from each other, are very flexible, and elastic, and have a white or greenish colour with a fine silky lustre. Though a single fibre is readily fused into a enamel, in mass it is capable of resisting the ordinary flame, so that when woven it produces a fire-proof cloth, and hence the name from the Greek *ἀσβεστός*, in the sense of *indestructible*. The most beautiful specimens have been found in the Tarentaise in Savoy; but Corsica must be considered as its principal locality, from its great abundance. It is also found in Cornwall at St. Neverne: likewise in several parts of Scotland. It occurs also in the United States of America, where it is sometimes used as a wick for an oil lamp.

Those varieties in which the crystals are coarser, with scarcely any flexibility, are called common asbestos. It is generally of a dull green, and sometimes a pearly lustre, and readily fuses before the blow-pipe flame. It occurs more frequently than amianthus, and is usually found in veins traversing serpentine.

There are three other varieties, known by the names of mountain feather, mountain wood, and mountain cork, which differ from the common asbestos by the fibres interlacing each other. The two first have received their name from their appearance; the third from its extreme lightness, and from its swimming in water. They have been found in Scotland.

ASCALABOTES, in zoology, a genus of reptiles. [See *GECKO*.]

ASCALON (*Ἀσκάλων*), a town of Palestine, on the shore of the Mediterranean, about twelve miles north of Gaza: it was one of the 'fenced cities' of the Philistines, but shortly after the death of Joshua it fell into the hands of the tribe of Judah; it was afterwards successively under the Assyrians, Persians, Greeks, and Romans.

[Copper Coin in the Brit. Mus.]

There was a celebrated temple of the Heavenly Venus (*Θεῖαν Ἀφροδίτην*) at Ascalon, which Herodotus (I. 105) mentions as having been plundered by the Scythians B.C. 630. Forty rose granite columns, belonging to an ancient temple, in the Greek style, are still standing, with capitals and friezes of the most beautiful marble. This temple is probably the representative of the old Syrian edifice. There are also the remains of a Roman amphitheatre at Ascalon. Antiochus, the academician and the master of Cicero, was a native of this place. In the early ages of Christianity, Ascalon became an episcopal see: and it was one of the strong holds of the Crusaders during the Holy War. On the plains of Ascalon a battle was fought between the Crusaders under Godfrey de Bouillon and the Saracens under the Vizier of Egypt. The cuirasses, casques, and swords of the knights are still found among the ruins.

The town stands on an extensive semicircular hill, the declivity of which is nearly insensible towards the land, but of considerable abruptness on the sea coast. The walls of the town, with their towers and battlements, are still standing, and among the ruins are vast Gothic churches, a palace, and a chapel dedicated to the Virgin, blended with traces of more ancient date. On the roof of the chapel are these words still legible: 'Stella matutina, advocata navigantium, ora pro nobis'; but the place is entirely deserted by every living being, save jackals and antelopes. The Arabs call it Djaurah, and believe it to be the residence of evil spirits; they assert that strange noises of battle are nightly heard amid the ruins. Excavations have been made by Lady Esther Stanhope, who, however, abandoned them on account of the expense.

At a short distance to the northward is a small modern village called Scalona, evidently a corruption of the ancient name; and here is the port for the small vessels that trade along the coast.

Ascalon lies in 31° 35' N. lat., 34° 47' E. long. (William of Tyre: Count Forbin's *Voyage au Levant*.)

ASCARIDES. [See *INTESTINA*.]

ASCENDANT. [See *ASTROLOGY*.]

ASCENSION, RIGHT and OBLIQUE, and **ASCEN-**

SIGNAL DIFFERENCE, astronomical terms, of which the two latter are nearly out of use, while the term *right ascension* is preserved, in a somewhat different signification from its original meaning, to denote one of the angles by means of which the position of a star is ascertained.

If we suppose a person at the equator, looking directly towards the east, and raising his arms on each side till they are horizontal, his fingers will then point towards the two poles (which, at the equator, are in the horizon), and a line drawn through his arms will be a part of the axis on which the heavens appear to turn. Every star will rise vertically, that is, if the diurnal motion were quick enough to justify the phrase, would appear to shoot above the horizon directly upwards. The great circle of the heavens which his eye traces out as he raises his head without turning to right or left, is the equator, and the same point of the equator rises every day with the same star. If there be a remarkable star in the equator, from the rising of which the spectator chooses to begin his *astronomical day*, he will know the time of rising of any star as soon as he knows how far the point of the equator which rises with it is from the star at whose rising he begins to count the twenty-four hours.

Suppose, for example, it is 60° ; then, since the whole 360° of the equator rise in twenty-four hours, 60 of them will rise in four hours, or the star will rise at four o'clock of his astronomical day.

Let O be the spectator, N and S the north and south poles, E the east point of the horizon, EZ part of the equator, and A the star. Through the north and south poles and the star draw a circle N A S, cutting the equator in T. Then if Q be the star at the rising of which the astronomical day begins, the number of degrees in QT is the right ascension of the star.

Instead of the horizon NES, any other circle may be substituted which passes through N and S; for example, the meridian N Z S. For, draw any circle through N and S, then the diurnal motion will bring A and T upon that circle at the same moment, and Q and T will pass that circle one after the other with the same interval as occurred between their times of passing E, or their times of rising.

Substituting the meridian (which always passes through the poles) for the horizon, this method of reckoning may be used in any latitude. For the same point of the equator always comes upon every meridian with the same star; but, instead of using a star in the equator as the point from which to reckon, the vernal equinox is preferred, or the point at which the sun's path crosses the equator when he ascends into the northern hemisphere. The distance of the point of the equator just mentioned from the vernal equinox, measured upon the equator according to the order of the signs, in degrees, minutes, and seconds, is the right ascension *in space* [see **ANGLE**] of the star. The same turned into time [see **ANGLE**] is the right ascension *in time*, and indicates the interval which elapses between the times when the equinox and star severally come on the meridian. The whole time which a star takes to complete its diurnal revolution, or the *sidereal day* [see **DAY**], it must be recollected, is not the common solar day, but about four minutes shorter.

The old term *oblique ascension* is an extension of the *right ascension*, as derived from our first illustration, to the *oblique sphere*, in which one pole is above the horizon, and the other below. Let P be the north pole, Z the zenith, EQ the equator, Q the vernal equinox. Let A be a star at its rising, and T the point of the equator which comes to the meridian with it (and would rise with it to a person at the equator). In the latitude represented in the figure, E is the point of the equator which rises with it, and QE is what used to be called the oblique ascension: the right ascension is QT; and TE, the difference between the oblique and the right ascension, was called the *ascensional difference*,

but was principally applied to the sun, because when turned into time, it shows the time before or after six o'clock, at sunrise. The ascensional difference is found by the following formula.

$\text{Sin. asc. diff.} = \tan. \text{latitude} \times \tan. \text{star's declination.}$
When the star's declination is north, from the right ascension *take* the ascensional difference; when south, to the right ascension *add* the ascensional difference: the result is the oblique ascension.

For the method of determining the right ascensions of the stars, see **TRANSIT INSTRUMENT**, **EQUINOX**.

ASCENSION DAY, a festival of the Christian church, on which the ascension of Our Lord is believed by some authors to have been celebrated from the very first century of the Christian era. It has been held for ages on the Thursday next but one preceding Whit-sunday. (See Brady's *Chron. Calendaria*, vol. i. p. 357.) It is also called *Holy Thursday*, a name by which it has been known in this country at least as far back as the time of King Alfred, in whose laws it occurs, On þone halgan þunneſdæȝ (or the holy Thursday).

It was on this day, or on one of the three days which immediately preceded it, and which were considered as days of preparation for it, that in ancient times the minister of every parish, accompanied by his churchwardens and parishioners, was accustomed to go round the limits of his district, to deprecate the vengeance of God, to beg a blessing on the fruits of the field, and to preserve the rights and boundaries of the parish. The week in which Ascension Day occurs is usually called Rogation Week, from the Rogations or Litanies which were used in the perambulations. The Anglo-Saxons called the days of this week *Lang dagas* (walking days), from the perambulations which were made. In London such parochial processions are still observed on Ascension Day itself.

Pennant, in *his Tour from Chester to London*, p. 30, tells us that on Ascension Day the old inhabitants of Nantwich piously sang a hymn of thanksgiving for the blessing of the Brine. A very ancient pit, called the Old Brine, was also held in great veneration, and, till within these few years, was annually, on that festival, bedecked with boughs, flowers, and garlands, and was encircled by a jovial band of young people, celebrating the day with song and dance.

It was upon Ascension Day, too, that the Doge or chief magistrate of Venice was formerly accustomed, by throwing a gold ring into its bosom, annually to espouse the Adriatic Sea; using the words 'Desponsamus te, Mare, in signum perpetui dominii.'—We espouse thee, O Sea, in testimony of our perpetual dominion over thee.—This practice, which is said to have originated in a grant from Pope Alexander III. to the Venetians, of power over the Adriatic Ocean as a man has power over his wife, ceased only with the government of the Doges.

ASCENSION ISLAND lies in the south Atlantic, between Africa and Brazil; the nearest land is the island of St. Matthew, 520 miles to the N.E. It is 68½ miles to the N.W. of St. Helena, and 1450 from the coast of Africa. Its form is an oval, seven miles and a half long, and six wide. Like all the islands in the Atlantic, it is of volcanic origin, presenting a surface of rugged conical hills, of different sorts of lava, from 200 to 300 feet in height, some of them with perfect craters. At the eastern part of the island is a double-peaked mountain of gritty tufaceous limestone, which rises to the height of 2818 feet, and from its comparatively verdant appearance has obtained the name of Green Mountain. The whole island is of a naked, desolate character, with a vast quantity of rocks lying upon each other in a very irregular way, with great chasms between them, and strewed with scoriam, pumice, and other volcanic substances, so that one might as well walk over broken glass bottles. The sea-coast is alternately of a black nitrous lava,

and of white beaches, formed by the pulverization of coral and shells, with calcined stones as light as dust. There are, however, about the middle of the island, between the hills, several little plains divided into small spaces, and so remarkably distributed as to appear like parcels of land cleared of stones, and separated by walls.

The island was discovered by João de Nova Galego in 1501, and is said to derive its present name from having been seen on Ascension Day. It was then entirely barren and uninhabited; not a shrub was seen; and the only vegetation which it produced was some coarse grasses, ferns, purslain, a species of convolvulus, and a milkthistle. There were goats, rats, mice, land crabs, and some few insects on the island. It was also much frequented by sea-fowl, such as the frigate and tropic birds, tern, boobies, and gannet, with whose nests the lower part of the island was covered; being hitherto undisturbed by man, they suffered themselves to be knocked down with sticks, or even laid hold of while sitting on their eggs. Turtle were found in great abundance, and the bay afforded a plentiful supply of fish—cavalas, old wives, conger-eels, and rock-cod, in consequence of which the island was much frequented by homeward bound vessels from the Cape of Good Hope and the East Indies: it was also a great resort for smuggling vessels from our American colonies, who used to meet the *Indiamen* here on their return home. It was long supposed to be without any stream or spring of fresh water whatever; but small springs have since been discovered, and have obtained the name of Dampier's Springs, from that celebrated navigator having been cast away here on his return from New Holland.

In 1815, during the confinement of Napoleon at St. Helena, the British government took possession of Ascension as a military station, and maintained on it a garrison, consisting of a naval lieutenant as governor, with sixty officers, seamen, and marines, who fortified the island with seventeen guns, the greater number at English Road, where they erected barracks and storehouses of the compact lava (the pulverized coral on the beach forming excellent cement), and contrived to cultivate small gardens, and rear some live stock. A look-out station was established on Green Mountain, where a small spring was discovered which soon yielded an average daily supply of about 110 gallons.

In 1821, the establishment was changed to a major of marines, as governor, with a staff of officers and a party of about 200 privates, most of whom were artificers and labourers, with a number of liberated Africans. From the attention and exertion of the garrison, the island is now in a state of progressive improvement as to its resources, natural and artificial. Roads have been made and iron pipes laid down to convey the water from the springs (an operation that used to be performed by asses and mules) to the fort, near which a large tank has been excavated, capable of containing 1700 tons, by which it is hoped that a supply of water may always be obtained sufficient for a squadron. Pasturage is rapidly making its appearance; there is a moderate supply of cattle and sheep, which, with turkeys, guinea-fowl, and almost every description of live stock, thrive well: geese and ducks, however, succeed but indifferently, owing to the want of fresh-water streams and pools. The wild goats, to the number of about 600, are allowed to wander in herds, feeding on the herbage they can procure, amongst which are some aromatic herbs which give a peculiarly fine flavour to the mutton. During the season, which is between February and July, when the turtle come ashore for the purpose of depositing their eggs, parties are stationed on the beach to turn as many as are likely to be required before the next season, which are afterwards kept in a large salt-water pond to be taken out at pleasure. Their general weight is from 400 to 700 pounds.

In order to destroy the rats with which the island was overrun, a number of cats were introduced, which, however, multiplying and becoming wild, proved very destructive to the young fowls and rabbits, so that the garrison have been compelled to call to their assistance a colony of bull-terriers to wage war on their combined enemies of the feline tribe. Guinea-fowl are very abundant, partridges, pigeons, and rabbits, from the Cape of Good Hope, with other species of game, have been imported, and the horse has lately been added to the list of their useful and domestic animals.

On the Green Mountain, above the height of 2000 feet, all sterility ceases; the soil is a rich mould, yielding sweet

potatoes, Cape gooseberries, onions, carrots, peas, beans, cabbages, radishes, and in short, almost every species of esculent vegetables; there are at present upwards of seventy acres under cultivation. In the valleys also, where the soil offers any prospect of success, spots are set apart for the cultivation of vegetables. Several kinds of fruit have been successfully tried, and thus an island which was once a desert cinder, now yields most useful vegetable productions; and as the climate is exceedingly healthy, it is obvious that this establishment will repay the liberal attention that has been bestowed upon it by affording an eligible rendezvous and dépôt of stores and provisions for any squadron destined either for the coast of Africa or Brazil. Including civil officers, the expense of the establishment is 10,400*l.* per annum.

The anchorage, though an open bay, is perfectly safe, and the island is never visited by gales of wind, but a heavy surf rolls on the beach, which sometimes interrupts the communication with the shore for days together. There is no regular tide, and the rise and fall is very trifling. On Green Mountain the annual range of Fahrenheit's thermometer is from 58° to 82°.

The fort is in 7° 56' N. lat., 14° 21' W. long. (Purdy's *Atlantic Memoir*, and various sources.)

ASCETICS (*ἀσκητική*), a term applied to the pugilists, wrestlers, and other athletes, among the antient Greeks, who prepared themselves by abstinence for their combats; subsequently, the term was extended to all those who practised the severity of virtue. The exercise of severe virtue among the Pythagorean and Stoic philosophers was called *ἀσκησις*, *askesis*; it consisted in chastity, poverty, watchings, fasts, and retirement. The ascetics seem to have had an Eastern origin. The Brachmans, Germani or Sarmati, Samanai, Hylobii or Allobii, Gymnosophistæ in Asia, and other sects in East-Africa, were ascetics, who like the present Sanyassians, Talapains, and Bonzes, in eastern Asia, exercised their ingenuity in devising new methods of self-torture. For the Jewish ascetics, see the articles *NASIREANS*, *ESSEES*. According to Eusebius (*Hist. Eccl.* ii. c. 23), James the Just, the brother of Jesus, was an ascetic at Jerusalem before the destruction of that city. The Christians were in the earlier centuries more distinguished by their purity of morals than by ascetic austerities. In the second century, the Christians began to distinguish between the commands given to all believers and the evangelical advice which they supposed to be applicable to those only who aimed at the higher sanctity of ascetics. The Christian ascetics were divided into *abstinentes*, or those who abstained from wine, meat, and agreeable food, and *continentes*, or those who, abstaining from matrimony also, were considered to attain to a higher degree of sanctity. Many laymen as well as ecclesiastics were ascetics in the first centuries of our era, without retiring on that account from the business and bustle of life. Some of them wore the *pallium philosophicum*, or the philosophic mantle, and were therefore called Christian philosophers, and formed thus the transition link to the life of hermits and monks, which was regulated in the fourth century. [See *HERMITS*, *MONKS*.] (Du Fresnoy *Glossarium Medicæ et Infimæ Latinitatis*, &c. v. *Askēta*; Mosheim, *De Rebus Christ. ante Const. M.* p. 311, &c.; Deiling, *Observationes*, t. iii. p. 615, &c. *De Vet. Ascetis*; Plato, *De Republ.* l. iii. p. 297, ed. Bip. tom. vi.; Plutarchi *Ipseus*; Epictet *Disert.* l. iii. c. 12, on *Askēsis*; Güters, *Mythengeschichte der Asiatischen Welt*, i. p. 138, seq. 170, 192; *Petri in Ersch und Grubers Encyclop.*; Neander's *Kirchen Geschichte*, b. i. abth. 2; Zimmermann on *Solitude*, pt. ii. chap. 3, *On the religious retirement in the first ages of the Christian Church*, &c.; Bryant's *Mythology*, vols. 4 and 5 of the 5vo.)

ASCHAFFENBURG, a principality, on both sides of the Main, and in the western part of central Germany: it is bounded on the N. by the Electorate of Hesse, on the W. and S. by the Grand Duchy of Hesse, and on the E. by the Bavarian dominions, of which it forms at present a portion, included in the circle of the Lower Main. It is 357 square miles in superficial extent, and, before the French revolution, belonged to the Electorate of Mentz. In 1803 it was made over to Archbishop Charles of Dalberg, ephemeral Arch-Chancellor elect under Napoleon: three years afterwards it was annexed to the Grand Duchy of Frankfurt; and in 1811 it was transferred to Bavaria, by virtue of the treaty concluded on the 19th of June between that power and Austria, and in exchange for the greater part of the territory of Salzburg, and some minor dependencies. The

noble forests of the Spessart and Odenwald occupy a considerable part of the eastern surface of this principality: the former alone is nearly seventy miles in length, and occupies an area of 672 square miles, between the most northern limit of Aschaffenburg and the territory of Würzburg: the elevated ridge on which the forest stands is a subsidiary range of the Rhetian Alps, and is rich in copper, cobalt, arsenic, lead, and iron. The Geysersberg (or Vulture's Mount) near Rohrbrunn, which has an elevation of 1875 feet, is the highest point in the Spessart. The district of Aschaffenburg, in the Bavarian circle of the Lower Rhine, which includes the town, contains sixty and a half square miles, extends on both sides of the Main, and has a population of about 13,000 souls.

Upon an eminence, forming the termination of a western declivity of the Spessart chain, and on the right bank of that river, in one of the most delightful sites which can be imagined, stands the town of Aschaffenburg, whose municipal existence dates from the eighth century at least. It is surrounded by walls on all sides but that towards the river, is irregularly built, and the streets are mostly narrow, steep, and crooked. The pride of its inhabitants is the Johannisburg, a handsome palace, forming a large and regular square, with towers to each face: it crowns the highest ground in the town, lies close upon the banks of the Main, and was erected by the elector of Mentz between the years 1605 and 1614. He and his successors used it as their hunting-seat, and it is still the occasional residence of the crown-prince of Bavaria. Attached to it are a library, picture-gallery, cabinet of engravings, collection of ecclesiastical rarities brought from the old collegiate church, besides an interesting series of models in cork of antient temples and ruins. The immediate vicinity of the palace abounds in picturesque scenery, and an orangery and botanic garden adjoin its beautiful grounds. The old Gothic collegiate church, which contains the tombs of its princely proprietors, and particularly that of Otho duke of Bavaria, who founded it, the massive buildings of the antient university, the former mansion of the Teutonic order, and the town-hall, are all deserving of inspection. There are also a lyceum, gymnasium, ecclesiastical seminary, an institution for the education of females conducted by the English sisterhood, and a school of design and modelling in the town. Aschaffenburg is celebrated for its manufacture of coloured papers, and carries on a considerable traffic in timber, tobacco, perfumery, wine, and other articles of luxury. The asylum for the indigent is well organized, and has separate accommodation for the infirm and orphans, a hospital, house of industry, &c. Aschaffenburg contains nearly 900 houses, and has eight churches, and 6700 inhabitants. It lies (according to Stein) in 50° 1' 29" N. lat., and 9° 7' E. long., 25 miles S. E. of Frankfort.

ASCHAM, ROGER, was born in 1515, at Kirby Wiske, near North Allerton, in Yorkshire. His father was house-steward in the family of Scrope, and his mother, whose maiden-name is not recorded, is said to have been allied to many considerable families. Roger, their third son, having passed his first years under the care of his parents, was adopted into the family of Sir Anthony Wingfield, who committed his education, with that of his own sons, to a domestic tutor of the name of Bond: and afterwards, in 1530, placed him at St. John's College, Cambridge, then one of the most flourishing in the University.

The destruction of the Constantinopolitan empire had, previous to this time, dispersed the Greeks and their language through Europe, though undoubtedly Greek was known by a few individuals in western Europe long before this time. But Greek now began to be taught in the Universities, and more especially at Cambridge, where a taste for this study had been raised by Cheke and Smith. Immediately upon his admission into college, Ascham applied himself to the study of that language; and, when he had arrived at some proficiency, with a view to quicken his improvement, is stated to have read lectures in it, while yet a boy, to other boys who were desirous of instruction.

Ascham took his bachelor's degree in the month of February, 1534, and on the 23d of March following was chosen fellow of his college: which election, says Dr. Johnson, he considered as a second birth, because it relieved him from the necessity of longer dependence on the bounty of Sir Anthony Wingfield, for whom he always retained a grateful and affectionate remembrance.

In Wingfield's family, Ascham had been educated in the

doctrines of the Romish church; but new learning and new tenets of religion were gaining ground; he entered into the controversies of the day, and gradually became a Protestant. Nor did his love for an academic life confine him to its severer studies only. He was eminent for other accomplishments. He had learned to play on musical instruments, and was one of the few who excelled in the mechanical art of writing; an art at that time highly valued, and the cultivation of which, as an adjunct to his learning, had an influence upon his future fortune.

He became M.A. in 1537, in his twenty-first year; and then, if not before, commenced tutor. Many of his scholars rose to eminence, and one of them, of the name of William Grindal, was made master of languages to the Lady Elizabeth.

As yet, it appears, there was no established lecturer in Greek at Cambridge: the University therefore appointed Ascham to read in the public schools, and paid him from the public purse an honorary stipend: but a lecture being founded by Henry VIII., Ascham quitted the schools, and returned to explain Greek authors in his own college. He was one of those who restored the pronunciation of Greek to our own modern mode of utterance.

To divert himself after the fatigues of study, his favourite amusement was archery; in which he spent or (according to some who censured him) lost much time. They possibly thought it an amusement of bad example in a place of education. To free himself from this censure, he wrote a small treatise, in which the praise and precepts of archery are joined, entitled *Toxophilus*, published in 1541, and dedicated to King Henry VIII., for which the king, at the suggestion of Sir William Paget, rewarded him with a pension of ten pounds a-year, a sum at that time of course worth more than at present.

Ascham, with this allowance and the enjoyment of his fellowship, must have been at least easy in his circumstances. The same year that he published his book he was chosen University Orator, in which office he wrote all the University letters to the king, and to the great men at court. About this time too it appears he was employed in teaching many illustrious persons to write a fair hand, and, among others, Prince Edward, the Lady Elizabeth, and the two brothers, Henry and Charles, dukes of Suffolk.

In 1548, upon Grindal's death, Ascham was called to court, to instruct the Lady Elizabeth in the knowledge of the learned languages, a duty which he discharged for two years, with great reputation to himself, and much satisfaction to his illustrious pupil; but at length, on account of some ill-judged and ill-founded whispers, Ascham took such a distaste to some persons in the Lady Elizabeth's family, that he left her a little abruptly. Dr. Johnson says, 'Of this precipitation he long repented; and as those who are not accustomed to disrespect cannot easily forgive it, he probably felt the effects of his imprudence to his death.' Chalmers says 'he took great and not unsuccessful pains to be restored to her good graces.'

On returning to the University he resumed his studies and the discharge of his office as public orator. His pension had ceased upon the death of Henry VIII., but it was restored by King Edward VI. Other pecuniary assistance also reached him from lovers of learning, and he had a small pension from Archbishop Lee.

In the summer of 1550 he took a journey into Yorkshire to see his native place and old acquaintance, where he received a letter from the court acquainting him that he was appointed secretary to Sir Richard Morysine, then going ambassador to the Emperor Charles V. In his return to London, he paid that memorable visit to the Lady Jane Grey, at her father's house at Broadgate in Leicestershire, where he found her reading the 'Phædon' of Plato in Greek; an interview, the particulars of which he has affectingly detailed in his *Schole-master*.

On the 20th of September following, he embarked with Sir William Morysine for Germany, where he remained three years, and wandered over a great part of that country, making observations upon all that appeared deserving of his notice. He made a short excursion into Italy, and mentions, in his 'Schole-master,' with great severity the vices of Venice. Dr. Johnson says 'he was desirous of visiting Trent while the council were sitting; but the scantiness of his purse defeated his curiosity.' While he was abroad, Ascham wrote a short but curious tract, entitled 'A Report and Discourse of the Affaires in Germany,' in which,

says Dr. Johnson, 'he describes the dispositions and interests of the German princes like a man inquisitive and judicious, and recounts many particularities, which are lost in the mass of general history, in a style which to the ears of that age was undoubtedly mellifluous, and which is now a very valuable specimen of genuine English.'

He was of great use to the ambassador, not only in the management of public business, but in the direction of his private studies, which were for the most part in the Greek language. For four days in the week he explained three or four pages of Herodotus every morning, and more than two hundred verses of Sophocles or Euripides every afternoon. He read with him likewise some of the orations of Demosthenes. On the other three, he copied the letters which the ambassador sent to England; and in the night filled up his diary, digested his remarks, and wrote his own private letters—many to his college—which showed that, in spite of the advantages of novelty and station, he sighed for his return to academical retirement.

While thus employed, his friends in England, in 1552, procured for him the post of Latin secretary to King Edward; but the King, in a short time, died; Marysine was recalled; and Ascham, who came back with him, once more retreated to his fellowship. He had, however, better fortune than he expected. Lord Paget recommended him to the notice of Gardiner, bishop of Winchester, and, though a protestant, his pension was doubled; and he was again instated in the office of Latin secretary, retaining at the same time his fellowship, and his post of public orator. Soon after his re-admission to the office of Latin secretary, he is said to have given an extraordinary specimen of abilities and diligence, by composing and transcribing, with his usual elegance, in three days, forty-seven letters to princes and personages of whom cardinals were the fewest. He was patronised at this time by Cardinal Pole, who, though he wrote elegant Latin himself, sometimes made use of Mr. Ascham's pen.

On the 1st of June, 1554, Ascham married Mrs. Margaret Howe, a lady of good family, who, Chalmers says, brought him a considerable fortune; and of whom he has given an excellent character in one of his letters to his friend Sturmius.

On the death of Queen Mary, in 1554, having previously been reconciled to the Lady Elizabeth, now Queen, he was immediately distinguished by her; and from this time, until his death, he was constantly at court, fully employed in his two offices, one of secretary for the Latin tongue, and the other of tutor to her Majesty in the learned languages, reading some hours with her every day.

In 1559, Queen Elizabeth gave him the prebend of Westwag in the church of York. This appears to have been his only preferment in addition to his places. In 1563, he was invited by Sir Richard Sackville to write 'The Schoolmaster,' a treatise on education, upon an occasion which he relates in the beginning of the book. This work, though begun with alacrity, in hopes of a considerable reward, was interrupted by the death of the patron, in 1566, and afterwards sorrowfully and slowly finished, in the gloom of disappointment, under the pressure of distress. But of the author's disinclination or dejection, there can be found no tokens in the work, which is conceived with great vigour, and finished with great accuracy; and perhaps, says Dr. Johnson, contains the best advice that was ever given for the study of languages. This treatise he completed, but did not publish. It lay unseen in his study, and was at last dedicated to Sir William Cecil by his widow in 1571. Some account of this work of Ascham's, and of his mode of teaching languages, is given by Mr. John Taylor, in his *Essay on a System of Classical Instruction*, London, 1829.

Some time before his death, Ascham was seized by a hectic disease, the most afflictive symptom of which was want of sleep. It was increased by night-studies, when trying to complete a Latin poem which he designed to present to the Queen on the new year; but, on the 23d of December preceding, he was attacked by an aguish disorder, under which he lingered only seven days, and died Dec. 30, 1568. He was interred, on the 4th of January following, in the church of St. Sepulchre, by Newgate.

Although his wife is said to have brought a fortune to Ascham, it is evident that he died in indifferent circumstances, leaving, as she expresses it in the dedication of 'The Schoolmaster,' 'a widow and a great sort of orphans.'

There seems reason to believe that Ascham was improvident. One of his failings is recorded to have been a propensity to dice and cockfighting. As a scholar and a man, however, he died universally lamented; and Grant, who wrote his life, says, that when Queen Elizabeth heard the news of his death, she exclaimed 'she would rather have thrown ten thousand pounds into the sea, than have lost her Ascham.'

The only works which Ascham himself published were 1. *Torophilus, the Schole of Shootinge*, 4to. Lond. 1545; repr. 4to. Lond. 1571; 4to. Lond. 1589, with a pref. by J. Walters; 12mo. Wrexham, 1788. 2. *A Report and Discourse of the Affaires and State of Germany and the Emperour Charles his Court*, 4to. Lond., J. Day. After his death were printed, 3. *The Scholemaster, or plaine and perfit way of teaching Children, to understand, write, and speake the Latin tongue*, 4to. Lond. 1571; repr. 4to. Lond. 1589; revised by James Upton, 8vo. Lond. 1711 and 1743. 4. *Apologia D. et Viri R. A. pro Cerna Dominica contra Missam et ejus prestigias: in Academia olim Cantabrigiensi exercitationis gratia inchoata*, &c., 8vo. Lond. 1577. 5. *Familiarium Epistolarum Libri tres; addita sunt pauca quædam Rogeri Aschami Poemata; omnia collecta operâ et studio E. G. Adjecta in fine ejusdem E. G. Oratio de Vita et Obitu Rogeri Ascham, et ejus dictionis elegantia*, 12mo. Lond. 1576, 1577, 1578, 1590; Hanau, 1692, 1610. Col. Alloh, 1611; the last and best edit. (with the omission of the Poems) by W. Elstob, 8vo. Oxf. 1703. Ascham's English works were published by the Rev. James Bennet, 4to. Lond. 1767, with a Life of Ascham prefixed by Dr. Johnson; repr. 8vo. Lond. 1815. A few of Ascham's original Letters are preserved among the Lansdowne Manuscripts in the British Museum. (See the Latin Life of Ascham, subjoined to the different editions of his Letters, by Edw. Grant, Master of Westminster School, the ground-work of all the biographies of Ascham; Johnson's Life; Strype's Crammer; Biogr. Brit.)

ASCHERSLEBEN, a circle in the south-eastern part of the Prussian province of Magdeburg, containing 168½ square miles, and, according to the census of 1831, 41,059 inhabitants. It possessed at that time 2866 horses, 6036 head of horned cattle, and 67,129 sheep and goats. Quedlinburg is its capital. It is an uncommonly fertile tract of level country, and raises large quantities of corn, flax, and rapeseed. Aschersleben was part of the bishopric of Halberstadt, which was secularized in 1648, and fell to the share of Brandenburg. Between the years 1807 and 1813 it was incorporated with the short-lived kingdom of Westphalia.

The town of this name lies within the circle, close to the confluence of the Wipper and Elbe, and on the banks of the last-mentioned river: 51°46' N. lat., 11°27' E. long.; and 18 miles S. E. of Halberstadt. In former times it belonged to the earldom of Assania, of which the bishop of Halberstadt made himself master in the year 1319. The town is surrounded by walls, with five gates; and has three churches, as many hospitals, a gymnasium, and orphan asylum. The number of its inhabitants, nearly the whole of whom are Lutherans, was, in 1831, 9538. It has very considerable manufactures of flannels, friezes, linens, earthenware, &c. Aschersleben was formerly a Hanse-town. The picturesque ruins of the ancient burgh of Ascam, the patrimonial seat of the house of Anhalt, are in its neighbourhood.

ASCIDIA, a genus of molluscous animals belonging to Cuvier's order of Accephale without shells. Savigny has considered these animals sufficiently important to constitute a class, under the name of Ascedies (Ascidia); while Lamarck has also formed them with others into a class, under the name of Tuniciers (Tunicata.) [See MORLUSCA.]

ASCLEPIADE.E. [See ASCULAPITUS.]

ASCLEPIADE.E. Among dicoyledonous plants there is a natural order which may be known from all others by the single character of its grains of pollen adhering together within a sort of bag which occupies the whole of the inside of each cell of the anther; and when it falls out sticks to glands of a peculiar character occupying the angles of the stigma. Independently of this circumstance, the anther and stigma adhere firmly together, and the fruit is a very curious body, consisting of two carpels, which, when young, are parallel to each other, and united at the point, but when ripe are both on the same plane, pointing in different directions, and shedding a large quantity of seeds, the end of which terminates in long down.

To this order the name of *asclepiadem* has been given, in

[Asclepiadeæ.]

1. A flowering shoot of *Asclepias syriaca*. 2. A single flower magnified. 3. The same seen from above: the centre is occupied by a broad cushion like stigma. 4. The anthera much magnified; *a*, one of the horned processes of the corolla. 5. The same cut vertically, and less magnified; *a*, one of the horned processes. 6. Pollen masses; *a*, the gland. 7. One half of a ripe fruit. 8. A transverse view of its inside near the point, showing how the seeds are arranged. 9. Seed. 10. The same cut across. 11. The same cut vertically, showing the embryo. 12. The embryo separate.

consequence of the genus *asclepias* being the largest which the order contains. It consists of shrubs or herbaceous plants, abounding in an acrid and usually milky juice, and found in their greatest abundance in tropical countries, but rarely in cold latitudes. At the Cape of Good Hope they form a singular stunted deformed vegetation, in the form of the leafless succulent stapelias, the flowers of which are among the most fetid productions of the vegetable kingdom. A great many species of *asclepias* inhabit North America, and for their beauty are frequently cultivated in Europe, especially the orange-coloured *asclepias tuberosa*. Their roots are acrid and stimulating, and usually emetic. Their flowers have curious horned processes, added to the corolla.

ASCLEPIADES. This name was common to a great number of persons, which has caused some confusion both in the antient and modern accounts of Asclepiades the physician, of whom only we are going to treat.

Asclepiades was a native of Prusa in Bithynia, but the time of his birth is unknown, nor can we ascertain which of the three towns of Bithynia called Prusa claims the honour of his birth. He appears, when young, to have spent some time at Alexandria, and at Parium, on the Propontis; probably also at Athens, where, if the story told in Athenæus (iv. p. 168) refers to him, he gained his living at first by grinding at a mill during the night, in order that he might attend the lecturers on philosophy during the day. In Athens he appears to have been on terms of intimacy with Antiochus, the academician, the master of Cicero.

It is not known in what year he came to Rome, but he lived there at least during the earlier part of Cicero's life; he was probably some years older than the Roman orator. He is said to have lived to a great age, free from all disease, and to have died by accidentally falling down stairs.

The foundation of the healing system of Asclepiades was the doctrine of corpuscles, which he borrowed from Heraclides of Pontus. His corpuscular elements, which he called *myktoi* (*μυκτοι*), differed from the atoms of Epicurus: they were without form, but still divisible, and subject to change. From the collision of these corpuscles in space, from their fracture, and the accidental union of the fractured parts, arose visible bodies. Thus from a union of corpuscles arose the human form; and the motion of the corpuscles, which compose the body, in the spaces assigned to them, or their pores, produce health or sickness, according as the motion is proper and harmonious, or the reverse. On this arbitrary theory all his pathology was founded. It seems to be a natural consequence that he was little acquainted with anatomy, as Galen remarks: he had no exact notion of the difference between the veins and arteries, he was unacquainted with the use of the nerves, and he founded them with the ligaments.

He is said to have been the first who divided diseases into acute and chronic, and to have considered them essentially different. Like his predecessors, he considered fever as an unnatural heat in all or most parts of the body, connected with a quick pulse; and he attributed it, as well as inflammation, to obstruction. When the larger corpuscles cause a more stubborn obstruction, more dangerous fevers arise; when the obstruction is caused by the finest particles fixing themselves in the pores, the fever is less violent. Accordingly, the character of intermittent fevers is explained by the various size of the corpuscles, since it is the finest particles that cause obstruction in a quartan, the larger in a tertian, and the largest of all in a quotidian fever.

He observed the double-tertian fever which was so common in Rome, and is described by writers after him. [See AGUE, vol. i. p. 223.] He distinguished very accurately between the violent or febrile dropsy, and the chronic one, unaccompanied with fever.

The practice of Asclepiades was in many respects good. He trusted more to dietetic means than to the use of medicines; and often recommended a change in the mode of living, in which he studiously attended to the most minute particulars. He disapproved of the frequent use of emetics and purges, and in place of the latter he recommended clysters. Blood-letting he practised pretty often, especially in inflammatory cases; but yet he considered that this practice was not equally useful in all climates. On the Hellespont, near his native country, it was often very serviceable, but in Rome and Athens frequently dangerous. He recommended cupping to be used with great caution.

He approved of friction in many cases, the gentle motion of the sick in a kind of hanging bed, and to him we must

perhaps attribute the shower bath, *pensilis balnearum usus* (see Plin. xxvi. 3), if Sprengel's interpretation is right. Asclepiades gained great favour among the Romans by his use of wine in many complaints, in which, up to his time, it had not been employed; yet he prescribed it with caution. Sometimes he used it even in febrile cases to restore the drooping strength, and he prescribed it also to persons who were convalescent. Laughter, music, and singing he also considered as frequently efficacious in the cure of diseases.

The school which Asclepiades founded continued for some time, and produced several writers, who diffused his principles and practice with more or less exactness.

Asclepiades, according to Pliny (xxvi. 3), was originally a rhetorician; Cicero also (*De Orat.* i. 14) speaks of his eloquence. Pliny treats him as an impudent quack, who gained great practice by humouring the whims of his patients, and prescribing such remedies as would be sure to please. If we are inclined to view him as an adventurer in the medical line, such as start up occasionally in modern times, still, as much of his practice was very good and safe, we may give him credit for being at least a clever quack.

For further information on Asclepiades, see Sprengel, *Versuch einer pragmatischen Geschichte der Arzneikunde*, 2nd ed. Halle, 1800, vol. ii. 6-27; and Asclepiadis Bithyni *Fragmenta*, by Gumpert, Weimar, 1794; Chr. F. Harless, *Medicorum veterum, Asclepiades*, &c. Bonn, 1828.

ΑΣΚΛΗΠΙΑΔΗΣ.

The bust of Asclepiades is only presumed to be his on the ground of the name occurring upon it, and from the improbability of its belonging to any other person of the same name, all of whom were men of much less note than the physician.

ASCOLI, (*Asculum Picenum*), a town in the Papal State, in the province called *La Marca*, and in the administrative delegation of "Fermo ed Ascoli." It lies on the right or southern bank of the Tronto, and between it and the Castellano, just above the confluence of the two rivers, in 42° 50' N. lat., and 13° 37' E. long. It is built on a rising ground, commanding a fine and fertile plain, which is enclosed by the Apennines, except on the eastern side, where the river Tronto flows through a valley towards the Adriatic Sea, from which Ascoli is distant seventeen miles. The main ridge of the Apennines rises about ten miles westward of Ascoli, forming the high summit called Monte della Sibilla, 7212 feet high. The valley of the Tronto is celebrated for its fertility: it abounds in vines, olive, and other fruit trees, and is studded with villages and country-seats. The mouth of the Tronto, called Porto d'Ascoli, is defended by a castle; and there is anchorage for small vessels. Ascoli is a frontier town of the Papal State, being only three miles from the boundary of the kingdom of Naples, and fifteen miles N.W. of Teramo, the chief town of Abruzzo Ultra II. A post road leads from Ascoli to Teramo, and thence to Sulmona and Naples. Another road leads from Ascoli eastwards to the mouth of the Tronto, and thence northwards along the Adriatic coast to Fermo and Macerata, where it joins the high road from Loreto to Rome. The Via Salaria was formerly the direct road from Rome to Asculum; after passing Reate it ascended the valley of the Velino, and crossed the Apennines between the sources of that river and those of the Tronto.

The origin of Asculum is lost in the obscurity of the ante-Roman ages. Its foundation has been attributed to the Sabines, who sent a colony north of the Apennines, whose descendants the Picentes were. The name of Asculum has been conjectured to be derived from a species of oak called in Latin *æsculus*, and now by the natives *es-hio*, with which the neighbouring mountains abound. Asculum was the chief town of the Picentes, and it was at one time allied to Rome; but having afterwards declared against the latter, was taken after a battle by the consul Publius Sempronius, B.C. 275. After a lapse of nearly two hundred years, passed in subjection to Rome, the people of Asculum joined the Marsian confederacy, and began the social war by killing the Proconsul Servilius, and all the Romans whom they found within their territory. Cneius Pompeius Strabo marched against them, but was defeated and driven within the walls of Firmum. Servius Sulpicius, coming with reinforcements, defeated the confederates, killed Afranius their general, and liberated Pompeius. The following year Pompeius, who was then consul, marched with a fresh army and besieged Asculum. Titus Judacilius, a native of the place, and one of the chief leaders of the confederates, hastened to its assistance, but not being properly seconded by the inhabitants, he could only succeed in throwing himself into the town with eight cohorts. He then put to death those who had been the cause of his failure, and seeing no chance of deliverance, having assembled his friends, he drank poison, recommending them to follow his example rather than behold the destruction of their country. Asculum soon after surrendered at discretion. The consul treated the inhabitants with the utmost severity. The chief citizens were whipped with rods, and then put to death: the rest were led prisoners to Rome or sold as slaves. Their property was confiscated to the Roman treasury, and the moveables given up to the plunder of the soldiers. Among the prisoners who followed the triumphal car of Pompeius, was the wife of Ventidius, one of the chief citizens of Asculum, carrying a child in her arms. This child became afterwards one of the most illustrious generals of Rome, fought under Julius Cæsar in Gaul, and afterwards was Antony's lieutenant in the east, where he defeated the Parthians and avenged the death of Cræsus. The booty made by Pompeius at Asculum was very great: after his death, his son, known afterwards as the great Pompey, was charged, among other things, with having appropriated to himself some books from the plunder of Asculum. (Plutarch, *Life of Pompeius*, cap. 3.) These books were afterwards taken, by Cinnæ, in the pillage of Pompeius's house, during the factions of Marius and Sylla. Asculum was afterwards restored by the Romans, who sent a colony there; and it continued to be the principal town of Picenum. After the fall of the empire, it suffered by the irruptions of the barbarians; its bishops, however, retained, from the 5th to the 13th century, a sort of authority over the town and district; and they continued, until the end of the last century, to be styled Bishop Princes of Ascoli. In 1213, Pope Innocent III. gave Ascoli to Azzo of Este, who was succeeded in it by his son Aldovrando. The town was taken and devastated by Manfred, and retaken by Charles of Anjou. It was for some time under the rule of the Malatesti, the lords of Rimini. It was afterwards united to the kingdom of Naples by Ladislaus. In 1473, it came under the power of the Princes of Carrara, whose authority was confirmed by Queen Joanna II. In 1476, Pope Martin V. having quarrelled with Joanna, took Ascoli, and annexed it to the Papal State, to which it has remained attached ever since.

Ascoli is one of the best built and most pleasant towns in the Papal State. Its buildings are constructed of *travertine*, with which the country abounds. There are eight parochial churches, besides the cathedral, several convents, and a seminary. The churches are rich in paintings, most of which are by native artists: for Ascoli has been remarkably prolific of painters, as well as sculptors and architects. The most noted are the painters Trasi and Ghezzi; and the three sculptors of the name of Giosafatti. On the square del Duomo is the *palazzo anzianale*, a handsome structure, which contains the theatre, a library, and a museum. On the square del Popolo is the government house, where the Papal governor resides. There are many other palaces belonging to the nobility. Among the few remains of antiquity are those of a Roman temple, which has been converted into the church of S. Gregorio Magno having several

Corinthian columns with capitals of beautiful workmanship. Ascoli is surrounded by walls and towers, and has a castle. It was once considered a strong place, on account of its situation. It is a bishop's see, and has a population of 12,000. Pope Nicholas IV. was a native of Ascoli. Francesco Stabili, commonly called 'Cecco d'Ascoli,' was also born here in 1257. He was physician, philosopher, astrologer and poet. He wrote *l'Acerba*, a desultory poem upon natural philosophy and ethics, in which there are some powerful passages; but the language is much inferior to that of Dante, whose contemporary Cecco was.

ASCOLI DI SATTIRIANO (*Asculum Apulum*), a town of Apulia, in the province of Capitanata, situated on a hill near the river Carapella, in 41° 9' N. lat., and 15° 27' E. long., ten miles S.E. of Bovino, and on the cross road from it to Venosa. It is a bishop's see, and gives the title of duke to a Neapolitan family. It is a small town, and we find that the whole diocese had not more than 8250 souls at the close of the last century. Asculum was antiently one of the principal towns of Daunia. It is first mentioned in history on the occasion of the war of Pyrrhus, who fought a battle against the Romans in its neighbourhood. Having afterwards espoused the cause of Hannibal, its territory was given up to the Roman veterans after the expulsion of the Carthaginians. It became afterwards a Roman colony, and its inhabitants were called Asculanenses, being thus distinguished from those of Asculum Picenum, who were called Asculani. Minatius Magius, the ancestor of Velleius Paterculus, was a native of Asculum. (V. Paterc. ii. 16.) Asculum was destroyed by Roger the Norman, but was afterwards restored. It is 66 miles E.N.E. of Naples.

ASCONIUS, Q. PEDIANUS, one of the earliest commentators on Cicero, who is usually considered to have been a native of Padua, though the opinion rests on no surer ground than a passage of Silius Italicus (xii. 212) where he mentions a person of the same name as a native of this city. We are unable to fix the exact period of his birth and death; but from a passage in one of his commentaries (*Ad Orat. pro Scaur.* p. 176, ed. Lug. Bat.) he was employed on his work about A.D. 11, in the reign of Claudius. Philargyrius, quoted by Servius (*Virg. Æn.* iii. 106), states that he was in his youth the friend of Virgil; but he must have been a mere boy when the poet died, A.D. 19, if Eusebius is correct in making him seventy-three years of age in the seventh year of Vespasian's reign, A.D. 76. At that time he became blind, and survived the calamity twelve years. (Euseb. *Chron. ad Olymp.* cccviii. 3.) This circumstance has induced some to suppose that there were two of this name: one, the friend of Livy and Virgil, and the commentator on Cicero's works, the other, an historian of a later period; but such a supposition is opposed by the concurrent testimony of the antients. These are the only facts which are known of his private history. Asconius was the author of a work which has been lost, directed against the calumniators of Virgil, and also of a Life of Sallust (*Aeron. ad Hor. Sat.* 1, 2:) but there seems no reason to suppose that he was the author of the work 'Origo Gentis Romanæ,' usually ascribed to Aurelius Victor. The most important of his labours was his Commentary on the Orations of Cicero, which he wrote for the instruction of his sons (*Ad Orat. pro Mil.* 6:); but under what title, none of the manuscripts enable us to decide. It seems to have extended to all the orations; but only fragments have been preserved, which, though in some of them much disfigured by the glosses of some ignorant grammarian, are still full of valuable information. We are indebted for the greater part of what we possess of Asconius to Poggio, the Florentine, who, during the Council of Constance, A.D. 1416, luckily discovered an old manuscript of it at the Monastery of St. Gall, in Switzerland. This manuscript can no longer be found; but the copy of Poggio is still in the possession of the Biblioteca Riccardiana at Florence. It contained fragments of a commentary on nine orations: *Divin.*; *In Verrem*, 3; *Pro Corn.*; *In Tog. Cand.*; *Contra Pis.*; *Pro Scaur.*; and *Pro Mil.* The general character of the commentary is, that it refers chiefly to historical facts, and has preserved some curious information on various points, with which we should not otherwise have been acquainted. We may more particularly notice the speeches of Cæsar against Dolabella; of Brutus for Milo; of Lucceius against Catiline; and of Cominius against Cornelius. The historians on whom he seems chiefly to depend for his information are Livy, Sallust, and Fenes-

tella. The commentary on the Orations against Verres is of so entirely different a character from that on the others, that it seems not an improbable conjecture that it is the work of some later writer, who availed himself partly of the labours of Asconius. The Latinity is full of barbarisms, and it is more in the style of later grammarians, who devoted their attention chiefly to observations on grammar, etymology, and synonyms. [See Niebuhr. *Prefat. ad Front.* p. xxxiv. not. 4. ed. Berl.] Angelo Mai ascribes to Asconius Peditanus some scholia which he lately discovered in a palimpsestus of the Amorosian Library at Milan, and published in 1814. They are notes on the oration *Pro Scauro*, and on the lost orations, *In Clodium et Curionem*; *De Ære alieno Milonis*; *De Rege Alexandrino*; besides on the still extant orations *Pro Archia*, *Pro Sylla*, *Pro Plancio*, *In Vatinius*. They cannot, however, be considered the genuine productions of Asconius; neither in style, nor in the kind of information they convey, do they resemble his commentary. Another MS. of the tenth century was afterwards discovered at the same library, containing short scholia on the four orations against Catiline, on those *Pro Marcello*, *Pro Ligurio*, and *Pro Deiotaro*. Angelo Mai has still more lately discovered another MS. in the Vatican Library, which he published in 1828, being a collection of the incedited fragments of a commentary on Cicero's Orations. (*Auctor. Class. e Vatic. cod. editi* Angel. Maio. Rom. 1828.) The first edition of Asconius was published, Ven. 1177; with the scholia of Mamutius, Ven. 1547; by Haacke, Lugd. Bat. 1644. See Fabric. *Bibl. Lat.* 11, 6; Madwig. *De Q. Asconii Peditani et aliorum veter. interp. in Cicero. Orat. Commentarius Disput. critic.* Havniæ, 1828; Behr. *Geschichte der Römischen Literatur*, Carlsruhe, 1832.

ASDRUBAL. [See **HASDRUBAL.**]

ASEDI. [See **ASEDI.**]

ASEERGHUR, a strongly fortified town in the province of Candeish, and within the government of the Bombay Presidency. This fortress, with a small adjacent tract of unproductive land, mostly jungle, is in possession of the English; the surrounding territory is subject to Scindia. The town is in 21° 28' N. lat., and 76° 23' E. long., and is situated about twenty miles to the north-east of the city of Boorhanpore, the antient capital of the Candeish province. Ascerghur is said to have been founded by a wealthy Hindu Zamindar, named Assa, and to have taken its name from that of the founder: it was considered as the capital of Candeish when that province was subdued by the emperor Akbar. The fortress crowns the top of a hill 750 feet high, the base of which is for the most part precipitous to the depth of 80 or 100 feet, leaving only two avenues of access, both of which are well fortified. This fortress has the further advantage of being abundantly supplied with water. Its importance, in the eyes of the natives, may be estimated from a name by which it was long distinguished, the key of the Decan.

Ascerghur surrendered, without much resistance, to the army under Colonel Stevenson in 1833; but on the conclusion of peace was restored to Scindia. It made a much better stand in 1819 against a besieging army of 20,000 men, under Generals Doyton and Malcolm; but was at length captured, after sustaining a bombardment of sixteen days, with the loss of 213 men killed and wounded, on the part of the English. The loss, on the part of the garrison, was 138 killed and wounded. On this occasion an entire company of Sepahis, in the pay of the English, were destroyed by the explosion of the magazine, which contained three hundred barrels of gunpowder.

The pettah, or suburb of Ascerghur, stands at the base of the hill whereon the fortress is erected. It is a large irregular village, with only one good street: in 1822 it contained about 2000 inhabitants.

The approach to Ascerghur is through a wild tract of country much infested by wolves and tigers, the latter of which are so daring, as sometimes to have entered the town and carried off some of the inhabitants. Until 1824, the civil and military establishment of Ascerghur was under the Bengal Presidency, but was then transferred to the government of Bombay. (Mill's *History of British India*; Hamilton's *East India Gazetteer*; Major Rennell's *Memoir.*)

ASELLI (or, according to the custom formerly prevalent of Latinizing the name, **ASELLIUS**), CASPAR, a physician who was born in the sixteenth century at Ticino, or Cro-

mona, and became professor of anatomy at Pavia. He is regarded as the discoverer of the *lacteals*, or the set of vessels which absorb or suck up the nutritious portion of the food of animals, *i. e.*, the chyle from the upper part of the intestinal tube, in order to convey it to the heart and lungs, so that it may become incorporated in the circulating fluid or blood. It is certain that, in 1622, he saw these vessels, and from the white colour of the fluid they contained, from the milk-like character of which is derived the name of *lacteal*, distinguished them from the other vessels, and demonstrated them in his lectures. But he was conducted by chance to make these observations, in the course of dissections for other purposes; and he does not appear to have traced the lacteals accurately, for he thought that they terminated in the liver, whereas they terminate in the mesentery.

He drew up, but never published, an account of his discovery. This treatise was printed after his death, which happened in 1626. It is entitled, '*De Lactibus: seu lacteis venis, quarto vasorum meseraicorum genere, novo invento, Dissertatio*,' with figures of the vessels in three different colours: 4to. Milan, 1627, and 4to. Basle, 1628; Leyden, 1610, and again 1611, and 8vo. at Amsterdam, 1645, and lastly among the works of A. Spigelius, folio, Amsterdam, 1645.

Aselli left a MS. treatise on poisons, but it does not appear to have been published.

ASH. [See FRAXINUS.]

ASH, MOUNTAIN. [See PYRUS.]

ASHANTEES, a powerful nation of western Africa. Mr. Bowdich (*Mission to Ashantee*, quarto, London, 1819, p. 228) was inclined to think, from the little he could collect, that the state had been founded by an emigration of a number of families from a former residence of the tribe: the situation of which he conceives to have been to the south-east of the district in which the new kingdom was first established. He states, that the common tradition, which he had never heard contradicted but once, is, that the Ashantees emigrated from a country nearer the sea side, and founded their present kingdom, after subduing certain nations further advanced in civilization than themselves, whose arts, and a portion of whose language, they adopted. The Ashantee, Fantee, Warsaw (Wossa), Akim, Assin, and Aquapim languages, he considers to be indisputably dialects of the same common tongue; and from this and other evidence he infers, that the nations now distinguished by these different names were originally one people. A tradition, indeed, still subsists, that all these tribes are the descendants of twelve families: and from one or other of these stocks individuals in each tribe still claim a descent, branches of the same line being found spread among all the different tribes. There is also a general tradition that their original settlement was not on the coast, but somewhere in the interior, from which they were driven by a foreign power. This appears to be the substance of Mr. Bowdich's account, so far as we can understand it.

The statement of Mr. Dupuis (*Journal of a Residence in Ashantee*, quarto, London, 1824, p. 224) is more specific. He says, that it is agreed by all that the original seat of the tribes of Ashantee, Gaman, Dinkira, and Akim, was in Ghobago, Ghofan, and Tononma, districts in the interior immediately to the north of the present Ashantee Proper; and that from their possessions here they were driven southward into the forest by the Moslems many ages ago, or, as the author expresses it, 'in the early age of Islam.' It was after this that the tract nearer to the coast was gradually peopled by the Fantees, Dinkirans, and other tribes, who were all, in fact, previously established along with the Ashantees in the upper country. As to this point, therefore, it will be perceived, the two accounts are directly opposed, the one making the founders of the Ashantee empire to have been a band of emigrants who separated from the rest of their nation; whereas, according to the other, the Ashantees were the original stock who remained stationary, after being driven southward by the Moslems, while different branches left them to seek habitations nearer the sea coast. We think the latter the more probable account. Mr. Bowdich's two emigrations look very like different versions of the same story.

Mr. Dupuis goes on to inform us, that in the early part of the 17th century Ashantee was considered a powerful little monarchy, and, in conjunction with its allies, could

probably send 60,000 men into the field. It had already obtained a kind of influential control over the neighbouring states of Akim, Assin, Quahou, and Akeyah; and the people had acquired a high renown for their military qualities.

At this time, however, the territory of the Ashantees appears to have been confined to the comparatively small inland district mentioned above, lying in the northern part of their present dominions. Dupuis indeed says that they were unsettled in their habitations, though firm and compact as a nation. The first war by which they are recorded to have secured any considerable increase of dominion was that which resulted in the conquest of the neighbouring kingdom of Dinkira. Dupuis says that this conquest happened, according to the Moslem records, in the year of the Hejira 1132, that is, A.D. 1719; and he quotes, in support of this account, the authority of Bosman, the Dutch governor of Elmina, who wrote, he remarks, in 1721, and who states that it had taken place but a few months previous. But Bosman, the second edition of an English translation of whose book appeared in London in 1724, appears to have written the letters of which it consists in the year 1701. In the first of them, he acknowledges the receipt of a letter from his correspondent in Europe, dated 1st September, 1700. His account of Dinkira and of its conquest by the king of Ashantee, or, as he writes the name, Asiante, is in the sixth letter. He describes Dinkira as lying so far inland that it often took five days to go to it from Elmina, and ten from Axum (a fort near the mouth of the Ancobera river): 'not,' he adds, however, 'so much on account of its real distance from either place, as because of the badness of the roads.' The kingdom of Dinkira, which had formerly been of small extent, had he states, eventually become so powerful, as to have gained the respect of all the neighbouring nations, with the exception only of Asiante and Akim, both of which were still superior to it in strength and resources. Dinkira, however, which held in subjection the three adjoining districts of Wassa, Eucasse, and Juffer, was the chief source from which the supply of gold was obtained. 'But a few months past,' continues the writer, 'it was so entirely destroyed, that it lies at present desolate and waste.' An outrage offered by Bosiante, the king of Dinkira, to one of the wives of Zay, the king of Asiante, made him determine to march against his enemy. Bosiante in the mean time died, but this produced no change in the resolution of the king of Ashantee. 'About the beginning of this year,' continues Bosman, 'being completely ready, he came with a terrible army into the field; and engaging the Dinkirans, who expected him, he beat them; but fighting them a second time, he entirely defeated them. The negroes report, that in these two battles above a hundred thousand men were killed; of the negroes of Akim only, who came to the assistance of the Dinkirans, there were about thirty thousand killed.' He intimates his belief, however, that these numbers must be greatly exaggerated. The plunder consequent upon this victory occupied the Ashantees fifteen days; and the booty collected by the king was said to amount to several thousand marks of gold. Dupuis says that the war with Dinkira is still remembered among the Ashantees. After the great battle, the body of King Bosiante was disinterred by order of the avenging victor; the flesh was given to be devoured by serpents, the skull and thigh bones were preserved as trophies. These relics still remain at the court of the king of Ashantee, and are exhibited on certain holidays for popular insult.

The conqueror of Dinkira, who is called Zay by Bosman, is named Sai Tootoo by Bowdich, and Sai Tooto by Dupuis. Zay, or Sai, or Sai, appears in fact to be the general title of the Ashantee kings. According to Bowdich, Sai Tooto was the conductor of what he calls the later emigration of the Ashantees, and the founder of Coomassie, the capital of the empire. Dupuis denies that he built the town, but allows that he greatly increased its size, and transferred thither the seat of the government, which had previously been sometimes at Kikiwhary, north of Coomassie, and sometimes at Begua, to the south of it. The conquest of Dinkira gave so great an accession of territory and power to the Ashantee state, and so completely altered its relations to surrounding powers, that Sai Tooto, upon whom has been bestowed the epithet the Great, may almost be considered as the founder of the present empire. The history of the country before his time is acknowledged to be legendary and

obscure. He is said to have been the first king by whom the Moslems, or Mohammedan inhabitants, were reduced to the same state of subjection with the heathen negroes, and compelled to serve in his armies. It was in his reign also, that a commercial intercourse with the Dutch settlements on the coast first introduced the Ashantees to an acquaintance with white men. Besides his conquest of Dinkira, he carried his arms into the heart of several other of the neighbouring states. He reduced the king of Gaman to the condition of a tributary; entirely subdued the districts of Tofal, Quahon, and another large extent of country beyond the Tando river, to the west of Coomassie; reduced the government of Akim to partial subjection, and ravaged Assin. 'In short,' concludes Mr. Dupuis, 'he created an empire, including tributaries and allies, which was chiefly of a feudal complexion, by the union of all those kingdoms and principalities between the 6th and 9th degrees of N. latitude, and between the 4th degree of longitude west from the meridian of London, and the river Volta. The auxiliary kingdom of Banna was the right arm of Ashantee in those days, and still is.' The empire of Ashantee, however, was still separated from the coast by a tract of forty or fifty miles in breadth, occupied by the perfectly independent states of Aowin, Amanaha, Abanta, Wossa, Fantee, Lukran, Aquapim, Aquambo, &c. Akim alone had drawn upon itself the resentment of Sai Tooto by its interference on the side of the Dinkirans, and had been compelled to avert the consequences by certain submissions and other sacrifices. It was while engaged in quelling a revolt of this power that Sai Tooto was killed, along with many of his principal nobility, in the year 1731.

He was succeeded by his brother Sai Apoko, in the course of whose reign both Akim and Assin were entirely reduced, and along with Gaman, Bonromy, and Yobati, incorporated as integral parts of the empire. After suppressing a formidable rebellion which suddenly arose in the heart of his kingdom, this sovereign died in 1742. His successor was Sai Akwasy, who after a reign made memorable by a most disastrous campaign with the powerful neighbouring state of Dahomey, lost his life in 1752, from a wound which he received in a war with Banna. His nephew, Sai Kodjoh, then mounted the throne, and reigned till 1781. During his time, a rebellion of several of the recently subjugated provinces brought the empire to the brink of dissolution; but it was eventually quelled, and the influence, if not the actual dominion, of Ashantee, even extended towards the south west, or in the direction of what is called the Ivory Coast. The reign of the next prince, Sai Quamina, was ushered in by a revolt of Assin, Akim, and Aquapim, which was, however, soon suppressed. But after some years, the leading Ashantee chiefs combined and deposed their sovereign, who had rendered himself obnoxious by a scarcely concealed preference for the Moslem creed, which it was believed he wished to establish as the national religion. This event took place in 1797. The brother of the deposed king was elevated to the vacant throne, under the title of Sai Apoko the Second. He reigned till the year 1800, when he was succeeded by his brother, Sai Tooto Quamina, then a boy of seventeen years of age, the same by whom the throne was still filled when Mr. Bowdich and Mr. Dupuis were in the country.

With the exception, perhaps, of that of Sai Tooto the Great, the reign of Sai Quamina has been by far the most important in the annals of Ashantee. Only a few months after his accession, the young king gave proof of his military talents, by conducting a campaign against the united forces of Gholan and Gholago, and defeating them in a decisive battle, in which, it is said, they lost not less than 100,000 men in killed and prisoners. But this must surely be an exaggeration. A considerable accession of territory, and a period of tranquillity which lasted for five years, followed this success. The circumstances out of which new hostilities arose, eventually led also to the intercourse between Ashantee and England, which forms to us the most interesting part of the history of that African nation.

It was in 1807, that an Ashantee army first reached the coast where the European forts are. Down to this time, from the mention of the Ashantees by Bosman early in the preceding century, they do not appear to have been visited by any person from Europe, and their very name had become almost forgotten. Mr. Meredith, who was then second officer in the English fort at Annamaboe, has, in his *Account of the Gold Coast*, given an ample detail of the events which introduced them to the acquaintance

of our countrymen, and corrections or explanations of some points in his narrative may be found in the work of Mr. Dupuis, pp. 250-261. The repose from warlike operations which Ashantee had enjoyed from 1801, was broken in 1806 by a revolt of two of the tributary princes of Assin, who were joined by the Fantees, a nation occupying the tract along the coast on which the forts of Cape Coast Castle and Annamaboe are situated. The Fantees seem to have felt that their independence was endangered by the growing power of the Ashantees; and there is some reason to suspect that the English authorities, ill informed of the relative strength and military skill of the two parties, encouraged a revolution, by which they hoped to prevent the further encroachments of the Ashantees. But the Fantees, though able to bring a numerous army of fighting men into the field, were no match for the Ashantees either in bravery or in the art of war. They were beaten by their enemy in every encounter, and in May 1807, the king of Ashantee had established himself and his army at Abrah, not more than fifteen or twenty miles from the sea. He soon after attacked and made himself master of the Dutch stations of Cormantine and Fort Amsterdam. It was now thought prudent by Mr. White, the governor of Annamaboe, to despatch a flag of truce to the negro monarch, with a request to be informed what object he had in view in coming to the coast. Sai Quamina, who, Mr. Dupuis says, was fully persuaded that this proceeding was merely an expedient to gain time, and besides, was quite aware of the encouragement and promises of assistance which his enemies had received from the English authorities, returned the haughty answer, that the governor should be told what his designs were when he should send him twenty barrels of powder and a hundred muskets. In another week, Aga, a town within a mile of Annamaboe, fell into the hands of the invaders. On the 15th of June, the people of Annamaboe went out in great force to attack the enemy, and the result was, the retreat of the latter, but in excellent order, after a short contest. But on the following day the enemy advanced upon the town, and soon carried every thing before them. Mr. Dupuis states, on the information of the king himself, that it was no part of his plan to attack the castle, that he made no attempt upon that building till the guns had been turned against him, and that even then he did not wish to carry matters to extremity against the whites. That the English, from the first, took the part of the townspeople, not only receiving the old men, women, and children within the fort, but employing all its force to repel the assailants, is acknowledged on all hands. Indeed, in the state to which things had by this time been brought, they could not have acted otherwise. The result, however, proved most disastrous both to the Fantees and their European protectors. The contest lasted from eleven in the morning till six in the afternoon, and in that time it is computed by Mr. Meredith that fully 8000 of the inhabitants of Annamaboe perished. About 2000 more escaped by flight. Of the 15,000 souls, of which the population of the place had consisted, only about 5000 remained at the close of the attack, including about 2000 women, children, and old men, who had found refuge within the English fort. Even of these, many had been destroyed by the shot which fell among them in the open court where they were placed. The garrison itself suffered severely, and was reduced to the utmost extremity. It consisted only of the governor, Mr. Meredith, three other officers, four free mulattoes, and twenty other men of all descriptions. Two men having been killed, and the governor, an officer, and four others of the men, having been wounded early in the contest, the force that could be depended upon was, about noon, reduced to eight individuals, including officers. But about six o'clock the enemy retired, and next day no attempt was made to renew the attack. Its renewal, according to Mr. Dupuis, was only prevented by the arrival in the Ashantee camp of a flag of truce from Governor White. This intimation of a wish for the cessation of hostilities was received with the warmest welcome, both by the negro monarch and his soldiery. That circumstance, which is stated by Mr. Meredith as well as by Mr. Dupuis, is of considerable importance in enabling us to form a judgment as to the original disposition of the Ashantee king towards the whites. These negotiations produced two amicable interviews between Sai Quamina and Colonel Torranne, the governor of Cape Coast Castle, in which every thing was speedily arranged, and the invading army took its departure from the coast on the

1st of July. 'The treaty of peace,' Mr. Dupuis asserts, 'was a formal and a solemn acknowledgment on the part of the governor,—that, by right of conquest, Fantee, including Cape Coast and every other town in the neighbourhood, belonged exclusively to the empire of Ashantee, with the reservation of a judicial authority to the (African) Company over such towns as stood in the vicinity of any of the castles.' It is further alleged, that another demand of the king's was so far acceded to, that some of the inhabitants of Annamadoe, who had availed themselves of the protection of the fort, were given up to be sold into slavery. It is certain that the two Assin princes, whose insurrection had occasioned the war, were, the day before his first interview with the king, ordered by Colonel Torrance, to be seized and sent as a propitiatory present to the victor, whose friendship he was now so anxious to secure. One of them made his escape, but the other was secured. Mr. Meredith is silent as to his fate, presuming, probably, that no reader could entertain any doubt about it. Mr. Dupuis states that he was sacrificed after having been subjected to the most cruel tortures, and that his head is at this day the decoration of the king's death horn.

As might have been expected, the Ashantee monarch did not fail to avail himself, on subsequent occasions, of the road to the coast which he had thus opened by his sword. He repeatedly returned to inflict further chastisement on the Fantees, restless under their new yoke, and constantly attempting to evade the payment of the tribute. Whether they were encouraged or not by the English authorities in these attempts may be matter of doubt. But in 1816 the English again drew upon themselves the resentment of the invader by interfering for the protection of the Fantees; and the Fort of Cape Coast Castle was in consequence subjected to a long and distressing blockade. The besiegers were only at last induced to withdraw their forces by liberal presents. The governor had to pay, in fact, a large sum in gold, which was claimed as the arrears of tribute due from the Fantees. This led to an attempt the following year, on the part of the African Company, to establish amicable relations with the powerful monarch of the Ashantees. An embassy proceeded to Coomassie, the capital of Ashantee, under the conduct of Mr. James, the governor of the fort of Accra, assisted by Messrs. Bowdich and Hutchison, writers, and Mr. Tedlie, an assistant surgeon, in the employment of the company. It is this mission of which Mr. Bowdich has written an account. The party left Cape Coast Castle on the 22d of April, and reached Coomassie on the 19th of the following month. Their reception was in the highest degree favourable: although it was evident from the first, that they would have a very formidable opposition to encounter from the Moors who were established in the city, and whose object naturally was to retain that monopoly of the commerce of the country which they had till now enjoyed. At one of their first interviews, however, the resentment of the king was suddenly excited by something that passed, which led him to infer that his dignity and rightful claims to the sovereignty of the Fantee territory had not been sufficiently respected by the English governor-in-chief on a particular occasion. In meeting this unexpected outbreak, it was conceived by the other members of the mission that Mr. Jones did not evince the intelligence or discretion which might have been expected from him in the circumstances; and Mr. Bowdich, on the instant, resorted to the extraordinary step of superseding his chief, and taking the conduct of the mission on himself. A speech which he made appeased the king's anger for the moment. His representations also, seconded by his two colleagues, induced the governor of Cape Coast Castle to order Mr. Jones home, and to leave in his hands the future management of the negotiation. On the 7th of September, accordingly, a definitive treaty was at last signed by Mr. Bowdich, 'in the name of the governor and council at Cape Coast Castle, and on behalf of the British Government' on the one part, and, according to his account, by both Sai Tooto Quamina, king of Ashantee, and Boitinné Quama, king of Dwabin and its dependencies, on the other. But Mr. Dupuis assures us that there is no such personage as the last mentioned Dwabin, or more properly Juabin, being merely a town in the vicinity of Coomassie, the governor of which never enjoyed the title of king. When, on Mr. Bowdich's authority, he happened to mention the king of Dwabin, the Ashantee monarch heard him with the utmost astonishment. He asserts that

the governor of Juabin signed the treaty merely as an attesting witness. On the other hand, in the translation of the document given by Mr. Bowdich, the two kings are mentioned together in every paragraph. Mr. Dupuis publishes another version, made from the original in his own possession, in which the party contracting with the representative of the Company, appears to be throughout only the king of Ashantee. The principal articles of the agreement were, that there should be perpetual peace between the British and the Ashantees, and also between the latter and all African nations residing under the protection of the Company's forts: that neither party should be considered to have any claim upon the other; that complaints of any injuries sustained should be made by the king of Ashantee, in the first instance, to the governor of Cape Coast Castle; that a British officer should be permitted to reside constantly at the capital of Ashantee, the king engaging to do every thing in his power to promote a commercial intercourse between his subjects and the English settlements; and finally, that certain of the king's children should be committed to the care of the governor-in-chief for education at Cape Coast Castle. A few days after the signing of this treaty, Mr. Bowdich and Mr. Tedlie set out on their return to Cape Coast Castle, and Mr. Hutchison remained at Coomassie as resident representative of the Company.

In the end of 1818, or the beginning of the following year, Mr. Hutchison was recalled by Mr. Smith, the governor of Cape Coast Castle, to fill an office in that fort. But in the meantime Mr. Joseph Dupuis had received from his Majesty the appointment of consul at Coomassie, and had already reached the African coast on his way to that capital. On arriving at Cape Coast Castle he found the aspect of African politics altogether different from what he had been led to expect. The king of Ashantee had set out on an expedition to put down some resistance to his authority in Gaman; and the result of the campaign was the incorporation of that tributary state as one of the provinces of the empire. At the commencement of the war the success of the Ashantees was by many considered very doubtful; and reports were even brought to the coast that the king's army had sustained a great defeat. Mr. Dupuis states that this delusive intelligence was eagerly listened to, both by the Fantees and the authorities at the English forts, who were eager to shake off the Ashantee yoke. The inhabitants of the town of Cape Coast Castle even proceeded to fortify their settlement by the erection of a wall, certainly with the connivance of the English, if not with their direct encouragement and assistance. When the king of Ashantee heard of these proceedings, he immediately gave orders that all intercourse should be suspended between his subjects and the English. Meanwhile the agents of the Company put every obstacle in the way of Mr. Dupuis proceeding to Coomassie, and partly from these difficulties, and partly from repeated attacks of illness, he was detained for more than a year at Cape Coast Castle. At length, however, negotiations having been opened by the arrival at the port of a mission from the king of Ashantee demanding explanation and satisfaction, he set out for Coomassie on the 9th of February, 1820, and reached that capital on the 25th of the same month. The next day he was admitted to an audience of the king, and met with the most gracious reception. For the history of the negotiations which followed we must refer to the account published by Mr. Dupuis. A definitive treaty was at last signed on the 23d of March, by which the king of Ashantee engaged that he would, with all his power and influence, support, aid, and protect, the British interests in that country; and would, on all occasions, march his armies to any part of the country where the interests of Great Britain might require their assistance. He also relinquished the claims he had made upon the governor of Cape Coast Castle, for compensation on account of the alleged violation of the former treaty; and agreed to an abolition of all differences both with the authorities there, and with all his Britannic Majesty's other subjects. The consul, on the other hand, acting in the name of the British government, acknowledged the right of his Majesty to the sovereignty of the Fantee territory; on the express condition, however, that the natives residing under his protection were to be amenable, for any act of aggression with which they might be charged, to the British authorities only. Another important stipulation was, that the path or road between Cape Coast and Ashantee should be kept constantly well cleared: the one half by the

English, the other by the Ashantees. Finally, the king of Ashantee was made to acknowledge, not only that he had himself taken his sacred oath of allegiance and fidelity to the Crown of Great Britain, but that all his principal captains and counsellors had done the same. It can hardly be supposed that the full import of this declaration, according to European notions, can have been understood by the negro sovereign; and it would have been better, if so empty an acknowledgment had formed no part of the treaty.

When Mr. Dupuis soon after returned to Cape Coast Castle, accompanied by several Ashantee chiefs, deputed by their sovereign as his ambassadors to the king of England, he found that the authorities there refused altogether to accede to the terms of this treaty. They rested their objections on the old ground, that the sovereignty of Fantee did not belong of right, as this treaty implied that it did, to the king of Ashantee. In this view they were supported by Sir George Collier, who happened to be there in the Tartar man-of-war, and who refused to convey the ambassadors to England. The first result of this conduct was, the gradual withdrawal of the Ashantee merchants and traders from all dealings with the servants of the Company. Although a body of Ashantee forces, however, had taken and retained possession of the town of Cape Coast, they continued to refrain from any actual hostilities. Meanwhile, in the beginning of the year 1821, the forts which had belonged to the African Company were taken by the English government into its own hands, and soon after, Sir Charles McCarthy was appointed governor-in-chief of all the British settlements on the western coast of Africa, from the river Gambia to the river Volta inclusive. When the new governor landed at Cape Coast Castle, in the early part of 1822, he found that fort closely blockaded by a strong Ashantee force. After a few months Sir Charles began to organize bands of the Fantees into a sort of militia, and to form alliances with various tribes of that nation, and of others established along the coast. The bulk of the population of the district, however, Mr. Dupuis asserts, remained steady to their allegiance to the king of Ashantee.

Sai Quamina appears to have died in the summer of 1821. His successor commenced his reign by a distinct proclamation of war against the English, whom he accused of the infraction of treaties, treachery, cruelty, &c. Soon after, a negro in the service of the garrison was seized by the Ashantees and put to death. It was now resolved by the English no longer to delay active hostilities. The first operations, conducted by Captain Laing, were crowned with success. In August, the Ashantees were completely defeated at Asseemma, in the Fantee territory, by a force, composed partly of Europeans, and partly of native soldiers, commanded by this officer. Encouraged probably by this victory, in the beginning of the following year, Sir Charles McCarthy had the temerity to advance into the interior at the head of a small body of troops, having previously divided his entire force into four separate divisions. He was attacked on the 21st of January, near the river Pra or Praa, by the enemy, whose numbers are said to have amounted to 10,000 men. The result was a total defeat of the handful of troops under the governor's immediate command. Sir Charles himself was wounded and taken prisoner, and, with the exception of two, all the officers who were with him, were either killed or captured. This disastrous encounter, however, did not terminate the war. It continued for nearly three years, though with long intervals of cessation from hostilities; and was only brought to a close by a severe action fought near Accra, on the 7th of August, 1825, in which the Ashantees were completely defeated. Soon after this, the king submitted to pay 600 ounces of gold, and to send one of his sons and a nephew to be educated at the Castle, as the conditions of a peace.

By these events, the Ashantees may be considered to have been driven from the tract of country immediately adjacent to the sea; but if they have retained their conquests in other directions, the empire must still be of considerable extent. According to the map published by Mr. Dupuis, it appears to stretch, including Gaman, from about our first meridian to nearly the 5th degree of west longitude, or over a range of country not much short of 300 miles in length. Its extent from south to north, when it reached the sea in the former direction, must have been at least as great.

The state next to Ashantee on the east is that of Dahomey, from which it is separated by the river Volta, otherwise named the Aswada. Its western boundary on the

coast, was the river Assinee; but in the interior, the province of Gaman lies in great part beyond even the westernmost branch of that river, there known under the name of the Bara. To the north and north-east of Gaman are the Manding tribes, and the independent Moslem states of Kong and Enkasy.

Both Bowdich and Dupuis have given a mass of details respecting the internal geography of the kingdom, upon many of which, however, very little dependence can be placed. Indeed, Dupuis has enumerated a multitude of errors, some of them of the most serious magnitude, into which his predecessor had fallen. The greater part of the information collected by Dupuis himself, again, was derived merely from the reports of persons with whom he conversed, whose statements, where defective, he patched up in the best way he could by hypothesis and conjecture.

The empire of Ashantee, Dupuis says, was popularly reckoned to be made up of no fewer than forty-seven different states, and this was before the annexation of the Kingdom of Gaman. The chief of these have been mentioned in the preceding historical sketch. According to the map of Mr. Dupuis, the following are the maritime provinces, in the order in which they are placed from west to east:—Amanaha, Ahanta, Fantee, Inkran, Aquapim, and Adampy. To the north of Ahanta is Tofal, and to the north of that Wossan. Farther in the interior are, Dinkira, Akia, and Aquambo. Still beyond these are, Ashantee Proper, and Quahou; then Massy and Akeyah; then Ajorah; then Coransah and Bouromy; then Takina and Yobati. To the north of these is placed the kingdom of Bauna, which is independent, although usually in close alliance with Ashantee. Beyond Bauna are the Moslem states of Ghofan and Ghobago, said to have been subdued by the late king Sai Quamina. Ghobago extends a considerable distance towards the north-east. Finally, to the west of all the above-mentioned provinces is the kingdom of Gaman, as already stated, with its provinces of Ponin, Safoy, Showy, Sumah, and Aowin, as they succeed one another from north to south.

The outline of the coast opposite to Ashantee will be more appropriately described under its common appellation, the **GOLD COAST**. Its general direction is from east to west, although from Cape Three Points in long. $2^{\circ} 46'$ W., it trends on both sides considerably towards the north. The chief rivers which fall into this part of the Gulf of Guinea, are the Volta, or Aswada, the course of which, for nearly 200 miles before it reaches the sea, is almost due south; but the principal branch appears to rise from a mountainous tract considerably to the westward;—the Praa, or Chamah, one branch of which (the Boosempura) flows from the east, while another passes near Coomassie, the capital, and here receiving the former, descends by a course almost due south to the sea, which it reaches about $2^{\circ} 10'$ W. long., forming the boundary between the Fantee and Ahanta territories; the Ancobro (or Rio de Cobre, that is, in Portuguese, the Serpentine River), on the west side of Ahanta; and finally, the Assinee, formed of the united waters of the Tando and the Bara, which join about $6^{\circ} 16'$ N. lat. The hilly portion of the country is in the east and north-east, in the provinces or states of Aquapim, Akim, Aquambo, and Akeyah; but there are no mountains of any considerable height.

The greater part of the country from the sea-coast, as far as fifty or sixty miles to the north of Coomassie, is still a thick forest, through which travelling is impossible, except along the paths or roads which have been conducted with great labour in different directions from the capital. The city of Coomassie, according to the reckoning of Mr. Dupuis, stands nearly in $6^{\circ} 51'$ N. lat., and in $2^{\circ} 16'$ W. long. from Greenwich. Mr. Bowdich has given both a plan and a long description of this barbarian metropolis. It is built, he says, upon the side of a large rocky hill of iron-stone, and is completely surrounded by a half-stagnant stream, or rather marsh, varying from 50 to 100 yards in breadth. The town is an oblong, nearly four miles in circuit, without including a suburb or back town, half a mile distant. Of the principal streets, four are each half a mile long, and from 50 to 100 yards wide. But the streets are merely ranges of fields, bordered with rows of houses. The houses are said to be built in straight lines, and the open spaces between the two rows have each a name. The palace stands in a long and wide street which runs through the centre of the town, and is inclosed by a high wall. The number of

streets in all, as reckoned by Mr. Bowdich, was twenty-seven. The population of the town was estimated by the Ashantees themselves at upwards of 100,000; but this is most probably an exaggeration.

Besides the eight great roads, which, according to Dupuis, lead from Coomassie, there are numerous minor roads, although most of them are merely narrow foot-paths, and are often quite impassable. Most of the towns and villages are on the line of some of the great roads. The inland tracts are greatly superior to those that lead down to the coast, an advantage which they owe both to the longer time they have been in use, and to the nature of the country through which they are cut. From beyond Coomassie down to the coast, as has been already observed, the soil is thickly covered either with lofty trees, or with brushwood and trees intermixed; but many of the parts traversed by the great roads in the upper country are open plains.

It would be quite idle to attempt to form any estimate of the numbers of the Ashantee population. Of the military force of the state, the most moderate account which Mr. Bowdich received was that it exceeded 200,000 men.

The men of Ashantee, according to this author, though very well made, are not so muscular as the Fantees. The women he thought in general handsomer than those of Fantee. Among the higher classes both sexes are remarkable for the cleanliness of their persons; but the lower orders are for the most part very dirty.

The most remarkable among the moral characteristics of the Ashantees are their warlike ferocity and their love of blood. These passions have, as usual, deeply coloured their religious belief and observances. We must refer to the work of Mr. Bowdich for an account of their theological system, which is throughout a compound of the most absurd follies. The most horrid of the practices by which they express their devotional feelings are those in which they indulge at what are called the Yaa and the Ada customs, the former commencing in the early part of September, when the consumption of the yam crop begins, the latter taking place, alternately on a greater and less scale, every three weeks. On all these occasions human blood flows in torrents. The sacrifices are described as exceeding in their sanguinary character even those that take place at the neighbouring court of Dahomey, with the description of which the European public has been longer familiar.

The government of Ashantee appears to be a despotism, partially controlled by an aristocracy, and to a greater extent by the ancient customs of the country. But in whatever degree the royal power may be restrained by these opposing forces, it appears to be unlimited in regard to the right to dispose at pleasure of the property, the liberty, and the lives of all classes of the population. The king, however, is said always to consult his great council before entering upon a war or upon any other business of public importance. The diminution of the numbers of the nobility has been for some reigns a policy steadily pursued by the crown; and Mr. Bowdich says that the order had been at last reduced to only four individuals. There is, however, besides the hereditary nobility, a council of captains, whose advice at least is usually asked by the king on important occasions. The law of succession to the throne (and the same rule holds as to the estates of private individuals) is in some respects very singular, the nearest heir being the brother, the next the sister's son, the next the son, and the next the chief vassal or slave. In the Fantee country it is asserted that the slave comes in before the son, who only inherits such property as his mother had possessed independently of her husband.

In Ashantee, besides the negroes, there is a large population of Moslems, that is of Moors professing the Mohammedan faith, who have penetrated thither from the north of Africa. These people, possessed as they are of the art of writing and other acquirements not shared by the negroes, form a very influential body wherever they are established. In former times they appear indeed, as already noticed, to have been left by the government in the enjoyment of almost complete independence. In different parts of the empire they still, according to Mr. Dupuis, 'live in political societies, governed by their respective princes, who are vassals to the king, but who enjoy prerogatives exceeding those of any other class of subjects.' From what is said elsewhere it appears that these princes, or caboreers, are appointed by the king. At Coomassie and many of the other towns, the commerce with distant places is almost entirely

in the hands of the Moslems. The provinces in which they are chiefly found are to the north of Coomassie; and it is stated that wherever they exist in considerable numbers the negro population is much less ferocious, and in general further advanced in civilization. The recently conquered countries of Ghofan and Ghobagho were Moslem states:—that is to say, the government was in the hands of the Moslems.

Mr. Bowdich has written a confused chapter on the Ashantee language, from which very little can be gathered. He says that from Amanaha to the Volta there are six different languages spoken: the Amanahie, Ahanta, Fantee, Affootoo, Accra, and Adampee. But the vocabularies which he has printed show that these are merely so many dialects of one language. He describes the Ashantee tongue as more cultivated and refined than the Fantee, Warsaw, &c., and as possessing superior euphony, from its abundance of vowel-sounds and its rejection of aspirates. Oratory is an accomplishment in which the Ashantee chiefs generally excel. The rest of Mr. Bowdich's dissertation is principally occupied with a comparison between the grammatical peculiarities of the Fantee and Accra dialects. All these dialects appear to be characterized by the absence of adverbs, prepositions, and those other disguised forms which occur in older languages. The Ashantee music, of which he gives some specimens, is spoken of in high terms by Mr. Bowdich for its sweetness and animation. Among their instruments are a flute made of a long hollow reed, with three holes; a box called a Sanko, the top of which is covered with an alligator's or antelope's skin, having a bridge raised over it, across which are extended eight strings; immense horns, made of elephants' tusks; and an instrument somewhat like a bag-pipe. They have also drums made of the trunks of trees hollowed out; and in their musical concerts the noise is increased by the aid of castanets, gourpongs, flat sticks, rattles, and old brass pans.

Mr. Bowdich has given various drawings of the houses of the Ashantees. The walls are usually formed of stakes and wattle-work, filled up with clay. All have gable ends and ridged roofs, consisting of a frame work of bamboo, over which is laid a thatch of palm leaves, tied with the runners of trees. Many of them have arcades, and many also are highly ornamented with plaster, paint, carving, and other decorations. The doors are formed of entire pieces of cotton wood; and deals of the same wood, cut out with an adze, are also sometimes, though rarely, used for flooring. There is frequently an upper story supported on rafters. The windows are described as being of open wood work, carved in fanciful figures and intricate patterns, and painted red; and the frames as 'frequently carved in gold, about as thick as cartridge paper.' While Mr. Dupuis was at Coomassie, the king commenced the erection of a fort, which, although built only of wood, was to be of great height and strength. It was intended as an imitation of Cape Coast Castle.

The principal manufacture of the Ashantees is that of cotton cloth, which they weave on a loom worked by strings held between the toes, in webs of never more than four inches broad. Silk is sometimes interwoven with the cotton. The cloths which they produce are often of great fineness of texture, and their colouring of the highest brilliancy. They paint their patterns with a fowl's feather, and Mr. Bowdich says, that he has seen a man produce these figures in this manner, with great regularity, as fast as he himself could write. Another of the arts in which they have attained considerable excellence, is the manufacture of earthenware. They also tan leather, and work in iron. Mr. Bowdich says that the sword blades which they make often evince very fine workmanship; but that they have no idea of making iron from the ore, as some of their neighbours farther in the interior do. He describes, however, an iron-stone of a dark red colour spotted with grey, from which he says they cast bullets. When lead is scarce, some of their ornaments are described as being made of brass; but we do not find it stated that copper is found in the country. But the art for which they are most famous is that of the fabrication of figures in gold. We must refer, however, to Mr. Bowdich's work for a description of the processes which they employ. Articles formed of gold abound in the houses of all the wealthier inhabitants; and in the king's palace those of most common use are described as being made of this precious material. Mr. Dupuis intimates, however, that the statements of Mr. Bowdich

upon this head, and also the descriptions he has given of the splendour of the Ashantee court in general, are somewhat high coloured.

Gold is found in this country both in mines and in particles washed down by the rains. According to Dupuis, the richest gold mines known to exist in any part of Africa are those in Gaman. Some of the richest of these mines are said to be esteemed sacred, and on that account are not worked. The wealthier inhabitants load their persons with lumps of native gold; some which Dupuis saw, he thinks, must have weighed fully four pounds. In Akim, and some other parts of the empire bordering on the Volta, from which much gold was formerly obtained, the mines are now either exhausted, or at least are no longer worked. There are many rich mines in the small district of Adoom, westward from Cape Coast and about three days' journey from the sea; and during the rainy season, it is said that not fewer than eight or ten thousand slaves are employed in washing for gold dust on the banks of the Bara, in Gaman.

The rainy season in Ashantee may be said to commence with the month of May; but the heaviest rains are from about the middle of September to the end of the following month. In some years, however, there is little or no rain at all during the usual season. Mr. Bowdich has given the variations of the thermometer for nearly a whole year, over which his own observations, and those of his associates, extended. In June it appears to have ranged at Coomassie from 73° to 84°; in July, from 71° to 81°; in August, from 68° to 80°; in September, from 70° to 82½°; in October, from 70° to 83°; in November, from 69° to 83½°; in December, from 63° to 85°; and in January, from 58° to 86°. In the morning, especially, it is much cooler at Coomassie than at Cape Coast.

The yam is the chief vegetable that is cultivated in Ashantee. It is planted at Christmas, and dug up early in September. But there is also grown a good deal of corn, rice, sugar-cane, and a mucilaginous vegetable called *encrura*, somewhat resembling asparagus. The plantations are of considerable extent, and very neatly kept. The principal domesticated animals are cows, horses of a small breed, goats, and a species of hairy sheep. Among the wild animals with which the region abounds are lions, elephants, hyenas, wild hogs, deer, antelopes, alligators, and a variety of snakes. Among the birds are vultures, parrots, and several small species of beautiful plumage, which sing melodiously. But all the departments of the natural history of the country are still very imperfectly known.

ASHBORNE (or, as it is written in ancient records, ESSEBURNE, ASIBURNE, and ASIBOURNE), a considerable market-town, in a rich valley not far from the east or left bank of the river Dove, which falls into the Trent. Ashbourne is 139 miles from London and thirteen from Derby. The population in 1831 was 2246, and the number of houses, including two which were building and twenty-seven uninhabited, was 502.

It is pleasantly situated. High hills shelter it from the cold winds of the north; and to the south-west it looks towards the valley mentioned above, where the Dove winds through some of the richest meadows in the kingdom. The church is in the form of a cross, with a tower rising from the centre, surmounted by a fine spire. The building was probably erected in 1241, as there is a memorial in brass of its dedication to St. Oswald in that year. It is in the early English style, and there are several good door-ways. The walls and buttresses retain the characteristics of this early architecture; but several parts of the church are of later date, and of the decorated English or perpendicular styles. It contains many monuments of the Coke and Boothby families, especially a beautiful monument by Banks to the memory of Penelope, daughter of Sir Brooke Boothby, who died in 1791, at the early age of six years. The figure of the child asleep, in white marble, has been much admired. There was formerly a presbyterian meeting-house in Ashbourne; and at present there are two places of worship, one for the General or Arminian Baptists, and one for the Wesleyan Methodists; as well as one for the Calvinistic Methodists (or Lady Huntingdon's connexion), in the suburb of Compton, antiently Campdene, which is separated from the town on the south side by the rivulet Hemmore, or School.

There is at Ashbourne a grammar-school founded by Sir Thomas Coke and others in 1585; and a Mr. Spalden, who lived in the beginning of the 18th century, by his will

(dated 1710), founded two elementary schools, one for thirty boys, and the other for the same number of girls. There are several almshouses in the town, which owe their origin to different benevolent individuals, especially to Mr. Spalden above-mentioned; and to Mr. John Cooper, who built at his own charge the Calvinistic methodists' chapel in Compton, and also built and endowed an almshouse adjoining to it.

The market is on Saturday, for corn and provisions. There are no less than eight fairs, all for horses, horned cattle, and sheep: wool is sold at the fair in July, which is considered the smallest fair in the year. Ashborne does not seem to possess any particular manufacture, unless it be of lace; but there are iron and cotton factories in the neighbourhood. The chief trade is in cheese and malt.

The parish is very large, and extends into three hundreds, or wapentakes: viz., Wirksworth wapentake (in which is the town), Appletree hundred, and Morleston and Lit-church hundred. It has three dependent parochial chapel-ries, viz., Alsop-in-the-Dale, Hognaston, and Parwick. The population of the parish, including that of the town (as given above), and of the chapelries, was in 1831, 5699, and the whole area was 16,490 acres.* The living is a vicarage, of which the Dean of Lincoln is patron. The rectory of Mapleton is annexed to it. The rectory of Ashborne was granted by William II. (Rufus) to the church of St. Mary in Lincoln, and to the bishop of that see and his successors; but by some arrangement at a remote period, it was attached to the deanery of that see; and is now leased out by the dean. Ashborne is in the archdeaconry of Derby and the diocese of Litchfield and Coventry.

Ashborne was the scene of some contests during the war between Charles I. and the Parliament. In Feb. 1644, the troops of the latter were victorious over the royalists. The young Pretender passed through Ashborne in his retreat from Derby, in 1745: (Lysons's *Magna Britannia*; Rhodes' *Peak Scenery*, &c.)

ASHBURTON (antiently written ASPERTON), a borough town in the hundred of Teignbridge, in Devonshire, on the road from London (by Exeter) to Plymouth: 192 miles from London, 19 from Exeter, and 24 from Plymouth.

The town is situated a short distance eastward from the river Dart, and consists mainly of a long street, through which the London and Plymouth road passes, and of a second street, turning off to the right, through which passes the road across Dartmoor to Tavistock. The houses are neat, and are mostly covered with slate, which abounds in the neighbourhood. A small stream, which turns several mills, runs through the town, and falls into the Dart about two miles lower down; just where the Plymouth road crosses the Dart. The church, dedicated to St. Andrew, is a spacious structure in the form of a cross, in the perpendicular style of Gothic architecture. The tower is ninety feet high, and is surrounded by a small spire. In the chancel are several stalls, as in collegiate churches. Adjoining the church is the antient chapel of St. Lawrence, in which the grammar-school is held, and also the meetings for parliamentary elections and other public business. This chapel was formerly endowed with lands valued in the time of Edward VI. at 10*l.* 15*s.* 8*d.* per annum. Of this amount, ten marks, or 6*l.* 13*s.* 4*d.* went as stipend to the chantry priest, who was to keep a grammar-school; and the remainder to maintain and repair the leaden pipes for the conduction of wholesome water for the relief of the infected, when the plague should be at Ashburton, that they might not infect others. These lands, it is probable, are the parish lands now devoted to the repair of the chapel; the endowment of the grammar-school coming from other sources. The chapel was used for marriages and other occasional parochial duty in the early part of the last century.

Besides the grammar-school, there are some endowments for the instruction of the children of the town, especially one given in 1754 by Lord Middleton and the Hon. John Harris (at that time members for the borough), under which, in 1821, upwards of ninety children received education from two schoolmasters of Ashburton. In 1805, the late Miss Dunning founded a gift of 6*l.* per annum, for the instruction of ten girls in reading, sewing, &c.

The independents, particular baptists, and Wesleyan methodists have meeting-houses in the town.

* In the parochial returns for 1831, the chapelries of Hognaston and Parwick are given as distinct from the parish of Ashborne.

The chief manufacture of Ashburton is that of serge, which is made for the East India Company. The market is on Saturday, for corn, provisions, &c. A yarn market, formerly held on Tuesday, under letters patent, granted by Charles II., has been discontinued for many years. There are four fairs, on the first Thursdays in March and June, and the first Tuesdays in August and November*. The March fair is a large cattle fair, and that in November a great sheep fair. The number of houses in the parish of Ashburton was, in 1831, 552, including thirty-nine uninhabited, and the population at the same time amounted to 4165.

Ashburton was a parliamentary borough in the time of Edward I., but did not again, except once in the reign of Henry IV., return members till the last parliament of Charles I. in 1640. The right of election was in the inhabitant householders and the holders of burgage tenures; but the boundaries of the borough were not clearly known. The number of voters was estimated at between 300 and 400, but the members were really the nominees of Lord Clinton and Sir Lawrence Palk. By the Reform Bill the number of representatives was reduced from two to one, and the boundary of the parish made the boundary of the borough. The number of houses in the parish, of 10*l.* value and upwards, was estimated in the boundary reports at 312. The returning officer is the portreeve, who is chosen annually at the court leet and baron of the lord of the manor.

The living is a vicarage in the rural deanery of Moreton, the archdeaconry of Totness, and the bishoprick of Exeter; and in the ecclesiastical province of Canterbury. It includes the chapelries of Bickington and Buckland-in-the-Moor. The dean and chapter of Exeter are the patrons.

Ashburton is one of the four towns in which the stannary courts are held. These courts are held before the lord warden or his substitutes, for the administration of justice among the tinners of Devonshire and Cornwall, by virtue of a privilege granted to them to sue and be sued only in their own courts. The other stannary towns are Chagford, Plympton, and Tavistock.

This town was the birth-place of John Dunning, the first Lord Ashburton, and of the late William Gifford, editor of the *Quarterly Review*.—(Lysons's *Magna Britannia*; *Reports of Commissioners of Charities*, &c.)

ASHBURTON, LORD. [See DUNNING.]

ASHBY-DE-LA-ZOUCH (in antient writings called ASCEBY and ESSEBY), a market town in the hundred of West Goscote, in the county of Leicester. It is on the little river Mese, or Mease, a feeder of the Trent, and on the road from London to Burton-upon-Trent; 115 miles from London, and 17 from Leicester, the county town. Its original designation was simply Ashby; the distinctive addition of De la Zouch, it received from the Zouches, who were lords of it.

This town consists chiefly of one street, in which stands a neat market-cross, and was nearly surrounded at one time by three parks, now no longer existing, viz. Prestop park, the great park, and the little park, of which the last was the homestead to the castle. The situation of the town obtained for it from Camden the character of *Villa Amoris-sima* (a most delightful town). The land around is chiefly pasture.

The church, dedicated to St. Helen, is a handsome and lofty antient structure. It is of stone, and the tower contains six large bells and a set of chimes. The body of the church is well pewed; and the chancel was fitted up with pews for his own family by Francis, Earl of Huntingdon, who died in 1790. On each side of the chancel is a large chapel, projecting considerably beyond the side of the church; that on the north side is converted into a vestry-room, and that on the south side is the burial place of the Hastings' family. In the latter is a sculptured monument of Francis, Earl of Huntingdon, and his countess, who both died in the sixteenth century. In this church there was, in 1804, when Mr. Nichols's *History of Leicestershire* was published, a singular instrument of punishment called the finger pillory. It consisted of a horizontal beam divided lengthways into two parts; the upper part turned on a hinge at one end, and was fastened by a lock at the other end, after the manner of the stocks. In this machine are different-sized holes for containing the fingers of the disorderly. The beam is supported by two upright posts about three feet high.

In an open pasture on the south side of the town, on a

So Lysons's *Magna Britannia*; the 10th Aug. and 11th Nov. according to others.

gentle eminence, stand the ruins of the castle of Ashby. This castle seems to have been of vast extent and very lofty. We can trace out the great hall, kitchen, various chambers of state, the chapel, &c.; wherein are found, in good preservation, rich doorways, chimney-pieces, arms, devices, and other ornamental accompaniments. (See Nichols's *Leicestershire*, vol. iii. p. 612.) It was built by Lord Hastings, a nobleman of great power in the time of Edward IV., and who was beheaded by order of the Duke of Gloucester (afterwards Richard III.), shortly after Edward's death. It was one of the places in which Mary Queen of Scots was confined.

The 'Ivanhoe' baths, erected within the last few years, are supplied from the collieries with water impregnated with muriate of soda, or common salt, to a greater degree than sea water. There are a small theatre, a handsome hotel, and lodging-houses.

There is in Ashby a free school, founded in 1567 by Henry, Earl of Huntingdon; also a school for educating and clothing twenty-six boys, founded in 1669 by Mr. Isaac Dawson, and a small foundation for the instruction of twelve girls. Another charity-school has been lately founded by Alderman Newton, of Leicester.

Woollen and cotton stockings, and hats, seem to be the chief articles of manufacture in Ashby; but the manufacturers suffered materially during the war which followed the first French revolution. The market is on Saturday, and is well supplied. There are four fairs in the year, besides a statute for the hiring of servants on the 22nd September.

Coal and ironstone are worked in the neighbourhood of the town, and there is a canal from the Coventry canal navigation, near Bedworth in Warwickshire, to the neighbourhood of Ashby (see Bradshaw's *Map of Canals*), and a railroad from this canal to the town. The elevation of this canal is 315 feet 5 inches above the base assumed as the general level in Bradshaw's *Map*. It runs for 18 miles direct distance from Bedworth without any lock.

The living is a discharged vicarage with the chapel of Blackfordby, in which the vicar performs service once a fortnight. It is in the deanery of Aekley, archdeaconry of Leicester, and diocese of Lincoln. There are places of worship for Presbyterians, Wesleyan and Calvinistic methodists, and, according to some late accounts, for Independents.

The parish is extensive, and includes the hamlets of Blackfordby and Boothorpe. Kilwardby, and the Calais, which now form parts of the town, were once distinct hamlets. The population was, in 1831, 4727, of whom 327 were in the chapelry of Blackfordby.

Ashby was the native town of the eminent Bishop Hall. In the civil war, in the time of Charles I., Ashby was garrisoned for the king, but evacuated and dismantled by capitulation. (Nichols's *Hist. of Leicestershire*.)

ASHDOD, or ASDOD (Ἀζωτος, of the Greeks), is situated on the shores of the Mediterranean, in Palestine, about nine miles N.E. of Asealon, and ten miles S.S.W. of Jammia. The mention of this place occurs frequently in the Old Testament; it was one of the five Philistine cities, and, at the division of the promised land, it fell to the lot of the tribe of Judah (Joshua xv.), who, however, appear not to have obtained possession; for we find (1 Samuel v.) that 300 years subsequently the Philistines in their wars with the Jews having captured the ark of the covenant, brought it to Ashdod, and placed it in the temple of their god Dagon, which fell to the earth before it. David probably got possession of Ashdod when he 'took Gath and its towns out of the hand of the Philistines.' (Chronic. i. chap. 18.) It was taken by the Assyrians about B.C. 714, but afterwards fell into the hands of the Egyptians, after sustaining, according to Herodotus, a siege and blockade of twenty-nine years in the reign of Psammeticus, during which it must have suffered greatly, for Jeremiah calls it 'the remnant of Ashdod.'

The temple of Dagon was destroyed by Jonathan Maccabæus, and the town burnt during the wars between Alexander Balas and Demetrius. It seems never to have recovered its former splendour, though A. Gabinius, the Roman governor of Syria, ordered it to be rebuilt. By the Romans it was called Azotus, and is also noticed by this name in Strabo and the Acts of the Apostles. Its modern name is Asdoud, a near approach to the antient one; but there are no remains of its former grandeur. It is now, Volney says, famous only for its scorpions. The country

around is open, and little cultivated, and the village small. The principal object is a large Turkish khan for travellers, which appears to occupy the site of some ancient building—probably one of the primitive Christian churches, as an altar and cross are still standing, and there is an inscription over the door in some Eastern language. It lies in $31^{\circ} 45'$ N. lat., $34^{\circ} 37'$ E. long.

The land along this part of the coast is perceptibly gaining on the sea, which is shallow, and deposits in this bend of the coast much of the sand from the mouths of the Nile. (Maugles and Irby. See Steph. Byzant.; and Nehemiah xiii. 23.)

ASHDOWN FOREST, a hilly and woodland district in the northern part of the county of Sussex, in what is usually denominated 'the Weald.' This weald was before the Conquest a vast forest, stretching from Chichester to the border of Kent; and the designation in its widest sense is understood to include all the county north of the South Down hills. Ashdown Forest contains about 18,000 or 20,000 acres. The black sand which covers it is of various depth, and lies upon a thick stratum of soft clay. The chief value of the district is as a rabbit warren. Crowborough Beacon, an eminence at the eastern extremity of the forest, is 801 feet high. The road from London to Lewes, through Maresfield and Uckfield, leads across this waste. (Young's *General View of the Agriculture of Sussex*. See *Ordnance Map*.)

ASHER, one of the twelve tribes of Israel. [See **PALESTINE**.]

ASHES, the remains of any thing burnt, whether of vegetable or animal origin, and to a certain extent of mineral bodies also. First with respect to *Vegetable ashes*:—Woody fibre, termed chemically *lignin*, is composed of oxygen, hydrogen, and carbon: it constitutes nearly the whole of all vegetable matter, and it is almost entirely dissipated when burnt. Two of its elements, by combining with the oxygen with which they were already united, and a fresh portion acquired from the atmosphere, form new compounds; these products it would be foreign to our present purpose minutely to notice, but it may be observed that they consist chiefly of water and carbonic acid gas. The carbon of woody fibre is the element which remains longest unacted upon, and on this circumstance the preparation of charcoal from wood depends. When, however, this carbon has been totally dissipated by the long continued and combined action of heat and the oxygen of the air, there remains only a small quantity of ashes; these are derived principally, if not entirely, from such substances as the plant takes up from the soil during its growth, and which, though universally met with, are most frequently to be considered rather as accidental than necessary constituents of the vegetable. Ashes vary in composition according to the nature of the plant, the soil in which it grows, and of the manure used upon it. But few, if any, of the constituents of the ashes occur in them in the state in which they existed in the plant: they are mostly the altered results of combustion. But to this part of the subject we shall presently recur.

The substances usually contained in the ashes of land-plants are potash, soda, lime, magnesia, silica, the oxides of iron and of manganese, chlorine, carbonic, sulphuric, and phosphoric acid; alumina occurs but rarely, and sometimes oxide of copper has been met with. The salts derived from the combination of some of these bodies are soluble in water: such are the compounds of potassium and sodium with chlorine, those of the same metals with the carbonic and sulphuric acids, and with silica. Lime, and some of the other bases, combined with the carbonic or phosphoric acid, or with silica, are insoluble in water. Very frequently more than one-half of the ashes of vegetables consists of carbonate of lime.

The quantity of ashes varies, not only according to the soil, age, and aspect of the plant, but also in different parts of the same plant, from one and a half to three and a half per cent. of its weight, after drying in the air. Sometimes the ashes amount to four or five per cent., and in the bark of the oak to six per cent.; the quantity and quality of the ashes also vary in the same kind of wood from the accidental circumstances already noticed. Berthier (*Annales de Chimie et de Physique*, tom. xxxii. p. 240) has given the results of numerous experiments on the ashes of different kinds of wood; from these the following are selected as almost extreme cases of the quantity of ashes obtained from various woods:—

	Per Cent.	Per Cent.	Per Cent.	
Elder	5	10.8	89.2	insoluble
Oak	2½	12	88	in water.
do. bark	6	5	95	
Birch	1	16	84	

The soluble saline matter yielded, per cent.,—

	Elder.	Oak.	Oak bark.	Birch.
Carbonic acid	27.42	24.0	23.2	17.0
Sulphuric acid	7.53	8.1	6.0	2.3
Muriatic acid	1.80	0.1	0.7	0.2
Silica	1.61	0.2	0.8	1.0
Potash and soda	60.64	67.6	69.3	79.5

The insoluble matter consisted of, per cent.,—

	Elder.	Oak.	Oak bark.	Birch.
Carbonic acid	39.8	39.6	38.5	31.0
Phosphoric acid	2.8	0.8		4.3
Silica	2.0	3.8	1.1	5.5
Lime	51.8	54.8	50.1	52.2
Magnesia	2.2	0.6		3.0
Oxide of iron	0.1		0.8	0.5
— manganese	0.6		7.4	3.5
Charcoal, &c.			2.1	
	99.3	99.6	100	100

On considering the constituents of the soluble part of wood-ashes, it will be evident that it must consist of the alkaline sulphates, carbonates, and chlorides; while the insoluble matter is chiefly composed of carbonate of lime, and probably of magnesia, phosphate of lime, and phosphate of iron. Wood ashes may contain a considerable portion of iron without its being indicated by the colour of its oxide, because it is in the state of phosphate; the manganese appears to exist as an oxide: this is indicated, not only by the greyish tint which it imparts, but also by the smell of chlorine evolved by the action of muriatic acid.

It needs hardly be stated that the incineration of wood is a most important operation; from its ashes are obtained the immense quantities of impure potash, and the carbonate called *pearlash*, imported from America and other countries. [See **POTASSIUM** and its salts.] Although wood-ashes thus yield carbonate of potash, yet there is no reason to suppose that this salt exists in the sap of the plant. On the contrary, in the opinion of Vauquelin, the alkali is there combined with acetic acid; and it is well known that acetate of potash is, by heat and the decomposition of its acid, converted into carbonate. The sap of plants contains also other vegetable acids, as the oxalic, citric, tartaric, malic, &c.; and the salts which these form with potash are decomposed by heat, and yield the carbonate. The sources of the alkalis is a subject which has been much discussed, but there is now no question of their being acquired from the soil, in the same way as the lime and metallic oxides. It is well known that basaltic rocks contain soda, and granite rocks potash; and it has been found that fir trees growing in a soil derived from the disintegration of basalt, contain much more soda and less potash than those which grow in disintegrated granite.

The ashes of land plants yield principally the salts of potash; those of marine plants afford a large quantity of soda salts, and especially the carbonate. There are several varieties of *salsola* and *salicornia* cultivated on the coasts of Spain, which, when full grown, are cut, dried, and burnt in trenches: the resulting ashes are called *barilla*, and are imported in the state of hard, grey, porous masses. The richest barilla contains about 40 per cent. of carbonate of soda, mixed with various saline and earthy impurities. It is used for soap-making, and in other manufactures requiring an alkali; but since the duty has been taken off common salt, and on account of the cheapness with which soda is obtained from it, barilla is now much less used than formerly.

Kelp is the ash of some varieties of sea-weed, especially of the *fucus saccharinus* and *fucus vesiculosus*. It is prepared in the islands of Scotland, and contains scarcely one-fifth as much carbonate of soda as barilla does; the remainder consists principally of chloride and iodide of sodium, sulphate of potash, phosphate of lime, earthy and carbonaceous matter. It is used in the manufacture of crown glass, as well as in that of soap.

It is extremely probable that a portion at least of the carbonate of soda found in the ashes of marine plants results from the double decomposition of common salt by the

potash salts originally existing in them. [See SODIUM and its salts.]

Coal ashes are extremely various both in their appearance and composition. Thus much of the coal of the north of England, under common circumstances, burns to a cinder, which is a mixture of the ashes of the coal, with some carbonaceous matter requiring rather a high temperature to burn it, on account of its being enveloped by incombustible matter. The coal of Somersetshire burns to red ashes, evidently coloured by peroxide of iron; those of the Staffordshire coal are nearly white.

Coal, like wood, consists principally of carbon, oxygen, and hydrogen, and, according to Dr. Thomson, it contains nitrogen also. The carbon generally varies from seventy-five to ninety per cent. The quantity of ashes yielded by different kinds of coal varies considerably; according to Kirwan, Wigan coal contains 1.57 per cent. of ashes; Whitehaven coal 1.7, and Swansea coal 3.33 per cent.; they consist principally of silica and alumina, with small quantities of lime, sometimes magnesia, and also peroxide of iron; but they do not contain either the chlorides, phosphates, or alkaline salts found in wood-ashes.

It may be remarked, that while the ashes produced by some kinds of coal are nearly useless, that form of them which results from the imperfect combustion of the north-country coal burnt in London is very largely and economically employed in brick-making.

Peat ashes have been examined by Klaproth; the peat of Mansfield yielded 20.5 per cent. of incombustible matter, consisting of silica, alumina, lime, sulphate of lime, and peroxide of iron. MM. Oberlin and Buchner have lately analyzed the ashes of the turf occurring near Strasburgh; 1000 parts of the dried turf yielded 180 of ashes, of a reddish grey colour, mixed with white and reddish gritty particles of an earthy, saline taste, and infusible by the blow-pipe. One hundred parts of these ashes yielded

Common salt, with a little sulphate of lime	19
Carbonate of lime and of magnesia	81
Phosphate of magnesia and of alumina	
Sulphate of lime and oxide of iron	
Alumina and silica	100

The ashes contained neither free nor carbonated alkali, no iodine, nor any sulphuret. (*Journal de Pharmacie*, Avril, 1831.)

With respect to *animal ashes*, we are not aware that the different forms of animal matter have been subjected to incineration. From the following results obtained by Berzelius, in his experiments on the ashes of bones, it is not difficult to anticipate that phosphate of lime would constitute the larger part of the ashes of the animal solids, excepting the fat; he found that ox bones, after the dissipation of the carbonaceous animal matter which they contained, yielded 66.7 per cent. of ashes, composed of

Phosphate of lime, with a little fluoride of calcium	57.35
Carbonate of lime	3.85
Phosphate of magnesia	2.05
Soda, with a very little chloride of sodium	3.45
	66.70

The ashes of human bones contain about four per cent. less of phosphate of lime, and almost 7½ per cent. more of carbonate than ox bones. With the exception perhaps of the phosphate of magnesia, all the above compounds existed as stated in the bone previously to incineration: this circumstance forms a remarkable difference between vegetable and animal ashes.

Animal ashes, termed technically *bone ash*, are sometimes, though with less effect than unburnt bones, employed as a manure; also for the purpose of making assay cupsels, and in the preparation of phosphoric acid.

Volcanic ashes only remain to be noticed. Vauquelin examined some ashes from Vesuvius which fell at Naples in 1822; their colour was greyish, they were tasteless, and found to consist of alumina, oxide of iron, muriate of ammonia, sulphate of lime, potash, copper, manganese, lime, and charcoal; the proportions of these, however, were not determined. (*Annales de Chimie et de Physique*, tome xxv. p. 72.) Vauquelin also analyzed the ashes ejected in the same year from Atna; they were of a grey colour, and in fine powder; when heated to redness in contact with the air, they exhaled sulphurous acid, and in a close vessel they yielded sulphur. The following statement shows that the composition of these ashes was very different from those of

Vesuvius ejected in the same year. One hundred parts consisted nearly of—

Silica	28.10
Sulphate of lime	18.
Sulphuret of iron	20.88
Alumina	8.
Lime	2.60
Charcoal	1.
Sulphate of copper and of alumina	21.52
Traces of sulphur, a muriate and moisture	
	100.00

(*Annales de Chimie et de Physique*, tome xxxii. p. 111.)

ASHFORD, a market-town in Kent, on the west side of the Stour, just below the confluence of the two upper branches: it is on the road from London (through Maidstone) to Folkstone, 53 miles from London, 19 from Maidstone, and 1½ from Canterbury. It is called in Domesday-book both Estefort and Essetesford, and in other ancient records, Esshetisford, taking its name from the Esse or Eschet, a now obsolete designation of the west branch of the Stour from its source near Lenham to this place.

The situation of this town is pleasant and healthy, being on a small eminence, with a gentle ascent to it on every side. The houses are well built, and the main street (through which the Folkstone road passes) is of considerable width, and is paved. The market-house is in the centre of it, and the church on the south side. At the east end of the town is a stone bridge of four arches over the river Stour. The market is on Saturday. There is a monthly fair or market for the sale of fat and lean stock, held on the first Tuesday in the month; and there are four other fairs, as far as we can gather from our authorities. Several gentle families reside in the town. The population of the parish in 1851 was 2,809.

Adjoining the church is a grammar-school of some repute, founded in the reign of Charles I. by Sir Norton Knatchbull. The master is still appointed by the Knatchbull family.

The church is in the form of a cross, with a tower rising from the centre, lofty and well-proportioned, and surmounted by four pinnacles. The church is in the perpendicular style, and has some good doorways and windows. Several sumptuous monuments of the Smyth family are in a chapel adjoining the south transept. The tower was erected in the reign of Edward IV. by Sir John Fogge, who also much repaired, if he did not rebuild, the church; and founded a 'college' or choir (consisting of the vicar as master or prebendary, two fit chaplains, and two lay clerks), which appears to have been suppressed before the Reformation. A chantry founded in the time of Edward III. was also suppressed during the progress of the Reformation. The living is a vicarage in the presentation of the dean and chapter of Rochester. There are places of worship for different denominations of dissenters: also two national schools, one for boys and one for girls.

The greater part of the parish constitutes what is termed 'the liberty of the town of Ashford,' and is separated from the jurisdiction of the hundred. It has a constable of its own. The town is governed by a mayor, and has a court of record every three weeks for all actions of debt or damages not exceeding twenty marks (*6L 13s. 4d.*).

ASHLAR, rough stones of various sizes. This term is applied to free stones when they are first taken out of the quarry.

ASHLER, a facing made of squared stones. In countries where stone is scarce and expensive, ashler principally consists of thin slabs of stone set to face the brick and rubble walls of buildings. These slabs are generally from four to six inches thick. Ashler is of several kinds. Plane ashler is so called when the surface of the stone is made quite smooth. All the public buildings of London in which stone is used are more or less faced with plane ashler. When the stone shows on its surface a series of narrow parallel flutings, the work is called tooled ashler. This is principally to be met with in the basements of buildings where the stone is set with flutings running perpendicularly. There is also an ornamental kind of ashler, very common in buildings, produced by slightly cutting into the stones, so as to make a depression, along one, two, or more of the sides of the joints. This kind of ashler is called rusticated ashler. [For a more particular account of rusticated work, see MASONRY.] The Banqueting-hall at Whitehall, Somerset-house, the Bank of England, and St. Paul's Cathedral, may

be taken as examples of rusticated ashler in London: an example of rusticated ashler on the north side of the western entrance of St. Paul's Cathedral is given in the cut.

ASHLERING, a term in masonry signifying the act of bedding in mortar the ashler above described. The term is also used in carpentry to signify the short upright pieces of wood placed in the roof of a house to cut off the acute angle between the joists of the floor and the rafters: almost all the garrets in London are built in this way. The annexed cut, representing a section of a garret, shows the ashlering above described.

ASHMOLE, ELIAS, an eminent antiquary and herald, the founder of the museum which still bears his name at Oxford, was the only son of Simon Ashmole, a saddler of Lichfield, by Anne, daughter of Anthony Boyer of Coventry. He was born May 23d, 1617, and was placed at an early age as a chorister in the cathedral of Lichfield. He was afterwards taken into the family of James Paget, Esq., one of the puisne barons of the Exchequer, who had married his mother's sister; under whose roof he studied law, spending his leisure hours in acquiring music and other accomplishments. In 1638 he married Eleanor, daughter of Peter Mainwaring, of Smallwood in Cheshire, and in Michaelmas term the same year he became a solicitor in chancery. In February, 1641, he was sworn an attorney of the Common Pleas. He lost his wife on the 5th of December the same year. The troubles coming on, and being a royalist in principle, he retired from London into Cheshire. In 1645 he became one of the gentlemen of the ordnance in the garrison at Oxford, whence he removed to Worcester, where he was first a commissioner and afterwards receiver and registrar of the excise. He became, soon after, a captain in Lord Ashley's regiment, and comptroller of the ordnance. In the midst of these employments he was far from neglecting his studies, having entered himself of Brasenose College, Oxford, where he applied himself with great vigour to the study of natural philosophy, mathematics, and astronomy, and where his acquaintance with Mr. afterwards Sir George Wharton led him into the absurd mysteries of astrology.

In July, 1646, the king's affairs having grown desperate, after the surrender of Worcester, Mr. Ashmole withdrew again, for a few months, to Cheshire; but coming to London he fell in with Mr. afterwards Sir Jonas Moore, Mr. William Lilly, and Mr. John Booker, esteemed the greatest astrologers of their time, and was by them caressed, instructed, and admitted into their fraternity. In 1647 he went into Berkshire, where he made choice of the village of Englefield for the place of his retirement, at which he studied botany. In 1649 he married his second wife, the Lady Mainwaring (widow of Sir Thomas Mainwaring, Knt. recorder of Reading), whose second son by a former hus-

band, Mr. Humphrey Stafford, made great opposition to the match. The fortune which he obtained with this lady (he was her fourth husband) enabled him to open his house to the most learned and scientific persons of the time. In 1650 he published in 12mo. a treatise written by Dr. Arthur Dee upon the philosopher's stone, under the title of *Fasciculus Chemicus; or, Chymical Collections expressing the Ingress, Progress, and Egress of the secret Hermetick Science, out of the choicest and most famous authors. Whereunto is added, the Arcanum, or grand secret of Hermetick Philosophy. Both made English by James Hassolle, Esq.*, in which name, the letters of his own will be found transposed. He, at the same time, addressed himself to an undertaking of greater consequence, a complete collection of the works of such English chemists as had till then remained in manuscript; to which, as well as to an ardent passion for the study of chemistry, he had been excited by one Backhouse, who was reputed an adept, and whom, from his free communication of chemical secrets, Mr. Ashmole, in the fashion of the time, was accustomed to call 'father.' In his diary, April 3d, 1651, he says, 'Mr. William Backhouse, of Swallowfield in com. Berks, caused me to call him father thenceforward.' He likewise employed a part of his time in acquiring certain manual arts, such as engraving seals, casting in sand, and the mystery of a working goldsmith. In 1652, believing that a competent knowledge of Hebrew was necessary for understanding and explaining such authors as had written on the hermetic science, he applied himself to the study of that language, under a rabbi of the name of Solomon Frank. At length toward the close of 1652 his *Theatrum Chymicum Britannicum* appeared, a quarto volume, containing many pieces of our old hermetic philosophers. This work gained him a high reputation, and among other scholars to whom it extended his acquaintance was the celebrated John Selden, with whom he lived in intimate friendship till his death. Ashmole's marriage with the Lady Mainwaring, exclusive of mere family opposition, involved him in several law-suits, and at last in one in Chancery with the lady herself. October 8th, 1657, he says, 'The cause between me and my wife was heard, where Mr. Serjeant Maynard observed to the court that there were 800 sheets of depositions on my wife's part, and not one word proved against me of using her ill, nor ever giving her a bad or provoking word.'

Ashmole now devoted himself to the study of antiquity and records. This recommended him to Mr. afterwards Sir William Dugdale, whom he accompanied about this time, when making his survey of the Fens. Ashmole's relish for chemistry had abated, and he gave up his intention of extending his *Theatrum Chymicum* to several volumes. In 1658, however, he published a treatise on the philosopher's stone, entitled *The Way to Bliss: in three books: 4to.*; a work, in which he took leave of his friends the astrologers and alchemists with a good grace.

In the spring of 1658 Ashmole applied himself to the collecting of materials for a *History of the Order of the Garter*, the publication of which will be more particularly noticed hereafter. In this year also he went to Oxford, where he made a catalogue of the coins which had been given to the Bodleian Library by Archbishop Laud. In 1659 the younger Tradescant and his wife made over to him, by deed of gift, the Museum of curiosities at South Lambeth, which the two Tradescants, father and son, had been long accumulating.

Upon the Restoration, Mr. Ashmole was early introduced to the presence and favour of King Charles II. who, on June 18, 1660, bestowed upon him the place of Windsor herald; and a few days after appointed him to make a description of the royal collection of medals. On the 3d of September that year, he had a warrant signed for the office of commissioner of excise; and was also joined in a commission for an examination of the notorious Hugh Peters, respecting the royal library and medals which had fallen into Peters's hands in 1648.

On November 2, 1660, he was called to the bar in the Middle Temple hall; and in January, 1661, admitted F.R.S. Soon after this time, he had several new preferments bestowed upon him, and amongst them, by warrant, February 9, 1661, the secretaryship of Surinam. On the 17th of February, 1665, Sir Edward Byshe sealed his deputation for visiting Berkshire, which visitation he began on the 11th of March following. June 9, 1668, he was appointed accomptant-general and country accomptant in the

excise. His second wife, Lady Mainwaring, dying at the beginning of April this year, Ashmole paid his addresses with little delay to Elizabeth, the daughter of his good friend Sir William Dugdale, and was married in Lincoln's Inn chapel on the 3d of November following, by Dr. Lloyd, afterwards bishop of Worcester; and on the 19th of July, 1669, he received the degree of M.D. from the University of Oxford by diploma. He was now courted and esteemed by the greatest persons in the kingdom; and having finished his labours upon the History of the Order of the Garter, presented that work to the king, May 8, 1672, who, as a mark of approbation for his toil and research, presented him with a privy seal for 400*l.* In 1675 he resigned his office of Windsor herald; and in 1677, on Sir Edward Walker's death, might have been made garter king of arms, but waived the appointment in favour of his father-in-law, Sir William Dugdale. At the close of 1677 he was proposed to represent the city of Lichfield in parliament, but finding himself insufficiently supported, withdrew his pretensions. On the 26th of January, 1679, a fire broke out in the Middle Temple, in a set of chambers next to those in which Mr. Ashmole resided, by which he lost the greater part of his library, a cabinet of 9000 antient and modern coins, and a great collection of seals, charters, and other antiquities: his manuscripts, however, and his gold medals, were fortunately preserved, by being in the house which had been Tradescant's at Lambeth. Dr. Plot gave an account of this loss to Anthony à Wood, who printed it in his *Athene Oxonienses*.

In 1682, the University of Oxford having finished a building as a repository for curiosities near the theatre, Ashmole (according to a proposition made to them before it was begun) sent thither the collection of rarities which he had received from the Tradescants, together with such additions as he had made to them; to which he afterwards added the donation of his manuscripts and library. This is still called the Ashmolean Museum.

In the beginning of 1685 Ashmole was again invited to represent the corporation of Lichfield in parliament, but upon King James intimating to him, by Lord Dartmouth, that he would take it kindly if he would resign his interest to Mr. Lewson, he waited upon his Majesty and told him that he was all obedience. In 1686, on the death of his father-in-law, Sir William Dugdale, he declined a second time the office of garter, which he would have obtained for his brother-in-law, John Dugdale, but was unsuccessful. He however procured for him the place of norroy king of arms. This was one of the last public acts of Ashmole's life; the remainder of it was spent in an honourable retirement to the day of his death, May 18, 1692, when he was in the seventy-sixth year of his age. His body was interred at Lambeth, and a black marble slab laid upon his grave with a Latin inscription.

Besides the works already noticed, which were published during his life, Ashmole left large collections in manuscript:—1. *The Arms, Epitaphs, Funerary Inscriptions, with the draughts of the Tombs, &c. in all the Churches in Berkshire*, penned in 1666. These were in part published afterwards under the title of *The Antiquities of Berkshire*, three volumes octavo, 1717, 1723, and at Reading in folio, 1736. 2. *Familiarum illustrium Imperatorumque Romanorum Numismata Oxoniæ in Bodleiana Bibliotheca archivis descripta et explanata*, finished in 1659, and given by Ashmole to the public library in 1666, a MS. in three volumes folio. 3. *A Description and Explanation of the Coins and Medals belonging to King Charles II.*, a MS. formerly in the king's cabinet. 4. *A brief Ceremonial of the Feast of St. George, held at Whitehall, 1661, with other Papers relating to the Order.* 5. *Remarkable Passages in the year 1660, set down by Mr. Elias Ashmole.* 6. *An Account of the Coronation of our Kings, transcribed from a MS. in the King's private Closet.* 7. *The Proceedings on the day of the Coronation of King Charles II.* 8. *The Arms, Epitaphs, &c. in some churches and houses in Staffordshire*, taken when he accompanied Sir William Dugdale in his visitation. 9. *The Arms, Epitaphs, Inscriptions, &c. in Cheshire, Shropshire, Derbyshire, Nottinghamshire, &c.* taken at the same time. 10. *Answers to the Objections urged against Mr. Ashmole's being made historiographer to the Order of the Garter, A.D. 1662.* 11. *A Translation of John Francis Spina's Book of the Catastrophe of the World, to which is subjoined Ambrose Merlin's Prophecy.* 12. *Collections, Remarks, Notes*

on Books and MSS. 13. *The Diary of his Life.* This work was first published in duodecimo in 1717, under the title of *Memoirs of the Life of the learned antiquary, Elias Ashmole, Esq. drawn up by himself by way of Diary, with an Appendix of Original Letters.* Published by Charles Burman, Esq. Reprinted with Lilly's *History of his Life and Times*, octavo, London, 1774. It is from this diary, abounding in absurd and whimsical memoranda, that the dates and facts in the preceding memoir have been principally taken. (See also Wood's *Athene Oxonienses*, Bliss's edition, vol. iv. p. 354. *Biogr. Brit.* by Kippis, vol. i. p. 293.)

ASHOVER, a town in Derbyshire, pleasantly situated in a deep narrow valley, watered by the river Amber; six miles S.W. of Chesterfield, which is the post town, and four from Matlock. It has a small market, frequented during the winter by a few butchers; and two fairs for horned cattle and sheep. As the market is so insignificant and irregular, and is moreover held without charter (as are also the fairs), it is commonly regarded as a village: but Messrs. Lysons (*Magna Britannia*) reckon it among the market-towns. Stocking-weaving and tambour-working give employment to some of the inhabitants.

The church is a Gothic building with a handsome spire, and contains several monuments of the Babington and other families. There is in it a singular antient leaden font, hexagonal in the lower part, but in the upper part circular, and ornamented with rudely executed figures in bas relief, with flowing drapery, and books in their left hands, standing under circular or Norman arches and separated by slender pillars. There is an endowed school, with a school-house built in 1703; also meeting houses for the Wesleyan and Primitive Methodists.

The parish of Ashover is extensive, containing 11,290 acres, and has a population of 3179. It is mostly in the hundred of Searisdale; but the dependent hamlets of Dethwick, Lea, and Holloway, are in the wapentake of Wirksworth. The living is a rectory in the archdeaconry of Derby, and the diocese of Lichfield and Coventry. Dethwick is a chapelry.

There are in the parish considerable lead mines, especially those of Gregory, Brimstone Dyke, and Overton. Blende, or black jack, an inferior species of zinc ore, is found. Limestone is quarried in great quantity, also coarse grindstones, and whetstones of a finer grain. Ochre is found in some of the mines. Chamomile is cultivated for medicinal purposes in considerable quantities; and valerian, elecampane, and roses (the last for the leaves), to a smaller extent.

There are remains of Eastwood Hall, once the residence of the Reresby family, and a structure of some importance, as appears from its massive masonry. It is a gloomy building, with a modern dwelling attached to its shattered walls, standing at the foot of a high hill, which is covered with huge masses of sandstone rock, and crowned with a pine forest. At Overton in this parish is a house which was the property and occasionally the residence of the late Sir Joseph Banks.

At Lea, in this parish, are the ruins of an antient chapel; also a Unitarian chapel, a cotton mill, and a hat manufactory (Lea Wood).

On the declivity of a hill on Ashover common is a rocking stone twenty-six feet in circumference, called by the country people *Robin Hood's Mark*; and near this a singularly-shaped rock, supposed to have been a rock idol. (Lysons' *Magna Britannia*; Rhodes' *Peak Scenery*; *Beauties of England and Wales*.)

ASHTON-IN-MACKERFIELD, a chapelry in the parish of Winwick, in the hundred of West Derby in Lancashire. It lies on the road between Warrington and Wigan, about two miles and a half N.W. by N. of Newton, one of the boroughs disfranchised by the late Reform Bill. It contained, in 1831, 5912 inhabitants, who are chiefly employed in the cotton and hardware manufactures. Some authorities add that there are collieries and potteries. It is sometimes called Ashton-in-the-Willows. The chapelry is in the gift of the rector of Winwick, whose living is one of the richest in the north of England.

Besides the chapel of the Establishment, there are eight places of worship: three belonging to the Catholics, who are numerous; and one each to the Methodists, Independents, Unitarians, Baptists, and Quakers. (Aikin's *Description of the Country round Manchester, &c.*; Carlisle's *Top. Dict. of England, &c.*)

ASHTON-UNDER-LINE, a manufacturing town in the hundred of Salford in Lancashire, on the north bank of the river Tame, which here divides the counties of Lancashire and Cheshire. Duckinfield, which forms a suburb of Ashton across the river, and is united with it by a bridge, is in the latter county. Ashton is $6\frac{1}{2}$ miles east of Manchester, and $186\frac{1}{2}$ miles N.W. by N. of London.

Ashton is a thriving place; and on the whole well laid out and well built. The streets are paved, and the town lighted with gas. The church is large and ancient, furnished with a fine peal of ten bells. The architecture has been much altered by subsequent repairs; and the edifice sustained considerable injury from an accidental fire in 1821. Near to this church is an ancient edifice, called '*The Old Hall*,' supposed to have been built in the fifteenth century; and adjacent to it are the remains of a prison, whose appearance indicates still greater antiquity. This prison is known by the name of '*The Dungeons*,' and was used as a place of confinement till a comparatively recent period. A new church, the cost of which was defrayed by a grant from the commissioners for building new churches, has also been erected. It is of Gothic architecture, and has a square embattled tower surmounted by pinnacles. The court-house for the transaction of public affairs is a handsome building, with a theatre and a concert-room over it.

The chief business of Ashton is the cotton manufacture; the increase of which may be judged of by the fact, that in ten years preceding 1831 the mills increased from thirty to seventy. The goods produced are chiefly gingham, muslins, and calicoes. The Manchester and Ashton, Peak Forest, and Huddersfield canals, which connect Ashton with the various manufacturing districts of the north and middle of England, much promote the trade of the town. Hats, woollens, and silks are manufactured here or in the neighbourhood, and coal is dug in the adjacent districts, and indeed in the very outskirts of the town, in considerable quantity. There are more than twenty collieries in the district, which employ upwards of 1000 men.

Ashton was once a borough, but had been disfranchised; and its decay was indicated by the disuse of a market once held by patent granted by Henry VI. The ancient cross is still standing in the market place. The reviving prosperity of the town has led to an application to parliament for re-establishing a market; and within a few years an act for this purpose has been obtained, as well as one for regulating the police of the town, and for lighting, cleansing, and watching it. Under the Market Act, a site has been provided, and buildings erected, at an expense of above 10,000*l*. The market-day is not yet fixed. The main pipes laid down by the gas company exceed eight miles in length. There are four fairs in the year.

There is an ancient foundation-school; also a national school.

The town of Ashton (including, as it appears, the suburbs or quarters of Boston, Charlestown, Hurst, and some others) had a population in 1831 of 11,673, having increased by more than 5000 persons in the previous ten years.

The chief part of the town and of the parish is on the estate of the Earl of Stamford and Warrington. As lord of the manor he holds a court, at which constables are appointed, and in which questions of disputes, breaches of trust, and rights of tenants, as well as actions of debt under forty shillings, are cognisable. By the late Reform Bill Ashton was made a parliamentary borough, the boundary of which coincides with that laid down in the Local Police Act. It returns one member, and contained in 1831 above six hundred 10*l*. houses. There is a court of requests for the recovery of debts under 5*l*.

The living of Ashton is a valuable rectory, wholly or in part in the gift of the Earl of Stamford and T. Hunt, Esq. The parish is very extensive, comprehending about ten square miles. It is about six miles from N. to S., and four from E. to W. In it are several large manufacturing villages; but except in these and in the town itself, the population is not dense. The parish is divided into four arbitrary divisions, for the purpose of collecting rates, viz. Hartshead, Knotflanes, Audenshaw, and Ashton town; but it is all under one municipal government. The population of the whole amounted in 1831 to 33,597. The spiritual wants of these persons were provided for by five places of worship of the establishment, (viz. the parish church*, three parochial chapels, and one chapel of ease), and twenty-four other places of worship; of

which, nineteen were Methodist, three Baptist, one Independent, and one Johannite. (See *Parliamentary Returns* for 1830.)

The principal villages in the parish are as follows:—Stayleybridge is on the Tame about a mile E. of Ashton. It is not wholly in this parish; for part of it lies across the river, in the parish of Stockport in Cheshire. The two parts are, however, united by an excellent stone bridge, and included in one local act, for the purpose of lighting, &c. The importance of the place is of modern growth, though so far back as in 1795 it consisted of a continuous well-paved street of half a mile, and had in it an episcopal chapel of octagon form. The chief branches of trade were then, and had been for some time, connected with the woollen-cloth manufacture, and consisted of weaving, dyeing, pressing, &c. The population is not ascertained.

Mossley is N.E. of Ashton about two miles and a half. It is connected with Ashton by a new, but not very good road, over a range of high hills. There are scarcely any houses between the places; but in Mossley there are several good ones, and a parochial chapel in the gift of the rector of Ashton. The population in 1831 was about 1500.

Lees is N. by W. of Mossley, and about five miles N. by E. of Ashton. Its situation rather connects it with Oldham (through which its manufactures are carried off to Manchester) than with Ashton, with which it has little communication.

Hooley Hill, the populous part of Audenshaw, is a mi S.W. of Ashton. It has a population of between 2000 and 3000, and is rapidly increasing.

Fairfield, on the road from Manchester to Ashton, is a settlement of the Moravians. It has a chapel, and several

Near Mossley is Hart's Head Pike, a well known object, erected in 1758, on the site of a former structure, which is said to have been used as a beacon. The present building is of stone, and is an upright cylinder, surmounted by a cone, whose base nearly covers the upper surface of the cylinder. It commands a delightful view of the surrounding country.

On the W. side of the town, and on the N. side of the road from Manchester, is a large moss, or shaking bog, from the edges of which turf is cut for fuel. At the depth of ten feet, or thereabouts, lies a tolerable loam, which, with improvement, may be rendered good meadow-land. The moss may be crossed at all seasons. Fir trees, fresh and full of turpentine, have been found in it; likewise oaks quite sound, and as black as ebony.—(Aikin's *Description of the Country round Manchester*; *Boundary Reports*, &c.)

ASH-WEDNESDAY. This, which is the first day of Lent, had formerly two names; one was *caput jejuni*, 'the head of the fast,' the other was *Ash-Wednesday*, so called from the ancient ceremony of blessing ashes on that day, with which the priest signed the people on the forehead in the form of a cross, adding this admonition, *Memento, homo, quod cinis es, et in cinerem reverteris*: 'Remember, man, that thou art ashes, and shalt return to ashes.' (See *Festa Anglo-Romana*, p. 19; Moresini *Papatus*, p. 37; *Festivall*, fol. 1511, p. 15.) 'Mannerly to take their ashes devoutly,' is among the Roman Catholic customs censured by John Bale in his *Declaration of Bonner's Articles*, 1554. The ashes used this day in the Church of Rome are said to be made from the palms consecrated on the Palm-Sunday before. In Bishop Bonner's *Injunctions*, A.D. 1555, we read that 'the hallowed ashes given by the priest to the people on Ash-Wednesday are to put the people in remembrance of penance at the beginning of Lent, that their bodies are but earth, dust, and ashes.' The ancient discipline of sackcloth and ashes on Ash-Wednesday, is at present supplied, in the English established church, by reading publicly on this day the curses denounced against impenitent sinners, when the people are directed to repeat an 'Amen' at the end of each malediction. Compare Wheatley on the *Common Prayer*, 8vo. 1722, p. 227; Brand's *Popular Antiquities*, vol. i. p. 79. Brady, in his *Clavis Calendaria*, says, the primitive Christians did not commence their Lent until the Sunday now called the first in Lent. Pope Felix III., in the year 487, first added the four days preceding the old Lent Sunday, to complete the number of fasting days to forty, of which it actually consists. Pope Gregory the Great introduced the sprinkling of ashes on the first of the four additional days, which gave it the name of Ash-Wednesday; and the council of Beneventum, in the year 1091, strictly enjoined the observance of the ceremony, which was abo-

* We presume this must be the building mentioned above as a new church.

ished in England at the Reformation, and a commination service, as above alluded to, substituted in its stead.

ASIA, under which name we at present comprehend all the countries to the east of Europe and northern Africa, was also applied by the Greeks to the countries bordering on the eastern shores of the Mediterranean Sea, and extending thence eastward. Herodotus confesses that he is unable to account for the origin of the name. Homer (*Il.* ii. 461) mentions an *Asiæ* plain lying near the shores of the *Ægean* Sea between Ephesus and Sardis; and the traditions of the Lydians speak of a king Asius. Hence it seems probable that this name was originally applied to a small district on the western coast of Anatolia; in the progress of time, as the countries east of it became known to the Greeks, the name of Asia became co-extensive with their discoveries, till at length it was customary to designate by it one of the great divisions of our globe.

1. *Asia as known to the Greeks and Romans.*—From the earliest records of European history, the Homeric poems, we learn that an intercourse existed, before the war of Troy, between the inhabitants of Europe and Asia. But as far as we can infer from our authorities, it was more of a hostile than a pacific nature. Commercial exchange seems to have been nearly confined to a few Phœnician vessels which visited the islands of the Archipelago and some ports of Greece, and even with them piracy appears to have been as important an object as commerce. Though the Phœnicians visited the ports of Greece, the inhabitants of that country went only to a few places on the western coast of Asia Minor, and perhaps occasionally to Tyre; their geographical knowledge of Asia was consequently circumscribed within very narrow limits. But confined as their navigation was for a long time, it at last contributed to bring about the settlement of the Greek colonies in Ionia; and this event was followed by another of greater importance in a geographical point of view, namely, the extension of the navigation of these colonies to the countries round the Black Sea, and the exclusion of the Phœnicians from the commerce of this part of the world. The subjection of the Greek colonies in Asia Minor to the kings of Lydia seems not to have injured their commerce, and it doubtless extended their knowledge at least as far as the *Halys*, the boundary of the kingdom of Croesus, and perhaps somewhat beyond it.

The progress of geographical knowledge, which hitherto had been very slow, was accelerated by the establishment of the Persian monarchy, B.C. 550. The different states into which till then western Asia had been divided, and which had much impeded the commercial intercourse of its inhabitants, were incorporated into the extensive Persian empire, which comprehended nearly all the countries between the Mediterranean Sea on the west, and the Behr Dagh on the east, the Caspian on the north, and the mountains which border the valley of the Indus on the west; these countries were inhabited by twenty-nine different nations. The Greek colonies on the coast of Asia Minor, on the overthrow of the Lydian kingdom, had been compelled to submit to the Persian monarch, which circumstance soon led to their intimate acquaintance with Asia beyond the limits of Anatolia. We may judge of the rapid progress made by the Ionian Greeks in their knowledge of Asia, when we find that hardly fifty years after the foundation of the Persian monarchy, Aristagoras, the governor of Miletus, the most commercial and powerful of these colonies, was able to produce at Sparta a copper tablet or map (*Herod.* v. 49)—the first of which we have any distinct record*—on which the countries and military stations between Ionia and Susa were exhibited. About the same time the Persian dominion over all the above-mentioned countries being firmly established, a regular plan of administration was formed by Darius the son of Hystaspes; this king probably caused a geographical and statistical account of the whole empire to be composed, a custom common in Asia at more recent periods, as the *Agha-i-Akhbari* of the Mogul emperors shows, and one still in use in the Chinese empire. Some such work as this must have existed in Persia, for otherwise we can hardly account for the geographical description of the empire which Herodotus has inserted in his history (iii. 89, &c.; vii. 61, &c.). The sketch of the Greek historian enables us to form a pretty exact idea of all the countries subject to the Persian monarchs, and even of those which he had not an opportunity of exa-

mining personally. His information about the countries of Asia beyond the boundaries of the Persian empire is scanty, and much less exact: as it was acquired by oral communication with travellers and traders, it is not surprising that it is often incorrect and mixed with fables, though even the latter in many instances are founded on facts.

Before the time when Herodotus wrote, the Persian empire had become stationary. Accordingly we find that the geographical knowledge of the Greeks, for more than a century, did not advance beyond the ancient boundaries of that empire. But as the intercourse, both hostile and pacific, between the Greeks and Persians had during that period considerably increased, their knowledge of the different provinces composing the Persian empire was also enlarged. The most valuable information of this kind we find embodied in Xenophon's *Anabasis*, or the *Expedition of the Ten Thousand*. [See *ANABASIS*.] It was usual for the Persian kings to have Greek physicians about their persons, as we see in the instance of Democedes (*Herod.* iii. 129, &c.), Ctesias, and others. Such men had of course considerable opportunities for acquiring exact information. If the work of Ctesias had come down to us entire, we might have formed a better estimate of the value of his history of Persia, now known to us solely by the extracts of Photius and a few other writers. [See *CTESIAS*.]

The foundation of this extensive empire had proved advantageous to geography: its destruction also was favourable to its progress. By the conquests of Alexander, the remoter provinces of the Persian monarchy, of which a great part till then had only been known in such general outlines as those given by Herodotus, and by the vague information of individuals, were at once opened to the Greeks, who had been prepared for increasing their geographical information by their education and previous habits. The operations of military expeditions and the observations of military men have always rendered signal services to geography. Alexander attempted to cross the boundaries of the Persian empire on the north and on the south; and though his success was limited in the former quarter, the Greeks began from that time to have some notion of the nomadic tribes beyond the *Saxartes* (*Sir-dihon*), who then, as at present, wandered about in those extensive deserts. But his attempts on the south and east were crowned with success. He crossed the Indus and four of the rivers which traverse the Punjab, and had advanced to no great distance from the banks of the *Jumna* and the valley of the Ganges, when he was obliged to abandon his design of conquering India, owing to the mutiny of his army. On his return to Persia, he made an important addition to the geographical knowledge of the Greeks by exploring with his army and navy the coast and the valley of the lower Indus, and still more by ordering his admiral, Nearchus, to sail along the coast from the Delta of the Indus to the mouth of the Euphrates. [See *ALEXANDER*.] Besides the geographical knowledge acquired by these military operations, and the successful execution of the orders of the Macedonian conqueror by his admiral, this expedition first gave the Greeks a more exact notion of the great extent of India, of its riches, and the peculiarities of the nations which inhabit this great peninsula. The geographical information acquired during the expeditions of Alexander was incorporated in a map by one of his companions in arms, Diocarchus, a pupil of Aristotle.

Less satisfactory, though not less important, was the information which resulted more remotely from the conquests of Alexander. The Macedonian king destroyed Tyre, and transferred its commerce to Alexandria, which he founded near the western mouth of the Nile. As the Phœnicians, for perhaps a thousand years and upwards, had carried on a lucrative commerce with the countries to the east and south of the Persian empire, especially with India, by way of the Persian Gulf and the Red Sea, their merchants had frequent opportunities of collecting such information as tended to increase their commercial advantages. Accordingly the Phœnicians had more nautical and geographical knowledge than any other nation of the ancient world, and they had embodied it in writings. These were likewise transported to Alexandria, and probably aided the merchants of the new emporium in entering at once into the path of their commercial predecessors, and renewing the intercourse between Europe and India by the Nile and the Red Sea, which had been interrupted by the expeditions of Alexander. Accordingly we find that, soon after the death of the founder of Alexandria, Egyptian vessels from the

* Anaximander (see that article) is said by Agathemerus to have made the first maps.

ports of the Red Sea began to visit the shores of Malabar, and to venture as far as Cape Comorin and the island of Ceylon (called Taprobane by the Greeks). But though the geographical information acquired by commerce is often of the most valuable kind, its progress is extremely slow even in our time, and must have been still more so among the ancients on account of the numerous defects of their ship-building, and the backward state of their navigation. Besides, such information is commonly limited to the harbours and shores, and rarely extends to any great distance in the interior. Accordingly we find, that though the commercial intercourse between Alexandria and India was continued without interruption for many centuries, the additional geographical knowledge was scanty and vague; and though many of the harbours of Malabar were annually visited by Egyptian vessels, the information thus obtained concerning Ceylon, the coast of Coromandel, and the country farther to the east, is limited to a few places, and was obviously obtained by the Greeks of Egypt from native navigators, none of them probably having ventured to advance beyond the island of Ceylon and Cape Comorin.

The successors of Alexander, being almost continually engaged in wars among themselves, did not disturb the unsubdued nations which surrounded the Greek empire in Asia, with the exception of Seleucus Nicator, the King of Syria, who made, it is thought, a successful attempt to subdue a part of the valley of the Ganges. This opinion rests on the statement of Pliny (vi. 17). It is, however, certain that he sent an ambassador, Megasthenes, to Sandrocottus, king of the Prasii, to whom a considerable part of Hindustan was subject, and to this individual we owe some further particulars respecting India and its inhabitants. (Strabo, 702, 721, &c.) The Greek empire of Bactria, though its kings remained for many years in possession of the Indian conquests of Alexander, added little or nothing to the previous knowledge of the Greeks concerning that country.

Most of the Greek kingdoms in Asia were destroyed by the Romans, but they did not extend their dominion over all the provinces which once belonged to the Persian monarchy. The extreme eastern boundary of the Roman empire was formed by the Tigris, the Euphrates, and the mountains of Armenia. Their military expeditions being carried on in countries previously known, could add very little to the geographical knowledge of Asia. We ought, however, to make an exception with respect to the Caucasus. In their wars with Mithridates, king of Pontus, the armies of the Romans passed the boundaries of the known world and arrived at Mount Caucasus, with whose extent and situation they became acquainted, though they did not enter the valleys which lie in its bosom. In proceeding farther to the shores of the Caspian Sea, they got information of a commercial road through Bactria, by which the countries on the south of the Caspian Sea carried on an active commerce with India; and soon after another route was discovered, which led over the high table-land of Upper Asia to the Seres or Chinese, probably the road which still passes through the town of Kashghar. Nothing further was added to our geographical knowledge of Asia by the military expeditions of the Romans; but the immense riches which many Roman families had accumulated during the commonwealth, and which still continued to increase under the emperors, created a taste and demand for the exquisite productions of India and eastern Asia, and accordingly we find that not only the lately discovered roads to China and India were much frequented by merchants, but also that the commercial enterprise of Alexandria was so increased, that in the time of Strabo a hundred and twenty vessels were annually sent to the coast of Malabar. This intercourse was considerably facilitated by the discovery of the monsoons in the Indian Sea by Hippalus (Hudson's *Minor Geogr.* vol. i. *Periplus of the Erythrean Sea*): this passage has been sometimes interpreted as if the discovery of the monsoons was made about the time this *Periplus* was written, but there can be no doubt that navigators had availed themselves of the periodical winds long before.

The knowledge which the ancients acquired concerning the geography of Asia is embodied in the systematic works of Strabo, of Pliny, and of Ptolemy of Alexandria, the last of whom raised geography to a science by basing it on astronomical principles. From these writers it is evident, that only those countries into which the Macedonian conqueror had carried his arms were known with some degree of correctness as to their general features, and that beyond them

their knowledge was limited to a few places traversed by commercial roads, and to the harbours. Ptolemy was acquainted with the road leading over the high table-land in the centre of Asia to the Seres, as well as that through Bactria to India. He also had some knowledge of the north-western extremity of the Himalaya range (called by him Imaos or Himaos) and of Cashmere. He was well acquainted with the coasts of Arabia and Persia, and with those of India as far as Cape Comorin. The island of Ceylon, which at that time was the common resort of the eastern and western navigators of the Indian Sea, was also pretty well known to him, though the dimensions assigned to it are very erroneous. In its neighbourhood he states there were found 1378 islets, by which probably the Laccadives and Maldives are meant, and he names Jabadia (Yavadvipa) i. e. 'the barley-island,' as Java is called in Sanscrit on account of its fertility. He is, however, less acquainted with the coast of Coromandel, and still less with the countries to the east of the Bay of Bengal, where the Aurca Chersonesus evidently represents the peninsula of Malacca, on which the port of Zaba was situated, probably in the neighbourhood of Singapore. Then follows the Sinus Magnus or the Gulf of Siam, after traversing which by a voyage of twenty days, the emporium of Cattigara is arrived at, the harbour of the Sinae or Chinese, a place which must be sought for in the neighbourhood of Canton; and farther to the east with the Thine Metropolis (probably Canton) he arrives at the extreme boundary of his geographical knowledge on the east side of Asia.

Besides these works, the *Periplus* of Nearchus, and another probably written in the second century, and attributed to Arrian, give a more particular description of the coast of eastern Africa and of Asia. Another *Periplus* likewise, which certainly is the work of Arrian, contains a brief coast description of the Pontus Euxinus (Black Sea). [See ARRIAN.] As to the geography of northern Asia, few additions seem to have been made after the time of Herodotus and Alexander. In some respects there seems to have been a retrograde movement, as the father of history knew the Caspian to be a lake, which Strabo believed to communicate with the northern ocean. Ptolemy in his map restored the Caspian to its true character of an inland sea, but he placed its length from east to west instead of from north to south, as Herodotus had done. [See ARGONAUTS, vol. ii. p. 310; and Pomp. Mela, i. 2.]

II. *Asia as known in the Middle Ages.*—Though the Byzantine empire did not fall before the invasions of the northern barbarians, it was hemmed in on every side by powerful enemies. On its eastern boundaries, the kingdom of the Parthians was replaced by that of the Persians under the dynasty of the Sassanides, who, acting with all the vigour of newly-founded governments, stopped the progress of the Roman arms on that side. Consequently, the accession of geographical knowledge concerning Upper Asia was extremely scanty, but some information was obtained of the countries to the north of the Iaxartes, and of some parts of India. For the first we are indebted to an embassy of the Emperor Justinian II., who sent in 569 one of his governors to one of the wandering tribes of the Turks in the steppes on the west and south of the Altai Mountains and about the lake of Saisan, or Zaizang, with the view of inducing them to attack their common enemy, the Persians, without foreboding that the descendants of this very people, after a lapse of nearly nine hundred years, would destroy his own empire and choose Constantinople for their metropolis. Nearly about the same time, an Egyptian merchant, Cosmas, surnamed Indicopleustes, who for a long time had carried on a trade with India and repeatedly visited that country, composed his *Topographia Christiana*, in which he gives some new information respecting Ceylon, called by him Selediva, instead of the ancient name of Taprobane, of the commerce of that island with Tsinitza or China, and of the roads through Upper Asia by which the silk manufactures of this country were brought to Persia and Constantinople.

But the channels of geographical information were soon closed. The fanaticism of the newly-founded religion of Mohammed bore down all resistance, and in a short time Egypt and the Asiatic provinces of the Byzantine empire, except Asia Minor, were subjected to the Arabs and their Caliphs; the kingdom of the Sassanides also was incorporated in their widely-extended dominions. The intolerance by which the Mohammedans in the first two centuries of the Hegira (commencing A.D. 622) were distinguished,

interrupted every sort of commercial intercourse with India as well as with Upper Asia, and the distracted condition of the Byzantine empire, and the state of barbarism in which the western nations of Europe were sunk during the earlier part of the middle ages, was such as to deprive them for more than two centuries of any additional knowledge concerning the countries of the East. From the close of the sixth century to the beginning of the Crusades, no new facts were added to European knowledge of Asia.

Circumstances, however, arose which led the Mohammedans of the Caliphate to abate their intolerance and to adopt a more enlightened policy. Science began to be cultivated, arts to flourish, and commerce to be promoted among them. Geography had its full share of the advantages resulting from this favourable change. As every true Mohammedan was bound by his religious tenets to visit at least once in his life the Kaaba of Mecca, travelling became more frequent among the Arabians than it ever has been in any other nation; and as the love of letters increased and became more general, the number of their geographical works, travels, and voyages increased in the same proportion. Many of their works are undoubtedly still unknown, others are still inaccessible to European readers, but some have been translated. The most important are the *Oriental Geography*, translated by W. Ouseley, London, 1800, which was written in the beginning of the tenth century; the *Travels of Ibn Haukal the Arabian*, written about fifty years later; the *Geography of Edrisi* (1153), arranged, like that of Ptolemy of Alexandria, according to climates; the *Geography of Abulfeda* (1345); the *Geography of Ibn el Wardi* (1371); and the *Travels of Ibn Batuta* (1324-1354), translated by Professor Lee of Cambridge, London, 1829. Ibn Batuta was doubtless the greatest traveller that ever lived. He visited Timbuctoo and the Ural Mountains, Adam's Peak in Ceylon, the eastern coast of China, and Tanger in Africa (which was his birth-place), and traversed all the countries between these extreme points.

The Arabs seem also at an early period to have renewed the commercial intercourse with India by the Red Sea and the Gulf of Persia, and to have soon extended their navigation beyond the extreme limits attained by the Greeks of Alexandria. They were prompted to despise the dangers of such a perilous navigation as much by zeal for propagating their creed as by the love of gain, and they succeeded in converting the inhabitants of the Peninsula of Malacca and some of the islands of the Indian Archipelago. There are extant two works on the countries about the seas of China, written, as it is thought, by Ibn Wahab and Abu Seid about the end of the ninth century. The latter composed only a commentary on the writings of the former. Though it is possible that neither of these voyagers reached Canfu (Canton), they collected very interesting information on the southern provinces of China, its productions, and manufactures; some historical facts which they mention respecting an insurrection in these districts in 878 are confirmed by the annals of the Chinese empire, a coincidence which shows the authenticity of these works.

But the Arabs did still more for geography by establishing it as a science on mathematical and astronomical principles, and thus following up the work of Ptolemy. The Calif Al Mamun (813-833) ordered a degree of the meridian to be measured, and this task was executed by the three brothers Ben Shaker in the great plain to the north east of Damascus, between Palmyra and Racca on the banks of the Euphrates. In subsequent attempts at the projection of maps, the Arabs soon became sensible of the want of actual astronomical observation. This led them to the erection of observatories, and to the compilation of astronomical tables. Two works of this kind still exist: one composed about A.D. 1315, in the observatory built at Maragha, near the lake of Urmia; and the other in 1449 at Samarcand; the data contained in them, especially in the latter collection, formed till lately the principal basis on which our maps of the countries to the south of the Caspian Sea, and to the north of the mountains of Cabul and of the Hindu-kush range, were constructed.

Among the nations of Asia none perhaps has done more to increase the stock of geographical knowledge concerning this great division of the globe than the Chinese. The historical records of their empire prove clearly, that two hundred years before our æra the Chinese were anxious to collect geographical information concerning the extensive provinces and tributary kingdoms of their domi-

nions; and they have continued this work to the present day. Neither opportunities nor inducements were wanting for that purpose. An empire of such magnitude as the Chinese always has been, which frequently comprehended half the surface of Asia, renders the exact knowledge of the condition of its provinces, and of their inhabitants, a matter of necessity to the government. Besides the information thus collected by means of the administration of the different provinces, the emperor was in the habit of sending ambassadors to the tributary princes and nations, and to those who, from time to time, sent presents to the court of the Celestial Empire. These ambassadors were instructed to gather useful information concerning the countries they were sent to, and to include it in their reports of the embassies: the reports were afterwards deposited in the archives of government. From such materials the geographies of the Chinese empire were composed and published in print, the art of printing having come into general use among the Chinese in the tenth century. These works contain very abundant information concerning Tartary, Corea, Tibet, Turkistan, and Bucharia, and even valuable notices on Siberia, Persia, and India, as well as on Siam, Tonkin, Java, Formosa, and Japan. But till very lately this information could not be used by the geographer, the study of the Chinese language not having been attended to by Europeans. The number of those who now study this language is daily increasing, and we may soon hope to get access to these writings, which is the more desirable as most of the countries described in the Chinese works are still inaccessible to our merchants and travellers. The most copious geographical and ethnographical information about the eastern countries of Asia in the middle ages, before the establishment of the Mongol empire, is contained in the historical library of Ma-tu-an-lin, the most learned man of his time, who, in his work entitled *Hien-hian-thung-khuo* (Exact Researches of old Monuments), consisting of a hundred volumes, in 348 books, has given an epitome of Chinese literature to A. D. 1207. This great work is characterized by more judgment and accuracy than the similar compilation of Pliny the elder. Nine books are devoted to the geographical description of China, at the different periods of the native dynasties; and twenty-five contain the description of the foreign countries and nations.

Europeans began to renew their acquaintance with the countries of Asia on the shores of the Mediterranean in the eleventh century by pilgrimages, and soon afterwards by the Crusades (1096-1272) undertaken for the delivery of the Holy Sepulchre from the Infidels. The navies of the Italian republics accompanied these expeditions, and the citizens of Pisa, Florence, Genoa, and Venice had thus an opportunity of forming a correct idea of the advantages likely to result from a commercial intercourse with western Asia. Following up these views, they entered into a very lucrative commerce, and brought by their vessels the most valuable products to Europe. The Genoese, in 1261, having got possession of Galata and Pera, suburbs of Constantinople, and with them the exclusive commerce of the Black Sea, extended their commercial speculations to India through the Crimea, Caffa, La Tara (Azof on the Don), Astrakhan, Urgenz (Khiwa), and Tashkend, of which route the interesting work of Balducci Pegoletti, entitled *Libro de' Divisamenti dei Paesi e Misure*, written in 1335, gives some information. Their rivals, the Venetians, had come to an agreement with the sultans of Egypt, by which the direct road to India through the Red Sea was opened to them, and the sudden increase of the wealth of the republic proved that they knew how to profit by these advantages.

Whilst the Italian republics, from mercantile motives, kept to themselves the scanty information which they had acquired by their commercial intercourse with Asia, the western nations of Europe were at once brought into political connexion with those who inhabited the northern and inland parts of this continent. This was brought about by the conquests of Tshengis-khan and his successors. Soon after the death of Tshengis-khan, who had extended his dominion in little more than twenty years (1206-1227) over all the inland countries of Asia from the boundary of Siberia to that of India and Tibet, the Mongols entered Europe across the Volga, subjected Russia, laid prostrate the power of Poland, and gained a victory at the foot of the Riesengebirge, at Liegnitz in Silesia (1243). All Europe trembled; but the barbarians, having got

information of the death of their great Khan, instead of pursuing these advantages, returned to their native country, preserving, however, the dominion over Russia. Then the politics of Pope Innocent IV. and of King Louis IX. of France suggested the plan of directing the power of the great Mongol empire and its warlike army against the Mohammedan princes in western Asia, their implacable enemies; but this object did not seem practicable to the projectors of this plan, unless they could previously convert these barbarians to the Christian faith. For that purpose some friars were sent to the court of the great Khan; John di Plano Carpini in 1246, Father Ascelin, a dominican, in 1248, and William Rubruquis, or Ruysbroeck, in 1254; and though they did not succeed in the main object of their mission, the information which they acquired of the countries through which they passed made the Europeans for the first time acquainted with the immense extent of those regions formerly called by the vague name of Scythia, which from that time obtained the name of Mongolia, or Tartary. Carpini traversed a considerable part of the deserts to the south of the Altai range, and Ruysbroeck advanced even to the then metropolis of the Mongol empire—Karakorum, situated at the conflux of the Tula and Orghon, tributaries of the Selenga, to the south of the lake of Baikal. He gives a curious and very interesting description of that extraordinary town, which was everywhere surrounded like an oasis by extensive deserts. The Mongols, however, continued in their career of conquest in Asia, and at length subjected China to their sway (1275-1279) under the reign of Kublai Khan (1259-1294), the most able of all the successors of Tshengis.

At the court of this monarch the Venetian traveller Marco Polo resided from 1275 to 1292, and as he enjoyed the favour of the emperor in a very eminent degree, and was well acquainted with the most important languages spoken by the people of the country, he was frequently sent on missions to the remotest provinces of the Mongol empire, which were so distant from one another that he was often obliged to travel six months before he arrived at the place of his destination. After traversing, under such favourable circumstances, the Mongol empire in different directions, he was sent as ambassador to the islands of the Indian sea, and had thus an opportunity of becoming acquainted with this part of Asia also. On his return to Europe he passed through the strait of Malacca, remained, on account of the monsoons, five months in Sumatra, visited Ceylon and Malabar, and landed at Ormuz in the Persian Gulf. In

his missions and travels he had been in the habit of keeping a journal, and of entering what appeared to him most worthy of being recorded. On his return to Italy his incredulous countrymen importuned him by unceasing questions, and at length he resolved to make an extract from his journal of the most remarkable objects which he had seen or heard of. This he did in a book entitled *Il Milione di Messere Marco Polo*, or in Latin, *De magnis Mirabilibus Mundi*; one of the most curious and important works of modern literature, which has been translated into almost all European languages. It very materially influenced the views of Columbus, the discoverer of America, and directed the route of Vasco de Gama, who first went to India by the way of the Cape of Good Hope. The correctness of Marco Polo's information is better known and valued in proportion as, by the study of the Asiatic languages, and by the reports of modern travellers, we become more acquainted with the countries which he described. He has been frequently called the Herodotus of the middle ages, and has doubtless a claim to that title. If the name of a discoverer of Asia were to be assigned to any person, nobody would better deserve it, for he alone added to our geographical knowledge of Asia a much greater amount than what had previously been known by the ancients, together with what had been acquired by the travels of Carpini and Ruysbroeck. Besides the information which he gives us concerning Asia, he acquaints us with the eastern coasts of Africa and the island of Madagascar: the latter countries, as well as some parts of Asia, he had not personally visited; but even here his information has proved correct, and shows the care which he used in collecting his facts.

The chief subject of his description is the Mongol empire, which extended over more than one half of Asia, including nearly all the countries of which the ancients had either no knowledge at all, or very scanty and confused information. To the north, his knowledge extended to the lake of Baikal,

the Tunguse tribes, who had no cattle but rein-deer (which tribes he calls Mekrit), and the adjacent sea (Mare Oceano); and he informs us of the connexion between the plains of eastern Europe on the Volga and Don, and those of Tartary and Mongolia. Further, he gives a description of China, in which Peking had become the residence of the Mongol emperors, and of Japan, called by him Zipangu, which name is evidently formed of the Japanese Dshi-penkue (the Empire of the Rise of the Sun). Japan he had not visited; but as his protector, the great Kublai Khan, had sent, in 1280 and 1281, some naval expeditions from Khanfu and Zaitun, in the Chinese provinces of Chekiang and Fukian, to attempt the conquest of the Japanese islands, Marco Polo had a good opportunity of collecting information concerning them, though, as he says, they were 1500 miles from the Chinese coast. The countries to the west of China he had visited, especially Tibet; here he got information of Mien, *i. e.* Pegu, and Bangala, Bengal, in Hindustan, a name never before known in Europe. Kublai Khan had sent, in 1272, an army to conquer these countries. Marco Polo is the first European, as far as we know, who navigated the seas to the east and south of the peninsula beyond the Ganges; and here he mentions the Spice Islands, 7448 in number, as he says, but he did not see them. They are situated in the sea of Cyn, and are mostly inhabited; but they have no commercial intercourse with foreign nations, except the merchants of Ma-Chin, or southern China, who visit them during the monsoons. He next gives some general information of the islands of Sunda and the adjacent groups, which, according to the information he obtained from navigators, consist of 12,700 islands, partly inhabited and partly uninhabited. All these countries and islands were almost entirely unknown before the publication of the travels of Marco Polo. But of the countries previously known to the ancients, the information he gave was likewise interesting, and has proved very useful. He treats of Ceylon, Malabar, and Ormuz, which he himself had visited; and of Aden, Socotora, Abascia (*i. e.* Abyssinia), Zanguebar, and Madagascar, which names were for the first time introduced by him into Europe: those countries had been indicated to him by Arabian navigators. His information concerning these seas served, two centuries later, to direct the course of Vasco de Gama in his first navigation to the shores of India. For he says, 'Departing from the coast of Malabar, a vessel makes, by the assistance of a current, in three months, a thousand miles towards the south-west, and then arrives at Madagascar, and to the still more extensive islands farther to the west (*i. e.* Southern Africa), which are inhabited by black tribes with curly hair, rich in valuable productions, elephants, camelopards, gold, sandal-wood, amber, and frequently visited by merchants from Arabia and India.'

After the time of Marco Polo the number of travellers in Asia increased; but as none of them traversed any considerable part of it, they commonly tried to enliven their works by fables or inventions of their own, or by exaggerating the information which they had obtained by intercourse with the natives. Of this description is the information given by the Armenian monk Hayton, in his *Historia Orientalis*, who collected it from the communication of his uncle, king Hayton I. of Armenia, who, having been present at the court of the great Khan Mangu Khan, had some opportunity of collecting geographical facts. Equally worthless are the reports of the Venetian monk Oderico di Portenau (1317), and still worse the travels of the English knight John Mandeville (1358); these two travellers seem to vie with one another in exaggerating facts. But later, in the fifteenth century, we find some better information, especially through the Spanish ambassador Gonzalez Clavijo, who in 1406 was sent to the court of the famous Timur at Samarcand; and from the German adventurer John Schildberger, who served in the armies of Bajazet, the Turkish emperor, of Timur, and Shah Rokh, from 1400 till 1427; and especially the Venetian, Josaphat Barbaro, who travelled (1436-1471) in the countries east of the Mediterranean Sea, and carefully collected many remarkable facts. But all these travellers, though they brought back to Europe some useful information, contributed little or nothing to the extension of our knowledge, as to parts which had previously not been known at all, or only very imperfectly. This, however, was effected in a very eminent degree by the discoveries of the Portuguese soon after they had found their way to India round the Cape of Good Hope.

III. Progress of the geographical knowledge of Asia

after the circumnavigation of Africa.—The parts of Asia which had been visited by the Greeks were so far known, as to their boundaries, extent, and principal features, that they could be laid down with a tolerable degree of exactness. This will be evident to any person who examines Ptolemy's map of the extensive region between the Mediterranean, the Caucasus, the Caspian Sea, the Belur Tagh, and the river Indus, though it is also clear that the vague information which this geographer had obtained respecting India betrayed him into very great errors as to that country. The information acquired by the travellers of the middle ages was much less exact. None of them had determined the astronomical position of any place: but as they, and especially Marco Polo, had noticed the immense extent of the countries which they had traversed, a very erroneous idea was formed of their true position on the globe. Thus we find that the German astronomer and geographer, Martin Behaim, who, in 1484 and 1485, accompanied the Portuguese navigator, Diogo Cam, in his voyage of discovery along the coasts of Guinea, and in 1492 made, in his native place, Nürnberg, a terrestrial globe, has placed the Zipangu of Marco Polo, or the present Japan, at no great distance to the west of the islands of Cape Verde. A few years were sufficient to remove this error. But even later geographers, as Sim. Gryneus, Sebastian Münster, and others, in their *Typus Cosmographicus Universalis*, i.e. in their maps of the old and new world, drawn up in the first quarter of the sixteenth century, laid down the same country at a short distance to the west of the Terra di Cuba and Parias, in America, which had been discovered a few years before. It was only by the discoveries of the Portuguese subsequent to the circumnavigation of the Cape of Good Hope, that such errors were removed, and the true position and extent of these countries of eastern Asia ascertained.

Vasco de Gama arrived, in 1498, at Calicut, on the coast of Malabar, and the Portuguese pushed their discoveries in these seas with such activity and zeal that, in the course of less than half a century, they had explored them as far as Japan. Their first efforts to establish a commerce were directed to the coast of Malabar; and, as the Arabs or Moors, who then carried on a very active trade with these countries, tried every means to exclude them from these parts, and to embroil them with the numerous sovereigns among which this coast was divided, they were soon obliged to have recourse to arms, and to enter into alliance with some of the native powers. In a few years they had acquired a complete knowledge of the whole coast, from Cape Comorin to the Bay of Cambay and its rich emporiums, Surat and Brouch; and, as early as 1509, they made several settlements on the southern coast of Guzerat as far as Diu, which then had a considerable commerce with Persia and Arabia, and they erected on this coast some fortresses. The following year Alfonso Albuquerque took from the Mohammedan monarch of Deccan the famous town of Goa, which soon became the centre of all the Portuguese dominions in India and the seat of the viceroy and colonial government. The Portuguese now made advantageous treaties with the petty sovereigns along the whole coast of Malabar. But before this time the neighbouring island of Ceylon had been discovered by Almeida in 1506, which was at that epoch of the greatest commercial importance, being a station for the Arabian vessels which went to the Spice Islands for the spices, which, together with the cinnamon which grows in Ceylon, they exported to the harbours in the Persian and Arabian Gulfs, and thence to Europe. In 1517 the Portuguese erected the fortress of Colombo, in Ceylon, and began to exercise a dominion over its petty sovereigns. To secure the monopoly of India, they tried to exclude Arabian vessels from the Indian sea, and succeeded partly by the conquest of Ormuz at the entrance of the Persian Gulf, and by their superiority in naval force.

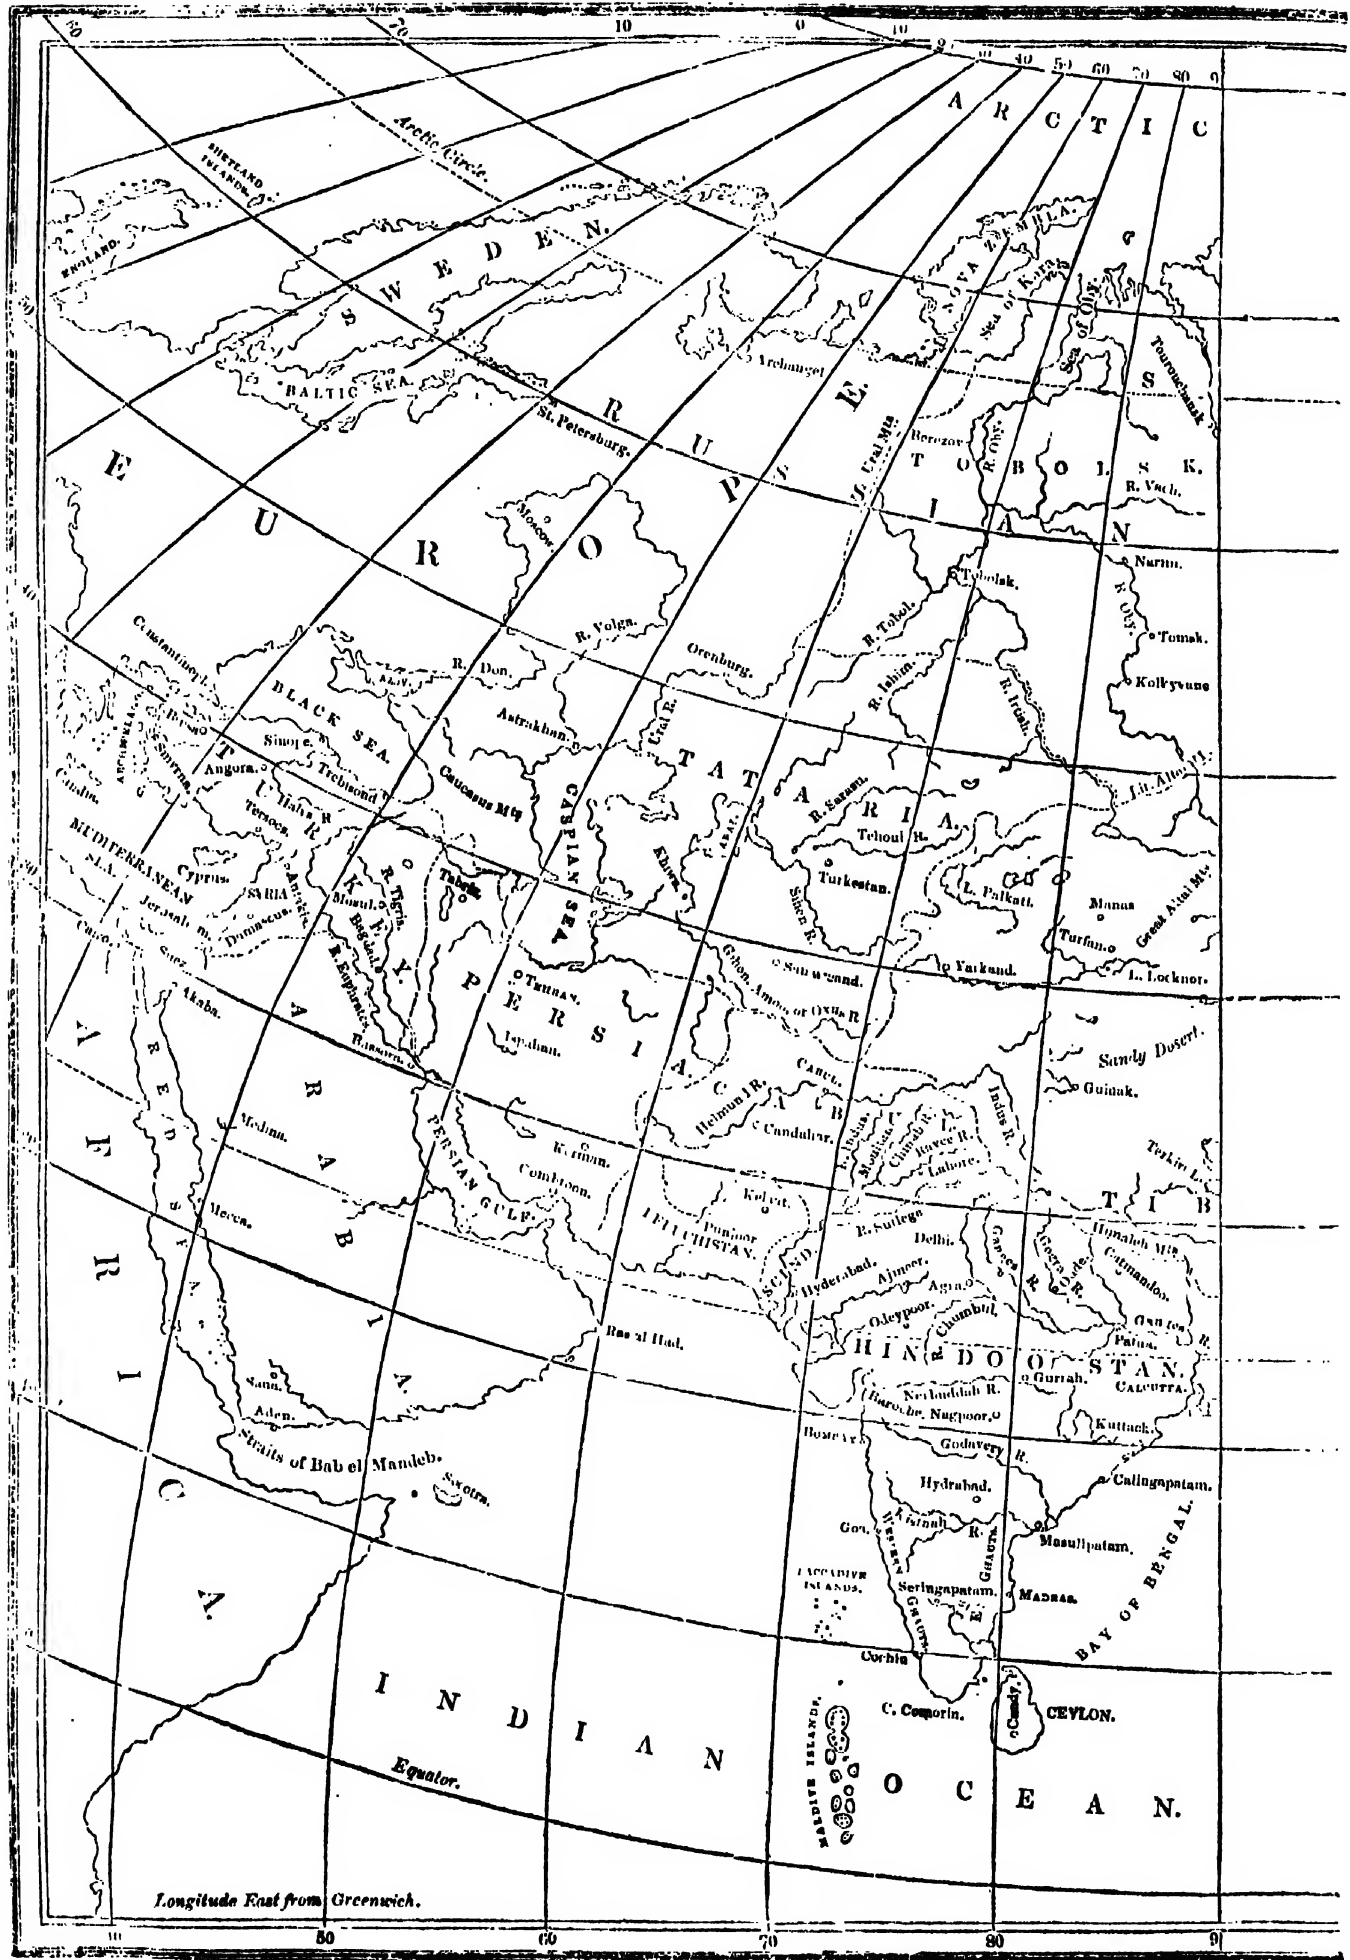

While the Portuguese were struggling to obtain the commerce of the Red Sea, they also extended their discoveries and conquests farther to the east. The town of Malacca soon attracted their attention. It was then what Singapore at present begins to be, the resort of all the nations of eastern Asia and the Islands; its harbour was continually visited by vessels from Malabar, Bengal, Siam, China, the Philippine Islands, the Moluccas, and the Sunda Islands. Albuquerque took it in 1511, and the discoveries and the navigation of the Portuguese were speedily extended in all directions. Now, for the first time, they entered the Gulf of Bengal, and became acquainted with the coasts and har-

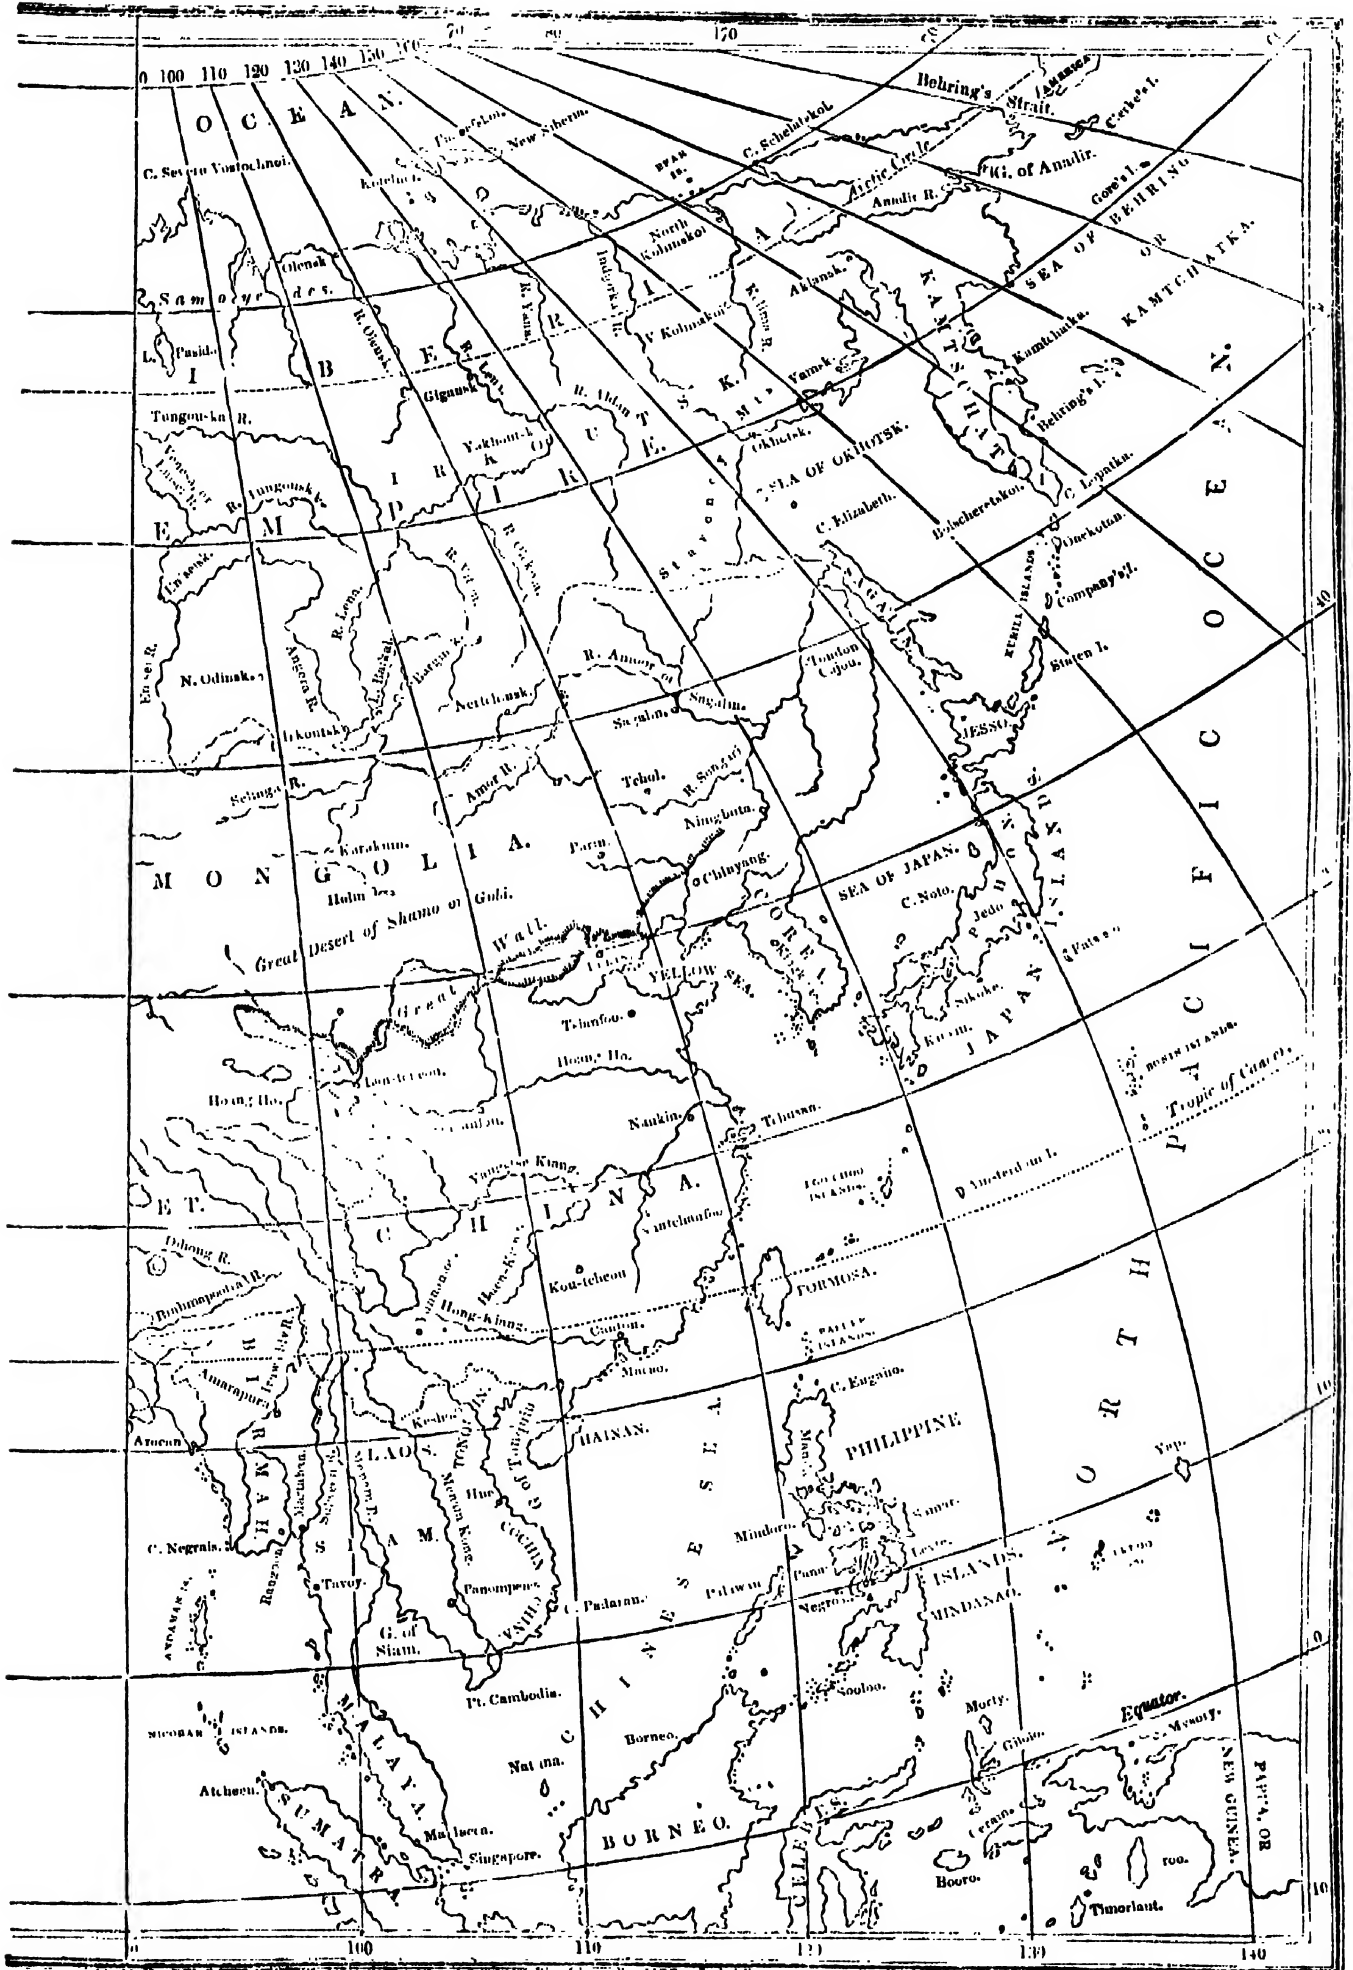

bours of Coromandel, Orissa, and Bengal. John de Silveira in 1518 visited the town of Chittugong, from which the finest cotton manufactures, silk, ginger, indigo, and sugar, were exported. The coasts of the peninsula beyond the Ganges were likewise explored, and some knowledge was obtained of the kingdoms of Aracan, Pegu, Ava, Siam, Camboja, and Cochin China. But the Portuguese directed their attention chiefly to the islands. From Sumatra which was divided into upwards of twenty kingdoms, they obtained gold, tin, pepper, sandal-wood, camphor, &c. They visited Java in 1513, and Borneo in 1523. The innumerable islands scattered over the Indian seas, which thus became known, led the Portuguese historian De Barros to set them down as a separate great division of the globe, calling it by the significant name of Polynesia. The extreme boundary of the Portuguese discoveries was the large island which they called New Guinea, on account of the resemblance of its inhabitants, the Papuas, to the negroes of Guinea on the African coast. In this navigation they successively became acquainted with Celebes, Sulu, Magindanao, Lazon, or Manila, and the Moluccas or Spice Islands, and even visited the Liquejo, Liew-kiew, or Loo Choo Islands, which are described as rich in gold, and whose vessels visited the harbour of Malacca.

In 1516 the Portuguese navigator, Ferdinand Perez, arrived at the coast of China, in the Gulf of Canton, but the Portuguese were not permitted to enter the harbour and to trade there. They were consequently obliged to confine their commercial intercourse with this empire to a trade with the inhabitants of the island of Hainan and the adjacent coast, till, in 1557, they found means to ingratiate themselves with the Chinese government by being materially instrumental in the destruction of a pirate, who for a long time had ravaged the shores and adjacent islands of southern China. For this valuable assistance they obtained the desert island of Macao, where they soon made a settlement; and as on the change of dynasty in the seventeenth century they were so fortunate as to declare in favour of the party which, in the end, proved victorious against the then established government, the possession of Macao was confirmed to them.

While the Portuguese were still carrying on their coasting trade with China, one of their navigators, Ant. de Mota, was cast by a storm in 1542 on the coast of Nipon, one of the islands which compose Japan, the Zipangu of Marco Polo. The Portuguese were treated with great hospitality, and for some time carried on a very lucrative commerce. Japan was the most eastern limit of their discoveries, by which Europeans became acquainted with the real extent of Asia, and with a great part of its coast. Had the Portuguese only been merchants, the advantages accruing from the commerce with such rich countries would probably have induced them to conceal their discoveries from the commercial nations of Europe: but they entered the Indian seas as conquerors also, and their historians (Barros, Couto, Ed. Barbessa, the companion of Magalhaens, Faria y Sousa, &c.) found in their heroic enterprises a subject for national exultation.

The Portuguese had exhausted their strength in forming settlements both in the Old and New World. The spirit of the first conquerors no longer animated the nation, and their tyranny and intolerance made them hated in their colonies. At the close of the sixteenth century Portugal fell under the yoke of Spain; and one result of the struggle of the Netherlands against the power of Philip II. was the gradual transfer of the Portuguese possessions in the East to the hands of the Hollanders, their successful rivals on the sea. The Portuguese were expelled from Japan (1639) and the Moluccas; they lost Malacca (1641) and Ceylon (1656), with their settlements on the Coromandel and Malabar coasts; and they remained, at the conclusion of peace (1663), only in the possession of Goa and Diu, which they have kept to the present day. The Hollanders, though they extended the settlements during the century that they possessed the dominion of the Indian seas, acted more on mercantile principles, and did not materially increase our geographical knowledge of the countries in which they settled. They published, indeed, a few descriptions of some of their colonies, and their natural productions, especially of the plants and shells (Rumphius, *Amboinsche Raritätenkammer*; Rheede, *Hortus Malabaricus*; Fr. Valentyn's *Beschreibungen*, &c.); but these works were generally defective in geographical information. The most important communication belonging to this period was furnished by the German

naturalist, E. Kämpfer, who, in the capacity of Dutch physician, resided in Japan from 1684-1692, and has given a good description of that country.

During the long-protracted contest between the Portuguese and Dutch in the seas of India, the most northern part of Asia which had not been known either to the ancients or moderns, suddenly emerged from the obscurity in which it had hitherto been involved. The sovereigns of Russia, who for more than two centuries had been dependent on the Tartarian princes of the family of Tshengis-Khan, obtained the full sovereignty of their country in 1161, and in the following century they extended their dominion, and with it our geographical knowledge, over the countries drained by the Don, Volga, and Ural, up to the Ural mountains, by the conquest of Kasan (1552) and Astrakhan (1555). In 1578 a chief or hetman of the Cosacks, Yermak Timofeyeff, who was in fear of punishment for having robbed some travellers, crossed the Ural range with a troop of his countrymen, and entered Siberia. The discovery of Siberia, and its subjection to the Russian sway, were pursued with such vigour, that in 1614 the mouth of the Amur was reached, and in 1648 the bold hetman Deshnef, favoured by a mild season, circumnavigated the most north-east corner of Asia, from the mouth of the Kowyma round the north-east cape to the mouth of the Anadyr, and thus proved that Asia was actually separated by an open sea from America. This fact, however, remained for a length of time problematical: the Russian navigator Behring (1725—1728), as well as Captain Cook (1778), found their way impeded by enormous fields of ice. In 1820—1824, the Russian captain Wrangel again succeeded in effecting this circumnavigation. The discovery and conquest of Siberia were completed by Peter the Great, who took possession of Kamtchatka in 1696.

Somewhat later, and still more unexpectedly, Europe obtained a complete geographical view of the immense empire of China, and a considerable part of central Asia. This was not due to conquest, nor to the activity and industry of travellers, but to science. The Jesuits had tried to convert the inhabitants of Japan to Christianity, and had met with more success than in any other country of Asia. But a persecution breaking out against them and their proselytes, from political reasons, the friars, who were now compelled to leave the country, directed their labors to China. Father Matteo Ricci, an Italian, a man of considerable attainments in astronomy and mathematics, soon acquired a great authority at the court of Peking, in 1600. One of his successors in the mission, Father Schall, was appointed chief of the bureau of *Heavenly Affairs*, and maintained himself in this place even after a revolution had taken place (1644), and the dynasty of the Mantshu emperors had ascended the throne. The Jesuits continued in favour to the middle of the last century (1759). During this time some of them had an opportunity of traversing various parts of the Chinese empire, and the countries of central Asia. Thus Father Ben. Goëss travelled (1607) from India through Kashghar, Yarkand, and the desert of Gobi, to the great wall of China, and ascertained that *Kotai* was northern China, and *Khambulu* the town of Peking, which till then had been considered as different countries and towns. Other Jesuits succeeded in insinuating themselves so far into the favour of the great emperor Kanghi, that some of them always accompanied him in his expeditions and travels, or were sent on certain missions. By these means they acquired a considerable knowledge of China and the countries dependent on it, as Mantshuria, Corea, and even of the great desert called Gobi, as well as of the manners, character, and institutions of the inhabitants of those countries. The observations of the Jesuits were published. But the greatest service which they rendered to geography was their map of China, which was made under the authority and at the expense of the Chinese government, by the friars Bouvet, Regis, and Jartoux, between 1708 and 1718; and after having been corrected by the friars Felix d'Arocha, Espinha, Hallerstein, and Gaubil, was published at Peking, by the authority of the emperor Kienlong in 1760, in 104 sheets. The great imperial geography, entitled *Tay-tshing-y-thoung-tchi*, written by the order of the emperor Kienlong, may be considered as a commentary on this map. The second edition (1790) of this extensive work has been enlarged to 480 books, and we are indebted for our knowledge of it to the industry of some Chinese scholars, especially Sir George Staunton, Davis,

Morrison, Abel Rémusat, the Archimandrite Hyacinth, and Klaproth. Modern travellers, especially the Dutch (J. Neuhof, 1755, and Van Braam, 1794), and the English (Lord Macartney, with Sir George Staunton and J. C. Hüttner, 1792, and Lord Amherst, with Ellis, Abel, Maxwell, Basil Hall, 1816), have added something to the before-existing stock; but the information which they have communicated extends only over a comparatively small extent of country. The voyage of Captain Maxwell, however, has materially improved our knowledge of the coast of the bay of Petcheli, and the peninsula of Corea, a coast which previously had not been examined with any degree of accuracy.

Whilst the conquests of the Russians in Siberia, and the operations of the Chinese government, opened to us the northern and eastern countries of Asia, our progress in the geographical knowledge of the southern and western countries was comparatively slow. The fanatical policy of the Turks, who, at the end of the fifteenth and the beginning of the sixteenth century, had got possession of them, shut up the roads through Asia Minor and the adjacent countries, which consequently were not visited, except by a few pilgrims. The policy of Persia, however, under the dynasty of the Sofides (from 1501—1722), was much more favourable to European travellers, many of whom got access to every part of the country, and even to the court, and collected very valuable information concerning the geography of Persia, the institutions, and the character and manners of its inhabitants. Such information is contained in the travels of Pietro della Valle (1614—1626), Adam Olearius and Albrecht von Mandelsloh (1633—1639), John Thevenot (1652), John Baptist Tavernier (1665), and especially in those of John Chardin, the court jeweller of the king of Persia and of Charles II. of England, who discovered the ruins of Persepolis; and of Francis Bernier, the physician of the emperor Aurung Zeb, who first gave some information on the valley of Cashmere. Gasparo Balbi, a Venetian jeweller, made a journey to India (1579—1588), by the route of Aleppo, Bir, the Euphrates as far as Felugia, and Bagdad. Rauwolf, in 1574, also descended the Euphrates from Bir.

Towards the end of the seventeenth century the suspicious policy of the Turks began gradually to relax; and the first fruits of the zeal to explore the countries subject to their sway was the discovery of the ruins of Palmyra by Hudifax in 1691, and the travels of another Englishman, Henry Maundrell, to Jerusalem in 1697. They were soon followed by the naturalist J. Piton de Tournefort, who explored Asia Minor, Armenia, and Persia (1701), L. Lucas the antiquarian, and the Dutch painter Corn. de Brayn, who visited Syria and Palestine: and, somewhat later, by the antiquarian Richard Pococke (1727), and C. Niebuhr (1766). In our times, these countries have been visited by Volney (1796), Seetzen (1802—1817), Clarke, Turner, Buckingham, and others. Arabia, which formerly had not attracted the attention of Europeans, and was only known from the description of Abulfeda, was pretty well explored in part of its extent by C. Niebuhr (1761—1767), and its geography, ethnography, and natural history have been considerably enriched in our times by Seetzen and Borchardt.

The geography of India, that country which, since it first became known, had always most excited the curiosity of the learned, and attracted the speculations of the merchant, was longer involved in obscurity than almost any part of Asia. Up to the middle of the last century, its coasts were very imperfectly determined, and very little indeed was known of the interior of the country itself. A few travellers, as Thevenot, Tavernier, and Bernier, had given some information about a few districts and routes, but it was extremely scanty. The true geographical knowledge of these countries began in the Deccan with the wars of the East India Company and the French (about 1740), and in Hindostan with the conquest of Bengal (1757). From this time its progress was extremely rapid. A great part of the valley of the Ganges was soon explored and surveyed, and an account of the remainder, and of other districts of Hindostan, was obtained by the translation of the *Ayin-i-Akbari*, an historical and statistical account of the Mogul empire, composed by Abul Fazl, under the orders of the emperor Akbar. [See ABUL FAZL.] The military expeditions against Hyder Ali and his son Tippoo Saib, rajahs of Mysore, gave that exact information of the southern parts of Deccan which is always

the effect of such operations. In the wars with the Pindaries and with the Mahrattas (1801—1818), the northern districts of Deccan and the central region of Hindostan were explored in a similar manner; and as in the wars with the then French government, the colonies of the French and Dutch (Pondicherry, 1793, Ceylon, 1796, Java, 1811) fell into the hands of the English, a full account of them, especially of the island of Java, then almost unknown, was published by Sir Stamford Raffles. The novelty of the scenes opened by these successive conquests induced many scientific men and exact observers of nature to explore these countries, and to them we are indebted for a number of valuable works. The most important are, Forbes's *Memoirs on Mulabar*; Sir Francis Hamilton's (*Buchanan's*) *Travels through Mysore*; B. Heyno's and M. Wilkes's *Researches on Deccan*; Leichenault's *Botanical Excursions through Deccan* (1816); Lord Valentia's *Travels* (1802—1806); Bishop Heber's *Travels* (1824—1826); Malcolm's *Researches on Malwa* (1820); Tod's *Rajasthan*; A. Burnes's *Topographical Researches on Cutch, &c.*; and his *Examination of the Indus and the Penjab*. An account of the island of Ceylon is found in the works of Perceval (1796), and of J. Davy (1816—1820); and Sumatra was described by Marsden. Many separate memoirs, either inserted in the Transactions of the Asiatic Societies of Calcutta and London, or published separately, have illustrated the geography, geology, natural history, or antiquities of some separate district or place*. [See ASIATIC SOCIETIES.] It may be truly said that India, which little more than fifty years ago was less known than almost any other country of equal extent, has since that time been so well explored by the industry of our countrymen, that there are few countries out of Europe on which we have better information.

The extensive conquests of the English on the banks of the Ganges and its tributaries, involved them at last in political relations, and in a war with the tribes of mountaineers inhabiting the Himalaya range, especially with the Ghorkas in Nepal; and this led to the conquest, in 1816, of some of the elevated valleys of these gigantic mountains, which hitherto had remained entirely concealed from the admirers of nature. Their exploration soon became the object of the concentrated zeal of some of our most scientific countrymen. The great height of their pinnacles was determined, and their character explored by Raper, Webb, Hodgson, Crawford, &c. Penetrating through these valleys, Moorcroft (1812) succeeded in entering the high table-land of Tibet, where his progress was impeded by the jealous policy of the Chinese; he afterwards reached Leh in Ladakh (1820—1825), and then passed through the valley of Cashmere, which, since the time of Bernier, had only been visited by G. Forster (1783). Before his time, Tibet had already been visited by Turner, who was sent to the Teshoo Lama, the high priest of the Buddhists, as ambassador, and on his way traversed the valleys of Bhotan.

The political relations, which the East India Company were obliged to enter into with the countries lying on both banks of the Indus, gave rise to the embassy of Mountstuart Elphinstone to the court of Cabul (1809), by whom the whole region known by the name of Afghanistan, which till then had remained almost entirely unexplored, was at once opened to us. A similar effect was produced by C. Grant's embassy to the court of Sind (1809). After that time, Christie and Pottinger traversed Beluchistan, and those regions which antiently were known by the name of Gedrosia and Ariana, and had probably not been visited by an European since the expedition of Alexander the Great: in these journeys they discovered the table-land of Kelat (1810), and the roads which lead thence to Kerinan and Herat. The recent journey of Burnes from the Indus into the countries on the Oxus river will make some important additions to our knowledge of these hitherto almost unknown regions.

Our knowledge of Persia has likewise received very important additions in modern times, especially from the industry of the English. This also has arisen from political relations: Sir John Malcolm, the author of the classical history of Persia, and Sir Harford Jones, were sent

to the court of Teheran, which they soon prevailed upon to place the organization of the Persian army in their hands, and to permit them to examine the Persian provinces with reference to their capabilities for defence. The result of these geographical researches was an improved map of Persia, and a list of routes through its provinces, published by Macdonald Kinneir in his *Geographical Memoir* (1813), who, in his travels (1813-14), examined also the roads leading through Kurdistan, Armenia, and Asia Minor. This information was greatly increased by J. Morier's travels, the labours of Ouseley in oriental geography and literature, by Ker Porter's and Rich's researches on Persian antiquities and architecture, and B. Fraser's travels, who in 1821 advanced to Mushed in Khorassan: Fraser first determined the height of the table-land of Iran, and corrected, by his observations, the southern shores of the Caspian Sea. Still more recently we have acquired valuable information from Captain Chesney's report on the Euphrates: the description of that river between Sir and Bassora, and many interesting facts as to its flooding, navigation, and the inhabitants on its banks, are contained in this unpublished document.

Of India beyond the Ganges nothing was known at the close of the last century except the coasts and a few ports; but the increasing power of the Burman empire soon produced political relations between it and the government of Calcutta, which in 1795 sent an ambassador, Col. Symes, to the court of Amarapura, accompanied by the naturalist Sir Francis Hamilton (*Buchanan*), from whom we have the first authentic account of that country. The war with the Burmese, which took place a few years ago (1824-26), made us acquainted with the valley of the Irawaddy, up to the capital of the Burman empire; and the ceded provinces (Aracan, Martaban, &c.), as well as the countries which were declared independent by the peace (Assam, Cashar, Manipore, &c.), began soon to be explored. During the negotiations for peace, Crawford was sent to Amarapura, and published an account of the Burman empire, by which he cleared up the geography of the peninsula beyond the Ganges as much as he had previously done by his account of Siam and Cochin China. This work and his history of the Indian archipelago, have considerably enlarged our views concerning the most unknown portion of India.

Next to the English the Russians have, in modern times, been most active in extending and completing our geographical knowledge of Asia. The establishment of mines in Daouria on the Amur, and in the Altai mountains between the Irish and Oby, gave rise to the travels of many scientific men, and the publication of several interesting travels and treatises. The most valuable works on the geography of Siberia are by Messerschmidt (1720), Dr. Müller, De Lisle de la Croyère, Gmelin, father and son, Falk, Pallas (1720), Georgi, Sievers (1791), and, in our times, Von Ledebour (1826), Dr. Meyer, Von Bunge, Hess, A. Erman, and Alexander von Humboldt (1829). The periodical missions to the court of Peking have added some information concerning the table-land which extends between Siberia and China, especially the travels of Timkowski (1819-21) and those of Von Bunge (1830), who first ascertained the elevation of the central table-land crossed in this journey.

The conquests of the Russians in Asia have given us a more complete knowledge of the Caucasus. Peter I. ordered a survey of the Caspian Sea to be made, which was executed by Simonof, and thus the true extent and form of that immense lake were first known. In the war against Persia in 1721-23, the northern ridges of Mount Caucasus and the countries watered by the Kur and Aras were explored; and discoveries were pushed further south, when (1800) the province of Grusia fell under the sway of the Russians. After that time, the valleys of the Caucasus were visited and explored by Gildenstadt, Reineggs, Von Biberstein, Klaproth (1807), Parrot, and M. von Engelhardt (1815), Kupfer, and M. Lenz (1829), who at last succeeded in reaching the elevated pinnacle of the Elburz; Parrot had previously ascended the Ararat.

The Russians have likewise penetrated into the countries east of the Caspian sea, and surrounding the lake of Aral by passing through the deserts inhabited by the Khirghis Karaks. This was chiefly effected by the missions and embassies of Nazarov to Khokhand (1813), of Murawieff to Khyva (1819), of Meyendorf and Eversmann to Bokhara (1820), and of Von Berg, Lewelini, &c., to the Lake of Aral, since 1823.

* Col. Lambton executed (1801—1812), under the orders of the East India Company, a trigonometrical survey of the southern part of Deccan, and measured a meridian from Cape Comorin northward to the Nerbudda in Malwa, nearly sixteen degrees in extent, and on this survey all our modern maps of India are constructed. Some others have added a few districts, as Dangerfield, Tod, and Burnes.

IV. General view of the extent and figure of Asia.—Asia lies to the east of Europe and Africa; it is separated from Africa by seas, except at one place, where these two great divisions of the globe are joined by the narrow isthmus of Suez. With Europe it is connected by extensive tracts of land under the meridian of the Ural, which mountain range, together with the desert and deep-lying plains that extend along the lower course of the Volga and the northern extremity of the Caspian Sea, ought to be considered as the natural boundary between Europe and Asia.

The great depression of these steppes, in which the town of Orenburg is not higher than the level of the Atlantic Sea, and the surface of the Caspian is more than 300 feet below it, is the characteristic physical peculiarity of the region on the common boundary of Europe and Asia; and it has greatly influenced the condition of the human race in the adjacent countries.

In the changes, to which the nomadic tribes in the interior of Asia were frequently subject, some of them were driven through that immense gate, which opens between the Ural range and the Caucasus, towards the eastern countries of Europe, richly endowed by nature with a soil fit for agriculture; and in this way a continual migration was effected.

Asia, whose area is more than five times that of Europe, differs materially in its physical figure from Europe and Africa. Africa is like a body without members, but Asia extends its limbs in three directions, preserving at the same time a preponderant mass of body; Europe, on the contrary, which may be considered as an appendage or continuation of Asia, exhibits a preponderance in its numerous limbs over the mass of the body.

The great mass of Asia may be compared to a four-sided figure, whose four unequal angles are placed respectively on the isthmus of Suez, the innermost angle of the Gulf of Tonkin, Cape Shalatzkoi in Siberia, and on the peninsula adjacent to the Gulf of Kara, east of Nova Zembla. It consequently extends to the south of the Tropic of Cancer, and in some parts stretches north of the Arctic Circle. The northern side of this figure, lying within and parallel to the Polar circle, is the shortest, extending only about 2700 miles; that near the Tropic, the longest, measures upward of 5000 miles. Four-fifths of the whole area of Asia, or about fourteen millions of square miles are comprehended in this figure; the whole of its surface amounts to about seventeen millions and a half.

From this extensive continental mass, which may be considered as the body of Asia, its members project on the east, south, and west, in the form of peninsulas and headlands. These peninsulas are that of the Tshuktshes jutting out towards America (with an area of 64,000 square miles), that of Kamtchatka (containing 56,000 square miles), that of Corea of equal extent, the curved arc of the coasts of China, and the three extensive peninsulas stretching south into the seas of India and Arabia,—the peninsula beyond the Ganges occupying 777,000 square miles, India within the Ganges comprehending upwards of a million of square miles, and Arabia about an equal extent: the three last, taken together, have an area nearly equal to Europe. And lastly, the peninsula of Asia Minor, which, not unlike a bridge leading to Europe, has served to facilitate the passage of nations and of civilization. The northern coast alone, though much more indented than any part of the coast of Africa, does not exhibit in its formation peninsulas of great dimensions. These members, detached from the main body of the continent, contain nearly three millions and a half of square miles.

It may be observed that the extensive tract of land which occupies the centre of the continent, and is beyond the reach of any of the seas enclosing Asia, is far superior in extent to the members which surround it; this tract forms what may be called *Central Asia*, and has remained in a state of lasting uniformity, in manners and civilization, whilst its appendages, which lie round it, have undergone numerous changes and made great progress in the arts of civilization.

If we consider—and we think we ought to do so—the islands which lie near a continent as its insulated members, we may say that no part of the globe equals the southern part of Asia in the luxuriance of this formation. Here lies the group of the Sundas with its thousand islands and islets, the most extensive archipelago of the globe, which forms an easy passage to the continent of Australia and to the Pacific Ocean and its numerous groups. Thus Asia exhibits

the greatest contrasts on the surface of the globe. Its interior presents to our view the most extensive, uninterrupted continental formation; and its southern extremity is more split into separate members, and varies more in rapid succession of land and sea, than any other part of the globe of equal extent.

Asia, exhibiting such characteristics in its outline, is no less remarkable for the formation of its surface, on which the climate, and consequently the vegetation and animal kingdom, of its different parts must chiefly depend. In examining the other divisions of the globe, we find that Australia exhibits level and comparatively low countries without any extensive high mountain-range, as far as we yet know. Africa is divided into two nearly equal parts, the southern of which forms an almost uniform table-land, whilst the northern, with the exception of the Atlas region, may be considered as a lowland. Europe contains in all parts plains of small extent lying between dispersed mountain-groups and ridges. In America all the highest land lies on one side, occupying its western coast from the extreme north to the south: it forms the most extensive system of mountain-chains on the globe, which inclose within their arms elevated plateaus, but of comparatively small extent. Asia exhibits different features. The whole mass of the interior continent rises to a considerable elevation above the sea, and this elevated mass, of which the high table-lands occupy by far the greatest extent, is not placed at one of the extremities of the whole mass, but occupies its centre.

From these table-lands, which occupy the centre, the surface descends in gradual and diversified terraces and slopes to the level lowlands which surround them. The table-lands themselves are traversed by numerous mountain-chains, and are everywhere enclosed by high ranges; but though these mountains are among the highest and most extensive on the globe, they occupy, when compared with the table-lands, a comparatively small surface. Their influence on climate and organic nature cannot therefore be equal to that which the table-lands themselves exercise, and consequently their relation to these latter is only subordinate. This observation applies even to the colossal range of the Himalaya, which forms the southern boundary of the extensive systems of table-lands occupying central Asia.

The table-lands, in the interior of the continent, form two separate systems different both in extent and in elevation: they are, as it were, two terraces, a higher and a lower one. The eastern system of these table-lands comprehends the plateau of Tibet and that of the great desert called Gobi, and the countries lying between them; it rises from 4000 to 10,000 feet, and in some parts still more, above the sea: the western, containing the plateau of Iran (Persia), does not generally attain the height of 4000 feet. The latter may occupy an area of about 1,700,000 square miles; the former, more than thrice as large in extent, contains about 7,600,000 square miles, and both taken together more than two-fifths of all Asia; the remainder of the continent is occupied partly by the terraces, by the intervention of which the table-lands sink gradually towards the lowlands, and partly by the lowlands themselves. The length of both systems of table-lands taken together and measured from west to east, from the Black Sea and the Persian Gulf to the sea adjacent to the coasts of Corea, is upwards of 5500 miles. Its breadth from south to north varies considerably: it occupies in its greatest extent on the east, between its southern boundary in the Chinese province of Yunnan and the northern in the country of the Mantshu Tunguses, from 1800 to 2000 miles; but on the west, between the coasts of Carmania and Gedrosia in Beloochistan, and the steep slopes to the lowlands of Bucharia, less than 700 miles.

The boundary of these plateau-regions is marked by Taurus and Caucasus at the north-western extremity, and by Mount Elburz at its slope towards the deep depression of the Caspian Sea; it afterwards advances farther north in the Altai range in Siberia, and on the north-eastern extremity is bounded by the alpine region of Da-uria. On the east the boundary is indicated by the mountain-ranges in western China, which have no common name, but extend from the western extremity of the Great Wall to the Snow Mountains (Siute Shan) in Kuang-si and Yunnan northward, to the innermost angle of the Gulf of Tonkin. The southern boundary is formed by the Himalaya range and

its branches, extending eastward and westward, the latter of which are known by the name of Hindu-Coosh or Hindu-Kuh. Farther to the west, where the plateau of Iran projects towards the south, the table-land region is separated from the Indian Sea by the mountains of Beluchistan, and thence from the Gulf of Persia by the steep Persian mountain-range (in its northern course called Zagrus), which extends along the coast of the gulf, and bounds the Tigris valley on the east: it afterwards joins the chains of Taurus and Amanus, where the Tigris and the Euphrates issue from the mountains. Here the boundary between the lowlands of Mesopotamia and the table-land is very distinctly marked; and from this point the range proceeds westward, under the name of Mount Taurus, and fills, together with the table-lands enclosed between its arms, the greatest part of the peninsula of Anatolia.

Both systems of table-lands are so connected, that, properly speaking, they form only one elevated and continuous protuberance on the surface of the earth, but they decrease considerably in breadth where they join one another; and exactly at this point of junction numerous high masses rise and form an extensive mountain-knot, where the ranges of the Himalaya, Hindu-Kuh, Thsunling, and Belur, meet one another; thus these table-lands are, at the same time, joined and separated in a very characteristic manner.

From the extremity of these table-land systems, especially on the south-east and north-east, south-west and north-west, there issue several separate mountain-chains, not connected with one another, but which form more or less a part of the table-lands themselves. By this peculiarity the highland of central Asia, as far as regards its surface and its extremities, appears not less indented and cut into several divisions and members than the whole continent of Asia on its shores and its exterior figure; the valleys, which by this indentation are produced on the borders of the table-lands, afford peculiar advantages for the progress of civilization. For, as we have already observed, the highland of Asia does not sink on one side only, but on all sides and towards every point of the compass; towards different oceans also, which are everywhere separated from the highland by extensive plains, varying greatly in magnitude and form. This circumstance, added to the valleys formed by the indentations in the exterior margins of the highlands, has given rise to numerous and most extensive river systems, which, descending through the intervening terraces, direct their winding course towards the north, south, west, and east, and thus give to the internal countries of this continent an open communication with the ocean.

The eastern highland of Asia is divided from the western, or, more accurately, the table-land of western Tibet from that of eastern Iran, between the meridians of Balkh and Cabul, by a tract of a peculiar nature. The eastern highland, much larger in extent and of higher elevation, presents more rigid forms, and has the figure of an irregular trapezium; the western has that of a rectangle extending towards the north-west, and is in every respect of a milder character. The mountain-knot formed at the common junction of the several mountain-ranges, which the companions of Alexander called the Indian Caucasus, and which now bears the name of Hindu-Coosh, is an extensive alpine region, or rather a mountain-isthmus, extending between the lowlands of Bucharía and of India, and uniting both highlands in the direction east and west, not unlike the isthmus of Panama, which connects the mountain region of North America with the Southern Andes.

To this peculiarity in the formation of this part of Asia we must add another, namely, the parallelism observable in the direction of the mountain-ranges which form the southern border of the highlands, or, in other words, their southern slopes. They extend in a diagonal direction from E.S.E. to W.N.W. The Himalaya range, which forms the slope of the table-land of Tibet, and extends from the Gulf of Tonkin to Cabulistan, a distance of nearly 2800 miles, is parallel to the Taurus-range, which, bordering the table-land of Iran on the south, extends from the mouths of the Indus to the western extremity of the Taurus in Lycia in Asia Minor, and is nearly of equal length.

This southern chain of the Taurus system is also parallel to the mountain-range which bounds the highland of Iran on the north, and which, considered as a continuation of the mountain-region of the Hindu-Coosh, is traced to the Demavend and Elburz near the southern shores of the Caspian Sea, and thence through Azerbaijan and Armenia,

though its surface exhibits great varieties in the part in which it terminates with Olympus and the heights of Ida on the shores of the Dardanelles, presenting towards the Black Sea rapid slopes. This northern chain of the Taurus system is nearly equal in length to the southern, extending upwards of 2500 miles. The Caucasus itself, which extends about 680 miles on the isthmus which separates the Caspian from the Black Sea, though it is some distance farther to the north, has nearly the same general direction.

But this parallelism, so remarkable in the western highland, is not observed in the eastern. Here too, indeed, some of the mountain-ranges traversing the table-lands run in the direction of west and east; but this is not the case with the principal chains, the Kuen-luen (35° 30' N. lat.), the Thian-shan (42° N. lat.), and the Altai mountains, farther to the north. In these mountain-ranges a decided divergency is observable. The distance between them widens as they proceed eastward till the most southern of their members, formed by the mountains of India beyond the Ganges, terminates on the peninsula of Malacca, opposite the Sunda islands; and the most northern, the Baikal and Da-urian range, traversing the countries on the Gulf of Okhotsk and the peninsula of the Tshuktsies, approaches the most northern shores of North America.

This diversity in the formation of the surface of eastern and western Asia has had corresponding effects on the civilization of their inhabitants. The divergency of the mountain-ranges in the eastern regions placed the nations inhabiting them at greater distances, whilst the convergency in the centre and in the western region produced a nearer approximation and more easy communication. But, after all, the great features of its formation, which determine its capabilities of influencing organic nature and the history of men, exhibit a marked direction east and west.

To form a complete picture of the varieties in the formation of the surface of Asia, we must add to these mountain-ranges extending in a diagonal direction others which meet them nearly at right angles. Such are the Belur Tagh, or Beloro, which is ascended in passing from the deep steppes of Bucharía eastward to the high table-land of Turkistan, and the towns of Kashghar and Yarkand; and the Soliman range, on the eastern border of Iran, which must be traversed in passing from the lowlands of India to the table-land of Persia. By these mountain-chains the most characteristic features in the formation of Asia are completed.

We have remarked that the two great systems of high table-land are connected by an Alpine region extending between the far advancing angles of two lowlands; that of India from the south, and that of Bucharía from the north, which seem to tend to meet one another, but are interrupted by the high summits of the mountain-region. Such a juxtaposition of all the great features which nature exhibits on the surface of the globe, on such a colossal scale, and in so limited a space, makes this one of the most remarkable spots on the face of our planet. This maximum of the contrasts of natural features, placed in the centre of the continent, is the principal characteristic which distinguishes Asia. By drawing a circle with a radius of a few hundred miles round this common centre, we comprehend in it the countries of Cashmere, Sogdiana, and Cabulistan, the ancient empires of Bactria, Delhi, and Samarcand, the cold table-lands of Tibet, of Khotan, and of Kashghar, up to the ancient Seres and Paropamisadæ; the most elevated snow-topped summits on the globe, the richest and most diversified Alpine regions and valleys, the sources of the greatest and, in an historical point of view, of the most remarkable rivers of central Asia, the Penjab of the Indians on the south, the famous Mawar-al-nahr on the north, and the richest plains in these lowlands; we have Persia on the west, India on the east, Bucharía, Turkistan, and Tibet, on the north. It is the centre of Asia fixed by nature; one of the great physical influences which prompted man to progress and to civilization in the early ages of his history. How numerous and powerful must be the inducements to change in a country where the climates of the polar region come nearly in contact with those of tropical countries intermingled with the temperate zone; and where this diversity of climate is found within a space so limited, and yet diversified by hundreds of different slopes, terraces, and valleys, which, partly watered by rivers and torrents, and partly entirely without running water, are placed near one another, but often rise to such different levels above the sea! What an influence must such a country exercise on

organic nature, and on the civilization and history of man; and how powerful must this influence have been through all the generations that the human race has existed!

To these two great and characteristic features, namely, the splitting of the south-eastern part of the continent into peninsulas and innumerable islands, and the great contrasts exhibited in the formation of the surface in the centre, we must add a third, which belongs to western Asia. This characteristic feature is partly its external form, and partly its geographical position in the centre of the antient world, to which we may add the influence which it has exercised on the progressive civilization of the inhabitants of the whole globe. As Asia is here connected with Europe and Africa, the three great divisions of the globe are thus brought into contact, and the intercourse thus established between the different nations inhabiting them is still more facilitated by the great maritime roads which nature has placed in this centre of the antient world—the gulfs of Arabia and Persia, the Caspian Sea, the Black Sea, and the sea which extends between Egypt and the peninsula of Asia Minor. This part of Asia is not characterized like the south-east by being split into manifold divisions and members, by which the phenomena of nature are multiplied and diversified, and the intercourse of nations and their progress in civilization facilitated; nor does it exhibit great contrasts in the formation of its surface: but we find here, in the western regions of Asia, more than at any other place, extensive countries surrounded and penetrated by considerable branches of the sea, which characteristic is rendered more important by being placed where the east and the west approach one another.

Such are the great features which characterize the external form and the interior surface of Asia. We shall attempt to indicate the peculiar character of each of these great natural divisions.

First of the eastern highland, or system of table-lands. The axis of its elevation, or its highest part, lies in a direction from south-west to north east, and begins between Cashmere, Badakshan, and the Thsungling, on one side, and the Kailas mountains, and the sacred lakes of Manasarowara and Hrawan-hrad in Tibet, on the other, east of the sources of the Ganges; it extends to the snow-covered heights of Mount In-shan, situated at the most northern bend of the Hoangho river, and thence it traverses the Khing-khan mountains east of the lake of Baikal, which form the southern and south-eastern border of the great desert of Gobi, to the most northern bend of the river Amur, which seems to be caused by the north-eastern extremity of the axis. On this most elevated part of the eastern highland the table-lands of Great and Little Tibet probably rise to the height of from 10,000 to 14,000 feet above the level of the sea (those of Little Tibet measured on the banks of the Upper Satadru or Setledge); and perhaps the elevation of the deserts of the Gobi, about the lake of Khukhu-nor, or Koko-nor, is not much less. Farther to the north-east, the great caravan-road, which traverses the desert of Gobi between Kiachta and Peking, the table-lands sink considerably, and attain only the height of from 3000 to 4000 feet. This axis of the highland, which is inhabited by Tibetan and Mongol tribes, is not parallel to the separate mountain-chains which traverse the irregular trapezium of the highland from west to east, but cuts them in a diagonal direction. That part of the highland which is situated to the south-east of the axis seems to contain some very high table-lands; but the greatest part of it is probably occupied by very high mountain-ranges, which descend towards the adjacent low-countries with a rapid and steep declivity, and by themselves constitute the most extensive mountain-region of the globe. This Alpine region, however, if we except a small part of the Himalaya range, is almost entirely unknown to Europeans.

To the north and north-west of the axis extends the greater of the two triangles composing the trapezium of the Eastern Highland of Asia. It sinks gradually towards the lakes of Baikal, Zaizang and Aral, forming a series of terraces which continually exhibit less of the characteristic features of the table-lands, till they terminate with the steppes round the lake of Aral, which are below the level of the ocean; the surface of the lake of Aral itself is 186 feet beneath the level. These steppes, therefore, do not form a part of the Highland, but of the low and deeply depressed plains which surround the Caspian Sea and the lake of Aral. At present only the elevation of the large

lakes which lie on the northern borders of the lowest terraces, and in their most depressed cavities, has been determined with any degree of exactness. The lake of Zaizang is upwards of 1600 feet above the level of the sea, according to the measurement of Ledebour and Humboldt; the lake of Baikal nearly 1800 feet, according to Erman; and Kiachta, the great commercial town between Siberia and China, situated on a second and higher terrace, is 2530 feet above the sea, according to the barometrical measurement of Erman. During the latest Russian mission to China, a series of heights was ascertained across the Gobi by Bungo and Dr. Fuss, from Kiachta to Peking; and it was found, that the pass leading over the mountain-chain of the Dshirgalantu, lying south of the Chinese provincial capital Urga, and on the south of the river Tola, is only 5005 feet above the sea; and that on the southern border of the Gobi, not far north of Peking, the highest mountain-passes which are crossed by the great Chinese wall are only 5525 feet above the sea-level.

Between Urga and the great wall extends the desert called the Gobi. It is not a level plain, but sinks towards the middle, where it is about 3000 and in some places only 2600 feet above the sea, and forms a long extended flat valley, lying from west to east. The lowest part of this valley is occupied by the proper Gobi, called also Shamo (i. e., sea of sand); its surface is covered with sand, and abounds in salt. In all its extent it displays the traces and phenomena [having once been covered by the sea, and among the Mongols a notion still exists that it will again be filled with water.

Farther to the west, towards the Gobi of Hami called Han-hui or the dry sea, the table-land probably rises again, but still farther to the west it is perhaps again furrowed longitudinally from west to east by a wide and extensive depression of the surface. We are induced to make such a conjecture by the course of the large river traversing Kashghar and Yarkand, which running eastward terminates in the lake Lop, which probably occupies the lowest part of the valley. The culture of cotton and the vine in Chinese Turkistan, along the tract indicated, together with its numerous commercial towns (Kashghar, Yarkand, Aksu, Kutsche, Karashar, Turfan, Hami), which are traversed by the great road leading over central Asia to China, render it very probable, that this valley is not much elevated above the level of the sea, and that the countries lying in this direction offer no great obstacles to travelling. This valley is bounded by two high mountain chains, running west and east, of which that to the north is called the Thian-Shan (Bogdo Oöla) range, and the southern the Kuen-lun (Koul-koun) mountains. These two extensive mountain-ranges may be called the interior mountain-chains of the Eastern Highland of Asia; the Altai mountains on the north, and the Himalaya range on the south, constitute the exterior mountain-chains of this elevated region.

Between these four extensive mountain systems lie the three wide plains which occupy the central countries of Asia, and in which respectively are found the three large lakes of Balkash, Lop, and Tengri. These three plains comprehend the three countries known under the names of Zungary, Tangut and Tibet, and their general level probably rises higher and higher as they advance from north to south.

The mountain-chains of the Eastern Highland of Asia are little known to us, if we except a small portion of the Altai mountains, and a part of the Himalaya-range. Of the Altai mountains, only the most western ridges, to the east of Semipalatinsk, between the rivers Irtysh and Oby, have been explored, and here only their northern slopes, which are known by the name of the Altai Ore Mountains (or Erzgebirge), because they yield annually 70,000 marks of silver and 1900 marks of gold: they rise near Kolywan to about 5400 feet above the sea. But the higher snow-topped ranges called the Altai Bielki, in which excellent jasper and porphyry are found, and which extend farther to the east, near the lake of Telezkoi, attain a height of 10,000 feet and upwards. Neither the woody mountains surrounding the lake of Baikal, nor the Da-urian ranges, which contain rich veins of silver, have so great an elevation, though their height has not been ascertained by actual measurement. They are however remarkable for their formation; their tops do not present craggy summits, but rather extensive and nearly-level plains like the table-lands.

The mountains in the interior of the Highland are not

known, except a few spots, which have been traversed by travellers and caravans. Neither their height, direction, nor position is exactly ascertained.

The Himalaya mountains are much better known, at least a part of them, though it is only a comparatively small portion. If we limit the application of this name to the mountains which lie between India and Tibet (though indeed it might with good reason be extended much farther), we find that only a fifth of the mountain-range has been partly explored; that portion which has been measured is still much smaller, though perhaps it is the highest part of the whole system. It comprehends the Alpine country about the sources of the Ganges; the Jumna, a tributary of the Ganges; and the Setledge, a tributary of the Indus. This Indian Alpine region exhibits a greater variety of elevated scenes, natural productions, tribes of men, and difference of political constitutions, than any other mountain-country on the globe. Besides rising in colossal forms to a great height, it covers a great surface of country. In length it is about 1300 miles, and would cover in Europe all the countries between the Pyrenees and the sea of Azof. Its breadth is from 250 to 350 miles. Compared with the Alps, the Himalaya mountains exceed them twice in breadth and thrice in length; the Alps occupy an area of about 130,000 square miles, but the Himalaya from 500,000 to 600,000 square miles. It consists of a great number of ridges running parallel to the direction of the whole range from south-east to north-west, which, however, in many places, are connected with one another by transverse ridges, and in others separated by deep and narrow ravines and glens, in which the different branches and tributary rivers of the Indus and Ganges run. The whole chain, beginning from the high pinnacles of the Hindu Coosh, near Cabul, and terminating in the most eastern valleys of Asam, near the source of the Brahmaputra, is overtopped everywhere by the most elevated ranges, which are always covered with snow—a circumstance which has given rise to the Indian name Himalaya, signifying *the dwelling of snow*.

The whole range may be divided into three sections. The most eastern, or that of Asam and Bhotan, is less known than the remainder. Though it exhibits many high summits, only the peak of Chamalari, near the boundary of Tibet and the road leading to Teshoo Loomboo, has been seen at a small distance by Turner, who estimated its height at about 25,000 feet above the level of the sea.

The central region of the Himalaya range comprehends the mountains of Nepaul, which have been examined with some care by the English residents at Kathmandu, the capital of Nepaul, which town, situated in a valley of the range, is, according to Colebrooke, 4784 feet above the sea. Three groups of high peaks which rise above the line of eternal snow, between the valleys of the Upper Trisul and the Upper Gandaki Ganga, have been measured. The groups of the Salpu mountains and that of the Dhayabung mountains are nearest to Kathmandu, on the north of the town; eight of their peaks which have been measured are from 16,000 to 21,000 feet above the sea. Some days' journey to the north-west lies a still higher group, containing five peaks, not one of which is less than 22,000 feet, but the Sweta-ghar (or the White Tower) attains 25,261 feet, and the Dhawalagiri (or the White Mountain), $28^{\circ} 30'$ N. lat., $83^{\circ} 30'$ E. long., 28,000 feet. The latter is the highest known pinnacle on the globe. Except their heights, very little is known of these gigantic mountains.

The western region of the Himalaya range comprehends the ridges traversing the Alpine countries of Kamaoon, Gherwall, Bissahir and Sirmore; and as these countries are dependent on the East India Company, the mountains have been explored with great care, and even trigonometrically measured. Here we find the very high group of the peaks of the Iawahir ($30^{\circ} 22' 19''$ N. lat., and $79^{\circ} 57' 22''$ E. long.), between the upper courses of the Gores and Dauli Ganga, on the boundary between Kamaoon and Bhotan, to the south of the Niti Ghat (16,895 feet) and to the north of the town of Almora (5337 feet above the level of the sea), which, rising to the height of 25,749 feet, was considered by Hodgson, at the first measurement, the highest mountain on the globe. These summits have only been measured from a distance, and the mountains are not yet explored; but their elevation has been determined by the measurement of Hodgson, as well as that of Webb. To the east of this extensive group, the country between the upper courses of

the Gores and of the Kali, the two principal branches of the Kali-Gogra, is covered with a mass of mountains, many of which rise above the line of eternal snow; twelve of their peaks, measured by Webb, attain the height of from 18,000 to 22,000 feet; but they have not been explored in their valleys and ramifications. Still more crowded are the snow-covered peaks to the north-west of the group of the Iawahir summits, especially between the sources of the Vishnu Ganga and Bhagirathi Ganga, where are the colossal summits of Kedarnath and the Rudra Himalaya. This is the case also about the sources of the Jumna, where we find the Bunderpuch and the high chain, which divides the north-western branches of the last-mentioned river from the valley of Baspa and the Setledge, which latter chain is traversed by twelve mountain-passes, and connected with the Radding Kailasa mountains, on the banks of the Setledge. Even on the north-western banks of this river we find the snow-covered summits of the Kotgerh and the Purkyul. These alpine regions have been explored by Hodgson, and others have continued his survey. Hodgson counted, at his first survey, upwards of fifty summits, rising with craggy conical peaks above the line of eternal snow, of which twenty-three attained upwards of 20,000 feet, and seventeen exceeded in height Mount Chimborazo. The number of the snow-covered mountains which extend farther to the north-west through the alpine region of the Kulu Cashmere Himalaya range and approach the Hindu-Coosh mountains near Cabul, seems nearly innumerable, but none of them have been measured or otherwise explored. The Hindu-Coosh itself, to judge from the great masses of snow with which it is covered, seems to rise to nearly an equal height.

Along the lowest southern slopes of the Himalaya mountains extends a flat country, hardly a thousand feet above the sea, covered with bogs and forests, exposed to a sultry heat, and dreaded by travellers on account of the prevalence of fevers. It is called Tariyana; its inhabitants are disfigured by goitres. The adjacent ridges, and the lower valleys (called Duhs) of the Alpine region, which rise to the height of from five to six thousand feet, and in which are situated the capitals of the Alpine states, as Rampur on the Setledge (3375 feet above the sea), Sirinagur on the Alakananda Ganga (2300 feet), Almora on the Kosila (5337 feet), Kathmandu, &c., are among the best watered, most luxuriant, fertile, and picturesque Alpine countries in the world. To the north east of these places the mountains rise, but only at a considerable distance attain the line of eternal snow. They are arranged in numerous ridges, commonly running parallel to one another and in direction of the whole mountain region, but connected by transverse ridges and groups, and separated by frightfully deep and steep ravines running in some places longitudinally, in others transversely. The most northern of the chains rises above the level of the high table land of Tibet, and forms the boundary of the highland of eastern Asia. On the side of the table-land they descend with a gentle slope, and soon terminate in extensive undulating plains. The intercourse between India and Tibet is carried on over these high ridges by means of the mountain passes, the lowest of which are probably not much below the height of Mont Blanc, being nowhere less than 14,000 feet above the level of the sea; and some rise even to 18,000 feet.

Nothing renders the Himalaya mountains more remarkable than the different level to which the lines of vegetation ascend on the lower ridges adjacent to the plains of Hindustan, on the interior ridges, and again on the boundary ridges of the table-land. This level, as well as the line of eternal snow, rises higher as the ridges approach the table land, and thus the higher regions are cultivable and inhabited at an elevation where a lower down no habitation and no agriculture are found. A. Gerard has carefully examined this remarkable phenomenon, and has stated the following facts, observed in ascending the valleys of the Setledge. He divides the whole mountain-range into three regions. Region A, lying along the southern slopes of the Himalaya range, displays cultivated fields to the height of 10,000 feet, but the corn must often be cut green; the highest inhabited place is 9500 feet; the upper boundary of trees 11,800; the upper boundary of shrubs 12,000, and in some well-sheltered places, dwarf birch and little shrubs are found at 13,000 feet. Region B comprehends the higher ridges of the mountains, and here, in the valley of the Baspa, the highest human dwelling is 11,400 feet above

the level of the sea, and this is likewise the highest point which agriculture attains; trees are found at 13,000 feet and upwards. Region C extends over the table-land itself, where villages are built at the elevation of 13,000 feet; fields are cultivated at 13,600; very good birch forests grow at 14,000 feet, and some low shrubs, especially *tama*, used as fire-wood, attain to 17,000 feet above the sea.

The highland of eastern Asia is on every side surrounded by extensive terraces, through which the great river-systems descend to the low lands bordering on the ocean.

On the mountain-ranges which bound the table-lands on the north four great rivers take their rise: the Irtysh from the lake of Zaizang joins the Obi and Tobol; the Yenesei unites with the Angara, which issues from the lake of Baikal, and with the two Tunguskas: the Lena, with its great tributary the Vitim; the fourth is the Amur. They run respectively 2000, 2500, 2000, and 1900 miles, measured along the course of the rivers. The Irtysh, with its tributaries, drains upwards of 1,300,000 square miles, the Yenesei about 1,000,000, the Lena nearly 800,000, and the Amur about 850,000,—all taken together, a surface much more extensive than that of Europe, and by far the greatest part of it belongs to Siberia. They abound in fish, and have plenty of water, so that two-thirds of their courses are navigable; but the lower part is for more than six months of the year covered with ice. This causes in spring-time an excessive swelling of the waters in the upper branches and tributaries, by which their banks are torn off, and great masses of rocks and earth carried down, and strewed over the flat country along the lower course of the river. The navigation on the principal water-courses from south to north is, for this reason, very inconsiderable; but it is much more important in their tributaries running east and west, by means of which a water-communication is established through the greatest part of the countries lying between the Ural Mountains and Okhotsk.

From the mountain-region, bordering on the highland of eastern Asia, two extensive terraces descend gradually towards the Pacific Ocean, besides a great number of smaller ones. The latter are watered by smaller rivers, but the two former give rise to the two great river-systems of the Hoang-Ho and Kiang (Kinchah-Kiang, Ta-kiang, or Yantse-kiang), of which the former runs upwards of 2000, and the latter more than 2900, if their great bends are taken into account. Each of them carries off the waters of a surface of above 700,000 square miles. The Chinese call them the sons of the ocean, a name probably derived from the tides ascending them upwards of 400 miles, by which they are changed into seas of fresh water, and rendered navigable to a great distance from the sea. This great advantage of the Chinese rivers, arises from their geographical position with respect to the Pacific Ocean, in which the tides rise to the greatest height. The sources of these two rivers are not very distant from one another on the table-lands, but in their middle course they are widely separated to the north and south by the ranges which form the borders of the highland; in the lowlands of China, however, they converge again, and their embouchures are only about a hundred miles distant from one another; but before they fall into the sea, they are connected by numerous canals. The tract between these rivers may therefore be considered as one immense *delta*, and the rivers themselves as a *double* river-system, formed on the most colossal scale, between which is situated the best cultivated country on the globe, central China, which to these rivers is indebted for its system of canals, and its civilization.

The rivers of southern Asia form three distinct groups, of which those of India east of the Ganges are little known: only their mouths and the lower parts of their course have been explored. These rivers, of which six or seven run a considerable distance, taken together, contain probably a greater volume of water than all the rivers of the northern half of Africa. Their course lies from north to south, or S.S.E., and the valleys drained by them extend in a parallel direction between the mountain-ranges, which are as uniform as the valleys, and widen towards the Sunda Archipelago, in the shape of a fan. The rivers of Camboja, Siam, and Pegu, which are the largest, carry off a great volume of water, and are navigable to a considerable distance from the sea; but they have not yet been explored, except the river of Pegu or the Irawaddy, which, in the late war with the Burmese, was navigated by armed vessels, and ascended by the steam-boat *Diana*, up to the town of

Ava, 446 miles from its mouth. It is said to be navigable for boats three hundred miles higher, to B'hamo. Its upper course was visited in 1827 by Wilcox and Burlton, who, setting out from Sadiya in Asam, traversed the Lang-tam mountains, and had a view of the river in $27^{\circ} 30'$ N. lat. only about fifty miles from its sources, which lie in the snow-covered mountains farther north. At this place, the Irawaddy is about eighty yards wide. On the maps of D'Anville, this river seems to be identical with the Zangbo-tsu, or the great river of Tibet, which flows to the south of H'Lassa; and some passages, quoted by Klaproth from Chinese authors, confirm the conjecture of the French geographer. If this is true, the Irawaddy has a course of nearly 2000 miles, and its sources lie at no great distance from those of the Ganges. But the information collected by Crawford in Ava, and by Wilcox in Asam, is not in favour of this hypothesis. [See BRAHMAPOOTRA; ASAM; and *Asiatic Researches*, xvii. p. 457, &c.]

The rivers of India, within the Ganges, run in a direction quite different from that of the rivers beyond the Ganges, which are parallel to one another. The Ganges and the Indus take a diverging course and enter different parts of the sea; but their tributaries, especially the Jumna and the Sutledge approach one another, and facilitate the commercial intercourse of the nations which inhabit the banks of the principal streams. The advantages which result from these rivers flowing into different gulfs are still greater. The Gulf of Bengal brings the inhabitants of the peninsula into communication with the nations of Malay origin and with the Chinese, whilst the Gulf of Malabar opens to them the coasts of Persia and Arabia. It is principally through this direction of its rivers that India within the Ganges has enjoyed such opportunities of civilization over India beyond the Ganges.

The river-system of the Ganges and Brahmapootra extends about 1300 miles in length, and drains a surface of nearly 650,000 square miles. The Ganges rises in the Himalaya mountains, in the most elevated regions of the globe, covered with extensive masses of snow, from which abundance of water continually descends, and is carried off by a dozen great rivers, many of which exceed the Rhine in volume and in length of course. These rivers enter the Delta of Bengal, which is twice as large as that of the Nile, and presents a most extensive and intricate system of rivers and canals, for irrigation as well as for navigation. By its junction with the Brahmapootra, which descends through the valley of Asam, the river-system of the Ganges becomes double and not unlike that of the great Chinese rivers. The Ganges and the Brahmapootra descend from regions different in natural advantages, of which only that adjacent to the Ganges has attained a high degree of civilization.

The river-system of the Indus has the highest historical interest, partly from containing the Penj-ab, the country of the five rivers, which descend from the eastern mountains, partly from the Cabul, the only important river which joins it on the west, and partly from its geographical position. Flowing along the eastern edge of the table-land of Iran, with a general course from north to south, it forms the true boundary between eastern and western Asia. India, that country which more than any other has attracted the admiration of the philosopher, the cupidity of the conqueror, and the speculations of the merchant, is accessible from the west only by two roads, one of which leading along the valley of the Cabul river, passes through Attock on the Indus to the Penj-ab; the other, which has been less used, leads from Herat through Candahar to Shickarpoor near the Indus. The track which leads from the table-land of Iran through Cabul to the narrow terrace on which Peshawar is built, and thence to Attock, is the high-road, along which the nations of Asia for many generations descended in their passage to India, but which never was ascended by the nations of that country. The sources of the Indus have only been discovered in our times (1812), as well as those of its great tributary the Satadru (Setledge); both of them rise on the high table-land of Tibet, the Indus on the slopes of the Kailasa Mountains, and the Satadru in the sacred lake of Manassarovara. These rivers, therefore, do not originate, like the Ganges, on the southern slopes of the Himalaya range, but on its northern descent and the high table-land itself; a fact which till lately was not known. From this circumstance it follows, that these rivers pierce the range in all its breadth, and pass through immense clefts in the

mountain-mass, before they arrive at the low plains of Hindustan. Below the Punjnad (or Pancha-nada, *i.e.*, the five-fold river), which receives all the waters of the Penj-ab, the Indus, like the Nile, is not enriched by any considerable tributary; and its delta, which was once so famous for its civilization, is at present in a neglected state, and has partially been changed into an uncultivated desert. The whole course of the Indus amounts to upwards of 1500 miles, and it drains a surface of more than 400,000 square miles.

Such are the ten or twelve extensive terraces of eastern Asia, which, differing in their forms and geographical position, and traversed by large river-systems, display a great diversity of natural productions, and have given a different turn to the progress of civilization among the nations which inhabit them. They are partly divided from one another and partly surrounded by the lowlands. But these latter are not flat level countries. Mountain-ridges and table-lands often rise in the middle of them, though they do not attain such a height as those of central Asia. Such a table-land is found in southern China, where it constitutes the mountain-region of Yun-nan, Su-chuan, and Kuang-si; in India beyond the Ganges, where it occupies Laos; and on the peninsula within the Ganges, where the table-land of Deccan is doubtless the most remarkable and at the same time the best known of these subordinate highlands.

This plateau of Deccan occupies with its elevated plains, which at an average rise from 3000 to 4000 feet above the level of the sea, the greatest part of the triangular peninsula between the Arabian sea and the Bay of Bengal. The mountain-range, known by the name of the Ghauts, forms the western edge of the table-land, and descends rapidly to the narrow, rocky, and picturesque coast of Malabar, which is characterized by its numerous harbours. On the northern side, where the Vindhya mountains stand, it sinks in steep terraces extending through the provinces of Malwa and Bundelkund, till it terminates in the flat plain of northern Hindustan. Towards the east its descent is formed by gentle slopes and terraces, as the course of all its rivers shows, which run off from the high plains to the flat and broad, but sultry and arid, coast of Coromandel, which, though surrounded by shoals and without harbours, has become the favourite place of European colonies. This table-land of Deccan is much favoured by nature. Its insulated position is quite independent of the highland of central Asia; it is placed between two seas and in the conflict of the monsoons, and cooled by sea-breezes. Moreover, its surface being formed by a series of terraces, which lie within the tropics, it enjoys all the advantages of tropical countries, without partaking of their disadvantages. On the sultry coast the luxuriance of vegetation is displayed in the cocoa-palm, the mango-tree, the cinnamon laurel, and the pine-apple; it thence passes through forests of teak-trees to the rice-fields on the table-land of Mysore; and still higher on the cool summits of the mountains it offers to the observer the fruit-trees and grain-fields of Europe, flax-plantations, and rich meadows. It is easy to comprehend, that these numerous and great advantages, rarely if ever so closely united, determined at an early period the civilization of its inhabitants, and impressed on it a peculiar character. Among the three peninsulas with which Asia terminates on the south, and which remind us of the three peninsulas of Europe, Greece, Italy, and Spain, on which civilization made such rapid progress, the peninsula of Deccan has doubtless contributed most to the progress of social improvement. The same advantages are enjoyed by the adjacent island of Ceylon, which resembles the Deccan in the form of its surface, and may be considered as an appendage of it. The similar results arising from the extensive group of the Sunda Islands with respect to the adjacent countries of southern Asia have already been noticed.

We shall now give a general view of Western Asia, the Highland of which, though much smaller in extent, forms the second principal feature in the physical character of this continent. It is not only nearer Europe, but likewise much more akin to it in its natural structure, and for both reasons more closely connected with it in an historical point of view. The form of its surface, less colossal and extensive in its parts, more nearly resembles that of Europe; and the same may be said of its climate and people.

The Highland of Western Asia, which is named the high table-land of Iran, in opposition to the deep plains which are adjacent to it on the north-east, called Turan, has

the figure of a rectangular oblong, extending from the Upper Indus through all Western Asia to the shores of the Grecian Archipelago. Its centre is occupied by Persia; over its western parts extends the dominion of the Turks, and its eastern division contains Afghanistan. It is materially distinguished from the Highland of Eastern Asia by its surface being more generally cultivable, and exhibiting extensive tracts which actually are cultivated, or were so formerly. The latter circumstance is abundantly proved by the numerous ruins of large towns and other monuments of architecture which exist even in those districts which at present are without cultivation; as on the north-east in Khorasan, the ancient kingdom of Bactria, towards the south in Karmania and Persis, and even in the western districts, as in Kurdistan, which formed a part of ancient Media. This observation, however, is not applicable to the south-eastern corner of the Highland, comprehending the ancient provinces of Gedrosia and Arachosia, which at present forms a part of Beluchistan and attains its greatest elevation in the table-land of Kelat, which rises, according to one estimate, to 7000 feet above the level of the sea. Its eastern and extremely rapid descent towards the valley of the river Indus, which is formed by steep rocks and feeds no rivers, is without cultivation and even without roads except one, and only inhabited by savage tribes of Afghan origin who have no historical records. The road alluded to is that from Candahar, through Pisheen, Quetta, and Baugh, to Shickar-poor. (See Conolly's *Overland Journey to India*.)

The northern edge of the Highland, which extends along the southern shores of the Caspian sea and the deep plains of Bucharina, is historically famous for containing the Bactrian, Parthian, Hyrcanian, and Caspian mountain passes, which are narrow defiles, offering a passage for the armies of the conquerors descending from Iran to Turan. This country has for many centuries been the abode of warlike mountain tribes, whose chiefs, by holding possession of the mountain passes on the north, have extended their dominion over the extensive plains of the table-land. This was the policy of Nadir Shah and of Fet'h Ali Shah, who, sensible of this peculiar circumstance, fixed their residence at Teheran, a town built near one of the passes, on the high table-land. The caravans, which travel eastward to India and Bucharina, and westward by Tauris (Tabreez) to Armenia and Asia Minor, are obliged to pass along the southern side of this mountainous boundary girdle and near the openings of the passes. Along the great road, which is invariably fixed to this tract by the nature of the surface on the northern boundary of the table-land, there rose numerous great emporiums. Here we find the towns of Cabul, Candahar, Herat, Meshed, Nishapoor, Teheran, Rai (the ancient Rhagæ), Cashm, and Tauris.

The southern border of the table-land of Iran is still more distinctly marked by nature. It is separated from the low and narrow coast and the wide plains watered by the Tigris and Euphrates, by a broad mountain tract, which beginning at the mouth of the Indus extends to the place where the rivers of Mesopotamia, breaking through the rocky masses of the high table-land, enter the low plains. This mountain tract consists of from three to seven ridges, running parallel to one another and separated by as many narrow longitudinal valleys, which sometimes extend many days' journey in length. The ridges themselves are, like the Jura mountains in France, composed of limestone, and rise like terraces from the low coast higher and higher. Beyond them extend the wide table-lands. There are but few mountain passes leading through this natural entrenchment of Persia, a country which on this account may be considered as a fortress erected by nature for the defence of the nations which inhabit it. Among these narrow mountain passes which lead from the sultry low coast called the Gurnasir (warm region) through the great staircase of mountain terraces to the cool table-land in the interior called Sirhud, three roads have acquired some celebrity in history, which we shall notice more particularly under the names of *eastern, middle, and western mountain road*.

The eastern mountain road begins at the harbour of Bender Abassi or Gambroon, near the entrance of the Gulf of Persia, and leads northward to Kirman, the ancient Karmania, situated on the cool table-land, in a spot which abounds in springs and is covered with fruit trees, though on all sides surrounded by desert plains, in which it lies like an

oasis in the midst of the Libyan Sahara. From Garmroon a road also leads past Lar to Shiraz. (See Herbert's *Travels*, p. 124, &c.)

The middle mountain road begins at the town of Abou-shelir or Bushire, on the shores of the Persian Gulf; and leads first over a lower ridge to Kazrun, near Shahpoor, the residence of the Sassanidae (of king Sapor I., A.D. 240), which is situated in the first valley; from this point it passes over a rocky mountain to Shiraz, once the residence of the Arabian caliphs, which is built in a wider and richer valley; farther through winding mountain roads and narrow ravines to the valley in which the ruins of Persepolis still excite our admiration. From these ruins the road, in a northern direction, again traverses some narrow passes through high rocks, which are full of monuments of the early ages of Persia, till at last it issues out of the mountain region and enters the extensive table-land on which Ispahan, the residence of the Sufi dynasty, is built. The residence-towns of these different dynasties have been built on the fields of battle where signal victories were obtained, and are placed at the openings of the most difficult mountain passes, full of narrow defiles. The Arabs were obliged to pass through this difficult road on their way to Persepolis, and this has likewise been the route of modern travellers who have entered the inland provinces of Persia from the Persian Gulf. The Macedonians, under Alexander, and after them Timur, made their way from the banks of the Karoon to Persepolis up the valley of the Jerahi and by the pass of Kalat-i-Sefid.

The western mountain road which lies to the north-west of the former, may be called the Median, in opposition to the Persian, which passes through Persepolis. Beginning at or near the modern Bagdad, it passes through the Medice Pylæ of the mountain range called Zagros, runs by Ker-manshaw, Besitoon, and the remains of the temple at Kungavur, and terminates at Hamadan, the ancient Ecbatana in Media. This road, like the preceding, presents many historical monuments, and it crosses the upper course of the rivers which flow through the low lands of Susiana.

Thus a series of towns, the seats of ancient kings, and now the sites of historical monuments, beginning with Ker-man and comprehending Persepolis, Parsagada (or Parsagarda), Ispahan, and Hamadan, and terminating again at Tauris, lies along the internal slope of mountain ridges which border the table-land of Iran on the south, analogous to that series which we have observed along the northern girdle of the mountain range. By these towns the boundary is marked which separates the region of the natural fastnesses, of the mountain passes, of the battle-fields, of the pastures, and of the country adapted to the chase, which is formed by the mountain terraces, from the interior table-land, which is more level and uniform in its aspect. The table-land itself is traversed by some ridges of hills, which extend mostly in a general direction east and west, and attain only a moderate height above the plain; it is also furrowed by a few valleys, or rather depressions of the surface, which more or less are covered with green meadows, or scanty pastures or steppes, and in a few places with sandy deserts or a soil impregnated with salt.

Fraser, on his route through Persia from Abushehr to Teheran, determined the elevation of many points above the level of the sea, and his statements give a very instructive view of the continually changing surface of Iran. Abushehr is built on the shore of the sea in the sultry Gurmshir, and has a climate favourable to the growth of palms. Kazrun, lying on the first mountain terrace, is 2772 feet above the level of the sea. The highest point of the pass Desht-i-Arjun, above Shiraz, rises to 7200 feet. The town of Shiraz itself, which is built on the second mountain terrace, is 3281 feet above the sea: its climate is favourable to the vine: the roses grow to the size of trees, but the palm does not succeed. The highest point of the pass over the third mountain ridge above Persepolis rises to 6666 feet. Ispahan, lying in the plain which forms the third terrace, is 4110 feet above the sea. From this level the mountain passes lying farther north near Kohrood rise nearly 2000 feet higher. Towards Koon we find the greatest depression in the table-land: here the surface sinks to 2016 feet. It rises again in the plain on which Teheran is built, which has an elevation of 3500 feet. The mountain pass which leads to the Caspian sea past Kishlae, rises to 4572 feet; and the entrance of the Hyrcanian pass at Shahrood to 3414. The Deuawend, the highest mountain peak in this

country, attains indeed an elevation of 10,000 feet; but most of the adjacent summits do not rise above 7000. The northern slope of this range towards the Caspian sea is extremely steep and rapid, which is owing not only to the short distance at which that immense lake is situated from the crest of the mountains, but also to the singular fact that its level is more than 300 feet below the surface of the ocean.

The most remarkable and characteristic feature in the surface of Persia is the absence of any considerable river, though this country occupies a space at least equal to that of all Germany. This does not arise from a want of spring water, which is found at no great depth under the surface almost everywhere, and renders this country cultivable in most districts; but it is owing to the want of extensive valleys traversed by running waters. This want has deprived it of an extensive river system, and consequently of the most powerful means provided by nature for a continual progress in civilization. To this circumstance it must be attributed, that the nations inhabiting Iran never got entirely rid of the character peculiar to a pastoral life and the continual change of abode, though it must be admitted that from time to time they have exhibited a considerable degree of mental culture.

At the western extremity of Iran, between the innermost corners of the Gulf of Persia and of the Caspian sea, about the fiftieth meridian, the table-land narrows to nearly half its former extent, but it increases in elevation. To the east of this line extensive plains form the prevalent characteristic, but to the west, mountain masses rise higher and higher. Here begins the alpine region of Persia with Kurdistan, here are the lakes of Urmia and Van, and the sources of the rivers Zab, Tigris, Aras, and Euphrates. The table-land is replaced by mountains, which rise to an enormous height, and by elevated valleys between them. Such is Azerbaijan, the fire-region, the native country of Zoroaster. On the north-west both the mountain ranges and the table-lands are again united in the compact mountain region and high table-land of Armenia, of which Azerbaijan forms only a lower terrace. The countries of Asia, which extend west of Armenia, resemble in their structure Europe rather than Eastern Asia. The surface no longer presents such compact masses, which rise to a considerable elevation, and extend over a great space; it offers to the view more separated and distinct masses, which form as it were individual limbs. We may distinguish four different divisions of this kind.

The first is the elevated and mountainous table-land of Armenia, which extends in the form of a triangle between the angles of three seas, the Caspian, Black Sea, and the Gulf of Alexandretta. Its plains, on which the town of Erzerum is built, rise to 7000 feet above the level of the sea, according to the measurement of W. G. Browne, and the highest summits of the Ararat, which overtop the plains, attain the height of 17,260 English feet, according to the statement of Parrot.

The second great division is formed by the Caucasus, which is united to Armenia by ridges of moderate height, in part covering the Caucasian isthmus. This high mountain region is characterized by its isolated position and its entire independence of the table-lands of Asia, as well as by its double descent to the north and south, which renders it much more like the mountain regions of Europe than those of Upper Asia. It may be compared with the alpine region of Switzerland, and is distinguished like that country by its natural productions and the character of its inhabitants, though the rivers which rise in its mountains (Kur, Phas, Kuban, Terek) cannot be compared with those of Europe in length or in importance.

The third separate mass, which lies on the western border of the Highland of Asia, is the peninsula of Anatolia, which on three sides is surrounded by seas, and on the east is joined to Persia by the mountain system of the Taurus. Its interior is occupied by a table-land, which, at an average, perhaps rises to the height of about 2000 feet above the sea, and descends with steep slopes towards the north and the south. Towards the west the descent is gentle, being formed by long fertile valleys traversed by abundant streams till it terminates on the shores of the Aegean sea in a coast full of promontories and indentations, marking the termination of the ranges which run from east to west in this peninsula. It extends, as we have already observed, like a bridge for the passage of nations between Asia and Europe; it

may be compared with the Pyrenean peninsula in many respects. [See ANATOLIA.]

The fourth region, which is connected with the Highland of Western Asia, is formed by the Syrian mountains, which running towards the south contain Mount Libanus, and thence continue to the elevated cone of Mount Sinai, an isolated mountain mass, which is a rare occurrence in Asia.

Western Asia, though indented by gulfs and arms of the sea, which make peninsulas and head-lands, is not favourable to the formation of extensive river systems, which only occur on the eastern side of Asia. Like Europe, it presents forms of less dimensions and more adapted to the dominion of man. Only one extensive river system exists in this country, and this consists of two large rivers; a feature which is peculiarly characteristic of Asia. This is the river system of the Euphrates and Tigris, or of the Shatt-el-Arab; the north branch of the Euphrates comes from near Erzerum, and the east branch from the western extremity of the table-land of Iran, where the country rises to an alpine region, or to a complete mountain system, with diverging ridges and intervening elevated valleys. The Tigris rises on the south side of the high range, along the north side of which the east Euphrates flows. The Euphrates has a winding course of near 1800 miles, measuring along its whole line. When these rivers have forced their way through the Taurus, the Euphrates north of Runkala, and the Tigris above Mosul, they begin to converge and to surround Mesopotamia, till they approach, but do not actually unite in, the ancient Babylonia. Their waters traverse the same delta, and enter the Persian Gulf by one channel.

We cannot refrain from making an observation on the historical effect of these systems of double rivers in Asia. We find that in the valley of the Nile civilization descended along its banks from one royal residence to another, from Meroë to Thebes, and thence to Memphis and Sais. But in the valleys of the double rivers of Asia we meet with double royal residences, double civilization, and double political systems, as Babylon and Ninive respectively on the Euphrates and Tigris; Delhi and H'lassa, with Brahmanism and Buddhism, on the river-system of the Ganges; and on the double river-systems of China, the southern and the northern empire, Ma-chin and Khatai. When in the progress of time civilization descended these streams, and met at their conflux, or where they approach near one another, the different degrees of perfection which it had attained, and the different turn it had taken, must have produced, as the nations came in contact with one another, a beneficial effect. The same observation applies to the fourth great system of double rivers, the Sir and Gilon, on the banks of which, in the centre of Asia, the same fact is repeated in the royal residences of Samarkand and Bokhara.

Like the table land of the Deccan, which forms a projecting, but independent and isolated limb of the highland of Eastern Asia, the peninsula of Arabia projects from the highland of Western Asia, and may be considered as an entirely independent member. As the Deccan is separated from the highland region by the lowland of Sind, so Arabia is divided from the mountain-system of the Taurus by the lowland of Syria, which extends to the S.W. of the Euphrates. On the south of this lowland the country again rises, and assumes quite a different character. This constitutes the highland of Arabia, which, in the form of a trapezium, contains the table-land of Nejd, the native country of the Wahhabites, a cold country, connected on the south with the elevated Yemen or Arabia Felix, which descends in terraces towards two seas. Its descent towards the west is steep, and formed by parallel mountain-ridges, with well-sheltered valleys between them, in which the famous towns of Mecca and Medina are situated. This part of the country is better known than the similar steep descent towards the south between Aden and Hadramaut, and thence to Muscat. The eastern declivity, which appears to descend with a gentle slope towards the Gulf of Persia, and surrounds the islands of Bahrein, noted for their pearl-banks, is no better known. The cold Nejd is the native country of the Arabian horse and the Arabian camel. On the terraces bordering it on the west the mild climate allows plantations of coffee, and the low and narrow coast, with its sultry air, produces, like the Gurmsir of Persia, the date-palm, which will not grow either on the table-land of Nejd or on that of Iran.

Arabia exhibits characteristics entirely different from those which mark the other parts of Asia. As already indicated by its geographical position, it forms a point of contact between Asia and Africa, and participates in the distinguishing qualities of both. Even its inhabitants, the original Arabs, resemble no nation so much as the mountaineers of Abyssinia, who inhabit the upper country on the opposite side of the Red Sea, speak a language akin to that of Arabia, and are equally well-formed in their body, and probably nearly equal to them in their mental faculties. The Chinese, confined to their own territory by the nature of the country which surrounds them, and separated from the remainder of the world by seas and mountains, feel no inducement to abandon their fertile and extensive country; they therefore never concerned themselves about other nations, and excluded foreigners from their country. The Hindu, born only for his own Indian world, and fit for no other, placed in a country in which all the advantages with which Asia is gifted by nature are concentrated, early acquired a high degree of civilization; but he has never passed the boundary of his native land, and, with equal indifference, has received all foreigners who have entered the country as conquerors, merchants, colonists, or missionaries. The Arabs, on the other hand, whose native country spreads out between two great divisions of the globe, have assimilated themselves to both, and at one time extended their dominion to the most western point of Africa as well as to that of Asia. By far the greater number of Arabs are dispersed without the peninsula, which is the native country of their nation, but which prepared them for the endurance of every climate. Its sultry coasts resemble, in soil and natural qualities, the arid deserts of Libya: the moderate climate of the terraces approaches that of Deccan, Iran, and Catalonia, and the cold Nejd differs little in its physical character from the highland of Central Asia, on which we find the Arabs dispersed to a great distance from their native country.

We now pass to the third great division which the surface of Asia exhibits, the Lowlands, which everywhere are situated without the highland regions and the valleys formed in the extensive terraces around them. These latter, according to a rough estimate, may occupy a surface of about 4,300,000 square miles, or more than one-fifth of the whole extent of Asia, and consequently there remain about 6,000,000 square miles for the surface of the lowlands. These lowlands lie spread around the more elevated parts of the interior, and occupy countries of great extent along the sea, so that the lower course of the great river-systems traverses these often widely-stretching plains with many great windings and with very little fall. In these plains the great empires, by which the history of this division of the globe is so distinguished, have attained their greatest power, and continued for the longest period of time. The extensive low plains are six in number; they are different in their natural character, and in no way connected with one another.

The first is the great Chinese Lowland on the eastern shore of Asia, along the Pacific Ocean, beginning at Peking and extending along the Yellow Sea or Whang-Hay, southward past Nanking to the province of Kiang si. Lying south of the 40th parallel, and extending nearly to the tropic, it enjoys a temperate climate, and exhibits the most advanced state of agriculture, the most extensive system of canals, the most active internal navigation, and is the richest and most populous granary in the whole world.

The second is the Indo-Chinese Lowland, which, lying between the Gulf of Tonkin and that of Siam, extends from the tenth degree of north-latitude to the tropic, and comprehends the kingdoms of Cambodia and Siam; its northern boundary, however, is not yet ascertained. It unites the advantage of being situated south of the tropic with those of being plentifully provided with water, and it is therefore exceedingly well adapted to the culture of rice. A part of its surface is covered with stagnant water and lakes.

The third is the Lowland of Hindustan, or Sind, which comprehends the northern part of India, and extends in the form of a triangle between the Gulf of Bengal and that of Goozerat. It is bounded by the two river-systems of the Ganges and Indus, and overtopped by three table-lands, those of Tibet, of Iran, and of the Deccan. Being situated out of the torrid zone, but near the tropic, it enjoys all the advantages of a tropical climate, without its disadvantages. None of the lowlands equal it in the richness and variety of the natural scenes which surround it on

all sides: it is no less populous than that of China, which it far exceeds in the number of different nations inhabiting it, and that of royal residences and centres of civilization, (Delhi, Agra, Benares, Calcutta, Lahore, Multan, Ajmeer, &c.,) nearly all of which are placed near its centre. In the western half, however, of this region, a narrow tract of land is covered with moveable sand, not unlike the Sahara.

The fourth Lowland is that of Syria and Arabia, which on its eastern extremity is bounded by the innermost corner of the Gulf of Persia, on the west by the mountains of Syria, on the south by the table-land of Nejd, and on the north and north-east by that of Iran. Only its northern half is watered by the river-system of the Euphrates and Tigris, while its southern half suffers much from want of moisture, and presents an arid and desert aspect.

The first two lowlands may be called *maritime*, and the second two *continental*. The Chinese and Indo-Chinese Lowlands are for the most part surrounded by seas, exposed to the continual action of high tides, and frequently drenched by the moisture brought by the winds from the east and south-east. The lowland of Hindustan, and that of Syria and Arabia, on the contrary, border only on narrow bays, and are on the south and on the north overtopped by high table-lands always enjoying a dry atmosphere. Hence it follows, that in the last-mentioned lowlands dryness of the air prevails, as moisture in the former, and that they must be distinguished by all the consequent variations of vegetation and animal life. In China and the peninsula beyond the Ganges the inhabitants approach in their manners and customs the inhabitants of islands; but in India and Babylonia they are like the inhabitants of inland countries. The southern half of the lowland of Syria and Arabia, indeed, resembles the African Sahara, and is therefore called the Arabian Desert. Though situated without the tropic, it displays a tropical nature; and divested of the peculiarities by which Asia is distinguished, it partakes more than any other country of the features which characterize Africa, its arid climate and its natural productions.

The fifth is the northern or Siberian Lowland, which is by far the most extensive of all, occupying more than half the area of all the lowlands of Asia taken together, and extending along the Polar Sea the whole length of the continent from the Ural Mountains to the Pacific Ocean. Though traversed by extensive river-systems, it derives little advantage from this circumstance, as it contains only in the southern third of its surface (between 50° and 60° N. lat.) habitable and cultivable land; this part has been colonized in all its extent by European settlements, the most numerous in Asia. The northern and most extensive district, lying either within the polar circle or near it, is beyond the boundary of the cultivable world, and belongs rather to the polar region than to that division of the globe which has received the name of the East. The Lowland of Siberia, though its maritime boundary exhibits no great variety of forms, has, by its little elevation above the level of the sea, a great influence on the whole continent of Asia, which doubtless would have presented quite a different aspect, if high mountains had risen on the northern shores of Siberia, and formed its boundary towards the Pole.

The sixth Lowland is that of Bucharia, which is entirely continental, not being in contact with any part of the ocean, and only watered by inland seas, the Caspian and the lake of Aral. Its greatest extent is in the direction of the system of the double rivers which traverse it. Beginning at the innermost angle, formed by the western edge of the table-land of Tibet and the northern edge of that of Iran, this greatest of all the depressions on the surface of the globe extends, to the north-west, over the countries adjacent to both banks of the Volga, up to the river Don and the boundary of Europe, between the mountain-ranges of the Ural and of the Caucasus. Thus it may be considered as an intermediate form which connects Central Asia with Europe. Its extensive plains, which are scantily watered, are a kind of mean between sandy deserts and agricultural soil, and their surface is mainly formed of gravel. They are what are commonly called *steppes*—plains covered with grass, and without wood, in which are scattered, like oases, a few tracts of cultivable ground. Such a country is the natural abode of nomadic tribes. Deprived of all natural riches, except in a few places where agriculture is carried on by artificial irrigation and immense labour, and rather characterized by a total want of natural capabilities, this lowland

is very remarkable in an historical point of view. Being placed in the centre of very extensive countries, and surrounded by different nations, it has been involved in all the great historical events: it was here that the conquerors, such as Cyrus and Alexander, who proceeded from the west, or those of China who came from the east, the Bactrians, Ghaznavides, and Great Mogols, who advanced from the south, and the Russians from the north, have found a stop to their farther progress.

The natural poverty of this country, and the comparative richness of those surrounding it, together with the want of fixed abodes, and the various political changes of the neighbouring countries, have frequently induced its inhabitants to pass its natural boundaries. Whilst their neighbours, the Chinese and Hindoos, never left their country, but took root there like plants, and became stationary nations, the inhabitants of this lowland have been, through all centuries, nations of change and migration, who, since the times of the Scythians, Goths, Alans, Uzes, Comanes, Petsheniges, Turks, and Tartars, till nearly our own times, have inundated Europe from time to time, and changed its face by destroying, impairing, or retarding civilization. Their own country, meanwhile, was not exempt from great changes, both as respects the nations which inhabited as well as the dynasties which governed it; and still, in our own times, it exercises a great influence on political events by its geographical position and the obstacles which it opposes to the progress of the three great empires of Asia—the Chinese on the east, the Russians on the north, and the British on the south.

In thus bringing the whole surface of Asia into one view, we find it composed of ~~the~~ lowlands, different in their nature, and independent of one another; they spread below and around two highlands occupying an immense space, which themselves are surrounded by seven or eight less extensive and entirely separated mountain or table-land regions; that of southern China, the peninsula without the Ganges, Deccan, Arabia, Syria, Armenia, and the isthmus of the Caucasus,—all of which exhibit peculiar features, by which the countries surrounding them are characterized, in the same manner as the great highlands characterize the whole continent. If we add to their number ten or twelve intermediate formations, constituting the terrace-regions, we have nearly a score and a half of great natural divisions on the surface of Asia, of which every one is subject to its peculiar natural laws, presents its peculiar natural appearance, and maintains a distinct character. Considerations on their mutual connexion and reciprocal influence alone can afford us a true view of the infinite variety and combination in the natural phenomena and the historical events of that great division of the globe, to which both the records of history and the laws of nature have induced us to assign the common name of Asia.

Minerals. Precious Stones.—Rock-crystal in the greatest variety, anethysts in the Altai, Himalaya, and Ural mountains; carnelians, agates, in western India, and in the Gobi desert; casholongs and onyxes, in Mongolia; yu, or oriental jade, in Turkistan; different kinds of jasper, in the Altai mountains; pearl-stone, marcasit, on the shores of the Gulf of Okhotzk; beryl, in the mountains near the lake of Baikal; lapis lazuli in the same mountains, as well as in the Hindu Cosh, and on the banks of the Oxus; topazes, in the Ural mountains; circony, chrysoberyl, sapphires, on the island of Ceylon; rubies, in Ceylon and in Badakshan; turquoises, in Khorasan; diamonds, in Deccan, Borneo, and the Ural mountains.

Volcanic products are met with on the Sunda Islands, in Japan, and Kamtchatka, in the neighbourhood of Tauris, and many parts of the highland of Armenia, and in western Anatolia.

Steatite, earth-flax, asbestos, and coalin, or the finest porcelain-clay, are found in China and Japan; tale in Siberia; coals in northern China, and different parts of Hindustan; rock-salt in the Ural mountains, northern China, the Penjab, Ajmeer, Yemen, Anatolia; salt in the salt-seas of the steppes, and sometimes on the surface of the ground; sal-ammoniac in the volcanic steppes of Central Asia, not far from the river Ili; nitre in Hindustan; borax, or tinquial, in Tibet; petroleum, near Baku, on the shores of the Caspian Sea, on the Euphrates at Hit, and other places, and at Kerkook east of the Tigris; asphaltum on the Dead Sea, in Palestine. Hot springs are very abundant in the snow-covered ranges of the Himalaya range, especially along the

upper branches of the Ganges, and in the N.W. of Anatolia.

Metals.—Gold in Japan, Tibet, Yun-nan, Cochin China, Tonkin, Siam, Malacca, Borneo, Asam, Ava, and in the Ural mountains; many rivers bring down gold in their sands; silver in China, Da-uria, Japan, Armenia, Anatolia, and the Ural mountains; tin in Malacca, Anam, the Sunda Islands, and the empire of the Birmans; mercury in China, Japan, and Tibet; copper in the Ural and Altai mountains, Japan, China, Nepal, Azerbaijan, Armenia, and Mount Taurus; malachite in China and Siberia; iron from the Ural mountains, through central Asia as far as the Peninsula beyond the Ganges, as well as in Japan and Persia; lead in Da-uria, China, Siam, Japan, Georgia, and Armenia.

Extensive layers of fossil shell-fish are found on the highest table-lands of Tibet, from 16,000 to 18,000 feet above the sea, and the strata of the tertiary formation in Siberia are full of animal remains of the old world, as the elephant, mammoth, rhinoceros, &c.

V. *The Man of Asia.*—As Asia is the most extensive of the great divisions of the globe, it is likewise far superior to the rest, if we consider the number of its inhabitants, their variety, and historical fame. Upwards of 400 millions are dispersed over its surface; consequently, twice as many as the inhabitants of Europe, and more than eight times that of the inhabitants of America, which continent in its area approaches nearer to Asia than any other.

Many questions may be raised respecting the population of Asia. It may be asked, whether, or not that continent was ever more populous than at present? How many of its inhabitants were destroyed during the wars of the Mon-

? How far has its population decreased, owing to the despotism exercised by the Turks in the western countries? How many nations have already become entirely extinct, or exist in very small numbers, as the Philistines, the Phœnicians, the Babylonians, the Parsees, the Lydians, the Bactrians, the Medes, the Sogdiani? More than forty nations were destroyed in the middle age by the Mongol wars, according to the statements of the annalists of that time; and some have become nearly extinct in our times, as the Doms in the Himalaya range, the Miao-tse in southern China, the Tata in northern China, the tribes of the Tunguses, eastern Turks, and Samojedes in the mountains of Savansk, and others in Mount Caucasus. These questions cannot be answered with any degree of probability.

But we may safely assert that the number of foreigners who have settled in Asia is extremely small, compared with the numbers who have left it to inhabit other divisions of the globe. We may estimate the number of Europeans in India at a hundred thousand, those settled in Siberia, the descendants of the Cosacks included, at two millions, which probably exceeds the truth; and the Greeks of European origin, inhabiting Anatolia, at one million and a half, or even two, though these Greeks have long ago been changed into Asiatics. Few settlers have gone to Asia from Africa and America, and still fewer from Australia. The Egyptians never settled in Asia, but the Arabs settled in Egypt. Negro slaves are dispersed over Persia, Arabia, and Hindustan, but they are few in number. Abyssinians indeed, from time to time, entered Asia in crowds; they came, however, not as a nation, but as mercenary soldiers in the service of Arab emirs or of Indian rajas; and their descendants, like those of the Portuguese, have entirely merged in the native population. America, at all events, has not much increased the population of Asia: the Tchukches, on the most north-eastern peninsula of Asia, who belong to the family of the Esquimaux, as the affinity of their language induces us to suppose, have perhaps not passed the sea into Asia, but are rather aborigines of Asia.

Thus we find Asia, like all other large divisions of the globe at the present day, inhabited by aborigines and foreigners, the two great divisions of mankind in an historical point of view. Asia has been the principal country from which emigration has spread, so far as the history of man is known: it has been the parent of nations who have left its bosom, to form, in other countries, a new character of social life.

If we consider the inhabitants of Asia according to the physical division of three principal races, the white (or Caucasian), the yellow (or Mongolian), and the black (or Ethiopian), and three intermediate races, namely the dark brown (or Malay), the negro-like (or Papuas, also called Austral

negroes), and the copper-coloured (or American), we find that the greatest number of these races, and of those nations which connect them, are dispersed over the surface of this continent. They cannot always be exactly distinguished by the form of the skull, the hair, or the complexion of their skin. The three principal races border on one another in the elevated valleys of Central Asia, where the skulls of the Cashmirians show their Caucasian origin; whilst those of the Bhots, or inhabitants of Bhotan and Tibet, are Mongolic, and between them the skull of the negroes is found, if it be true, according to the observations of Traill, that the nearly extinct slave-tribe of the Doms, in the valleys of Kameroon, belongs to the dark-coloured and woolly-haired race of the negroes. But perhaps these Doms are only the most northern representatives of the Austral negroes, which are dispersed through the peninsula beyond the Ganges and the Sunda Islands, as well as in the adjacent islands of Australia as far as New Guinea, and which, since they have become known, have been constantly called Papuas. By Cuvier they are enumerated among those tribes which have separated from the true negroes. The Malay race in their neighbourhood inhabits the island of Sumatra and the peninsula of Malacca. All the races enumerated are found in Asia, except the copper-coloured races of America; the Caucasian prevails from the centre of the continent toward the west and north-west, and the Mongolian likewise from the centre towards the east and north-east.

We shall not pursue further that division of the nations of Asia which is derived from the history and the genealogy of the different tribes, nor that which depends on their physical character, but rather follow that which results from the spoken languages. But we must also observe, that these three points do not always exactly coincide, and that many difficulties are still to be solved by further investigation. Still we think that the division which rests on the internal structure of the languages, is, as far as the investigation of this matter has been carried, the most certain and safest, and that the nearer or remoter kindred which exists between different nations may in some measure be indicated by it. Adopting, therefore, the division of nations according to their languages, the following groups may be enumerated in Asia.

The first in the order of historical importance is the Semitic nations. These are the Syrians and the Chaldeans, or the ancient Aramæans; the Phœnicians—though the number of the pure and unmixed families belonging to this people may be very small—probably still exist in their ancient country, especially near the Libanus; the Jews, who from Palestine have been dispersed over all Asia as far as the coast of Malabar and the northern provinces of China; the Arabs, who are the most numerous of this race and less mixed with other nations, are dispersed through all western Asia as far as the mouths of the Indus and the sources of the Oxus.

It has only recently been demonstrated that the languages spoken by the aborigines of the countries on the Ganges and Indus, and even the peninsula within the Ganges, as well as those of Persia, and farther to the north-west the nations of Europe, as the Slaves, and those of German origin in the west and centre of Europe, display a great affinity in the grammatical structure as well as in the roots of numerous words. To this group belong the inhabitants of India, who speak the numerous dialects or languages derived from or connected with the Sanscrit. This remark applies also to the nations of Iran, as the Persians, perhaps the Kurdes, Beluches, Gipsies, and even the Bucharians, &c., though many of them have been mixed with other nations of Turkish, Mongolic, or Arabic origin. Besides these we must enumerate the Ossetes (or Iron, the descendants of the Alans) in Mount Caucasus, and some nations of Slavish origin inhabiting Asia, as well as the greatest number of the inhabitants of Europe.

The Armenians either belong to this group, or constitute a separate one. But the researches on the grammatical structure of their language have not yet been carried far enough to determine this point with any degree of certainty. From the mountainous table-land which is their native country they have been dispersed through the central and southern countries of Asia as far as China, and may in this respect be compared with the Arabs. The latter indeed are also met with in Africa, but the Armenians are found in Europe even as far as the middle course of the Danube river, but everywhere only as pacific settlers.

The Georgians form a separate group, inhabiting the Caucasian isthmus, between Mount Caucasus and the river Kur; besides the proper Georgians in Imerethi, three branches belong to it, the Mingrelians, Suanes, and the Lazs: the latter occupy the eastern shores of the Black Sea, and are the descendants of the ancient Colchi.

Different from them are the nations which inhabit the Caucasus as aborigines, and not as an adventitious people. They are divided into three principal tribes, the eastern Caucasians or Lesghiens, the middle Caucasians or Mitsdjekhes, also called Chekhes, and the western Caucasians or the Chercassians and Abassias, all of which are again divided into different smaller tribes, as is usual among mountaineers.

The Turkish nations form one of the most extensive groups. The greatest number of them occupy Central Asia, beginning on the east with the table-land of the Gobi of Hami, and the countries about the lake of Lop, and extending to the west through Turkistan, where they are called eastern Turks. Farther to the west, in the low land about the lake of Aral, they receive the name of Turkomans; and still farther in Asia Minor, and in the Ottoman empire of Europe, they are named Turks or Osmanlis. These nations may be considered as the principal stock of this great division, but its branches extend to the north and to the south between other nations of Mongolic or Persian origin, and are manifoldly interwoven and mixed with them; and although the physical structure of their body sometimes may display the most remarkable differences, these nations, from Peking to Constantinople, speak dialects (called by us the Turk-Tartarian dialects) which are understood by all of them. The Turkmans or Truchmenes, a pastoral nation, divided into innumerable tribes, form the principal stock of the inhabitants of northern Persia, on the west side of the Caspian Sea, in Shirwan, Asia Minor, Khiva, and Bucharia, where a tribe of the eastern Turks, who are the original inhabitants of the centre of the table-land of eastern Asia (in Khotan, Yarkand, Turfan, Kashghar), under the name of the Uzbeks, have obtained the dominion of Turkistan and Bucharia. The Kirghises were formerly under the name of eastern Kerkis (Kazak or Hakkas), the neighbours of the Mongols, and inhabited the upper course of the Yenesei and the Altai mountains, but they have been obliged to emigrate towards the west, where they occupy at present as pastoral tribes the steppes, which have received from them the name of the *Steppes of the great, middle, and little Kirghis tribes*. The Bashkires are settled in the southern branches of the Ural mountains. Besides these, many other nations and tribes, which commonly are called Turkish Tartarian, or Tartarian Siberian, or only Tartarian tribes speak Turkish dialects, though some of them have been mixed with Mongolic tribes. Among these may be enumerated the Nogai on the banks of the Kuban and Kuma near Mount Caucasus, who partly occupy also the Crimea in Europe; the Kumuks in the same country: the Karakalpaks near the lake of Aral; many tribes commonly called Tartars settled in Siberia, between Tobolsk and Yeneseisk; the Barabinses wandering about on the steppe of Baraba, the Kusnes on the river Tom; the Katshuzes, Belyres and Biruses in the mountains of Sayansk and the banks of the Upper Yenesei; the Teleutes, about the lake of Teletzkoi, and lastly the Yakutes, who form the extreme link of the Turkish nations towards the north-east, and occupy the banks of the middle course of the river Lena about Yakutzk, and even extend to the mouth of that river.

The nations of Samoiedic origin occupy two different countries distant from one another. The southern division inhabits the banks of the Upper Yenesei and the mountains of Sayansk, where the remnants of the formerly very numerous samoiedic nations have remained in that country, of which they were the aborigines; they are divided into four tribes, the Uriankhai (or Soyot of the Chinese), the Motores, the Koibales, and the Karakashes. The northern division is settled along the Polar Sea to the north of the Lower Tunguska, and extends from the mouth of the river Yenesei to that of the Oby, and farther west to the northern part of the Ural mountains, and even in Europe as far as the White Sea; so that these tribes, which properly are called Samoiedes, are separated from the other above-named branches of their family by Turkish tribes and the Yeneseians, who inhabit the country lying between them.

The Yeneseians are an isolated and small tribe, whose abode is confined to the valley of the river Yenesei in its middle course between Abakansk and Turukhansk, and who formerly, like their neighbours the Samoiedes, inhabited the mountains of Sayansk and of the Altai-range, but like them were obliged to emigrate towards the north, when other nations which lived in their neighbourhood began to press upon them with superior force—an event which seems to have been extremely common in the countries in the north and north-west of Asia.

The nations of Finnic origin belong less to Asia than to Europe, where they are dispersed from the western declivity of the Ural mountains through the valley of the Upper Volga, as far as Lapland. Two tribes of this origin are found in Asia, the Vogules and the Ostiakes of the Oby river, who may be comprehended under the general name of Eastern Finns; they occupy the country extending from the Ural mountains eastward to the middle course of the Oby, so that they separate the northern Samoiedes from the Turkish tribes inhabiting the western districts of Siberia farther to the south.

The Mongolic stock of nations branches out into three great divisions—the proper Mongols, the Buriates, and the Olöt or Kalmucks. The proper Mongols are settled on the southern side of the desert of Gobi as tribes charged with the defence of the boundary of the Chinese empire, and there they are called Tsakhar, whilst other tribes, comprehended under the name of Khaika, occupy the northern side of the Gobi. Other tribes farther to the south-west, towards Tangut and Tibet, are known under the general name of Sharaigol or Khör among the inhabitants of Tibet, also Sokbo, i. e. pastoral tribes. The greatest number of them depend on the court of Peking, and are distributed under different banners; a small number however are under the dominion of the Russians, in the countries surrounding the lake of Baikal, which likewise is inhabited by the second great branch of the Mongolic nations, the Buriates, who seem to have kept possession of their original native country. The third great branch of this extensive stock, the Olöth, who are dispersed over all the countries between the lake of Khukhu-Nor and the banks of the Volga, are again divided into four branches, and are known in Europe by the name of Kalmucks (Kalmakh), which was given to them by the Russians. The most extensive of these branches was once formed by the Zungares, who, in the middle of the last century (1757), in their war with the Chinese, were partly destroyed, and their original country on the banks of the river Ili and of the lake of Balkash, on the south-west of the Altai mountains, which for some time had been entirely uninhabited, though it contains extensive pastures, was afterwards occupied by another branch of the Olöt, the Turgut, whose tribes had till then been settled on the banks of the Volga to the north of Astrakhan. But some of their tribes remained on the banks of the Volga, and others are dispersed through Central Asia, as far as the lake of Khukhu-Nor. The third principal branch of the Olöt, the Khoshud, are less numerous, and inhabit likewise the countries surrounding the lake of Khukhu-Nor or the Blue lake. The fourth great branch of these Mongols, the Turbet, are settled still farther to the east, on the upper course of the Hoang-Ho.

The Tunguses form one of the most extensive families of nations in the north-eastern countries of Asia, occupying all that part which lies to the east of the northern Samoiedes on the Polar Sea, of the Yeneseians, of the Uriankhai on the upper course of the Yenesei river and on the mountains of Sayansk, and to the north-east of the Mongolic tribes. From the upper course of both Tunguskas, they extend to the Polar Sea and the river Olenek, and thence over the middle course of the river Lena, and from the eastern extremity of the lake of Baikal over the river Witim as far as the shores of the Gulf of Okhotzk, where they are called Lamutes, or inhabitants of the shore. Towards the south-east they occupy the countries lying on the middle course of the Amur or Saghalien Oola and the banks of the Sungari Oola to the boundary of the peninsula of Korea. But neither at the mouth of the Amur, nor farther to the south, do the Tunguses extend to the shores of the sea; the latter being inhabited by the Aino, a tribe not belonging to this stock. The branches of the Tunguses are very numerous, but in modern times none of them has rendered itself conspicuous except that tribe which occupies the south-

eastern corner of the country inhabited by them, and is called Mantchoo, which conquered China in the middle of the seventeenth century, and still governs that country. These Mantchoo Tungoses are found dispersed over all the provinces of the Chinese empire, where they constitute the military nobility.

The north-eastern part of Asia from the mouth of the Lena river to the sea between Asia and America is occupied by three nations, who speak quite different languages, though they live near one another on a country of comparatively no great extent. These nations are the Yookaghires, on both banks of the Indighirka; the Koriakes, from the Kowyma river to the Anadyr river, and round the Gulf of Penshinsk; and the Tchuktches, inhabiting the most north-eastern extremity of Asia. Between the latter and the Eskimaux tribes in North America such an affinity exists, as to language, that they have obtained the name of Polar Americans. The Kamtchadales too, who have given to, or received their name, from the peninsula which they inhabit, form a separate group of nations, speaking a peculiar language.

The tribes which are comprehended under the name of Kuriles, or Aino, are placed to the east of the Tungoses, or more exactly at the mouth of the Amur river and on the coast which extends to the south as far as Corea; they inhabit likewise the islands lying along this coast and extending southward to Yesso on the north of Japan, and northward under the name of Kuriles to the southern cape of Kamtchatka. Though these fishing tribes are dispersed over a very extensive coast, they have a common language.

The Japanese speak a language peculiar to themselves; and though their civilization exhibits a striking similarity to that of the Chinese, it seems not to have been influenced by the latter, but to have risen entirely from the peculiar character of the Japanese. Both their language and their civilization are confined to their islands, with the exception of the islands of Liew-kiew, whose inhabitants certainly belong to the same stock, but their language is said to be different.

The Koreans, or inhabitants of the peninsula of Corea, constitute likewise a separate nation, which many centuries ago inhabited the mountain-range which forms the northern boundary of the peninsula, and then were called Siäupi; at present they are confined to the peninsula itself by their neighbours, the Mantchoo, who occupy the country farther north, and are quite different from them.

The Chinese constitute the most numerous and most civilized nation of eastern Asia, forming by far the greatest part of the population of China itself, and possessing a very rich literature. They are also dispersed over the other countries subject to the court of Peking, and even beyond this boundary, where, however, they have only settled in more modern times. They have likewise formed many settlements on the island of Formosa, as well as on the Sunda islands, in Siam, Malacca, and in Ceylon.

The Tibetans, or inhabitants of Tibet, who call themselves Bhot or Bhota, constitute a very numerous group of tribes, which are far dispersed over the table-lands of eastern Asia, to the north of the Himalaya mountains, but all of them are very little known; it seems, however, that they are divided into many branches extending to the west, east, and north-east.

The different nations which occupy the peninsula without the Ganges, as the inhabitants of Anam, i. e. of Tonkin and Cochin China, those of Siam, Pegu, and Ava, or the Birmanians, are still very imperfectly known; their languages, history, and peculiar manners and character have only of late years become an object of inquiry. The Malays are better known; they perhaps once occupied the mountain region of the peninsula of Malacca, but at present are only settled on the Sunda islands and the southern extremity of that peninsula. They speak a distinct and cultivated idiom, which is far diffused, on the west as far as Madagascar, and on the east over the islands of Sunda and the Philippines, and even to the most eastern island groups of the Pacific Ocean.

These are the principal groups of nations inhabiting Asia; but in the inland countries of that continent there still exist some feeble remains of ancient nations which have not yet been subjected to a close investigation. Such are the Miao-tse in southern China, the Goands in Deccan, the Lolos and Carayn on the peninsula beyond the Ganges,

the Siapush in the Hindu-Coosh mountains, and some others.

VII. Political divisions.—As nearly everything belonging to the geography of Asia appears to be formed on a colossal scale, the political relations of the different states which have taken possession of its extensive natural divisions are the same. We may state with certainty that at present there are only six empires of great power and importance which possess among them the whole continent. The others, of less extent and importance, are either dependent on these six, or at least are subordinate, and rendered of less political weight, from being separated from each other by the six. The east of Asia is occupied by the Chinese empire, the north by Russia, and the south by the British dominions; the other states lying between them, as the empire of the Birmanians, and the kingdoms of Siam and Cochin China, are only of the second or third rank. The west of Asia, however, comprehends Persia, which is now divided into two states, Afghanistan (eastern Persia), and Persia Proper (western Persia), Turkey and Arabia; and if we except the small states of Khiwa and Bueharia in the low lands round the lake of Aral, there hardly exists an independent nation or sovereign of any weight in political matters. The area, as well as the population and the physical resources of Asia, are very unequally divided amongst those great monarchies.

Asia, according to an approximate estimate, contains from nineteen to nineteen and a half millions of square miles, including the islands, which occupy nearly one million and a half of square miles, or more than one third of the surface of Europe. If we further subtract the extensive lakes, as the Caspian Sea and the lakes of Aral, Baikal, and Balkash, which together occupy a surface of upwards of 20,000 miks, we find that the whole surface of continental Asia is reduced to about seventeen millions and a half, which may be supposed to be inhabited by from 150 to 500 millions of souls. Europe, which, according to a rough estimate, contains upwards of three millions of square miles, is inhabited by about 180 millions of souls; therefore, though Europe contains only about one sixth of the surface of Asia, its population is equal to more than one third of that of the latter continent. But political importance depends entirely on wealth and population, and not on the great extent of countries. Very extensive tracts, which are possessed by the two largest monarchies of Asia, are very thinly inhabited, whilst other portions of that continent have an excessively dense population, which gives them great weight in their political relations with the neighbouring nations.

The Russian empire extends through two of the great divisions of the globe, from the Atlantic Sea to the Pacific Ocean, and contains about 7,100,000 square miles, with a population of about 55 millions; more than two thirds of its surface, namely, 5,800,000 square miles, and only one-fifth of its population, namely 11 millions, belong to Asia. In this account are included the ancient Tartarian kingdoms of Kasan and Astrakhan, which by some geographers are assigned to Europe, and the wandering tribes of the Kirghies, which are estimated at 300,000, and the mountaineers of the Caucasus, at about half a million. Besides the two great Tartarian kingdoms of Kasan (the ancient Bulgar), and Astrakhan (the ancient Kaptshak), the Russian empire in Asia contains Siberia, the eastern boundary of which is not exactly fixed: the Caucasian provinces, three in number, which lie on both sides of Mount Caucasus and constitute a military government; the steppes of the Kirghises, a protected country; and the Siberian islands and peninsulas in the Polar region of the Pacific Ocean, as far as the north-western shores of North America. Up to the year 1822 Siberia was only under the orders of military governors; but at that period it was placed under a civil government, and divided into two great provinces or general governments, namely, Western Siberia, which comprehends the governments of Tobolsk, Omsk, and Tomsk; and Eastern Siberia, to which belong the governments of Irkutsk, Veresensk, and Yakutsk, with the two maritime governments of Okhotsk and Kamtchatka; and it is observed that, since this change has taken place, the settlement of European colonies through Northern Asia, to the east of the Ural mountains, has considerably increased.

The Chinese empire is limited to one of the great divisions of the globe—Asia, but it comprehends more than one-fourth of its surface, namely, upwards of five millions

of square miles, with a population amounting at least to 235 millions; but if we may rely on the population list published by the court of Peking in the great imperial geography, the whole population of the empire in 1813 amounted to 361,703,110 individuals, consequently upwards of a hundred millions more than we have supposed. Its extent is greater than that of all Europe by nearly two millions of square miles, and its population is nearly double that of Europe, if we follow the statement of the Chinese government, or is equal to it and the whole population of the Russian empire in addition, if we follow the more moderate supposition. The subjects of the Russian emperor in Asia do not exceed 1-40th of the whole population of that continent, but those who obey the Emperor of China may be considered as constituting one-half of all its inhabitants. Though, therefore, both these empires are nearly equal in extent, the amount of their population is widely different, and the Russian empire occupies a very subordinate political relation. China occupies the first place among the political bodies of Asia, and in this position it has maintained itself for two thousand years, whilst the power of Russia does not yet reckon two hundred. But every part of the immense surface of the Chinese empire is not of equal importance. In the Russian empire the Ural mountains are the natural boundary of its body, whose head is placed in Europe, but whose limbs extend through the whole north of Asia as far as Kamtchatka, and are a mere appendage, which adds very little to the internal force of the body. Nearly the same circumstances exist in China. The head of the Chinese empire is at a short distance from the Pacific Ocean, on the eastern side of the table-lands of the Gobi and of Tibet, in the rich and fertile and densely-populated lowlands of China, or in that part which is properly called China (Chin). But all the other provinces to the north of the Great Wall and to the west of its western extremity, must be considered as an appendage, which is of comparatively very little political importance with regard to the whole empire. By some event this union might be dissolved, and the exterior limb separated, which has actually taken place more than once on the change of the reigning dynasties: but such events have not injured the proper body of the empire, which has rather attained a greater concentration of its internal forces by this separation. These external provinces or intermediate countries are only of importance to the government by impeding foreigners (*i.e.* barbarians, called *fou*) from entering into immediate intercourse with the natives of the Celestial Empire, and as a barrier against the more eastern empires and nations (Si yu, Si-fan). As provinces of inferior political importance, but forming an impenetrable barrier to intercourse with the neighbouring nations, we must consider all the countries extending over the Chinese table lands, the boundaries of which are nearly coincident with those of the highlands of eastern Asia. The Chinese empire accordingly comprehends five great divisions of countries, besides some of less extent; and with respect to their political relation towards the government, they may be divided into three classes. The first class comprehends China Proper alone, the permanent seat of government and the residence of the sovereigns, either in the southern capital (Nan-king), or in the northern (Pe-king), as at present. The second class is composed of three great kingdoms, subject to the court of Peking,—Mantchooria on the north-east, the native country of the present dynasty, which is of Tungoose origin: Mongolia on the north and north-west, or the native country of all Mongolic tribes; and Hami, Turfan, Khotan, Yarkend, Kashghar, and the mountainous Bucharia, or rather Chinese Turkistan, which are properly the native countries of the eastern Turkish Tartarian tribes. The third class is composed of the protected countries, which have only in part received Chinese institutions, such as Tibet, Rhotan, Undes, Ladakh, and other small countries on the table-lands towards the south and west; and on the east the peninsula of Corea and the island of Formosa, as well as the Liquejos or Liew kiew islands.

The British dominions in the East Indies are, for the most part, in India, or the peninsula within the Ganges, a country which is little less than half the surface of Europe, and has a population inferior to that of Europe by only about fifty millions, so that, though only half as large as Europe, India has nearly three-fourths of its inhabitants. Were the whole population of the Russian empire in Asia uni-

formly and equally distributed over the country, every square mile would be inhabited only by two individuals: the same calculation, applied to the whole Chinese empire, would assign to every square mile somewhat more than forty-six persons; but in India, more than double that number. This circumstance is of great moment in the political balance in favour of the British dominion, especially as their possessions comprehend those parts of the peninsula which are the most densely peopled, and in which agriculture and civilization have made most progress; whilst the dominion of the Chinese extends over many countries, inhabited by wandering nomadic tribes, still sunk in barbarism. If we consider only the immediate possessions of the British in India, excluding even the island of Ceylon, we find that they have a population of from seventy to eighty millions on a surface little exceeding 650,000 square miles; but their political importance can only be duly estimated, if we consider how this population is concentrated, and how easily accessible these countries are by sea and the great navigable rivers. To this we may add, the security which the peninsula derives from being in the hands of a nation possessing the most powerful navy in the world. But the British influence is not limited to the immediate possessions of the three presidencies of Calcutta, Madras, and Bombay: it extends over a great number of dependent and protected sovereigns, who possess a territory as large as that of the East India Company, and, taken together, probably not less than forty millions of subjects. The whole number of such rajas and nawabs exceeds forty, and some of them possess countries of considerable extent, as the monarchs of Oude, of Nagpoor, Mysore, Satarah, Travancore, and the Nizam of Golconda. To these we must add the island of Ceylon, which belongs to the crown, and is of the greatest importance as a well-situated and convenient station for the navy. The countries which are still entirely independent of British influence are situated on the extreme boundary of India, as the government of the Sikhs, and the alpine state of Nepal, both on the northern limits of the British possessions. The territories of Runjeet Singh extend from the Setledge to the Indus, and from Cashmere to Multan, comprising the whole of the countries of the Penjab: under him the Sikh nation has changed from a republic to an absolute monarchy. One sovereign only at present exists within the boundary of these territories, who may still lay claim to independence, the Maharaja Sindiah, a Mahratta prince, whose possessions, everywhere surrounded by the British dominions, extend to the north of the table-land of De. But all these independent states are subordinate as to power and influence; they comprehend less than 200,000 square miles of surface, with a population short of ten millions. By the peace concluded at the termination of the Burmese war (1826), the possessions of the Company have been increased, by the acquisition of Aracan, with upwards of 20,000 square miles, and a population of about 200,000 souls, and of the more southern maritime provinces of Ye, Tavoy, and Mergui, with a surface of more than 30,000 square miles, but a very scanty population, not exceeding 35,000 persons. But nevertheless the possession of the latter country is important, by securing to the British nation the dominion over the gulf of Bengal and the straits of the Sunda islands.

The Portuguese, whose settlements were formerly so numerous on the coasts and in the islands of the Indian Sea, have preserved Goa, with a few adjacent places, Damian, and a small portion of the peninsula of Guzerat, with the fortress of Diu, a place important for the construction of vessels. These possessions, together with the island of Macao, in the bay of Canton in China, and some small districts of the island of Timor, are supposed to contain about 30,000 square miles, and half a million of inhabitants.

The French settlements in Asia are confined to India, and comprehend the governments of Pondicherry, with the towns of Pondicherry and Carical, on the coast of Coromandel, and a few other places, among which Chandernagor, in Bengal, and Mahé, on the coast of Malabar, are the most important. The whole area possessed by the French does not exceed 450 square miles, with a population of 200,000 individuals.

The Danish colonies consist only of the town of Tranquebar, and its territory, on the coast of Coromandel, a place remarkable for the influence which the missionary establish-

ment of the Protestant creed, which was erected here more early than in other places, exercised on the neighbourhood. The Danes have also a small settlement at Serampore, on the Ganges.

The settlements of the *Dutch* were formerly dispersed over the coasts of both peninsulas of India, as well as over the adjacent islands; but they were obliged to abandon them by degrees; and since 1821 they have been limited to the islands. Their power begins on the west with Sumatra, and extends over Java, as far as the Moluccas, or Spice Islands. These possessions comprehend a surface of about 86,000 square miles, and a population of perhaps five millions. They are divided into seven governments: Batavia, with the seat of the general governor, and Sumatra, Amboyna, Banda, Ternate, Macassar, and Timor.

These are the great empires and the colonies of the European nations, among which the north, east, south, and centre of Asia is divided; but besides these, there still exist some sovereignties, which, though not powerful enough to influence materially the political affairs of that continent, possess considerable importance in their immediate neighbourhood. Such are the empire of Ava or Birma, with a surface of perhaps more than 250,000 square miles, and a population of fourteen millions; the kingdom of Asam, with about a million of inhabitants, whose raja, however, is dependent on the British in Calcutta; and in its neighbourhood, a few small states in the mountains, as that of the Garrows, Manipore, Cashar, &c.; farther, the kingdoms of Siam and Annam, which latter comprehends the ancient sovereignties of Cambodia, Cochin China, and Tonkin, some petty but independent princes on the peninsula of Malacca, on which the British only possess the town and harbour of Singapore, with its annexed territory, and about 30,000 inhabitants, and a great number of petty sovereignties on the Sunda islands. Still we have to notice the most eastern of all Asiatic countries, Japan, which consists of many islands, comprehending an area of more than 200,000 square miles, with a very dense population, estimated at twenty-five millions.

The political relations of western Asia are quite distinct from those of its eastern countries. Other political bodies here predominant. The influence of the British on the south, and that of the Russians on the north, is here only subordinate; and the empire of China has no weight at all. In the lowlands, on the banks of the Gihon and Sir Darya, political power is subject to continual changes and divisions, which put a limit to the extension of the influence of the Chinese empire, though it projects like a wedge between Siberia on the north and India on the south. This territory of the nomadic tribes, with its agriculture dispersed in the fashion of oases, is probably the country of the Massagete of the ancients, the Khorasania and Mawar-al-Nahar of the Arabs, the Zagatai of the Mongols in the middle ages, and contains at present the states of Bokhara, or Usbekistan, and Khiva, each of which may comprehend about 100,000 square miles; and besides these, many petty sovereignties in the mountain regions, as Khokan, Badakshan, Turkistan, Tashkend, &c. All these countries must be considered as placed without the political relations of eastern, as well as of western Asia, and cannot be enumerated among the civilized kingdoms, which have attained a fixed and determinate form of government.

The nations whose power is prevalent in western Asia are the Persians, the Arabs, and the Turks. Persia, which occupies the centre, would doubtless exercise a decisive influence, if it still formed one entire and undivided empire; but for more than half a century this country has been divided into two sovereignties, Eastern Persia, or Afghanistan, and Western Persia, or Persia Proper, nearly equal in extent, and each comprehending upwards of 500,000 square miles. But their population is still more unequal: Western Persia contains about nine millions of inhabitants, but Afghanistan probably does not exceed seven. The political power of the latter is besides diminished by its southern portion, called Beluchistan, which comprehends half of its surface, and perhaps one-third of its population, being placed under the sway of its own sovereign, and still further by having lost nearly entirely some of its provinces, as Herat on the west, and Cashmere on the east, which at present are united to it by very slender bonds. Both countries however, Persia Proper and Afghanistan, preserve the importance which is secured to them by their geographical situation, as being the countries through which the commercial intercourse between eastern and western Asia is carried

on, which influence is still considerably increased by their being placed between the dominions of the Russians on the north, of the Turks on the west, and the British in India on the south.

Arabistan, the country of the Arabs, is of very little weight in the political affairs of Asia, and has always been so since the destruction of the caliphate. Its inhabitants are for the most part divided into wandering tribes, who are mostly independent of one another, and therefore cannot act in union and with effect. Some of them are subject to the Turkish empire, but the Arabs and Turks consider one another as personal enemies, and have frequent feuds. Though this country is very thinly peopled, its inhabitants may be estimated at from ten to twelve millions, and it is divided into four considerable sovereignties and a great number of smaller political bodies, which however are often more or less dependent either on an Arabian prince or a foreigner. The four great sovereignties are formed by the religious political government of the Wahhabites, in the centre of the country, the Nejd, which indeed seemed entirely destroyed in 1815, but which again, as has already been the case more than once, raises its head, and begins to exist as a separate political body, though it is in some measure subject to the pasha of Egypt. The most powerful monarchs, besides them, are the Imam of Yemen on the southern shores, and that of Muscat on the south-eastern corner, who, no less than the Sheriff of Mecca, and a great number of petty Beduin princes, are always engaged in secret or open war against the Turks, who claim them as their subjects. At the present moment it may be said that the power of the Turkish emperor over Arabia is only nominal.

The Turkish empire constitutes the last of the three great powers of western Asia; but its power in Europe having considerably declined, especially of late years, this has had a corresponding effect on its political relations in Asia; and it can no longer be said that this empire extends over countries lying in the three great divisions of the antient world.

Not many years ago, the surface of the Turkish empire was estimated at 900,000 square miles; but since that time its possessions in Africa, which formed nearly a third of the whole, have been lost; Greece has been separated from its territory in Europe, and even of the countries belonging in Asia to the Turkish empire, which, on a surface of about 450,000 square miles, contain about twelve millions of inhabitants, a great province, Syria, has been yielded up to the pasha of Egypt. The other provinces, divided into pashalics, are not in any intimate connexion with one another, nor even with the centre of the empire, and a great number of the inhabitants of the pashalic of Ezerum, protects the northern boundary of the empire against Russia have been transplanted to other countries. Many of the nations which inhabit the provinces lying on the boundary as the Turkmenians, the Kurds, the Caucasians, are still more difficult to keep in subjection than the pashas themselves.

ASIA, BOTANY OF. With reference to the character of its vegetation, Asia may be conveniently divided into seven regions, namely, 1. the Siberian; 2. the Tartarian; 3. the Cashmerian; 4. the Syrian; 5. the Himalayan; 6. the Indian; and 7. the Malayan or Equinoctial. There certainly no very precise limits between these, but they may be taken as representing so many well-marked features of the Asiatic Flora, and as expressing the most important difference of climate which this division of the world exhibits.

1. The *Siberian* region comprehends all the northern parts of Asia lying between the Arctic Ocean and Tartary, including Kamtehatka on the east and the whole range of the Caucasian and Ural Mountains on the west, thus forming a broad belt passing over the whole continent, and limited on the south by the 50th parallel of latitude. In its general features this region is essentially European on the west, and similar to the west coast of America on the east. Its northern portion experiences in many places extremely rigorous winters and short summers, and the earth is perpetually frozen below the vegetable mould that overlies the surface. In the neighbourhood of Eneseisk or Yeneseisk this is particularly remarkable. In that part of Asia the cold is so incredibly intense, that, according to Gmelin, 72° below zero of Fahrenheit is not very unusual, and it has been known as low as 120° below zero; birds and animals, as well as man,

perish beneath this dreadful temperature, their very blood being frozen in their veins.

In a country where this degree of cold exists, vegetation must of necessity be of the most stunted description; accordingly we read of whole districts covered with nothing but morasses of coarse rushes mixed with diminutive birches and arbutus, small willows, and an arctic bramble or two; cabbages will not exist, and corn is almost unknown in a growing state. In somewhat milder districts, where perpetual sunlight begins to be exchanged for the alternation of day and night and longer summers, the country is clothed with immense forests of birches, larches, and pines, among which the *Cembra* pine is a noble object, frequently attaining the height of 120 feet; to these are added Tartarian maples, balsams, poplars, and wild cherries, along with many species of *Curagana*, which is a genus characteristic of Siberia. Great numbers of gentians, especially *G. algida*, with its blue and white blossoms, large patches of the yellow *Rhododendron chrysanthum*, and the rich purple *Rhododendron dauricum*, with quantities of dwarf almonds and a great variety of other pretty flowers, fill the meadows and open parts of the country. Lilies of different kinds are met with in abundance in the eastern parts of the Siberian region, and their bulbs are used in Kamchatka for food: in many places are also found rhubarbs, especially that sort called *Rheum undulatum*, but not the official species, the station of which is probably in the Tartarian region. Among the strong points of resemblance between this portion of the Asiatic Flora and that of the opposite coast of America may be mentioned the abundance of cinquefoils (*Potentilla*) found in both, one of which, *Potentilla pectinata*, appears to be common to both countries; *Pedicularis resupinata*, a very remarkable species, is also met with in both. Corn is cultivated successfully only in the southern parts of the Siberian region. In the eastern part, according to Malte Brun, grain has not been found to ripen either at Oodskoi, which is under 55°, or in Kamchatka at 57°, but the south-west parts possess remarkable fertility. On the north of Kolyban, barley gives a return of twelve and oats of twenty fold. Wheat is, however, raised with difficulty, and in its room the inhabitants sow different kinds of buck-wheat (*Polygonum*), from which a bad kind of bread is prepared, as in China and some parts of Lombardy.

II. The Tartarie region, as it is next the Siberian, so it resembles it in most respects; and it may even be doubted whether it ought to be botanically distinguished, especially as very little is known of the exact nature of any part of its Flora, except that of Kunawur. It may, however, be characterized as being essentially Siberian in its genera, but distinct in the majority of its species; and so modified by the extreme cold and dryness of the climate, in consequence of the great elevation of the country, that most of the Siberian species, which are formed to breathe a more humid air, can scarcely exist in it. Cut off from the plains of India by the lofty pinnacles of the Himalayan range, it has no gradual communication with a tropical Flora in any of its provinces, but retains to its most southern limits its own peculiar aspect. Of the few species which botanists have seen from the most southern part of this region, scarcely any are met with in Siberia. What is called by travellers Tartarie Furze, has been ascertained by Mr. Royle to consist of prickly species of *Genista*, *Astragalus*, and *Caragana*; and the gooseberries, and currants, and willows, and rhubarb, are all of kinds unknown to the north of Asia, starved and stunted by the miserable climate.

The passes to the northern face of the range of stupendous mountains which divide the Himalayan region from that on the west, are described by Burnes as almost destitute of vegetation: but the assafortida plants grow there in great luxuriance, and form the principal pasture of the flocks which browse on them. An umbelliferous plant, called Prangos, is also found a valuable winter food for sheep.

In some places of this Trans-Himalayan region the aridity of the atmosphere is so great, that things neither rot nor decompose, but fall to dust in course of time: the surface of the soil is parched up and actually baked white by the scorching influence of the sun's rays, so that the face of the hills is actually dead. On the elevated table-land of Tartary the mountains are from 18,000 to 19,000 feet above the sea, and rise from the water's edge without forests or even a bush,

clothed with a withered and russet vegetation, and bare of snow. (Royle.) In other places, however, many trees are met with, among which are Tartarie species of ash, hazel, cypress, oaks, poplars, birches, pavia, &c. The *Neozapine* (*Pinus Gerardiana*), the seeds of which are eatable, like those of the stone pine in Europe; the Indian cedar (*Abies Deodara*), *Abies Webbiana*, and a few other trees, with a northern aspect, straggle on the mountains from the Indian side, and give an air of grandeur to some parts of this otherwise desolate region. Some places in the lowlands, such as Balk, where the climate is less arid, produce fruit of great excellence, and resemble the Flora of the Cashmerian region. In Kunawur, barley, buckwheat, and turnips, were seen by the Messrs. Gorard at 13,600 feet; and a little lower the ground was covered with thyme, sage, and many other aromatic plants. At 17,000 feet Tartarian furze still grows.

III. In the northern districts of Persia, and in those provinces which stand between the Indian territory and that kingdom, nature still refuses to assume the tropical features which, as will presently be seen, characterize Asia south of the Himalaya and east of the Indus. In many respects the vegetation of this, which may be called the *Cashmerian* region, is so like that of Europe, that, according to a French traveller in Cashmere, one would fancy oneself on a mountain in Auvergne, rather than in an Asiatic province bordering upon India. This arises from the resemblance that exists between the climate of many parts of Persia and that of Europe, which is mainly due to the high level of Iran. Sharp winters and fine warm summers nourish races of trees and flowers far more luxuriant and delicate than can appear in the long-protracted cold, and short summers of Siberia, or the dry and inclement steppes of Tartary. It is here that plants which delight in bright light and high summer heat, with a moist atmosphere, in their growing season, but which require a long and steady rest in winter, are met with in perfection: in a word, it is a climate which would suit tropical plants if it were not for the periodical cold. Rice, oranges, and olive, pomegranates, almonds, and fig trees, remind the traveller of Italy, while grapes, mulberries, and the ordinary European fruit trees cast a northern aspect over the scenery. All things that require much heat and light to arrive at perfection, such as the fragrant principle of tobacco, the mastic juice of the opium-poppy, and the tears of the manna-ash, are produced in the Cashmerian region in the greatest excellence. In some places the appearance of a few herbs of tropical forms indicates an approach to the vegetation of India: such as the salep plant, which belongs to a genus otherwise confined to the tropical parts of Asia; cotton; and here and there the sugar-cane: but there is no trace of the great features of a more southern vegetation. In Cashmere the most interesting part of the flora is collected. In this province flourish many of the fruits now cultivated in Europe: apricots, peaches, plums, cherries, apples, pears, and grapes, all in the greatest profusion, supply the markets. The walnut, which here is wild, is cultivated extensively for the sake of the oil which is pressed from its seeds, and used both in cookery, for burning, and instead of linseed oil for painters' work. 'The vine scales the summit of the poplar, and is never restrained by pruning, though, compared with it, those of Europe, either on the trellis or the wall, sink into insignificance.' In the forests are found oriental planes and horse-chestnut trees (*Parus*) truly wild; in the fields grow most of our European kinds of corn along with rice; and in the gardens the ordinary culinary vegetables of Europe. The Singhara nut (*trapa*) forms an object of general cultivation in the lakes which surround the city of Cashmere; one lake alone is stated by Moorcroft to produce from 96,000 to 128,000 ass-loads of this nut, and about 30,000 people are almost wholly supported by it for five months out of twelve. Nothing perhaps is more remarkable in Cashmere than its floating gardens, formed from the entangled stems of water-lilies covered with earth, and planted with melons and cucumbers, which, thus treated, arrive at the highest state of perfection, and are produced in great numbers.

The prangos, already mentioned, a kind of umbelliferous plant, is collected in some parts for the sake of the leaves, which, when dried, furnish a fodder much esteemed for sheep: and finally, the saffron crocus, which arrives at a great size, is extensively cultivated, and is a source of considerable revenue.

IV. Dovetailing, as it were, with what we have called the

Cashmerian region, passing even through southern Persia into northern India, and finding its eastern limits in the Great Indian Desert, of which Delhi may be considered as the extreme point, is a botanical region that requires to be distinguished, and to which the name of *Syrian* may be conveniently given, from its commencing with Syria on the west. It also comprehends the greater part of Turkey in Asia, and the north of Arabia. It might almost be called a *Southern Tartarian* region, for its peculiar appearance is caused by aridity and heat, as that of the real Tartarian region is caused by aridity and cold. At its western extremity the Syrian region resembles the north of Africa and the south of Europe in many of its plants; on the east it is occupied by species having a certain degree of relation to the others, but more Indian in their character; for instance, it appears from Mr. Royle's list, that near Delhi such plants as species of flacourtia, elytraria, cocculus, and lepidagathis, which consist principally of Indian species, are intermixed with fagonias, grewias, capers, camel's-thorn (*Alhagi*), æruas and scrubby heliotropes, which are truly Syrian. Desolation is the characteristic of a very large part of this region; destitute of water, and scorched by a fervid sun, it is physically impossible for the vegetation to consist of any but stunted shrubs or starved and withering herbs. The trees are few and thorny, and scantily clothed with foliage; the very herbs are spiny from want of power to develop the soft green parenchyma of the leaf between their rigid veins; and they are shaggy with long hairs, which nature gives them as a feeble means of sucking up the scanty moisture of the atmosphere. If among this barren region oases are found shaded with date trees and mountains rich with verdure, they only form a sad contrast with the dreariness of the scene beyond them, and by no means diminish the truth of the picture we have drawn. Sindh may be considered the most south-eastern point of the Syrian region; here the vegetation of uncultivated tracts is described as of a miserable description. Great quantities of a sort of tamarisk, intermixed with thorny aencias, a deformed euphorbia, the flowers of which are still more uninviting than its bloated leafless stem, neem trees (*melia*), and peepuls (*Ficus religiosa*), constitute the principal features of the scenery.

V. From countries like these we turn to the rich and varied sides of that stupendous mountain-ridge which, under the name of the Himalaya, forms an eternal barrier between Tartary and Hindustan. Of this fine region, which may hence be called the *Himalayan*, an invaluable account is given by Mr. Royle in his *Illustrations of the Botany of the Himalayan Mountains*, to which we are indebted for the principal part of our data regarding the vegetation of India. In consequence of the rich and humid plains that lie at its feet, and its great elevation, it is characterized by an intermixture of tropical and temperate plants, the former of which ascend the sides of the hills till they lose themselves among the latter, which in their turn give way, as the snow is approached, to truly Alpine vegetation. In the Himalayan region may also be comprehended the whole of the north of China and Japan and the higher ranges of the Neilgherry.

strong is the resemblance between the plants of these countries and the north of India in their leading features. As the Himalayas are ascended from the plains, the pineapple is found no longer to flourish; mangoes and custard-apples suffer from cold; the plantain is only able to exist in consequence of the numerous coverings formed by the sheaths of its leaves. The trees are nearly the same as those of the plains of Upper India, 'consisting almost entirely of dicotyledonous species, which lose their leaves in the cold weather as completely as trees in more northern climates.' Two species of *phœnix*, or date, form the only palms that are met with; and bamboos become few and weak. But within the Himalayas, at elevations of 2000 feet and more, are valleys which, 'being within the influence of the tropical rains, have a peculiarity of atmospherical phenomena which favours the existence of a series of forms not otherwise to be expected in a climate of which the mean temperature is so low.' Here accordingly are found oranges in a wild state, arborescent plants related to the cashew-nut, cassias, baubiniæ, and gigantic cotton-trees, great forests of saul trees (*Shorea robusta*), and shrubby euphorbias; among which are found abundance of scitamineous plants and many epiphytal orchideæ. Cane-palms (*calamus*) reach these valleys, but ascend no higher; and are met by a pine (*Pinus longifolia*), which descends from the mountains till it loses

itself amidst tropical forms and a few straggling elms, willows, roses, violets, and other European-looking plants. Mr. Royle mentions 4000 or 5000 feet as the average height at which tropical trees entirely disappear.

It is in the mid-region of the Himalayas, 'between 5000 and 9000 feet of elevation,' that its most lovely features are to be seen. Here in many places occur in the rainy season a few lingering tropical herbs, which are protected from the cold in winter by the earth in which they grow; several scitamineous, begonias, osbeckias, and justicias, are found among quantities of balsams; while the trees are oaks, sycamores, elms, hornbeam, and pine-trees, and the shrubs berries, roses, and honeysuckles, all of Indian species but European forms: in this favoured spot are also found numerous saxifrages, crowfoots, geraniums, and violets, with gentians, primroses, and labiate plants. It is this belt that is inhabited by the scarlet rhododendron, and on its lower edge by those wild camellias and tea-like plants which render it probable that the tea-plant itself with all its commercial wealth might be transferred from China to the British dominions in India. At 9000 feet elevation is found the curious *Roscoealpinia* of Mr. Royle, which is a most remarkable instance of an Alpine species of a tribe almost every other species of which is tropical.

The third and upper belt only ceases with vegetation, which on the Himalayas is protracted to an elevation unknown in any other part of the globe. As we ascend from the second belt, trees of rhododendron and *Quercus lanata* are first passed through. To them succeed pines and firs of various kinds; of which the most remarkable species are *Pinus excelsa*, and *Abies Webbiana*, *Podocarpus*, and *Marrubium*, which exist in a splendid state at 11,000 and 11,500 feet of elevation: oaks in great variety, yews, birches, sycamores, and poplars, together with *Rhododendron campylobulatum*, roses, viburnums, and honeysuckles; after which follow patches of snow, with the Himalayan band (a very curious circumstance), levelled with the ground. To these succeed forests of *Quercus semicarpifolia*; and finally the limits of vegetation are marked by a few starved yews and junipers, with primroses 'pressing up in the warmer situations, dwarf species of *Rhododendron*, *Andromeda fastigiata* (the heather of Mr. Frazer), and *Sedum Lindleyana*. It is curious to find on these mountains some plants, the general conformation of which is first Chinese and then American; instances of which occur in the genera *Trochetis*, *Abelia*, *Canellia*, and many others, which are Chinese, and in *Triosteum*, which is completely American.

The agriculture of this region is as singular as the other parts of the vegetation: wheat is sometimes cut at the top of a mountain, and rice at its foot. Maize, millet, and many small grains constitute the rain crop: capsicums, turmeric, and ginger, are grown as high as 4000 feet; cotton succeeds even in Kumaon: wheat is cultivated as high as 10,000 feet, and even 12,000 feet according to Captain Webb.

Notwithstanding the difference in the aspect of the countries and the want of the mountains that constitute the great features of the Himalayas, the plants of the north of China and Japan are undoubtedly of a nature sufficiently similar to be included in the Himalayan region; and if also to comprehend the mountain Floras of Java and other Malayan islands, we should probably be correct. At present, however, the data regarding these places are not sufficiently exact to enable us to separate them from the Malayan region in which they are found.

VI. In the Indian region should be comprehended all those countries which, like Hindustan, are capable of bearing coffee, indigo, sugar-canes, palms, and other ordinary products of a tropical district, without excessive humidity existing at all periods of the year. In this view it would include Arabia Felix, Burma, Siam, Cochin China, and the continental lands connected with these countries. What is called jungle is met with in most parts of this region. In the words of Mr. Royle, 'tracts of this kind are low, and being inundated during the rainy season, as well as by the hill-streams frequently overflowing their banks, are generally in a moist state, and have hence been called the Turrai or moist land. The powerful rays of a nearly vertical sun beating upon this, and a dense mass of vegetation where there is little circulation of air, produce a heated and moist atmosphere highly favourable to the production of tropical plants.' From the southern and eastern parts of this tract, or the confines of Silhet and Chittagong, Drs. Rox.

burgh and Wallich obtained their splendid specimens of tree-ferns.

In these damp and swampy forests eternal pestilence reigns; so that the native wood-cutters are often unable to remain in them more than a few days at a time, fevers, and bowel complaints universally attacking them after a short exposure to their baneful influence. It is here, however, that some of the most remarkable and valuable of the vegetable productions of continental India are to be met with: it is here that are found the sapan trees, so important for their extreme hardness, teak, and many of the finest of the Indian timber trees; and amidst the vapours arising from the beds of the mountain-torrents which often tear a way for themselves through the forests, abound numerous species of ferns, together with those singular plants called by botanists *Orchideous epiphytes*, which cling by their aerial roots to the branches of trees, and astonish the traveller by their brilliant colours and grotesque forms.

In the cleared ground, where the soil is exposed to the rays of the sun and the earth is dried by a free ventilation, palms and evergreen trees of remarkable kinds are met with. Mangoes are planted round the villages, Palmyra-trees (*Borassus flabelliformis*) are in many places extremely common; coco-nuts and Gomuto palms (*Arenga saccharifera*) are of frequent occurrence; a coarse grass overruns the plains, except in the cultivated spots, which are occupied by rice, sesamum, cotton, hemp, sugar-canes, yams, indigo, maize, the betel and other peppers. In place of *epiphytural orchideae* the branches of trees are occupied with parasitical *loranthi*, which, absorbing their food from the inside of the trees that bear them, are able to set at defiance the dry atmosphere with which at one season of the year they are surrounded. Tobacco arrives in some places, as on the coast of Martaban, at such excellence as to rival that of Shiraz, and to render it a subject of surprise that it should not have been an article of export. Add to these areca palms, plantains, and bananas, jacks (*Artocarpus integrifolia*), guavas, and jamrosale trees, and a tolerable notion will be had of the ordinary appearance of the true Indian region. The flora of this country is, however, so vast, that no general description can give an idea of its richness and variety.

Among the most remarkable features in the Flora of India is the Banyan tree (*Ficus Indica*), the branches of which emit roots which descend to the earth, where they fix themselves, and become in time large trunks. When a banyan tree becomes old, and acquires a great number of such trunks, one individual will have the appearance of a grove. Many cases are cited of trees of this sort arriving at a prodigious size; the following, mentioned in the Journal of Asiatic Society as growing in the territory of Mysore, will give a good notion of the surprising magnitude they sometimes attain. 'The centre tree is about fifty or sixty feet in height, and its branches cover an area of seventy-six yards in one direction and eighty-eight in the other, while the drops now dependent from, or rather supporting, its gigantic branches, amount in number to one hundred and twenty-one, of which some are of enormous size. The place exhibits on all sides vast branches broken off, which have been evidently once connected with thirty trees, now disunited from the centre stock; but the original connexion can still be sufficiently traced to render unnecessary the testimony of the villagers, who state that they and their fathers have been in the habit of disuniting these trees by separating the intermediate parts for the construction of solid cart-wheels, for which, from their size, they are well suited. On measuring the transverse diameters of the whole area, they are found to contain more than 100 yards each way—this single tree thus affording a circle of foliage and shade exceeding 300 English yards in circumference.'

Ceylon may be referred to the Indian region, notwithstanding its insular position. It produces cinnamon forests, nutmegs, and coffee; satinwood and ebony trees are found in abundance in the jungle about Trincomalee; while the forests of the island abound generally in other kinds of timber valuable for naval and other purposes. A kind called Wallaporte is spoken of by Mr. Brooke as girthing from twenty-eight to thirty-two feet.

VII. The seventh and last region of the Asiatic Flora is that which we would call the *Equinoctial or Malayan*. Spread over islands lying under the line—their centres usually occupied by mountains, and their coasts washed by the waters of a vast ocean—the features of this Flora are essentially different from those of the continent of India. The atmosphere

is in a state of perpetual humidity, acted upon by a vertical sun; the land is little cleared, and allows but slender opportunity for the sun and wind to dry it. Many of the islands are little better than a mass of jungle, or at all events these dense and pestilential woods occupy a considerable portion of the surface. Many of the islands are intrenched with rank after rank of the living palisades of the mangrove, rooting into the mud, and surrounding the taller stems of the Nipa palm, Barringtonias, and thickets of sword-leaved vaquios trees. These woods are so dense that the sun never penetrates them; so entangled with climbers, coarse grasses, bamboos, and cane-palms, that no human being can penetrate them without a company of pioneers; and so damp that the parasites actually struggle with the leaves of the trees on which they grow for mastery over the branches; spice-trees, nutmegs, and cinnamon, camphor-trees (*Dipterocarpus*), and tree-ferns, here find their home; and in the depths of their recesses are sometimes nourished the fungus-like form of the huge *Rafflesia* flower. On the mountains are many species of oak, dammar pines, rhododendrons, and magnolias; and at the summits are found crowsfoot, valerians, bilberries, berberries, brambles, honeysuckles, gentians, and other well-known European forms.

The cleared ground of these countries is occupied with a great variety of fruit trees common to the rest of India, along with the mangosteen, durian, and rambutan, many-headed pines, jacks, and shaddockes, which attain their highest perfection here only. Even in the smaller islands the vegetation is of a similar kind. All the Maldives of any extent are richly clothed with wood, chiefly palms; among which the cocoa-nut is of such importance, that it is doubtful whether some of the Malayan islands would be habitable without it, from their want of water; the inhabitants give its milk to their cattle, and never use any other beverage themselves.

(See *Journal of the Royal Geographical Society of London*; *Journal of the Asiatic Society of Bengal*; Royle's *Illustrations of the Botany of the Himalaya Mountains*; Matte Brun's *Geography*; Gmelin's *Flora Sibirica*; Wallich's *Plantae Asiaticae Rariores*; Reinwardt *über den Charakter der Vegetation auf den Inseln des Indischen Archipels*, &c.)

ASIA, ZOOLOGY OF. Considered in relation to its extent, the continent of Asia and its islands contain a greater number and variety of animals than any other quarter of the globe. This, indeed, might reasonably be expected, from the diversity of soil and climate, the alternations of heat and cold, of drought and moisture, of mountain and lowland, of luxuriant forest and bare plains. Nor is it only in the number and variety of its zoological productions that Asia claims our particular attention. Their intrinsic value in the economy of human society, the prominent part which they played in the early civilization of mankind, and the universal importance which still attaches to the cultivation of domestic animals among the most civilised and refined, as well as among purely pastoral nations, make the consideration of Asiatic zoology an object of interest not less to the historian, the antiquary, and the general inquirer, than to the zoologist. In fact, the great majority of the domestic animals which enabled man to till the earth, to extend his power, and to transport his commodities to distant regions, which first gave to civilized man that mastery over the productions of nature that, perhaps more than all his other attributes, distinguishes him from the savage, and which still continue to furnish him with food and raiment, are of Asiatic origin: the camel, the horse, the ass, the ox, the dog, are all of eastern derivation; and it is there alone that we must look for the original types of these useful animals. Naturalists have wasted much time in endeavouring to discover the wild sources from which some of our most common and useful domestic animals were derived; had they looked for the origin of the dog, the cat, the sheep, and the goat in those regions which witnessed the first dawn of human civilization, and in which these valuable servants were first brought under the dominion of man, their researches would probably have been attended with greater success; for it is but natural to suppose that the wild species, if they still exist in a state of nature, are to be found in the districts where they were first reclaimed.

The numbers, and relative distribution of Asiatic mammals, are expressed in the following table:—

ORDERS.	Whole No. of known species.	Whole No. of Asiatic species.	No. of species peculiar to Asia.	No. of species common to Asia and other Continents.
I. Quadramana	186	45	39	6
II. Cheiroptera	192	46	41	5
III. Carnivora	320	112	60	52
IV. Marsupialia	67	6	3	3
V. Rodentia	295	111	75	36
VI. Edentata	23	2	2	..
VII. Pachydermata	30	11	8	3
VIII. Ruminantia	157	64	46	18
IX. Cetacea	76	25	14	11
Total	1346	422	288	134

Thus it will be observed, that of 1346 known quadrupeds, 422, or very nearly one-third of the whole number, inhabit some part of Asia or its dependent islands; but of these it will be further remarked, that 288 only, or about two-thirds of the whole, are peculiar to that continent, the remaining 134 extending into the neighbouring continents of Europe and America. Indeed it may be generally observed, that the zoological productions of the northern parts of these three continents respectively, if not absolutely identical, are at least extremely similar, even in their most minute features; northern Asia, in particular, from its relative position, as situated between and connecting the other two, partakes equally of the productions of both; and it is probably to this circumstance, more than any other, that we ought to attribute the comparatively small number of its entire mammal inhabitants which are peculiar to this continent, when compared with those peculiar to Africa or America: Africa, for instance, contains 300 quadrupeds; yet out of these 50 only are found beyond the boundaries of that continent; America, again, out of no fewer than 537 species, has only 57 common to other regions, whilst, as already observed, Asia, out of 422 species, has no fewer than 134 equally common to Europe, Africa, and America. It will be likewise observed, from the foregoing table, that the Edentata and Marsupialia are the two orders of mammals in which Asia is most deficient, and that it is most rich in the number of its Ruminantia, compared with the whole number of known species. This is precisely the reverse of what we have already observed regarding the zoological productions of America, nor is the circumstance without importance to those who study the progress of society and the development of civilization in these two continents.

The elephant, though never bred in a tame state, ought to be considered at the head of the domestic animals of Asia. The inhabitants of India appear to have known and practised, when Alexander's army entered the country, the very same modes of capturing and training the elephant which are employed at the present day. Their ancient writings mention this animal as a domestic servant, and he is constantly represented in the same character upon their public monuments. Alexander the Great, during his expedition into the north-west parts of India, found the armies of the native princes attended by their war elephants, just as the European invaders of the same country have done in later times; and from that period the elephant appears to have been constantly employed by the successors of Alexander in western Asia, and also by the Carthaginians, and Pyrrhus, the king of Epirus, who fought against the Romans in Italy. Immense troops of wild elephants are still found in the northern parts of India, in the Malayan peninsula, in Ceylon, and probably in all the large islands of the Indian Archipelago. Those which are employed in the East India Company's service, and which rarely exceed seven feet and a half average height, are obtained in the upper provinces, principally from the vicinity of the great saul forest, which skirts the lower ridges of the Himalayan chain for some hundred miles, and in which these animals are particularly abundant.

The common domestic animals of Asia present more varieties of species, and attain to greater individual perfection of form, than those of any other quarter of the globe. The horse, the ass, the camel, and probably most other species, are originally natives of the central plains of this extensive continent, and, though no longer found in a state of nature, are still proverbial for their symmetry and spirit. In Arabia, particularly, the horse is, of all other animals, the object of

most especial care and value. No Arab, however poor in other respects, is without this noble animal, which is at once his friend and companion, the sharer of his riches or poverty, and the partner of all his toils. Subsisting on the same food as his master, which, during their long expeditions in the deserts, is often limited to a scanty supply of dried dates, temperate and enduring to a degree scarcely exceeded even by the camel or dromedary, lodged in the same hut, and caressed with the fondness of a child, the Arabian horse is never subjected to the performance of any mean drudgery or servile labour, and the record of his pedigree and kindred is preserved with the greatest care. This mode of treatment has a corresponding effect on the habits and character of the animal. In no other part of the world does the horse display so much gentleness, intelligence, and spirit as in Arabia; the pupil and constant associate of man, he almost seems to have caught a spark of human reason, readily comprehends and executes the orders of his master, and returns with delight and evident gratitude the attentions bestowed upon him. The nomadic and pastoral nations, which have from time immemorial occupied the central plains of Asia, are universally an equestrian people; they may be almost said to live on horseback, and indeed it would be impossible for them to carry on the predatory expeditions for which they have been in all ages remarkable, or to traverse the steppes of Asia, without the aid of this noble animal. Nor do these people employ the horse as a beast of burthen alone; his flesh supplies them with their favourite food, and the milk of the mare is the greatest dainty of a Tartar feast. Wild horses are said to exist in the interior of Tartary, where the inhabitants hunt them for the sake of their flesh; but the account in this instance, as in the similar report of the existence of wild asses in the same localities, cannot be implicitly relied upon, as travellers imperfectly acquainted with zoological distinctions frequently give the names of familiar animals to others which resemble them in form and appearance, without attending very closely to their specific difference. In the present instance, it is more than probable that both the wild horse and wild ass of eastern travellers are to be referred to the *Dziggetai*, a species of intermediate size and form, which inhabits the same regions, and has always retained its original freedom.

The asses, like the horses, of Asia are of larger proportions and more generous spirit than those which have been transported to other countries. That central Asia was originally the habitat of both these animals there can be no doubt, not only because we find them there domesticated at the earliest periods of which we have any record, but likewise because the Asiatics are, and, as far as we know, always have been, equestrian nations, whilst, in the neighbouring continent of Africa, the species was probably introduced from Asia, though at what period is uncertain. The horse, indeed, was early known and used in Egypt, as we know from the monuments and from written history. But the negroes of interior Africa, and, generally speaking, the whole southern part of the continent, are to this day destitute of either the horse or the ass. Nothing can present a greater contrast than the comparison of the degraded and degenerate ass of Europe with the same animal bred in his native country. Instead of the dejected air, shaggy coat, pinched dimensions, and miserable half-starved appearance which he presents in these countries, the ass of Persia, Syria, and the Levant approaches nearer to the larger size of the horse, and partakes much of his beautiful symmetry of form, noble carriage, and unrivalled speed.

It appears extremely probable that the camel and dromedary are likewise of Asiatic origin. The wide extent of the Arabian conquests during the middle ages introduced the latter species into most parts of northern and central Africa, where it has been ever since established; and is of the greatest use in crossing the sandy deserts which separate the inhabited regions of the north from the interior of the continent. The camel, which is distinguished from the dromedary by having two humps on the back instead of one, appears to have been in all ages more limited and confined in its geographical distribution than the latter species. The camel is found chiefly, if not solely, among the wandering Tartars, from the confines of Siberia to the northern ridges of the great Himalayan chain; whilst the dromedary spreads not only over Arabia, Syria, Mesopotamia, and Persia, but extended into India, and probably even into

China. These animals are mentioned among the earliest lists of the flocks and herds of the patriarchs: and it is not a little singular that here, as in the case of most other domestic animals, not the slightest trace seems to remain of the original wild stock from which the species was first reclaimed. Professor Pallas, it is true, reports the existence of wild camels in the neighbourhood of lake Aral, but he never met with them in his travels, though he frequently heard of them; and Baron Cuvier conjectures, with much seeming probability, that the reports refer to some of the wild animals to which the inhabitants of these regions, from religious motives, restore their liberty at the celebration of particular festivals.

Of the ox kind, no fewer than four distinct species have been, from time immemorial, domesticated in different parts of Asia. The common Indian ox (*Bos Indicus*), though usually confounded with the common ox of western Europe, is in reality a very distinct species; differing not only by his longer legs, and the large hump which marks his shoulders, like that of a dromedary, but likewise by his voice, and even by some details of internal conformation. This animal, from his superior height and more slender proportions, perhaps the most symmetrical and graceful of all the different species of the ox genus, has been from the earliest ages held in the greatest veneration by the natives of India; and there is a strong resemblance between the worship of Apis among the ancient Egyptians, and that which the followers of Brahma paid to the Indian ox, as an incarnation of their favourite deity Vishnu. But the whole race of Indian cattle are not equally regarded as objects of religious veneration: these attentions seem to be exclusively bestowed upon a particular breed: and the greatest care is taken to maintain the purity of this sacred race, and to preserve the pedigrees of its individual members. The common Indian cattle, however, are not regarded with the same religious sentiments. They are the usual beasts of draught and burthen in the country; and, from their great speed, are frequently used for the saddle, even by the Europeans settled in the upper provinces. The intercourse which India always seems to have maintained with other commercial nations of antiquity was the means of introducing this beautiful and useful animal into more distant regions: and we now find the Brahmin bull extending over a great part of Persia and Syria, and mixed with the common flat-backed species of the west, in Madagascar, Abyssinia, and generally along the whole eastern coast of Africa.

The Yak (*Bos grunniens*) is another species of ox which has been long domesticated in central Asia. It has always formed the common cattle of the Tartars, and is well described by Alian under the name of Poephagus. It is this animal which furnishes the tails of long silky white hair, of which the Turks make their military standards, and which are employed all over the East, under the name of chowries, for the purpose of driving away the flies and creating a refreshing current of air about the luxurious inhabitants of India and China. These favourite instruments of luxury are frequently set in silver or gold handles; and as they are an indispensable appendage to the state of a great man, they form one of the regular articles of import between Tibet and India, and are frequently sold for enormous prices. The use of these chowries is of very great antiquity throughout all eastern countries.

The Buffalo (*Bos bubalus*) is a third species of ox, long domesticated in the southern and eastern parts of Asia. India and China appear to be the original climate of this powerful animal: it is still found wild in all the great forests of both these countries, and is probably the only domestic quadruped of which zoologists have clearly ascertained the original source. The wild buffalo, called *arni* by the Indians, is said to be only inferior to the elephant in size; and from his ferocity and malignant disposition is much dreaded by those who reside in the vicinity of his haunts. Combats between the *arni* and the tiger were formerly a favourite sport of the native princes of India; but it is said by eye-witnesses that the tiger was in no instance a match for his powerful antagonist. Large herds of the domestic buffalo are kept throughout every part of the peninsula of India; and many anecdotes are related of their docility and attachment to the gullahs or herdsmen who attend them, and of the courage with which they defend their keepers from the formidable attacks of the tigers and panthers which inhabit the forests where they are usually pastured. The buffalo in India is not habitually used as

a beast of draught or burthen, but supplies the place of the common ox, in furnishing the inhabitants with milk and butter; whilst the ox of the country, which is seldom applied to these latter purposes, assumes the place of the horse, and is used for the saddle, the plough and the hackery, or carriage. Though long domesticated in India and China, the introduction of the buffalo into the west, or even into Persia, is comparatively a recent occurrence, and dates only from the conquests of the Mohammedans. Aristotle, indeed, seems to allude to the buffalo under the name of the Wild Ox of Arachosia (*Hist. of Animals*, book ii. 1); and the followers of Alexander must have become acquainted with the animal during that conqueror's expedition in the Penj-ab. But it was only towards the latter end of the sixth century that it was first seen in western Europe, having been introduced into Italy about the year 596; nor has the species ever extended either in this continent or in Africa, in which it is almost exclusively confined to Egypt.

The fourth and last known species of domestic ox which the Asiatic nations possess, is the Gayal (*Bos Garvus*). This animal is common among the Burmese, and in all the mountainous districts on the north-east boundaries of British India: it is also found wild, under the name of Gaur, in many parts of India, principally among the hills, and is as much dreaded by the Sheccarries, or native huntsmen, as the arni or tiger. The gayal is a very large animal, with a heavy carcase and short legs, which are commonly white from the knee downwards, whilst the body is of a uniform dark brown colour: the os frontis forms a singular excrescence or ridge which easily distinguishes the gayal from all other species of the ox kind; and the horns are round, and twisted into a kind of irregular spiral, with the points turned inwards and backwards.

Of sheep and goats, many different varieties are found in Asia. The broad-tailed sheep of Arabia was known to the ancients, and is mentioned by Herodotus (iii. 113) and Aristotle: this variety has now spread throughout all the steppes of the continent, as well as through Egypt and northern Africa, where the fat of the tail frequently amounts to ten pounds weight. The tail is the best part of the animal, for the flesh is dry and insipid; and instead of wool, the body is covered with a short coarse hair, unfit for manufacturing purposes. On the higher table-lands of the continent, however, other species of sheep are found with a longer and finer fleece; but in no instance does the wool of the Asiatic sheep approach in softness and beauty of texture to that of the shawl-goat of Cashmere, from the fleece of which the Indians manufacture those rich and valuable shawls, which are so highly esteemed in Europe as well as throughout the East. The shawl-goat is a small variety of very ordinary form and appearance; it is found principally in Bhotan, Tibet, and generally along the northern face of the Himalaya, but does not thrive when brought across the mountains, not even in the upper regions of Nepal, where it might have been expected that it would find a congenial climate: its wool forms a valuable article of commerce between Tibet and the lower plains of India. The Angora goat is an inferior variety of the shawl-goat, with drooping ears and long wool of tolerably fine texture, but not adapted to the same purposes as the richer wool of the Tibet animal. The common variety of goat in Asia, which appears to extend over every part of the continent, is a tall long-legged animal, with very short hair, large drooping ears, and small spiral horns. Its flesh is in many parts preferred to mutton; and the animal is valued in all places for the richness and abundance of its milk.

The Hog, though found wild in most parts of Asia, is a domestic only among the Chinese, who appear to esteem its flesh in proportion to the detestation with which it is regarded by the followers of Mohammed and Buddha. In India, herds of semi-domestic hogs are frequently found about the native villages; but as the religion of Brahma prohibits the destruction of animal life, and consequently the use of flesh as an article of food, they are turned to no account by the inhabitants; by whom, however, they are not regarded with the horror and detestation which attaches to them among the followers of the Arabian prophet. The Indians abstain from the use of pork for the same reason that they abstain from eating any other kind of flesh; not from any peculiar antipathy which they bear to the animal itself. The hog is regarded by the Chinese as the greatest luxury; and it is well known that the dog and the hog

were the only domestic animals which their first discoverers found among the Polynesian islanders. It appears probable, however, that the animal called a hog in the voyages of early navigators, and which was found spread over all the various archipelagos of the Indian Ocean, is in reality a different species from our common European hog, though closely allied to it in form and appearance.

The Dog of Asia, as in every other great division of the world, is subject to an almost infinite number of varieties. Troops of this animal, called in India pahria dogs, inhabit every village, and without acknowledging any particular master, know and obey the inhabitants, warn them of the approach of wild beasts and robbers, and perform the common offices of public scavengers. Legacies are frequently left for their support by the pious Hindoos; and hospitals are built for the reception and care of the aged and wounded. But besides these public troops, which may be considered as the property of the state, there are various varieties of sporting and other dogs kept by private individuals in different parts of Asia; of which the principal are the large mastiff of Tibet, and the greyhound of Persia. The flesh of the dog is a common article of food in China, as it formerly was in the islands of the Indian Ocean; and it is said to be a most amusing sight to the few Europeans who have obtained access to the large cities in the interior of the empire, to witness the antipathy with which these sagacious animals pursue their enemies the butchers, when they appear in the public streets.

The Cat has always been a favourite domestic among the Asiatics; and the Mohammedans, in particular, who consider the dog as unclean, lavish all their attention and caresses upon this far less gentle and sagacious animal. In the central plains and table-lands of Asia, in Khorasan, Cashmere and Bhotan, as well as in Angora and other districts of Asia Minor, the fur of the cat assumes a long silky texture, of great beauty and fineness; and individuals of the esteemed colours are frequently sold for extravagant prices. This is the breed which is often brought to Europe under the name of Persian cats; they are much more gentle in disposition than our common domestic cat, but are less useful, and decidedly inferior to the dog as a pet or companion.

Of the wild Mammals peculiar to Asia, we have already observed that there are, comparatively speaking, a greater variety than in any other portion of the globe. The true apes (*pithecus*) are, with a single exception, that of the Chimpanzee (*P. troglodytes*) of Africa, peculiar to this continent; as are likewise the *Semnopithecus*, an extensive tribe which differs from them only by the possession of a very long slender tail. Among these latter, the Kahau, (*S. nasutus*), a large species inhabiting China and the Malayan peninsula, nearly attains to the dimensions of man, and is remarkable for a large prominent nose, which assimilates it in general appearance more nearly to the human species than any other of the monkey tribe. The Macaques (*macacus*) are likewise a purely Asiatic genus of quadrumana, and appear to supply on this continent the situation which the baboons fill in Africa. They swarm in all the woods of India and China, and are remarkable only for their malevolent dispositions and their disgusting manners. Of the Lemur tribe, two genera, *nycticebus* and *tarsius*, inhabit Asia: all the rest of this numerous family, as we have observed in the article on the zoology of Africa, are found in the island of Madagascar, and along the eastern coast of the neighbouring continent.

Among the Cheiroptera, or Bat kind, the *pteropus*, or large frugivorous species, are almost exclusively Asiatic; as are likewise the *galcopithecus*, or, as they are commonly called by travellers, flying foxes. Both these genera inhabit the woods and forests of the intertropical parts of Asia, principally those of the great Indian Isles; unlike the generality of winged quadrupeds, they are of diurnal habits, live entirely upon leaves and fruits, and are eaten by the natives. The more common species of nocturnal and insectivorous cheiroptera swarm in every part of Asia; the most remarkable among them is a species (*cheiromoles*) with an opposable thumb on the hind feet, which inhabits the Malayan peninsula.

Among the Carnivorous animals of Asia are three or four different species of Boars; one of these (*Ursus syriacus*), lately discovered on Mount Lebanon, is frequently mentioned by the sacred writers; the others inhabit the Himalaya and other more eastern mountains, except one

species (*U. labiatus*), which is found in the jungles on the plains of India. Besides these, the common brown bear of Europe, and the white, or Polar bear, abound in Siberia, Kamtehatka, and along the shores of the Frozen Ocean. The Bali-Saur (*uretonyx*) is the badger of India; and among the smaller Carnivora, the *Gymnura*, *Mydaia*, *Ailuri*, *Arctites*, and *Paradoxuri*, are peculiar to the continent of Asia and the large islands of Borneo, Sumatra, and Java. Among the fur animals, northern Asia produces the sable, the ermine, and various other species of *mastela*; the sea-otter, the most valuable of all, has been hitherto found only in the northern Pacific, along the coasts of Asia and America, from the parallel of Japan northward, as far as navigators have yet been able to penetrate. The tiger, the most savage and formidable of all the carnivorous animals, exists only in Asia and the neighbouring isles; the Rimau-dahan (*Felis macrocelis*), a large species but lately described, inhabits Siam and Sumatra; and the leopard and panther are common among the forests of India. The lion also has lately been found in the province of Guzerat; but, unlike the African variety, he is without a mane, and appears to be altogether a much less formidable animal. The striped hyæna is common in all the warmer parts of the continent; and various species of wild dogs and foxes are every where abundant.

The Marsupial animals are for the most part confined to Australia; a few species, nevertheless, extend throughout the long chain of islands which nearly unite this continent with Asia. Of these, one is a kangaroo (*Macropus Bruguii*), the first of the genus ever discovered, having been described and figured one hundred and fifty years ago by Le Bruyn; the other five marsupials enumerated in the table belong to the genus *Phalangista*, and are distinguished from the Australian phalangiers, by having the tail partially or entirely naked and scaly.

Of the numerous Rodentia which inhabit every part of Asia, very few indeed are deserving of attention, either in a commercial or economical point of view. Three or four species of hares (*lepus*), and an equal number of lagomices, hare-rats, are the only Asiatic animals of this tribe which Europeans are accustomed to consider as fit for human food; the rest consist principally of squirrels (many of which are of large size and prettily variegated with stripes and shades of different colours), rats, gerboas, hamsters, marmots, flying-squirrels, and two or three different species of porcupines. The gerboas (*dipus*), of which ten or twelve species are found in the deserts of the interior, burrow in the sand, at the root of some plant or shrub, and are almost the only animals which enliven the long and dreary wastes which the traveller frequently encounters in Asia, hopping along on the hind legs like a bird, and crossing his path with the rapidity of an arrow. The flying-squirrels (*pteromys*) inhabit the forests of the whole continent, from Siberia to Java, and are remarkable for an expansion of the skin along the sides, which enables them to leap to the distance of forty or fifty yards, in passing from tree to tree: it acts like a parachute to prevent too rapid a descent, though it is incapable of being moved like the wings of birds, and consequently of exercising the proper function of flying.

The Edentata of Asia are confined to two species, both belonging to the genus *Manis* or Pangolins, frequently called scaly ant-eaters by travellers. These singular animals in fact resemble the real ant-eaters of the American continent in every thing but their external covering, which, instead of the ordinary hair of quadrupeds, consists of a succession of parallel rows of large imbricated scales, that lap over one another like the tiles of a house, and are capable of being elevated or depressed at the will of the animal. One of the Asiatic species is clearly indicated by *Ælian* (lib. xvi. cap. 6) under the name of *Phatagæ*.

Among the Pachydermata of Asia, the elephant has been already noticed. Three different species of rhinoceros are known to inhabit the continent of India and the great islands contiguous to the Malayan peninsula. The continental species (*R. Indicus*), and that which inhabits the island of Java (*R. Javanicus*), have but one horn; the Sumatran rhinoceros (*R. Sumatrensis*) resembles the African species by having two of these excrescences, for they cannot be properly called horns. Of the genus *Equus*, the common horse and ass have been already mentioned, as in all probability originally indigenous to the central plains of Asia. One other species, the Dziggetai (*E. he-*

monus), still retains its native freedom in the same localities. It is a beautiful animal, in point of size intermediate between the other two, with much of the symmetrical figure and graceful carriage of the horse, and of the same dun colour as the ass, marked along the back with a broad coffee-coloured stripe, but without the cross on the shoulder which distinguishes that animal. The Dziggetai, probably also the Koulan of the modern Persians, was well known to the ancients, and is mentioned by Aristotle and Xenophon by the name of the wild ass. Aristotle (vi. 36), in addition to the wild ass, mentions an animal called the Syrian mule, from its resemblance to a mule. The latter author mentions that, during the expedition of the Ten Thousand under the younger Cyrus, these animals were observed on the open plains of Mesopotamia, where the ostrich also lived; and though these gigantic birds no longer inhabit the Asiatic deserts, the same phenomenon is daily observed in South Africa, where the ostrich and the quagga are invariably found to associate together. Of the hog genus (*Sus*), two species at least are found in Asia: one of them, the common wild boar of Europe (*S. scrofa*), appears to extend over every part of the Old World; the other, the *Sus babyrussa* of naturalists, is peculiar to the great Indian Isles, and is remarkable for the singular manner in which the tusks of the upper jaw pierce through the lip on each side, and curl round and over the eyes like a pair of circular horns. The only other pachydermatous animal of Asia which deserves particular notice is the Malayan tapir (*T. Indicus*), a species the existence of which in this part of the world is the more remarkable, since its congeners are confined to the forests of South America.

Of the ruminating animals of Asia, the camel, the dromedary, and the four species of the ox kind which have been domesticated by the natives, have been already mentioned. In other respects, the principal feature in this department of Asiatic zoology is the great abundance of the deer tribe, and the comparative scarcity of antelopes. Out of thirty-seven known species of deer (*Cervus*), twenty-five are found in Asia, and of these twenty are peculiar to it; whilst not more than a dozen, out of nearly sixty antelopes, are found upon the same continent. These different species will be found described under the articles ANTELOPE and DEER respectively. But there is one small genus of Asiatic ruminants too remarkable to be passed over unnoticed,—the musks, so called from the Tibet species, which produces the perfume so well known by this name. The Tibet musk (*Moschus mosciferus*) is about the size of a small goat; both sexes are without horns, but the musk is produced by the male only, and is contained in a bag which grows upon the prepuce. This perfume has always been held in high esteem throughout the East, and when genuine and pure, is said to be sometimes sold for its weight in gold; but its great value holds out strong temptations to adulterate it with foreign substances, and the hunters are accustomed to mix the blood of the animal with it in order to increase the quantity, so that it can seldom be procured without adulteration. The Tibet musk inhabits the highest parts of the Himalayan and Tibetan mountains, seldom descending below the snow line, and leaping among the rocks and precipices with the security of the chamois or the ibex. Four or five smaller species of the genus *Moschus*, probably the smallest of all hoofed animals, being seldom larger than a good-sized hare, inhabit the forests of lower India and the islands.

The Cetacea of Asia are principally found along the northern coasts, and are the same species which frequent the Frozen Ocean generally. Various species of dolphins (*Delphinus*) inhabit the tropical seas, and the dugong (*Halicore*) is found among the great Indian islands; but in no other respects does this part of Asiatic zoology demand particular notice.

The principal circumstance worthy of notice in the birds of India, is the great abundance and varied and brilliant colours of the Gallinaceous tribes which inhabit this part of the world. Indeed the most valuable of our domestic fowls, the common cock and hen, as well as our domestic quadrupeds, originally came from this continent, and are still found wild in the woods of India; as are likewise the peacock, the pheasant, and many kindred species. The Himalayan mountains, in particular, produce three or four different species of the Tragophans, or horned pheasants, and the Impayan pheasant, remarkable for the brilliant me-

tallic lustre of its plumage. The gold and silver pheasants (*Phasianus pictus* et *nycthemerus*), so common in the aviaries of Europe, are indigenous in China, as are likewise the collared pheasant (*Ph. torquatus*), and a new species (*Ph. Reevesii*) lately discovered, remarkable for the great length of the tail feathers, which sometimes exceed four feet; the fire-pheasant (*Ph. ignitus*) and argus-pheasant (*Ph. argus*) inhabit the mountains of Sumatra and Borneo.

It has already been observed that the ostrich, though formerly abundant in the deserts of Mesopotamia, is no longer found on the continent of Asia, unless we take the testimony of Herbert (p. 132), who says that he saw ostriches in the plains between Lar and Shiraz (A.D. 1627). The cassowary (*Casuarus*), a bird which nearly approaches the ostrich both in size and internal structure, inhabits the islands of the Indian Archipelago. In other respects the ornithology of Asia is by no means peculiar; at least the generic forms are not so remarkable as those of either Africa or America. All the common European species are found even in the most distant parts of the continent, apparently so identical, that specimens from the two localities cannot be distinguished even by the difference of a feather. The common house-sparrow, for instance, is found in the Himalayan mountains, and is as abundant about the villages of Upper Nepal as in any part of England.

The reptiles, fishes, and insects of Asia are likewise too nearly assimilated to those of other continents to require a detailed enumeration of their different forms and genera. Like birds, these different classes of animals possess powers of locomotion which are denied to mammals; and it is consequently to the latter class alone that we can look for any thing very peculiar in the zoology of a continent like Asia or America. It is on this account that we have been more particular in the enumeration of the quadrupeds than of any other class.

ASIA MINOR. [See ANATOLIA.]

ASIATIC SOCIETIES are learned bodies formed for the especial purpose of instituting and encouraging inquiries into the geography, history, religions, languages, literature, &c., of the East. The earliest institution of this kind was the Asiatic Society of Bengal, founded at Calcutta by Sir William Jones, in January, 1784. Its transactions and the dissertations or essays read at its meetings, are embodied in the *Asiatic Researches*, the first volume of which was published at Calcutta, 1788, 4to.: the latest that has been received in Europe is the seventeenth volume, printed in 1832. Lately a separate physical class has been formed in the society, the attention of which is principally directed towards the zoology, meteorology, mineralogy, and geology of India: its transactions are published apart, under the title *Asiatic Researches: Transactions of the Physical Class of the Asiatic Society of Bengal* (part i., Calcutta, 1829; part ii., 1833, 4to.) Since the year 1832 the proceedings of the society have been published in a monthly periodical, *The Journal of the Asiatic Society of Bengal*, edited by James Prinsep, a publication which, from its cheapness and from the well-chosen variety of its contents, seems particularly calculated to awaken a general interest for the objects of the society.

At Paris an Asiatic Society was formed in the earlier part of the year 1822, by the well-known French orientlists, Silvestre de Sacy, Abel Rémusat, Saint-Martin, Chézy, &c., under the patronage of the Duke of Orleans (now King of the French). The transactions of this society were, from July, 1822, published in a monthly periodical, the *Journal Asiatique*, which, up to December 1827, formed eleven volumes, besides a separate volume containing an alphabetic index, &c. Since January 1828 the publication has appeared under the title of *Nouveau Journal Asiatique*. This journal is sent to all the members of the society, who pay an annual subscription of thirty francs (about 24s.). Through the careful management of its limited funds, the Asiatic Society of Paris has been enabled to encourage, by liberal subscriptions, the publication of several important works connected with oriental literature, and has besides printed some most valuable books at its own exclusive expense. Among the latter we shall here only mention the elegant edition and French translation of the Sanscrit play *Saountala* by the late M. Chézy.

A similar institution was formed at London in March 1823, and was incorporated under the denomination of the Royal Asiatic Society of Great Britain and Ireland, by a

charter which is dated August 11th, 1824. Its labours are published under the title *Transactions of the Royal Asiatic Society of Great Britain and Ireland*, of which, up to the present moment, two volumes, and two parts of vol. iii. have appeared. With a view to give a wider circulation to its proceedings, the society has determined in future to publish a *Quarterly Journal*, besides the *Transactions*, the first number of which is now in the press. The society possesses a library and museum, to which additions are constantly made by the liberality of its members and friends. The library contains some most valuable and scarce books and MSS. Among the latter, a collection of Sanscrit MSS., formed by Colonel Tod in Rajasthan, and presented by him to the society, deserves to be particularly noticed. Intimately connected with the Royal Asiatic Society is the Oriental Translation Committee, instituted in 1828, which has for its object 'to superintend the publication of translations of works in the oriental languages, and also occasionally of original texts, free of expense to the authors.' (*Regulations, &c.*, 1832.)

The literary societies of Madras and of Bombay, though originally instituted for more general purposes, deserve to be noticed here, as their labours have in a great degree been directed towards the same objects as the Asiatic Societies of Calcutta, Paris, and London. The Madras Literary Society owed its origin to the late Sir John Newbolt, aided by Dr. B. G. Babington; but shortly after its foundation the society was deprived, by death or by removal from India, of several of its most able contributors. A volume of *Transactions of the Literary Society of Madras* was published at London, 1827, 4to. The society has since been combined with that of London, under the denomination of the Madras branch of the Royal Asiatic Society. Of the *Transactions of the Literary Society of Bombay* three volumes have appeared at London, 1819-1823, 4to. In 1829 this society joined the Royal Asiatic Society, and is now designated as the Bombay branch of that institution. At Batavia a society of arts and sciences was formed by the Dutch, which in point of time even precedes the Asiatic Society of Bengal. Its *Transactions* have been published in Dutch under the title *Verhandelingen van het Bataviaasch Genootschap van Kunsten en Wetenschappen*: the first volume appeared at Batavia in 1780, 8vo.; the latest that we have seen is the fourteenth, published in 1833.

ASKEW, ANNE, a lady of an honourable family in Lincolnshire, whose name is otherwise spelt Ascough or Ascue, has obtained mention in most histories of England, as one of those sufferers who, before the final completion of the Reformation, abjured in part the doctrines of the Romish church. She was more highly educated than was ordinary in that day, and by study of the scriptures became a convert to the opinions of the reformers, at which her husband, one Kyme, a violent papist, was so much displeased that he turned her out of doors. She came up to London to sue for a separation, and appears to have attracted the favourable notice of the queen, or at least of some ladies high at court. She was soon accused of holding heretical doctrines concerning the sacrament, and denying the corporal presence of Christ's body in the elements after consecration; and on this charge she was committed to prison. Being examined before the chancellor, the bishop of London, and others, she is said to have replied boldly to the lord mayor's question, 'Whether the priests cannot make the body of Christ?' 'I have read that God made man; but that man can make God, I never yet read.' (Strype. *Memorials*, i. p. 387.) Yet it is said by Burnet, that 'after much pains, she set her hand to a recantation, by which she acknowledged that the natural body of Christ was present in the sacrament after the consecration, whether the priest were a good or an ill man: and that, whether it was presently consumed or reserved in the pix, it was the true body of Christ.' (*Hist. of Reformation*, B. iii.) Her recantation, however, was not satisfactory, or at least not effectual, for she was soon apprehended again, examined closely as to her belief and doctrines, and committed to Newgate, where she was again strictly questioned as to what ladies at court had shown her favour and encouragement. Not being able to extract any information on this point, she was placed on the rack and cruelly tortured in the sight, and as Fox says, by the hand, of the Lord Chancellor Wriothesly, whose eagerness in this matter is ascribed to his desire to gain some ground of offence against the Duchess of Suffolk, the Coun-

tes of Hertford, or some other ladies. But her patience and fortitude could not be shaken, nor does it appear that she had any disclosures to make. She was burnt with four others at the stake in Smithfield, July 16, 1546. (Fox's *Martyrs*; Burnet's *History of the Reformation*.)

ASKEYTON or ASKEATON, a small town in Ireland, in the Connello lower barony, in the county of Limerick, about twenty miles S.W. by W. of the city of that name. It was once a walled town of some importance; and till the Union, it sent two members to the Irish parliament. It lies at the conflux of the river Deel with the Shannon. The population in 1821 was 1239, and that of the whole parish 3425. The chief claim of Askeyton to notice is founded on the remains of an ancient castle of the Earls of Desmond; and the fine ruins of an abbey adjacent to the castle, first occupied by the conventual Franciscans, and then by the Observantines. There are two fairs in the year. Askeyton is a vicarage in the diocese of Limerick. (Archdale's *Monasticum Hibernicum*; Seward's *Topographia Hibernica*.)

ASKRIGG, a small market-town in the county of York. [See YORKSHIRE.]

ASKOE, one of the numberless isles in the Bucker-fjord, or bight of Bucker, which lies within the north-western limits of the bailiwick of Stavanger and province of Christiansand in Norway. It is celebrated for the spring, called the Spring of St. Agatha, which is very cold in summer, and has never been known to freeze in winter: 60° 27' N. lat.

There is a Danish island likewise of this name, which lies south of Famoe, near the coast of Zealand, and is inhabited by only 130 individuals. 54° 54' N. lat., 11° 46' E. long.

ASMONÆANS (Gens Asamonæa, בני חשמונאים or בני חשמונאים חשמונאים domus Hasmonæorum). The Asmonæan family derived their name, according to Josephus (*Antiq.* xii. cap. 6), from Asamonæus (*Ἀσαμοναῖος*). The son of Asamonæus was Symeon or Simon, whose son Johannes was the father of Mattathias, the father of the Maccabees. The name Asamonæus, or Asmonæus, had probably, like other Hebrew names, a significative meaning; the word חשמונאים (*Chasmanim*) occurs only once in the Old Testament, in Psalm lxxviii. 32. It there means *fat ones*; that is, rich noblemen, princes—grantees who keep many servants. Hence the designation Asmonæans implies nobles or princes emphatically so called. In the chronicles of Rabbi Joseph Ben Jehoshuang, in the Tsemaeh David of Rabbi David Gans, and other rabbinical writers, the cardinals are called חשמונאים. The word חשמן, *fatness*, occurs as the name of a town in the tribe of Judah (Jos. xv. 27). Chashuonah חשמונה, meaning *fatness*, was one of the stations of the Israelites in the Wilderness. (Num. xxxiii. 29.)

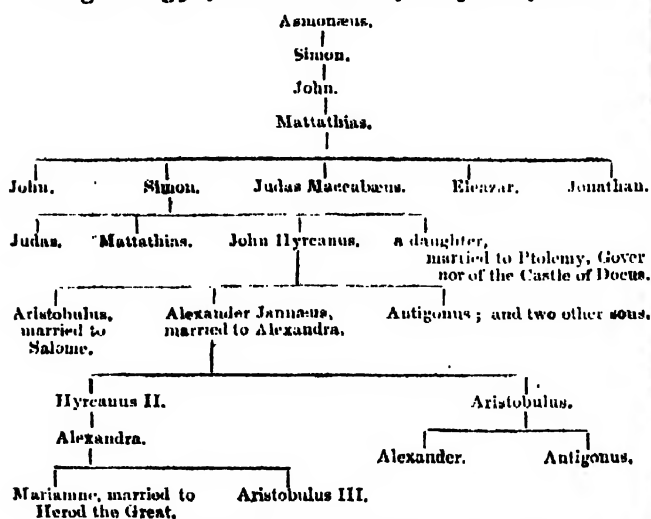

The state of the Jews, while subjected to the Seleucids, or Greek kings of Syria, has been compared to that of the modern Greeks under the dominion of the Turks. The Jews, like the modern Greeks before their last revolution, had, during this period, no political existence. Priests were the organ of every interest. The high-priest in Jerusalem, as well as the patriarch of Constantinople, were the heads of their respective nations.

The Jews had for many years been subject to the arbitrary rule and cruelty of the Syrian kings, when Mattathias and his five heroic sons, John, Simon, Judas, Eleazar, and Jonathan, commenced their victorious resistance to the attempt of Antiochus Epiphanes to compel the Jews to exchange their ancestral monotheism for the idolatry of their Syro-Macedonian oppressors. This struggle is described in the books of the Maccabees which are included among the books of the Apocrypha. It is also detailed in the Antiquities of Josephus, from Book xii. cap. 6, to the end of Book xvi. [See MACCABEES.]

The power of the Asmonæan dynasty lasted from the year B. C. 166 to B. C. 37; but the family survived the dynasty. It arose from the pious heroism of the Maccabees. Their first descendants ruled without the title of king, but with sovereign power: they united in their persons the functions of the high-priest, the chief civil magistrate, and the chief commander of the army. Their power was based upon the grateful esteem of the Jewish nation, which they had restored to independence. The later Asmonæan monarchs adopted the title of king, but they lost, with the pious virtue

of their ancestors, the love of the nation, and subsequently, by family discord, the kingdom itself.

The genealogy of the Amonean family is as follows:—

After the death of Mattathias, Judas, at the head of those Jews who had fled into the wilderness, made war (B.C. 166) against Antiochus Epiphanes, overcame and killed Apollonius in battle, and thus became chief of his people. The next year he vanquished Lysias and Gorgias, two other generals of Antiochus; he then purified the temple and restored the former worship. Antiochus, having heard of the defeat of his troops, swore that he would destroy the whole nation. As he was hastening to Jerusalem he died miserably, B.C. 164 or 165. Antiochus Eupator, his son, made peace with the Jews, but the war was soon renewed. In a battle against him, Eleazar, one of the younger sons of Mattathias, perceiving an elephant armed with royal harness, and supposing that the king was upon it, ran through the enemy's ranks, crept under the elephant and slew it. The dying elephant fell upon him and crushed him to death. Demetrius Soter having put to death Antiochus, usurped his kingdom, B.C. 162, and conferred the high-priesthood on Alcimus. In a battle against Bacchides, one of the generals of Demetrius, Judas was killed. [See JUDAS MACCABÆUS.] Jonathan succeeded his brother, and after some years of commotion, was made high-priest B.C. 153.

Jonathan entered into an alliance, B.C. 150, with the usurper, Alexander Balas, who pretended to be the son of Antiochus Epiphanes, against Demetrius, who soon fell in battle. Demetrius Nicator, the eldest son of Demetrius Soter, became king of Syria by the death of Alexander, B.C. 146. Tryphon, who wished to give the crown to Antiochus, the son of Alexander Balas, made an alliance with Jonathan; but wishing to usurp the kingdom, and fearing that Jonathan would not suffer it, he killed him by treachery. [See JONATHAN APPHUS.] Simon, B.C. 144, shook off the yoke of the kings of Syria, and took the city of Gaza and the fortress of Jerusalem. He made an alliance with Antiochus Sidetes; but it was soon after broken, and Antiochus sent Cendebeus against him. Simon, now too old to go to war, resigned the command to his sons, by whom Cendebeus was defeated. Ptolemy, the son-in-law of Simon, aspiring to reign in his stead, invited his father and brothers-in-law to a feast, at which both Simon and his sons were assassinated, B.C. 135. [See SIMON MATTHEWS.] John Hyrcanus, the third son of Simon, not being with him when he was murdered, Ptolemy sent to Gazara, in which place he was, to kill him. John, aware of his design, seized his emissaries and put them to death. Ptolemy now called Antiochus Sidetes to his assistance. They besieged Jerusalem, which being reduced to a state of famine, John was obliged to capitulate. John went afterwards with Antiochus in an expedition against the Parthians; and for his exploits against the Hyrcanians was surnamed Hyrcanus. [See JOHN HYRCANUS.]

Aristobulus, the son of Hyrcanus, became high-priest after the death of his father. Hyrcanus bequeathed the sovereign authority to his wife, but Aristobulus caused her to be shut up: and, contrary to former custom, assumed both the diadem and regal title, B.C. 106. He afterwards undertook an expedition against the Itureans, whom he in a great measure subdued, and introduced among them the

practice of the Jewish religion. Being attacked by illness, he returned to Jerusalem, leaving his favourite brother Antigonus to finish the war. The wife of Aristobulus took advantage of the absence of Antigonus to weaken his influence with his brother; and she endeavoured to excite in her husband's mind the belief that Antigonus sought to obtain the royal dignity. Antigonus, having brought the war to a successful close, returned to celebrate the feast of tabernacles, when Aristobulus summoned Antigonus to his presence. The approach to the palace was by a subterraneous passage. In this Aristobulus planted guards, with orders to despatch Antigonus if he should present himself armed, but to let him pass if unarmed. The wife of Aristobulus, who desired the ruin of Antigonus, privately informed him that the king wished to see him in his armour. Antigonus, entertaining no misgivings, came armed, and was murdered on the spot. The remorse of Aristobulus for his brother's murder aggravated his disorder, and he died at the close of the first year of his reign. Three of his brothers whom he had kept in prison were set at liberty on his death. The eldest, Alexander Jannæus, succeeded him in the royal title and office, B.C. 105. [See ALEXANDER JANNÆUS.] Alexander Jannæus reigned twenty-seven years, and was succeeded by his wife Alexandra, B.C. 79. His son Hyrcanus became high-priest. Alexandra reigned nine years. Upon her death, B.C. 70, the government devolved upon Hyrcanus II., a prince of a weak character and inactive disposition. His brother Aristobulus, dreading lest the influence which the sect of the Pharisees possessed over the mind of Hyrcanus should impair the royal authority, gained to his interest the commanders of the fortresses, and having caused himself to be proclaimed king, marched to Jerusalem. Hyrcanus reluctantly went out to meet him. In the midst of the ensuing battle, being abandoned by his soldiers, he threw himself upon the mercy of his brother, who granted him permission to retain the office of high-priest, and allotted him an ample revenue. Hyrcanus consented to resign the regal dignity, but after some time, being assisted by Aretas, king of Arabia, he attempted to resume his former rank. Aretas besieged Jerusalem, and Aristobulus was reduced to great straits; but having gained to his party Scæurus, one of the lieutenants of Pompey, Aretas was obliged to raise the siege and to return to defend his own dominions. Thus commenced the Roman power in Judæa. The authority of Aristobulus had not yet been sanctioned by the Romans; and on the appeal of Hyrcanus, Pompey, having heard the arguments of both parties, decided in favour of Hyrcanus, whom he reinstated in the government under Roman protection. Aristobulus upon this shut himself up in Jerusalem. Pompey besieged the city during three months; and took it at last by fixing his engines on the Sabbath. The Jews would not violate the sanctity of that day by offensive warfare, although they were ready to repel attacks: Pompey accordingly issued strict orders that nothing having the semblance of attack should be suffered to occur, in order that the Jews might have no pretext for disturbing his preparations. Pompey carried Aristobulus to Rome, and made him appear in the triumphal procession which celebrated, among other victories, the Jewish conquest. Aristobulus found means to escape from Rome, and returning to Judæa, excited fresh commotion. Gabinus, the Roman general, took him prisoner, and sent him a second time to Rome. On the breaking out of war between Pompey and Cæsar, the latter sent Aristobulus to Judæa to proclaim peace with that country on the part of Cæsar. He was poisoned shortly after by the partisans of Pompey.

The government of Hyrcanus was disturbed by continual commotions, which he had not the ability to prevent. Cæsar gave him many of the neighbouring towns, and allowed him to rebuild the walls of Jerusalem; but Hyrcanus derived little advantage from these concessions, as his minister Antipater, the Idumean, wrested from him all but the name of ruler. Antigonus, the son of Aristobulus, to revenge the death of his father, procured the assistance of the Parthians; coming to Jerusalem with an army he took Hyrcanus prisoner, and, in order to disable him for exercising the sacerdotal functions, cut off his ears. The king of Parthia treated Hyrcanus with humanity, and sent him back to Jerusalem, after Herod had invited him to return. Herod, the son of Antipater the Idumean, being informed that Hyrcanus maintained a correspondence with the chief of the Arabs, caused him to be put to death B.C. 30, at

the age of eighty. On the death of Hyrcanus, Antigonus became king; but being soon after besieged by M. Antony, at the expiration of three years from the commencement of his reign, he was put to death by the Romans, B.C. 37, to make way for Herod. Herod had ingratiated himself so much with Julius Cæsar, M. Antony, and the Romans in general, that with their assistance he was enabled to supplant the Asmonæans, and to commence a new dynasty A.D. 37. To confirm his authority, he married Mariamne, granddaughter of Hyrcanus II. and made her brother Aristobulus III. high-priest, reserving to himself the regal power; but finding that Aristobulus retained many partisans, he caused him to be drowned B.C. 35. It is worthy of remark, that the historian Josephus was descended from the Asmonæan family.

Mariamne, who was distinguished by her beauty and talents, was murdered by order of Herod on an unfounded suspicion of conspiracy and adultery. Her sons were also put to death on a charge of rebellious designs. But the Asmonæan family did not end entirely with their power, for we read in the commencement of the auto-biography of Fl. Josephus, 'By my mother I am of the royal blood; for the children of Asmonæus, from whom that family was derived, had both the office of the high-priesthood and the dignity of a king for a long time together. I will accordingly set down my progenitors in order. My grandfather's father was named Simon, with the addition of Psellus: he lived at the same time with that son of Simon the high-priest, who first of all the high-priests was named Hyrcanus. This Simon Psellus had nine sons; one of which was Matthias, called Ephraim: he married the daughter of Jonathan the high-priest, which Jonathan was the first of the sons of Asmonæus, who was high-priest, and was the brother of Simon the high-priest also. This Matthias had a son, called Matthias Curtus, who was born in the first year of the government of Hyrcanus; his son's name was Joseph, born in the ninth year of the reign of Alexandra: his son Matthias was born in the tenth year of the reign of Archelaus; and I was born to Matthias in the first year of the reign of Caius Cæsar. I have three sons; Hyrcanus, the eldest, was born in the fourth year of the reign of Vespasian, Justin in the seventh, and Agrippa in the ninth.' These are the last traces of the Asmonæan family.

The best sources of information concerning the Asmonæan dynasty are contained in *The Five Books of the Maccabees, with Notes and Illustrations*, by Henry Cotton, D.C.L., Archdeacon of Cashel, Oxford, 1832. Two of these books belong to the Apocrypha, which are frequently annexed to the Old Testament. See Josephus, *Antiq.* xii. 6—xvi. end.; Comp. נורין בן יוספון ed. Breithaupt, books iii. and iv., ed. Munster, from the commencement; Franc. Perez, *de Numis Hebræo-Samaritanis*, Valentini, 1781, p. 181, fol.; Franc. Perezii Bayer, *Vindicia Numorum Hebræo-Samaritanorum*, 1790, fol.; Ezechielis Spanheimii *Dissertationes de Præstantia et Usu Numismatum*, Lond. 1796, vol. i. p. 61, &c.; *Doctrina Numorum Veterum conscripta a Josepho Eckhel*, pars i. vol. iii, pp. 441—481; *Annales Regum et Rerum Syriæ Numis Veteribus illustrati ab Erasmo Frolich*, *Prolegomena*, pp. 74—91; *Description de Médailles Antiques*, par T. E. Mionnet, tome v. pp. 555—564.

In the British Museum there is a number of Asmonæan coins, from which the following drawings are taken.

[Silver. British Museum.]

[Brass. British Museum.]

The legends of the larger coin, which is of silver, are, if

expressed in the usual square character, שמעון = Shimeon, לחרות ירושלים = to the liberty of Jerusalem.

On the smaller coin, which is of brass, we read—

חרת ציון = liberty of Zion: שנת שתיים = second year.

ASP (*Lipera Haje*, Daudin), a species of noxious serpent, celebrated as the instrument of death which Cleopatra is said to have selected to terminate at once her amours and her existence. The asp (*aspis*) is often mentioned both by Greek and Roman writers; and from the discrepancies which are observable in the accounts given by different authors, it seems probable that two or three different species of poisonous serpents were known to the ancients under this common name. From various circumstances, however, and particularly from the description of Pliny (*Nat. Hist.* lib. viii. cap. 35.), it is evident that the most common and celebrated is the species to which the modern Arabs give the name of *El Haje*, or *Haje Nascher*. This animal measures from three

to five feet in length: it is of a dark green colour, marked obliquely with bands of brown; the scales of the neck, back, and upper surface of the tail are slightly carinated, and the tail is about one-fourth part the length of the whole body. The haje is closely allied to the cobra capello, or spectacled snake of India, the chief apparent difference being its want of the singular yellow mark on the back of the neck, from which the latter species derives its name. In other respects these two serpents are nearly of the same size; they are equally venomous, and both have the power of swelling out the neck when irritated, and raising themselves upright upon their tails to dart by a single bound upon their enemies. These habits render it probable that the puff-adder of the Cape of Good Hope, so called from its custom of puffing out or distending the neck and throat when disturbed or provoked, is no other than the haje or asp of Egypt, or at least a very closely allied species; but the two animals have never been properly compared, and till this is done the question of their specific difference or identity must remain undetermined.

The poison of the asp is of the most deadly nature. Pliny, in the passage above referred to, gives the following account of this celebrated serpent:—'The neck of the asp is capable of distension, and the only remedy against its bite is the immediate amputation of the wounded part. This animal, otherwise so much to be dreaded, has a sentiment, or rather a kind of affection, truly wonderful. It never lives alone, the male and female being constantly found together, and if one happens to be killed, the other seeks with the utmost fury to avenge its death. It knows and selects the destroyer from among crowds; it follows him to great distances, surmounts every obstacle, and can only be deprived of its revenge by the most speedy flight, or the intervention of some rapid river. It is difficult to say whether Nature has been more prodigal of evils or remedies. For instance, she has

bestowed upon this reptile, so terrible from the deadly effects of its poison, so indifferent a vision, its eyes being placed on the sides of the head so as to prevent it from seeing straight before it, that it is frequently trodden under foot before it is aware of its danger.' Forskæl, a Swedish naturalist, who has written on the animals of Egypt, informs us that the jugglers of Grand Cairo have the art of taming the haje, as those of India do the cobra capello, and teaching it to dance for the amusement of the populace; taking care, however, to deprive it of its poison fangs, though even then they avoid its bite when irritated. The habit which this serpent has of erecting itself when approached, made the ancient Egyptians imagine that it guarded the places which it inhabited. They made it the emblem of the divinity whom they supposed to protect the world; and accordingly they have represented it on their temples sculptured on each side of a globe.

ASPA/RAGI. [See ASPHODELEÆ.]

ASPA/RAGUS, a genus of monocotyledonous plants belonging to the natural order *asphodeleæ*. It is easily recognized by its very narrow leaves, which drop off the branching stem as soon as they begin to wither, by its small greenish-white or yellowish regularly-formed flowers, and by its seeds being enclosed in a pulpy fruit.

Unlike the principal part of monocotyledonous plants, and especially of those which belong to *asphodeleæ*, the stems of the different species of asparagus branch like those of dicotyledons, and even become hard and woody; some of them twine and scramble over other shrubs, and certain species even hook themselves to their supporters by means of their stiff and spiny branches which are stunted and destitute of leaves.

The species are natives of the temperate and tropical regions of the old world, but they are not found wild in either North or South America. The most remarkable one is the common cultivated asparagus which is found in sandy and maritime places in most parts of the middle and south of Europe, the Crimea, and also of Siberia and Japan. It is too well-known a plant to require description, and we shall therefore occupy ourselves exclusively with the method of cultivating it for its succulent and agreeable heads.

An asparagus plant consists of a cluster of fleshy roots connected by the stem, where a quantity of buds are formed, from which branches are yearly emitted. The heads are those branches in a young and tender state; their quality depends wholly upon their size and rapid growth. These are the simplest considerations that are involved in the cultivation of asparagus; the question is how the largest size and the most rapid growth are to be attained.

Seeing what the natural situation of the asparagus plant is when wild, it will be obvious that it should have a light soil which offers little resistance either to the emission of its roots or the protrusion of its stems; the soil should also be capable of both receiving and parting with water readily. Accordingly gardeners take care that all stiff loam, or stones, or solid masses of earth are separated from the soil of their asparagus beds, and that they are completely drained by having trenches 2½ feet deep cut between the beds.

To give vigour to the shoots, manure is added in as great a quantity as the cultivator can afford to apply it; when the seed is sown, or the young plants finally placed in the situation in which they are to produce a crop, an abundant supply of decayed manure, or of bones, or of parings of horses' hoofs, is buried below them; and they are also annually top-dressed with finely pulverized manure, when the beds are arranged in the winter. Attention being paid to these circumstances, asparagus is one of the easiest of all vegetables to cultivate; but no art or skill will produce precisely the soil which is most favourable for its growth. This exists naturally in some places in the fittest of all possible states, and it is there only that it is to be obtained in its greatest perfection; as in the rich alluvial soil of Battersea, Mortlake, and other places round London: in some of these villages it is produced of such extraordinary size that 110 heads in a state fit for the kitchen have been known to weigh more than 32 lbs. There are those who think that this gigantic asparagus is a peculiar variety; but it is ascertained that, on being removed into less favourable soils, it gradually loses its vigour and degenerates into the common kind.

The most convenient breadth for asparagus beds has been found by experience to be 4½ feet, and the least depth for the intermediate trenches 2 feet. The beds are either

planted with seedlings one year or two years old, burned six inches beneath the surface, and standing about a foot apart, or sown at once and the seedlings afterwards thinned to such a distance; the latter method is the most simple and the most effectual.

In this country it is frequently forced, but seldom with much success; the heads being usually small and stringy, without sufficient succulence. For this purpose an asparagus bed is dug up, and the plants transferred to a place heated with dung, where they come up in a fortnight or three weeks; but as the roots are always much injured by the operation of transplanting, the little success that attends this method is easily accounted for. In many parts of the north of Europe, especially about Riga, a far better mode is adopted. The forcing takes place in the asparagus beds themselves without disturbing the roots; the trenches are filled with hot dung, and the beds are covered with the same material about six inches deep; if the weather is very severe, the beds are also covered with frames, but this is rarely necessary in England. Treated thus, asparagus is as fine as if it waited till May to make its appearance. But when this method is practised the heads cannot be cut down at the natural time in the same season. In order to recover from the effect of forcing, they must be allowed to grow as freely as possible during all the succeeding summer, so that they may form a new supply of food for the support of the heads the succeeding spring. Where it is wished to have exceedingly large heads of forced asparagus, pieces of bamboo, or any other hollow tubes, should be put over the shoots when they first make their appearance. The latter will thus acquire a length of as much as eighteen inches without losing their tenderness.

ASPA/SIA. As the select companion and adviser of Pericles, and the associate, and, according to Plato, the instructress, of Socrates, this person claims a degree of notice to which she would perhaps not otherwise be entitled.

Aspasia was a native of Miletus, and the daughter of Axiochus. Of her early life we find no notice. She gained entire possession of the affections of Pericles, who divorced his first wife with her own consent, according to Plutarch, in order to marry Aspasia. We are told little of her beauty; much of her mental powers and cultivation. Plutarch says that Pericles resorted to her 'because she was a wise woman, and had great understanding in matters of government;' and that, in spite of her mode of life, the Athenians who frequented her society used to carry their wives with them to hear her talk. Socrates sometimes visited her in company with his friends. (See *Xen. Mem.* II. vi. 36; and the *Menæxenus* of Plato.) The *Menæxenus* is written to introduce a funeral oration ascribed to Aspasia, though the conclusion of the dialogue seems to intimate that the author did not mean that ascription to be implicitly believed. Socrates, however, as one of the speakers in the dialogue, gives Aspasia the high praise of 'having made many good orators, and one eminent over all the Greeks, Pericles, the son of Xanthippus.'

ΑΣΠΑΣΙΑ

On this and similar authority we learn that Pericles was indebted to Aspasia for much of that mental cultivation in which he excelled all men of his age. Her moral influence, if the scandalous chronicles of antiquity be true, was less beneficial. She is accused of having led the Athe-

nians, by her influence with Pericles, into two wars. One of these was the Samian war, B.C. 440; an interference in behalf of Miletus, the birth-place of Aspasia, to secure to it the possession of Priene, contested by Samos. Thucydides, in his brief account (I. 115), gives no hint that the Athenian leader was guided by any such corrupt influence: he merely says that the Milesians, being worsted, came to Athens, and accused the Samians; their complaints being assisted by a strong desire on the part of the Athenians to render the Samian government more democratical. Aristophanes charges Pericles with having involved the country in a quarrel with Megara, by a non-intercourse act, in revenge for the forcible abduction by some Megarians of two young attendants upon Aspasia. (See *Acharn.* 523, ed. Kust.) Other comic writers, among whom Plutarch names Cratinus, were not slow in taking advantage of her real or supposed influence, and called her the new Omphale, Deianeira, Juno, with epithets of no civil nature appended thereto. Hermippus, the comedian, prosecuted her on the more grave charge of not believing in the gods, and besides, of being instrumental in debauching free women to gratify the lust of Pericles. (See also Plutarch's *Pericles*, c. 24.) We are told on the same authority (that of Plutarch), that nothing but the personal exertions, the tears, and entreaties of Pericles procured her acquittal. These stories, however unfavourable alike to Pericles and Aspasia, depend on the authority of late writers, as Plutarch and Athenæus: contemporary writers contain no hint of them, with the exception of the comic writers, whose trade was scandal. We have no notice of Aspasia's adventures after the death of her lover and patron, except that she transferred her affections to Lysicles, a man of low origin and vulgar mind, who, however, by her instructions, according to Plutarch, became after the death of Pericles for a time the popular leader in Athens. (See Plutarch's *Pericles*, c. 21, 30, 32; and Bayle.)

ASPECT, an astronomical term, now entirely disused, applied to the various positions of the planets with respect to one another, as seen from the earth. The terms *conjunction* and *opposition* are the only two out of five names of aspects which have been retained; the remainder being called *sextile*, *quartile*, and *trine*. At *conjunction* two planets have the same longitude; when sixty degrees apart, the aspect is *sextile*; when ninety, *quartile*; when 120, *trine*; when 180 degrees apart, or opposite, they are in *opposition*. The following are the characters which are used.

Name of Aspect.	Character.	Diff. of Longitude.
Conjunction	♂	0°
Sextile	✱	60°
Quartile	◻	90°
Trine	△	120°
Opposition	♂	180°

ASPEN. [See *POPULUS*.]

ASPER, or ASPRE, a small Turkish coin, and money of account. As a coin it is worth something more than an English halfpenny. The only impression it bears is that of the Prince's name under whom it was struck. Three aspers make a *medina*. The pay of the Janissaries, when they existed, was from two to twelve aspers per diem.

Kelly, in his *Universal Cambist*, informs us, that at Aleppo and the seaport of Scanderoon, at Cairo, and at Patras in the Morea, accounts are kept in *piastres* of 80 aspers: at Algiers, in *saimes* or *doubles* of 50 aspers: at Constantinople, in *piastres*, sometimes divided into 80 and sometimes into 100 parts, called aspers or *minas*: at Salonica, in *piastres* of 120 aspers: at Tripoli, in *piastres* of 52 aspers: at Smyrna, the general division of the *piastre* is into aspers, the number of which varies: thus the English and Swedes divide the *piastre* into 80 aspers; the Dutch, French, and Venetians, into 100 aspers; and the Turks, Greeks, Persians, and Armenians, into 120 aspers. (See the *Univ. Cambist*, vol. i. pp. 4, 5, 72, 276, 307, 317.)

ASPERGILLUM (in Zoology), a genus of the family *Tubicolées* (Lamarek), furnished with a bivalve shell incrustated, as it were, in a tubular testaceous sheath. This tubular sheath gradually lessens in diameter to the aperture which is farthest from the incorporated bivalve. The end nearest to the bivalve is dilated into a concave disk, with a central fissure, and perforated with minute but raised holes. The disk is bordered by a tubular frill. There are but few species; and of these, *Aspergillum Javanum*, known to collectors as 'The Watering-pot,' is the most common.

ASPERN, GREAT, a village in the province of Lower

Austria, situated on an arm of the Danube, nearly opposite to Vienna, but a little to the east of it, and containing about 900 inhabitants. It is celebrated for one of the severest contests which occurred between France and Austria, in the short, though, for the latter of those powers, disastrous campaign of 1809. On the 12th of May in that year, Napoleon had made himself master of the Austrian capital, and the Archduke Charles had, subsequently to his repulse at Eckmühl, taken up a position on the left bank of the Danube, close upon Vienna. Napoleon was not long in possessing himself of two islands in that river, by which he threw his forces across it; and, on the 21st of May, offered his adversary battle from the position he had taken up at the villages of Aspern, Esslingen, and Engersdorf. In this position he was attacked with so much ardour by the Archduke's forces, that both Aspern and Engersdorf were carried before nightfall. Aspern itself, which has since been rebuilt, was converted into a heap of ruins, after enduring thirteen successive assaults. Esslingen and the entrenched island of Lobau however remained in the hands of the French; but the Archduke, having employed the next night in destroying the bridge of communication between the island and the left bank of the river, renewed his attack upon Esslingen the ensuing morning, and ultimately drove General Massena and his broken troops back upon the island. The obstinate gallantry with which the field was contested may be inferred from the loss of the French, which amounted to 30,000, or, according to the Austrian accounts, 41,000 men, in killed and wounded; not more than 3500 prisoners and but three pieces of cannon remained as trophies to the victors. A pyramid was erected by the Austrians with the 3000 French cuirasses which they collected on the spot. Marshal Lannes, with Generals D'Espagne, St. Hilaire, and Albuquerque, fell during this two days' struggle; and Massena, Bessières, and many other generals, were wounded. Never was victory, however, by the sacrifice at which it was purchased and the excess of confidence which it created, more fatal to the fortunes of the conquerors. The battle of Wagram, fought on the 5th and 6th of July following, placed Napoleon in a situation to dictate the most humiliating terms to the Austrian sovereign at Schönbrunn: the cession of one third of his dominions and the loss of upwards of eight millions of subjects were the price which he paid for a peace with the conqueror.

ASPHALTITES, LACUS. [See *DEAD SEA*.]

ASPHALTUM, (a Greek word, *ἀσφαλτος*, of unknown etymology,) frequently known by the name of *slaggy* or *compact mineral pitch*, is one of the varieties of bitumen, arising from the decomposition of vegetable matter. (See *NAPHTHA*.) It occurs massive, of a dark brown or black colour, with a conchoidal fracture, and a resinous lustre. It is opaque, and exceedingly brittle at a low temperature, but softens and fuses by the application of heat; in density it varies from that of water to 1.6. It may be recognized by the following characters: it is insoluble in alcohol, but soluble in about five times its weight of naphtha, with which it forms a good and useful varnish; its combustion is rapid and brilliant, with the production of the bituminous odour.

It is found in most countries, but most abundantly on the shores, or floating on the surface, of the Dead Sea; at Hit, above Babylon, on the Euphrates; near the Tigris in Trinidad in the West Indies it fills a basin of three miles in circumference and of unknown depth. There is a pitch-spring in Zante, which we know to have been at work for above 2000 years. (See Herod. iv. 195.) It is also found in limestone at Bleiberg in Carinthia, in beds of sandstone in Albania, and in veins in the Hartz in Germany; in Derbyshire, Shropshire, and several other places. It is the principal colouring matter of the dark indurated marl, or shale, which is found in coal districts.

ASPHODELEÆ, or the asphodel tribe, are monocotyledonous plants, which form a very natural assemblage, for the most part easily recognized, although in certain species and genera it approaches other orders so closely as to be distinguished only with great difficulty. They all have regular flowers with three sepals, and three petals of nearly equal size and colour, six (very seldom three) stamens, and a superior three-celled ovary, with only one style. Their fruit is either dry or succulent; and their seeds have a brittle coat.

Asphodelæ are known from *juncææ*, or the rush tribe, by their larger and more coloured flowers, and by the hardness

of the coat of their seeds; from *liliaceæ*, or the lily tribe, by the smallness of their flowers, and the latter character; and from *melanthaceæ*, or the colchicum tribe, by their single style, and by their anthers being turned towards the ovary. They may be formed into two subdivisions.

The first, or the *alliaceous* subdivision, in which there is no true stem, and which consists entirely of bulbous species; the roots being emitted and perishing annually. To this belong the onion, garlic, and their allies, together with the hyacinth, squill, and star of Bethlehem (*ornithogalum*). A great quantity of species are favourites with the horticulturist, on account of their early appearance in the spring and their easy cultivation.

[Asphodelæ.]

A plant of *Ornithogalum fimbriatum*. 1. A flower seen from within. 2. The same viewed from without. 3. The stamens and ovary. 4. Two stamens apart. 5. An ovary. 6. The same cut perpendicularly. 7. The same cut horizontally.

The second subdivision, consisting of the true asphodels and those which resemble them, have no bulbs, but in their stead clusters of fleshy roots such as we find in the asparagus, which belongs to this subdivision: the stems of these are frequently woody, but in that case they are branched; *dracena*, or the gum-dragon tree, is a most remarkable instance of this, it having almost the appearance of a dicotyledon when deprived of foliage. This subdivision also contains aloes, with their thick fleshy leaves and forked stems.

ASPHODELUS, the genus from which the foregoing natural order takes its name, comprehends some handsome hardy perennial plants, with fleshy finger-like roots, and upright undivided annual stems covered with long leaves; they are among the most highly developed of the monocotyledonous plants of northern countries. The most remarkable species are the following:—

A. luteus, or the common yellow asphodel, is a beautiful perennial, very often seen in cottage-gardens, or on the outskirts of shrubberies. It grows wild in Barbary, Sicily, Dalmatia, the Peloponnesus, and even spreads into the Crimea. Its stems are from two to three feet high, never branched, and covered all over with long narrow bluish-green leaves, which have very broad, sheathing bases. The flowers are handsome, deep yellow, with a green streak on the outside of each petal. The fruit consists of red pulpy berries.

Very nearly related to this are, *A. capillaris*, which differs chiefly in its very narrow leaves, shorter bracts, and extremely narrow divisions of the flower; and *A. Sibiricus*, figured in the *Botanical Register*, plate 1507; which is principally known by its dwarfer stature, earlier and paler flowers, more glaucous leaves, and shorter bracts.

A. albus, or the white asphodel, found all over the southern provinces of Europe and the basin of the Mediterranean Sea, is as frequently seen as the first, and in similar situations: its flowers are white with a reddish streak on the outside of each petal, and are disposed in branched clusters.

A. ramosus, of many gardens, seems merely a branched state of this species; and several other reputed species with white flowers are also, in all probability, not distinct.

ASPHYXIA, a Greek word (*ἀσφύξια*) which signifies a cessation of the pulsation, originally expressed any state of disease in which there was a suspension or loss of the heart's action, and a consequent failure of the pulse; but the term is now used to denote a suspension or loss of the power of respiration. The state of asphyxia is that in which the respiratory actions are either temporarily suspended, or have wholly ceased; a state necessarily inducing such a change in the nature of the blood as is incompatible with the continuance of life. The blood which circulates in the two great systems of blood-vessels, veins, and arteries, is essentially different [see BLOOD]; that in the veins is incapable of supporting life; that in the arteries is the proper nutrient and excitent of the system. The object of respiration is to convert venous into arterial blood. The blood returned from the system to the right side of the heart is venous; when it has circulated through the lungs, and thereby been brought into contact with atmospheric air, it is changed into arterial blood. Of all the conditions necessary to the action of vital organs, that of receiving a due supply of arterial blood is the most indispensable. If a ligature be placed around the trachea (windpipe) of an animal, so as completely to prevent the access of air to the lung, and if at the same time the carotid artery be opened, that is, one of the great arteries which springs from the arch of the aorta [see AORTA], and which passing along the neck to the head, is the main channel through which the brain receives its supply of arterial blood, it is found that in a definite time the blood flowing in this artery has ceased to be arterial, and has become venous. Taking the average of a great number of experiments performed on dogs for the express purpose of ascertaining this fact, it is found that in about three-quarters of a minute after the complete exclusion of air from the lung, the blood in the carotid artery begins to lose its vermilion colour. After a minute and a quarter, it has become obviously dark. In the space of a minute and a half, no difference whatever can be perceived between the blood that flows from this artery, and ordinary venous blood: in this space of time, therefore, the system of an animal from whose lung air is excluded is brought completely under the influence of venous blood.

While the blood is thus changing from arterial to venous, the function of the brain is greatly affected. Sensibility diminishes as the blood darkens, and when it has become quite dark the power of sensation is wholly abolished, and the animal lies in a state of profound coma.

The influence of the circulation of venous blood upon the muscular system is no less powerful than that upon the nervous, for the muscle can no more perform its function without the stimulus of arterial blood than the brain. When, in consequence of the exclusion of air from the lung, venous blood is sent out to the system, the heart is always the first muscle that feels the effect of this abstraction of its accustomed stimulus; because venous instead of arterial blood is instantly brought into direct contact with the surface of its left cavities [see HEART], and because venous instead of arterial blood is sent by its nutrient arteries (the coronary, which are the first branches given off by the aorta) into its very substance; and this blood, as has been already stated, is incapable of affording it the requisite nourishment and excitement. Accordingly, the action of the heart is always greatly affected from the very first moment that an animal is brought under this condition. At first its contractions are somewhat accelerated, probably on account of the violent struggles of the animal, and in consequence of the emotion of fear; but in a few seconds its action begins to be arrested, and it becomes rapidly less and less frequent until it sinks to a point surprisingly low. When in a state of health and unexcited, the pulse of a dog is 130 in a minute; but in two minutes after the exclusion of air from its lung, it sinks to twenty-five, and it often falls still lower. Immediately before death it invariably becomes again accelerated, sometimes rising to its natural standard; but what it then gains in velocity it loses in strength, and in all cases within three minutes after the complete exclusion of the air from the lung, the action of the heart has become feeble; this feebleness gradually but rapidly increases, until at the end of the fourth minute it is seldom that the action is at all perceptible by the finger. But though the heart be the first to feel the effect of the abstraction from the system of its

usual stimulus, yet the blood which is transmitted to all the other muscles of the body is alike incapable of exciting them to contraction: the muscles of respiration suffer with the rest, so that the respiratory movements, that is, the alternate enlargement and diminution of the cavity of the chest, indispensable to the entrance and exit of fresh currents of air, cease. In this manner are abolished, though not quite simultaneously, yet in rapid succession, the functions both of respiration and circulation.

As the circulation fails and the pulse sinks, the muscles termed *sphincter*, that is, muscles placed at the mouths of certain cavities in order to close their passage, that their contents may be retained for a given time, are commonly relaxed; the rectum and the urinary bladder evacuate their contents; often violent convulsions now come on, and immediately before the extinction of life the faeces and urine are expelled with great force.

The phenomena attendant on the state of asphyxia, and which are characteristic of it, are now sufficiently manifest. It is impossible to raise the thorax so as to draw in air, that is to inspire; nevertheless, violent though vain efforts are made to accomplish this object; but although no air can be introduced into the lung, yet a small portion can be expelled from it, so that the lung is ultimately brought to the extreme state of expiration. Complete exclusion of the air is rapidly followed by the abolition of sensation, this by the diminution and the ultimate cessation of the heart's action, together with the diminution and ultimate cessation of the respiratory movements; and when these changes have terminated in death, the body remains warm for a very long period; the aspect of the countenance is peculiar; the face is swollen; it is either of a reddish violet hue or of a livid colour, and the eyes are clear, bright, and preternaturally prominent. Shakspeare's description of this state is physiologically correct:

"But, see! his face is black and full of blood;
His eye balls further out than when he liv'd,
Staring full ghastly, like a strangled man;
His hair uprear'd; his nostrils stretch'd with struggling;
His hands abroad display'd, as one that grasp'd
And tugg'd for life, and was by strength subdued."

As the animal heat is longer retained than is usual in death from other causes, so the coming on of the stiffness consequent on death is longer protracted; but when it has once come on, it is retained for a proportionally longer period.

The morbid appearances in the internal organs observable on dissection are, *in the brain*, turgescence of the blood-vessels, especially of the veins, which are gorged with blood; the blood itself is preternaturally fluid and of an unusually dark colour. No diseased appearance is commonly found in the cavities of the brain, nor is its substance materially changed from the healthy state. *In the respiratory organs*, the mucous or lining membrane of the larynx, trachea, and bronchi, are unusually red; the bronchial divisions are of a violet or reddish-brown tint; the lungs are of a blackish-brown colour, and when cut into, large drops of a thick, fluid, and very black blood ooze out. *In the organs of circulation*, the heart is the organ chiefly affected. Its veins are gorged with dark blood; dark-coloured blood is found both in its right and in its left cavities, but it is invariably accumulated in a larger proportion in its right than in its left cavities; generally there is at least one-third more in the right than in the left. *In the abdominal organs*, the liver, the spleen, and the kidneys, are gorged with dark and fluid blood. Thus the blood in all the organs of the system is always unnaturally fluid in consistence and dark in colour.

CAUSES. From what has been stated it is obvious that whatever is capable of preventing the admission of air to the lungs, or of arresting the chemical action of the air upon the blood, is capable of producing the state of asphyxia.

I. Various circumstances are capable of acting in the first mode. 1. Whatever affords a mechanical obstruction to the action of the respiratory muscles, as a heavy weight resting upon the chest. 2. Whatever affords a mechanical obstruction to the due expansion of the lungs, while the respiratory muscles still act with the requisite energy, as the accumulation of fluid in the cavity of the chest, or the diminution of the cavity of the chest by the enlargement or displacement of the abdominal viscera. 3. Whatever affords a mechanical obstruction to the entrance of the air into the lung, as the application of a ligature around the wind-pipe, causing strangulation; the submersion of the body in water, or drown-

ing; the introduction of foreign bodies into the larynx, trachea, or its divisions, the bronchi: exposure to a too rarefied atmosphere, or to irrespirable gases, such as nitrogen, hydrogen, carburetted hydrogen, carbonic acid gas, &c.

II. The circumstances which are capable of producing the state of asphyxia, by arresting the chemical action of the air upon the blood, are either what may be termed mechanical or vital. The mechanical are those which act in the mode just adverted to, namely, by preventing the entrance of air into the lung, as suspension, submersion, and so on. The vital are those which act chiefly through the medium of the nervous system. If injury be done to the organic nerves which supply the lungs, or if from any cause the nerves of this class fail to supply the lungs with the nervous influence which it is their office to afford, the requisite changes in the blood do not take place. Such an injurious effect upon this class of nerves may be brought about gradually and progressively by the long-continued action of intense cold upon the system, or may be produced instantaneously by a stroke of lightning. The like cause may also act through the nervous system upon the respiratory muscles, stopping the action of what may be termed the mechanical portion of the respiratory apparatus, namely, the alternate enlargement and diminution of the thoracic cavity. Injury done to the other great division of the nervous system, the sentient; injury or division of the eighth pair of nerves; injury or pressure upon the upper portion of the spinal cord (the *medulla oblongata*); injury or pressure upon the spinal cord itself, and especially upon that portion of it which is placed in the neck, whether from fracture or from dislocation of the bones of the spinal column, may destroy the contractility of the respiratory muscles, and thus stop the respiratory movements. It often happens that both sets of causes are combined; the contractility of the muscles of respiration being destroyed by the operation of the same causes which abolish the nervous energy of the lungs.

There are certain varieties of asphyxia which, on account of their practical importance, being states of continual occurrence from accident and otherwise, require a separate consideration. The more important of these are drowning, hanging, strangulation, and suffocation. The physiological condition of the system is the same in each of these varieties of asphyxia; but there is a treatment suitable to each, which will be better explained under its appropriate head. [See DROWNING, &c.]

ASPIRATE, a name given to one of the divisions of consonants. Grammarians have generally avoided any formal definition of the principle which characterizes this or the other classes of letters; they have generally deemed it sufficient to enumerate those letters which belong to each class, and to assign names to these classes without giving any reason for the selection. The subject is confessedly one of difficulty, and it is therefore with much doubt that the following system is proposed. In the pronunciation of the letters called *tenués*—viz., *k, t, p*—the moveable organ, whether tongue or lip, comes into the minimum of contact with the organ struck, whether palate, teeth, or lip, and the stroke is rapid. In the pronunciation of the *medials*—*g* (as in *goose*), *d, b*,—the surface of contact is greater, the contact itself closer, and of longer duration. Lastly, in the utterance of the aspirated letters, the organs are brought more or less closely together through the whole breadth of the mouth, so that the vibration of air passes through a long narrow fissure. If the pressure or approximation be of slight intensity, and of short duration, the series of aspirates, *y, ch* (as at the end of German or Scotch words), *th* as in *thing, ph, w* are produced. If the pressure be closer and more lasting, there result the aspirates *gh, th* as in *this*, and *v*. The former series might perhaps deserve to be called aspirated *tenués*; the latter, aspirated *medials*. The sibilants again seem to have a claim to be admitted under the genus aspirate. If this claim be allowed, *s* as in *such, sh* (or *ch* of the French *chemin*), *j* as in the French *jour*, may be called the sibilant *tenués*; and *ch* (as in the English *church*), *j* (as in the English *journey*), are the corresponding medial sibilants. The letter *h*, which has been omitted in our series, is only a faint *ch* (as pronounced by the Germans). Indeed, if the pedigree of this letter be traced upwards, it will be found to terminate in the Hebrew *cheth*. [See ALPHABET, pp. 379, 380.] In the comparison of cognate languages, it is important to bear in mind—first, that the aspirated letters are often convertible with one another;

and secondly, that they are severally interchangeable with the medials and tenues of the same organ. Thus, 1st, *ch* of the Greek language often corresponds to *h* in the Latin: *chein* (χίμα-ων, χίμα-τινος) Gr., *hiem-s* Lat., *winter*; *chamai* Gr., *humi* Lat., *on-the-ground*; *cha* (χα-ακιν) Gr., *hia-re* Lat., *to gape*. [See GUTTURALS.] 2. *h* in Greek corresponds to *s* in Latin, *hepta* Gr., *septem* Lat., *seven*; *hex* Gr., *sex* Lat., *six*; *huper* Gr., *super* Lat., *above, (upper.)* 3. *th* in ordinary Greek to *ph* or *f* in the Æolic dialect and Latin; *ther* ord. Gr., *pher* Æolic Gr., *fera* Lat., *a wild beast*; *thlib* ord. Gr., *phlib* in Homer, *press*; *thura* Gr., *a door*; *fora-s* Lat., *out of doors*; *tharsus* (or *thrasus*) Gr., *fortis* Lat., *bold*; *thre* Gr., *fle* Lat., *bewail*. 4. *th* into *s*, as *sios*, *god*, in the Laconian dialect, instead of *theos*. 5. *th* in ordinary Greek to *ch* in other dialects: *ornith* ordinary Greek, *ornich* Doric, *a bird*. Hence in the same language *ith* (ιθ-ια) and *ich* (ιχ-ρο) enter into the two forms which signify *a step*; *erch* and *elth* into the two forms of the verb signifying *to go*, *ερχομαι*, *ελθων*. Hence too the different forms of the Greek and Latin names for Carthage, *Carchedon* Gr., *Carthagon* Lat., in which the second interchange of *d* and *g* compensates for the inverse change of the aspirates *ch* and *th*. 6. *f* in Latin corresponds to *h* in Spanish, *fabu* Lat., *haba* Sp., *a bean*; *fabula-ri* Lat., *habla-r* Sp., *to talk*; *fac-ere* Lat., *hac-er* Sp., *to do*; *falo* (*fatum*) Lat., *hudo* Sp., *fate*; *formoso* (*formosus*) Lat., *hermoso* Sp., *beautiful*. For the relation of *sw* and *w* with *h*, see DIGAMMA.

Secondly, the several aspirates are, as above stated, interchangeable with the medials and tenues of the same organ. Examples of these changes will readily suggest themselves in every language. The most deserving of attention are perhaps those which exist between the English and German:

initial <i>h</i> , in German,	corresponds to	<i>ch, sh</i> , in English.
final <i>g</i>	" "	<i>w, y</i> , "
final <i>ch</i>	" "	silent <i>gh, ch, k</i> .
final <i>t</i>	" "	<i>th, d</i> , "
initial <i>d</i>	" "	<i>th</i> in <i>think</i> .
final <i>d</i>	" "	<i>th</i> in <i>the</i> .
<i>th</i>	" "	<i>d</i> "
initial <i>z</i>	" "	<i>t</i> , "
final <i>tz, ss</i>	" "	<i>t</i> , "
final <i>b</i>	" "	<i>v, f</i> , "
<i>pf</i>	" "	<i>p</i> , "
final <i>f</i>	" "	<i>p</i> , "
initial <i>v</i>	" "	<i>f</i> , "

(See Grimm's *Deutsche Grammatik*, or Becker's *German Grammar*, English edit. p. 26.)

ASPOE, a small island, situated in the Gulph of Bothnia, belonging to the Russian province of Finland. It forms a parish, has a light-house, and contains about a hundred Finlanders. 60° 17' N. lat., 26° 77' E. long. (Klint.)

ASPREDO, in zoology, a genus of abdominal malaco-pterygious fishes, characterised by the horizontal flatness of the head, and the enlargement of the anterior part of the trunk, arising from an unusual development of the bones of the shoulder. They are further distinguished from the Silures of Linnæus (from which extensive genus, indeed, they were originally separated by that great naturalist himself) by the proportional length of the tail; by having the eyes placed in the upper surface of the head, and the intermaxillary bones concealed beneath the ethmoid, directed backwards, and furnished with teeth only along their posterior margin; and finally, they are remarkable as being the only known fish, not being cartilaginous, which have not moveable opercula, the bones of which these organs are composed being soldered on either side to the tympanum and preoperculum. The opening of the gills is consequently formed by a single slit in the skin immediately behind the posterior side of the head; and their membrane is composed of six branchiostegous rays. The lower jaw is transverse, and the upper projects considerably beyond it, and forms a small attenuated muzzle. There is but a single dorsal fin, which is of small extent, and situated on the fore-part of the body: the anal fin, on the contrary, is very large, and occupies the entire length of the tail. This genus contains but very few species, the principal of which, the *Silurus Aspredo* of Linnæus, inhabits the rivers and lakes of North America.

ASPROPOTAMO. [See ACHELOUS.]

ASS, a well-known and useful domestic animal, whose good qualities are too frequently undervalued, from being

contrasted with those of the horse, without considering the different nature of the treatment which these two quadrupeds receive--the care and attention bestowed upon developing the form and cultivating the spirit of the one, and the neglect and ill-usage to which the other is so generally subjected. Buffon has well observed, that the ass is despised and neglected only because we possess a more noble and powerful animal in the horse; and that, if the horse were unknown, the care and attention which is lavished upon him, being transferred to his now neglected and despised rival, would have increased the size and developed the mental qualities of the ass to an extent which it would be difficult to anticipate, but which eastern travellers, who have observed both animals in their native climates, and among nations by whom they are equally valued, and the good qualities of each justly appreciated, assure us to be the fact. Indeed, the character and habits of these two quadrupeds are directly opposed in almost every respect. The horse is proud, fiery, and impetuous, nice in his tastes, and delicate in constitution; like a pampered menial, he is subject to many diseases, and acquires artificial wants and habits, which are unknown in a state of nature. The ass, on the contrary, is humble, patient, and contented with scanty and coarse fare which other cattle reject; he bears with patience and fortitude the most cruel and oppressive treatment; yet he is more susceptible of strong attachment than the horse, has apparently more prudence and reflection, and is capable of a degree of education which would not be anticipated from the forlorn and dejected appearance which coarse food and harsh treatment have rendered habitual to him. In Persia, Arabia, and other eastern countries, however, the ass is a very different animal from what he is in Western Europe. There, instead of being neglected and despised, half-starved, and treated with cruelty, care is taken to cultivate the breed by crossing the finest specimens; even the wild ass is procured for this purpose, the pedigrees of the different races are carefully recorded, and the size, strength, and symmetry of the ass so much improved, that he is rendered equal to the horse for most purposes, and in some cases even his superior. 'The asses of Arabia,' says Chardin, 'are perhaps the handsomest animals in the world; their coat is smooth and clean; they carry the head elevated, and have fine and well-formed legs, which they throw out gracefully in walking or galloping. They are used only for the saddle, and are imported in vast numbers into Persia, where they are frequently sold for four hundred livres; and being taught a kind of easy, ambling pace, are richly caparisoned, and used only by the rich and luxurious nobles.'

The ass is, properly speaking, a mountain animal; his hoofs are long, and furnished with extremely sharp rims, leaving a hollow in the centre, by which means he is enabled to tread with more security on the slippery and precipitous sides of hills and precipices. The hoof of the horse, on the contrary, is round and nearly flat underneath, and we accordingly find that he is most serviceable in level countries; and indeed experience has long since taught us that he is altogether unfitted for crossing rocky and steep mountains. As, however, the more diminutive size of the ass rendered him comparatively less important as a beast of burthen, the ingenuity of mankind early devised a means of remedying this defect, by crossing the horse and ass, and thus procuring an intermediate animal, uniting the size and strength of the one with the patience, intelligence, and sure-footedness of the other. The mule, indeed, appears to have been known at a very early period; and if we may believe an extract from the works of Mago, a Carthaginian writer on Husbandry, preserved by Columella, it would even seem that instances were not rare in Northern Africa of this animal being fruitful, and continuing its species: a phenomenon, however, which was as unknown among the Greeks and Romans as it is at the present day.

If any reliance can be placed upon negative evidence deduced from the writings of Moses, it would appear that the ass was a common domestic animal among the nations of Western Asia, many ages before the horse was reduced to subjection. The earliest express mention which the sacred historian makes of any kind of cattle subsequent to the deluge, is on the occasion of Abraham's visit to Egypt, when, to use the words of Scripture, 'Pharaoh entreated him well for Sarah's sake; and he had sheep, and oxen, and he-asses, and maid-servants, and she-asses, and camels.' No allusion is here made to the horse; and it is not pro-

bable that Pharaoh would have neglected to include this noble and useful animal among the other riches which he bestowed upon Abraham, if the Egyptians themselves had possessed it in a state of domestication; nor is it likely, if he had, that the sacred historian, so minute in other particulars, would have passed over this in silence. The conclusion therefore would appear to be, that in the time of Abraham the horse was not domesticated in Egypt. It appears further, from the catalogue of Abimelek's presents to Abraham, from the enumeration of Abraham's effects on the marriage of his son Isaac, from the catalogues of Jacob's riches, of his present to his brother Esau, and of the spoils taken from the city of Sechem, that the horse was unknown to the Syrian nations for many ages after the time of Abraham; but on all these occasions the ass is invariably mentioned among the other species of domestic cattle which constituted the wealth of the patriarchs. Though thus early domesticated in the East, it was long before the ass was introduced among the inhabitants of Western Europe. Aristotle assures us that in his time there were no asses in Pontus, Scythia, or in the country of the Celts, that is in modern Germany and France; and we know that even in the time of Elizabeth this animal was extremely rare in England.

The wild ass, called Koulan by the Persians, is still common in many parts of central Asia. It stands much higher on its limbs than the common ass, its legs are longer and more slender, and it is altogether a more graceful and symmetrical animal. The mane is composed of short erect hair, of a dusky colour, and rather a woolly texture: the colour of the body is a uniform silvery grey, with a broad coffee-coloured stripe extending down the back, from the mane to the tail, and crossed on the shoulder by a transverse band, as in the domestic variety. The Koulan inhabits the parts of Central Asia, from the 48° of North latitude to the northern confines of India. They migrate from north to south according to the season. In summer they are commonly found about lake Aral, but in autumn they collect in vast troops under the conduct of a regular leader, and proceed towards the south, arriving at Cutch and Guzerat in October or November, and returning northward again in the middle of spring. The Persians and Tartars hold the flesh of the Koulan in high esteem, and hunt it in preference to all other descriptions of game. Olearius assures us that he saw no fewer than thirty-two wild asses slain in one day by the Schah of Persia and his court, the bodies of which were sent to the royal kitchens at Ispahan; and we know from Martial, that the epicures of Rome held the flesh of the Onager, or wild ass, in the same estimation as we do venison.

Cum tener est Onager, solaque Lalisio matre
Pasetur: hoc infans, sed breve nomen habet.

Martial, xiii 97.

From a passage in Pliny (lib. viii. c. 41) it would appear that the Onager inhabited Africa, and that the most delicate and best flavoured lalisiones, or fat fowls, were brought from that continent to the Roman markets. Leo Africanus repeats the same story of wild asses being found in Africa, but no traveller has since met with them, and, as far as we at present know, the species is confined to Asia. It has even retired from Syria and Asia Minor, where it was formerly found. [See HORSE.]

ASSAFŒTIDA (in Botany). [See FERULA.]

ASSAFŒTIDA is a gum-resin, obtained from the roots of the *Ferula assafetida*, a perennial plant growing in Persia, in Khorassan, and in the province of Lar. In its recent and purest state it is white and transparent, but by exposure to the air it becomes of a clear brown colour, sometimes verging to red or violet, and of a waxy appearance. At the ordinary temperature of the air it is of the consistence of wax, slightly viscid or glutinous, and becoming soft with the heat of the hand, by which the grains are united into smaller or larger lumps, which, when broken, contain many almond-like pieces. The portions which correspond to this description constitute the best kind of assafœtida, which is called assafœtida in grains.

The inferior sort is dark-brown, of a dull, fatty appearance, viscid, and greasy, containing portions of the stalks, and other impurities: it is called assafœtida in masses.

Sagapenum, the source of which is unknown, is by many supposed to be a kind of assafœtida.

The smell of assafœtida is penetrating, very disagreeable, and lasts some time. The taste is bitter, unpleasantly aro-

matic, of an alliaceous or garlic-like character. Its chief component parts are volatile oil, resin, and gum; and it is soluble in vinegar, proof-spirit, and yolk of egg. Triturated with water, it forms an emulsion, from which the resin is gradually precipitated. Assafœtida can only be powdered at the temperature of freezing (32° of Fahrenheit); but even after being powdered, though kept in a cool place, it is apt again to run into masses.

An artificial assafœtida is sometimes formed of resin and garlic juice; but this has only a weak smell, and is more perfectly soluble in alcohol.

Assafœtida acts on the human system as a stimulant, more especially of the nerves of the chest and abdomen. It also influences, like all gum-resins, the vessels distributed on the lower portion of the abdomen, or the pelvis. Though not so heating as its chemical composition might lead us to expect, it not only directs the blood more powerfully to these organs, but ensures its uniform supply. It is also a valuable antispasmodic, in irregular action of the muscles either of the respiratory or digestive organs.

Its power of at once rousing the nervous system and promoting the flow of blood towards the enfeebled stomach and bowels, render it very serviceable in imperfect digestion, attended with constipation.

From a knowledge of its powers in such cases, the Romans employed it along with their food, as the Persians still do.

In hysteria it is extremely useful, both during an attack of spasm, and during the interval between the paroxysms.

In colic, and even ileus, its action is often rapid and effectual, especially if thrown into the rectum: in this way cases of the most obstinate constipation, especially in hysterical females, have yielded to it.

In asthma, in the later stages of hooping-cough, and in the cough of old age, in cough occurring in weakly subjects, not connected with inflammation or tubercles, above all, in the cough of hysterical females, it is of very great service. In the last-mentioned case, it is improved by combination with myrrh and preparations of iron, as it likewise is when employed to act on the uterine system.

It is also employed externally, as a means of keeping up counter-irritation; and a convenient plaster may be formed by adding 1-12th part of camphor to 11-12ths of assafœtida. For internal exhibition, pills, or tincture, or watery solution (which must be used immediately after it is prepared) are the ordinary forms of administration. In cases of organic disease of the heart, especially enlargement, and in fulness or congestion of the brain or spinal chord, or in any organic disease of these, assafœtida is improper.

ASSAHAN, a district and town situated on a river of the same name, in the Batta country, on the north-east coast of Sumatra. The town is in 3° 1' N. lat. and 99° 52' E. long. The river, which is above 4000 feet wide at its mouth, is shallow, and is rendered difficult of access by an extensive sand bank. The Portuguese had formerly a settlement up the Assahan river, and the remains of an old fortification still exist, about 70 miles from its entrance, where a colony of emigrants from Java was once established.

The commerce of Assahan was formerly very considerable, but has now much declined. It is principally carried on with the Malays of the opposite peninsula, and with the English settlements of Penang and Singapore. The articles of import are salt, opium, cotton goods, muskets, and gunpowder. The exports are various—dye-woods, rattans, wax, rice, and horses. A trade in slaves was formerly carried on from Assahan. As many as 300, mostly females, have been sent away in one year to Malacca; and it is curious to observe the small comparative value then placed upon human beings in the Eastern markets, where a horse sold for thirty dollars, while the price demanded by the merchants for their fellow-creatures varied, according to age and bodily capability, from twelve to forty dollars per head. Happily this trade has partaken of the general commercial depression.

The population of the whole district was estimated in 1822 at 70,000. Some, but not all, of the tribes who make up this number, are said to be addicted to cannibalism. (See Hamilton's *East India Gazetteer*.)

ASSASSINS, a military and religious order, formed in Persia in the eleventh century. It was a ramification of the Ismaelites, who were themselves a branch of the great Mohammedan sect of the Shiites, the supporters of the claims of Ali's posterity to the caliphate. [See ALI BEN ABI TA-

LXX.] But among the Ismaelites there were many who were Mussulmans only in appearance, and whose secret doctrine amounted to this: that no action was either good or bad in itself, and that all religions were the invention of men. These unbelievers were formed into a secret society by one Abdallah, a man of the old Persian race, who had been brought up in the religion of the Magi, and was a hater of the Arabs and of their faith. After several bloody insurrections against the Abbasside caliphs, the Ismaelites succeeded in placing on the throne of Egypt a pretended descendant of Ismael, the seventh Imaum in the line of Ali, from whom the Ismaelites had taken their name. [See ISMARLITES.] This descendant, whose name was Obeid Allah Mehdee, was the founder of the Fatemite dynasty, so called from Fatema, Mohammed's daughter. Under the protection of these princes a lodge of the secret doctrine was established at Cairo, and its members spread over a great part of Asia. Their ostensible object was to maintain the claims of the Fatemite caliphs to universal dominion, and to urge the destruction of the caliphs of Bagdad as usurpers. One of the adepts, Hassan ben Sabah, thought of turning these instruments to his own advantage. He had filled high offices under the sultan of the Seljuide Turks, but on being disgraced, he went to Egypt, where he was received with distinction by the caliph, became a zealous adherent of the Ismaelite lodge, and after many vicissitudes and wanderings obtained possession, by the aid of his brethren, of the hill-fort of Alamoot (or *culture's nest*), situated to the north of Casvin, in Persia, and there (A.D. 1090) established an independent society or order, consisting of seven degrees, with himself at the head as sheikh al jebel, i. e., sheikh of the mountain. Under him came three dai al kebir, the grand priors of the order; 3dly, the dais, or initiated masters; 4thly, the refeeks, or companions; 5thly, the fedavees, or devoted; 6thly, the laseeks, aspirants or novices; 7thly, the prophane, or common people. Hassan drew out for the dais, or initiated, a catechism consisting of seven heads, among which were—implicit obedience to their chief; secrecy; and lastly, the principle of seeking the allegorical and not the plain sense in the koran, by which means the text could be distorted into anything the interpreter pleased. This did away effectually with all fixed rules of morality or faith. But this secret knowledge was confined to a few; the rest were bound to a strict observance of the letter of the koran. The most effectual class in the order were the fedavees—youths often purchased or stolen from their parents when children, and brought up under a particular system of education, calculated to impress upon their minds the omnipotence of the sheikh, and the criminality as well as utter impossibility of evading his orders, which were like the mandates of heaven itself. These fedavees were clothed in white, with red bonnets and girdles, and armed with sharp daggers; but they assumed all sorts of disguises when sent on a mission. Marco Polo gives a curious romantic account of the garden at Alamoot, to which the fedavees, designed for an important mission, was carried in a state of temporary stupor produced by powerful opiates, and where, on awakening, he found every thing that could excite and gratify his senses. He was made to believe that this was a foretaste of the paradise of the prophet, reserved for his faithful and devoted servants, and thus became willing to encounter death, even under the most appalling forms, in order to secure a permanent seat in the abode of bliss. Marco Polo's narrative is confirmed by Arabian writers, and Von Hammer inclines to believe it true in the main: others attribute the visions in the garden to the effects of the intoxicating preparation administered to the fedavees. The name of *hashish*, which is that of an opiate made from hemp-leaves, is supposed to have been the origin of the word 'Assassins'; others derive the latter from Hassan ben Sabah, the founder of the order. The word becoming familiar to the crusaders was by them carried to Europe, where it was used as synonymous with that of *sicarius*, or hired murderer; but the Italians have adopted it to signify a robber on the high road, without necessarily implying the crime of murder.

The Assassins, either by force or treachery, gained possession of many other castles and hill-forts in Persia. The sultan Melek Shah attacked them, the doctors of the law excommunicated them, but the fedavees carried secret death among their enemies; the sultan's minister, Nizam ul Mulk, was stabbed, and his master soon after died suddenly, it was supposed by poison. The Assassins spread into Syria, where they acquired strongholds in the mountains near

Tripoli; and the sultan of the Seljuides was glad to come to an agreement by granting them several districts. Hassan ben Sabah having extended his order over great part of the Mohammedan world, died at Alamoot in 1124, after thirty-five years' reign. He bequeathed his authority to Keah Buzoorg Omeid, one of the dais of the order. Buzoorg renewed the war with the Seljuides, and Abous Wofa, his Dai al Kebir in Syria, entered into a temporary alliance with Baldwin II. king of Jerusalem, through the agency of Hugo de Payens, grand master of the Templars, against their common enemies the Seljuide Turks. After this, the Assassins were sometimes on friendly terms, but oftener at variance, with the Christian princes of Syria and Palestine, as well as with their Mohammedan neighbours. To accomplish their object they never scrupled to resort to assassination. In 1126 the prince of Mosul was stabbed as he entered the mosque by Assassins disguised as dervises; soon after, a caliph of Bagdad was killed likewise, and also a sultan of Cairo, notwithstanding his Fatemite descent. In 1151 Raymond count of Tripoli was stabbed by the Assassins; it was suspected, at the instigation of his wife. At this time the Syrian branch of the Assassins had become in a manner independent of the Persian one. The sheikhs of the latter, successors of Buzoorg, continued to reside at Alamoot, but they were weak and profligate: one of them, Hassan, who had the rashness to disclose in public the mysteries of the order, was murdered by his son Mohammed, who was himself poisoned by his son Jellal-ed-deen, who succeeded him in 1177. Jellal-ed-deen was a man of more sense than his predecessors; he made his peace with the caliph, sent his harem on the great pilgrimage to Mekka, and received the appellation of New Mussulman. After a short but peaceful reign he was succeeded by his son Aladdin, who, being murdered, the office of sheikh al jebel devolved upon Roked-ed-deen, Aladdin's son. By this time the caliph of Bagdad had applied to the great Mongol conqueror, Mangoo Khan, who sent his brother Hulakoo to exterminate the murderous sect. Alamoot was taken, and Roken-ed-deen was made prisoner; the fortress Kirdcoo resisted for three years, but at last all the haunts of the Assassins were taken, and the inmates were massacred without distinction, A. D. 1256.

The Syrian or western branch of the Assassins, however, continued to exist for some years later under their Dai al Kebir. Massyad, not far from Beyroot, was their principal stronghold. The history of this branch is the most familiar to Europeans, being much interwoven with that of the crusaders and of the great Sultan Sala-ed-deen. The latter was several times in danger from the daggers of the Assassins. The Dai al Kebir Sinan, a man who had a reputation for sanctity, sent in 1173 an embassy to Almeric, the Christian king of Jerusalem, offering, in his name and that of his people, to embrace Christianity, on condition that the Templars, who were their neighbours, should remit the annual tribute of two thousand gold ducats which they had imposed on them, and live in future in peace and good neighbourhood towards them. Almeric was delighted with the offer, and dismissed the envoy with honour. The envoy, however, on his return to his territory, was killed by a party of Templars, led by Gaultier du Mesnil. After this the Assassins resorted again to their daggers, which they had laid aside for many years. Among other victims, Conrad, marquis of Tyre and Montferrat, was murdered by two fedavees in the market-place of Tyre, 1192. The reasons for this murder, which some have ascribed to Richard of England, have been the subject of a long controversy, which Von Hammer does not succeed in elucidating. The Assassins kept the Christians of Tripoli in perpetual fear. They levied contributions on the Christian princes for the safety of their lives; and they even demanded it of St. Louis, king of France, on his passing through Acre on his return from the Damietta expedition. Louis, however, indignantly refused. At last the Syrian Assassins were conquered, and their stronghold taken, by Bibars, the Mamluke Sultan of Egypt, fourteen years after the destruction of the eastern branch by the Mongols. Many, however, found refuge in the mountains of Syria, and became mixed with the Yezzed Koords; and some of the tenets of the order are believed to linger still among them. (Hammer, *Geschichte der Assassinen*; also Sir John Malcolm's *History of Persia*; and Wilken's *History of the Crusades*.)

ASSAULT and BATTERY. An assault has been commonly defined to be 'an attempt or offer with force and

violence to do a corporal hurt to another.' Thus, presenting a gun at a person within the distance to which it will carry, throwing a stone or other missile at him, drawing a sword and waving it, or even holding up a fist in a threatening manner, are given as instances of assault. An assault does not necessarily imply any corporal injury done to the party assaulted; pointing or snapping a loaded gun at a person behind his back, so that he is not aware of his danger, would be an assault, though no actual injury is sustained. But it has long been settled law, that no words, however insolent and provoking, unaccompanied by an act of violence, can amount to an assault.

A *battery*, which is said to imply an assault, consists of any kind of corporal injury, however small, designedly done to another by an actual contact with his person. The injury need not be done by the immediate hand of the party; nor is it material whether the act is wilful or not, provided it proceeds from a mischievous design. Thus, in a case where a lighted squib was thrown into a market-place, which was tossed about from hand to hand and at last struck a man in the face and put out his eye, it was holden to be an assault and battery by the first thrower.

A person who commits an assault and battery is liable to an action of trespass by the party injured, and also to a criminal prosecution for a misdemeanor and breach of the peace; but the proceeding by indictment and action for the same assault is always discouraged in practice; and where a defendant is found guilty upon an indictment, and the court is informed that an action has been brought for the same injury, a nominal sentence is usually passed, unless the prosecutor will consent to discontinue his action.

It is not uncommon to permit the prosecutor of an indictment for a common assault to compound the offence with the defendant even after he has been convicted; and upon the declaration of the former that he is satisfied, a nominal punishment only is imposed. This practice, which is called *speaking with the prosecutor*, has been introduced for the purpose of reimbursing the person really injured the expenses of the prosecution, and of compelling the offender to make him some compensation, without the circuity of a civil action. Though sanctioned by long usage, it is a relaxation of the strict rules of the criminal law, and is liable to much objection in principle, as enabling an individual to assume the character of a public prosecutor for the purpose of redressing a private wrong. This objection to the practice has been strongly animadverted upon by Mr. Justice Blackstone, and it is now much less frequent than formerly. (Blackstone's *Commentaries*, vol. iv. p. 363.)

The punishment of persons convicted of common assaults is fine and imprisonment at the discretion of the court, exercised upon the circumstances of each particular case. By a variety of statutes, assaults aggravated with respect to the place where, or the persons on whom, they were committed, were formerly punishable with great severity; most of these statutes were, however, repealed by the stat. 9 Geo. IV. c. 31, which authorizes an increased punishment upon certain specified cases of aggravated assaults. Thus, persons convicted of assaulting magistrates, officers, or other persons concerned in preserving wrecks, are, by the 24th section of that statute, liable to be transported for seven years, or to be imprisoned, with or without hard labour, at the discretion of the court. So also, by the 25th section, persons convicted (1) of any assault with intent to commit a felony; (2) of any assault upon a peace or revenue officer in the execution of his duty; (3) of any assault with intent to resist the lawful apprehension of the party assaulting for any offence against the law; (4) of any assault committed in pursuance of a conspiracy to raise wages, may be imprisoned, with hard labour, for any term not exceeding two years.

The statute of 33 Henry VIII. c. 12, which punishes assaults in the king's palaces with the loss of the right hand and perpetual imprisonment, has been repealed by the above statute of the 9 Geo. IV. c. 31; but it seems that the penalty of the loss of the right hand attached by the common law to assaults committed in the actual presence of the king, or in his constructive presence in the superior courts of law, still remains. This subject was much discussed in a case which occurred in 1799, when the Earl of Thanet, and several other persons, were convicted of a riotous assault and rescue in a court of Oyer and Terminer and Gaol Delivery at Maidstone. Upon their being brought up for judgment, the court of King's Bench entertained

doubts whether it was not imperative upon them to pass the specific sentence of amputation; but the attorney-general entered a *Noli prosequi* as to those parts of the charge upon which the doubts had arisen. (See Howell's *State Trials*, vol. 27, p. 822.)

Actions for trivial assaults were formerly among the most frequent subjects of litigation in our courts of justice; and in order to discourage them, it was enacted by the statute of 22 and 23 Car. II., c. 9, that 'in all actions of assault and battery, wherein the judge at the trial of the cause shall not certify upon the record that an assault and battery were sufficiently proved, the plaintiff, in case the jury shall find the damages to be under 40s., shall recover no more costs than the damages so found shall amount unto.'

By a recent statute (9 Geo. 4, c. 31, sect. 27), persons guilty of common assaults may be convicted summarily by two magistrates, who are empowered to impose a fine not exceeding 5*l.* with the costs; and in case of non-payment, to commit offenders to prison for two months. By the 28th section of the same statute, a certificate under the hands of the convicting magistrates that the complaint was dismissed as trivial, or that the assault complained of was justified, or payment of the fine adjudged, or completion of the term of imprisonment for non-payment thereof, shall be a bar to all further proceedings, criminal or civil, for the same cause.

ASSAYING, a chemical operation, which differs from analysis only in degree. When an analysis is performed, the nature and proportions of all the ingredients of a substance are determined; but in assaying, the quantity of any particular metal only which the ore or mixture under examination may contain is ascertained, without reference to the substances with which it is mixed or alloyed.

The operations of assaying are sometimes conducted entirely in what is called the *dry way*, or by heat; at other times in the *moist way*, or by acids and other re-agents; and in some cases both methods are necessarily resorted to in assaying the same ore or mixture of metals.

The use of the term assaying is sometimes restricted to alloys or mixtures of gold and silver; but in the present article we shall point out the methods of assaying the ores of the following metals also—copper, iron, lead, tin, and zinc.

The assaying of silver and gold is effected by a process called *cupellation*. Cupels are small flat crucibles made by pressing bone ash, moistened with water, into circular steel moulds, and they are dried by exposure to the air. The principle upon which the operation depends is, that all metals with which gold and silver are usually alloyed, are convertible into oxides by exposure to atmospheric air at a high temperature, whereas the precious metals remain unacted upon.

To assay silver by cupellation, it is requisite to obtain lead as free as possible from silver; when it is procured by reducing litharge, it contains only about half a grain of silver in a pound; and this portion may be neglected. The silver to be assayed is flattened and made quite clean: about thirty-six grains are to be weighed and wrapped up in the proper quantity of lead, which depends upon that of the base metal in the alloy; this, if coarse, is harder than standard silver, of a brilliant glassy appearance, and is flattened with difficulty on the anvil: if soft, easily flattened, and if a dead-white colour, a nearer approach to purity is indicated: the quantity of lead must then be apportioned according to the experience of the assayer, and varies from three to fifteen times the weight of alloy to be operated on. It is to be observed, that cupels do not absorb more than their own weight of oxide of lead, and also that if the quantity of this metal be too large, some of the silver is carried with the oxide into the cupel, and a loss of product is incurred.

The alloy and lead are to be put into a cupel when made very hot in a small earthen oven, called a *muffle*, which is placed in the assay furnace; the mixture soon fuses, is covered with a coat of oxide of lead, becomes flattened, gives off fumes, and considerable motion ensues on its surface. The lead thus gradually oxidizing and fusing is absorbed by the cupel, and carries with it the baser metals with which the silver was alloyed. The alloy is at first flat, but becomes gradually convex, and presents continually increasing shining points; when this happens, the cupel is to be brought forward to the mouth of the muffle; the shining points disappear, the silver becomes iridescent, and the operation is complete. Care must be taken to allow the assay to cool very gradually, and its weight will denote the quantity of

fine silver contained in the quantity of the alloy subjected to examination.

The assaying of gold is performed, to a certain extent, exactly in the same way as that of silver; and if the gold were alloyed only with copper, the process would be as simple as that of silver assaying. Usually, however, gold contains silver, and this cannot be got rid of by cupellation; the *parting* process is therefore had recourse to: this consists in dissolving the silver by dilute nitric acid, which leaves the gold perfectly pure, unless the silver is so small in quantity as to be protected by the gold from the action of the acid, which is very commonly the case. To obviate this difficulty the gold alloy, supposing it to weigh twelve grains, is to have from twenty-four to thirty-six grains of pure silver added to it, and to be cupelled with one hundred and eight grains of lead. The button obtained is to be flattened into a plate of about one inch and a half long, and four or five lines broad, returned to the furnace, kept for some time at a red heat, taken out and suffered to cool, and rolled up about the size of a quill. This is to be put in a matrass with about three times its weight of nitric acid, of sp. gr. 1.25, and heated on a sand-bath. By the action of the acid the silver is dissolved, and the *cornets*, as they are termed, of gold, are left of a dull-brown colour, and without any metallic appearance: these are repeatedly washed with distilled water, and heated in small clay crucibles to bright redness. The pieces of gold having thus acquired their usual appearance and properties, are to be weighed, the absolute loss in weight indicating the purity of the alloy subjected to trial.

Iron ores are chiefly of three kinds: the impure protocarbonate, commonly called the argillaceous iron ore; the peroxide, including the specular and hæmatite iron ores; the black, or magnetic ore, which is a compound of the protoxide and peroxide. The argillaceous iron ore is that which supplies by far the greatest proportion obtained in Britain; the hæmatite occurs in north Lancashire and many other places; the mines of Elba yield the specular ore, whilst the Swedish iron is obtained principally from the magnetic ore.

Various methods have been proposed for assaying these ores, but the principle is in all of them the same; it is that of separating the oxygen from the iron, by the greater affinity of charcoal for that element at high temperatures. The operation of the charcoal is frequently assisted by the use of a flux to combine with the earthy matter, and to convert it into such a glass as will let the melted metal easily fall through, and form, on cooling, a clean button. A flux composed of lime and bottle glass has been used, or the clay which accompanies the argillaceous iron ore is to be burnt and mixed with an equal weight of lime; 200 grains of the powdered ore may be mixed with an equal weight of this flux and forty grains of powdered charcoal; the mixture, put into a Cornish and Hessian crucible, is to be heated in a wind-furnace or a forge. It is not always easy to apporportion the charcoal exactly to the oxide of iron in the ore; when it is either too large or too small, the product of iron is deficient, and this will be denoted by the imperfection of the glass.

In the supplement to the *Encyclopædia Britannica*, Mr. Mushet has given the results of using various fluxes with an iron ore that yielded forty-six per cent. of the metal; and it appears that the following mixture of the ore and substances, all of course reduced to powder, gave the largest proportion of iron: ore 200 grains, lime 100, borax 100, charcoal 40, gave 91 of metal; it is therefore evident that only one-half per cent. of iron remained in the glass.

According to M. Descotils (*Ann. de Chimie*, t. 84, p. 188), the earthy portion of the argillaceous iron ore is frequently such as to form a glass without adding any flux whatever to the charcoal. He used crucibles lined with a mixture of clay and charcoal; and thus, among many other assays, with nearly similar results, an ore which was found by analysis to contain about thirty-seven and three-quarters per cent. of iron yielded thirty-six per cent. of the metal, and the glass was of excellent quality.

Copper ores, with reference to the mode of assaying them, may be divided into two classes—those that contain sulphur, and those that do not. The former class may be subdivided into such as also contain iron pyrites, arsenic, tin, lead, zinc, &c., with a considerable quantity of earthy matter; and such as are composed principally of a mixture of the sulphurets of copper and iron, with but small portions, if any, of other metallic or earthy minerals.

To treat the first subdivision of the sulphureous ores (which constitute at least 99-100ths of all copper ores sold in Great Britain), a flux should be prepared by mixing the following ingredients in the under-mentioned weights:—

2 parts	.	.	Fluor spar,
1 ditto	.	.	Slaked lime,
1 ditto	.	.	Borax,
1 ditto	.	.	Red argol (impure tartar),
½ ditto	.	.	Nitre,

all finely powdered and well mixed.

The sample of ore being reduced to a coarse powder, take 400* grains of it, and calcine it in a Cornish or Hessian crucible, at a moderate red heat, for fifteen or twenty minutes, stirring it repeatedly with an iron rod flattened at the end. During this operation the ore will increase considerably in bulk, and it should never be continued after this begins to diminish. Having taken out the crucible in order to allow it to cool, fill the furnace† with fuel, and put on the cover to increase the heat. When cool, mix the ore, without taking it out of the crucible, with about 400 grains of the prepared flux, and cover the surface of the mixture with common salt; introduce it into the furnace, and continue it therein, at a white heat, until the whole is well melted, which will be known by the surface of the mass assuming a smooth and quiet aspect. If the furnace is in good condition, this will generally be effected in about twenty minutes. Should the operator have reason to think that the mixture in the crucible has not melted thin, so as to allow the metallic regulus to subside through the slag, he may project upon it a mixture of a scruple each of nitre, borax, and argol; and this may be again repeated if necessary, adding, however, ten grains of flour of sulphur. When thoroughly melted, pour the contents of the crucible into a hemispherical iron mould, previously warmed and greased; allow it to become solid, and then quench it in water. Separate the button of regulus from the slag with a small hammer; it ought to be round and well defined, of a reddish-brown colour with shades of blue, or else bluish white. When of the former colour, it contains a little more sulphur than the latter. Should the button of regulus exhibit a brilliant bluish-white surface, the slag should be re-melted with two drachms of red argol, and a scruple each of slacked lime and sulphur, which will give a small button of regulus to be added to the former. It may here be remarked, that a button of regulus with a nucleus of metallic copper should always be rejected, and a fresh assay commenced, calcining the ore less. And if, when the slag and button of regulus are quenched in water, it renders the latter immediately turbid, and of a dirty orange-yellow colour, it should also be rejected: the ore in this case also having been too much calcined, or too large a quantity of nitre used. On the contrary, if the regulus does not collect in a compact well-defined button, but spreads under the slag a considerable way up the sides of the mould, and of a dull-brown aspect, the ore has not been sufficiently calcined.

The regulus must now be calcined: for which purpose reduce it to powder, and expose it in a clean crucible to a very dull red heat, constantly stirring it. As the operation proceeds, the heat must be increased and the stirring continued, until the whole of the sulphur is dissipated. Especial care must be taken, particularly at the commencement of the operation, to prevent the regulus from clotting or sticking together, which is caused by excess of heat or want of stirring, and much retards the operation. The same remark applies also to the calcination of ores.

The crucible having been removed from the furnace, and allowed to cool, add to the calcined regulus about a drachm each of borax and red argol, with a scruple of nitre, covering the whole with common salt. Melt the mixture well, and pour it into a mould as before; quench it in water, and knock off the slag (which reserve) from the metallic button. The latter is now termed coarse copper, and requires to be refined; for which purpose return the crucible to the furnace, putting into it the button of copper, upon which, when

* The weight used by assayers of copper ores is 400 troy grains, marked 100 (technically called *cents*), which is subdivided down to one, and that again to one eighth. Ore giving a button that weighs ten three-eighths is said to produce ten three-eighths per cent., and so on. The average of all the copper ores smelted in Great Britain is about eight and a half per cent.

† The furnace used for assaying copper ores is a simple air furnace, about seven inches square and fourteen inches deep, communicating with a chimney by a lateral flue five inches wide by two deep. The fuel is coke, broken to pieces about the size of walnuts, the small sifted out. Cornish crucibles are used, and require neither stand nor cover, being kept with the mouth just above the surface of the fuel.

melted, project about half a drachm of flux (prepared as below), and the like quantity of common salt. Shut up the furnace for about two minutes, or until the flux is well melted, and then pour out into the mould as before. Separate the flux (which reserve) from the button; and if the latter does not appear to be fine (or free from alloy), repeat the operation until it is. An unerring mark of fineness is a sinking or concavity in the centre of the upper surface of the 'assay,' or button; but so long as the upper surface is convex, it is not fine. If the button, when fine, instead of having a smooth brilliant surface, of a yellowish red colour, exhibits a roughish surface of a dark red colour, and having firmly attached to it bits of a dark red slag, the refining process has been pushed too far. The button being fine, take the slag which was reserved from melting the calcined regulus, together with the flux and slag from the refining process, and mix these with three drachms of red argol and a very little charcoal powder, and melt well in the crucible in which the refining is performed. This will give a small metallic button, which refine as before.

The flux above alluded to, which is used for refining, is prepared by burning together a mixture of three parts nitre, two parts red argol, and one part of common salt. This is best done by putting the ingredients into a large iron mortar, and stirring them with a red-hot poker until combustion ceases. The mass should be reduced to powder before it is quite cold, and preserved in a well-stopped bottle, or it will deliquesce. About half a drachm of this flux and of common salt are usually taken, and this will generally be a sufficient quantity, but as much should be used as will perfectly cover the button when it is poured into the mould, otherwise the metal will oxidize, which of course is to be avoided.

The ores of the second subdivision of sulphurets are best assayed by calcining them perfectly in the first instance, so that the first melting shall give a metallic button, instead of a regulus or sulphuret. To effect this, when the ore has been calcined until the whole of the sulphur is driven off, it should be melted with a drachm each of slacked lime and fluor spar, the same quantity of borax and red argol, with a little nitre; and then proceeded with precisely as directed for calcined regulus.

Copper ores not containing sulphur, or only in very small quantity, may be calcined for a short time (a few minutes is sufficient), and melted as directed in the last section, except that the quantity of lime and fluor may be reduced, and some scales of iron from a smith's forge added.

Lead.—The principal ore of lead is the sulphuret, commonly called galena; but the carbonate, or white lead ore, is sometimes found in considerable quantity.

To assay the former ore. Take 400 grains coarsely powdered, mix it with 100 grains of iron in filings or small pieces, 100 grains of black flux, and 50 grains of cream of tartar; put the mixture into a Cornish or Hessian crucible that will hold double the quantity, and cover it with common salt to the depth of half an inch. Expose it to a yellowish-white heat for about ten minutes, or until the matter in the crucible has ceased to boil, and is become smooth; then either pour it out into a hemispherical iron mould warm and greased, or allow it to cool in the crucible.

If the ore is much mixed with iron pyrites, or earthy matter, the quantity of iron should be reduced, and a little fluor spar and borax added to the other ingredients.

The carbonate is best assayed by melting it with half its weight of black flux and a little cream of tartar, covering the mixture as before with common salt.

Tin.—The ores of tin are principally of two kinds, the oxide and the sulphuret; the latter is, however, very rare.

To assay the oxide of tin, or black tin, as it is commonly called, it requires only simple fusion with half its weight of black flux, one-eighth borax and the like of cream of tartar, covering the mixture in the crucible to the depth of half an inch with common salt.

The sulphuret, or pyritous tin ore. Let 400 grains be reduced to powder and carefully calcined, with occasional additions of small portions of charcoal powder, constantly stirring it with an iron rod, and so managing the fire as to prevent the ore from clotting. This operation should be continued until the ore ceases to emit either sulphureous or arsenical vapours. When thoroughly calcined, file off from the stirring-rod any portion of the ore that may adhere to it, adding it, of course, to that in the crucible. Add likewise 40 grains of lime, 20 grains of fluor spar, 150

grains of black flux, with a small quantity of nitre, borax, and cream of tartar; when these are well mixed, cover with common salt, and when melted quite smooth, allow the crucible to cool, when the tin will be found at the bottom.

Zinc.—The ores of zinc are of two kinds, the carbonate, or calamine, and the sulphuret, or blende.

There is perhaps no mode of directly assaying the ores of this metal, so as to obtain their metallic contents. That generally given in books of chemistry and metallurgy, viz., distillation of the roasted ore mixed with charcoal in an earthen retort, will be found universally to fail, either entirely or partially. Even in the treatment of these ores in the large way, the quantity of metal obtained seldom exceeds one-half the quantity which they contain: the loss arises partly from the escape of uncondensed metallic vapour, and partly from unreduced oxide.

The best mode of making comparative assays of the ores of zinc is as follows: if the ore is the carbonate, or calamine as it is usually termed, reduce it to pieces of the size of hazel nuts, weigh thirty-two ounces avoirdupois, and expose it under a muffle, or in a large crucible, to a moderate red heat, until the pieces are red-hot throughout. When cold, reduce the ore, which will have become very friable, to a fine powder: re-weigh it and note its weight, mix it with its own bulk and one-half more of powdered charcoal, and press it down moderately tight into a Stourbridge clay crucible, which it should not fill nearer than two inches to the top. Then take a piece of moistened and tempered clay, in which a little charcoal-powder and sand have been mixed, roll it out to one-eighth of an inch thick, and cut out of it a round cake to fit into the crucible upon the mixture of calamine and charcoal, giving it a little concavity on its upper surface. Then weigh as much granulated copper as is equal to two-thirds of the *calcined* calamine, spread it upon the disc of clay in the crucible, cover it with charcoal-powder, and lute a clay cover to the crucible. Set the crucible in an air furnace, and expose it to a bright-red heat for three hours, and then increase the heat to a yellowish-white for another hour; then take out the crucible and allow it to cool, collect the brass which will have formed on the clay disc and weigh it: if its weight equals that of the *calcined* calamine, the latter may be considered of good quality for commercial purposes. The arrangement may be varied by mixing the granulated copper with the calamine and charcoal, instead of putting it on the clay disc: but when the operation is finished, it will be more trouble to collect the grains of brass.

This is an operation that requires considerable nicety in the management of the fire, for if too hot, the metallic zinc is vaporised faster than the copper can combine with it; and on the other hand, if not hot enough, the oxide will not be reduced. Attention to a few trials will give the requisite judgment.

The sulphuret, or blende, is assayed in the same way, except as to calcination.

Blende must first be reduced to a fine powder and fully calcined upon the floor of a muffle, so heated as to exclude any carbonaceous smoke or flame, stirring it constantly with an iron rod until it ceases to give any indication of sulphur. The powdered blende should not lie above one-fourth of an inch thick on the muffle, and the heat should be very gradually raised from a dull to a bright cherry red. When perfectly calcined, it must be treated in the same way as calcined calamine.

ASSEMÂNI, JOSEPH SIMONIUS, a learned Maronite native of Syria, who came to Rome towards the beginning of the 18th century, was made Archbishop *in partibus* of Tyre, and librarian of the Vatican, by Clement XI. He was sent by that Pontiff on a literary mission to Egypt and Syria, in the years 1715-16, and he brought back to Rome many valuable MSS. He then set about compiling his *Bibliotheca Orientalis Clementina Vaticana*, four volumes folio, Rome, 1719-28, being a biographical account of the Syrian writers, divided into three classes, *i. e.* Orthodox, Jacobites, and Nestorians, with copious extracts in the Syriac text, and a Latin version, lists of their works, and comments on the same. He intended to proceed with the Arabian, Copt, and other Eastern writers, but nothing appeared in print beyond the Syriac. The fourth volume of the *Bibliotheca* is engrossed by a learned dissertation on the Syrian Nestorians.—2d. *S. Ephraem Syri Opera omnia quæ extant*, six volumes folio, Rome, 1732-46. This edition of the works of St. Ephraem, one of the old Syrian fathers,

containing the Syriac text and a Latin translation, was begun by Ambarach, another learned Maronite living at Rome, and better known as Father Benedetti, being a member of the society of the Jesuits, and after his death was completed by Assemani. This work is much esteemed, and the Latin is better than that of the other works of Assemani, who was more skilled in the Oriental than in the Latin language.—3d. *Kalendaria Ecclesiæ universæ, in quibus Sanctorum nomina, imagines, festi dies, Ecclesiæ Orientis ac Occidentis, præmissis unius cujusque Ecclesiæ originibus, recensentur, describuntur, et notis illustrantur*, six volumes quarto, Rome, 1755-7.—4th. *Bibliotheca Juris Orientalis Canonici et Civilis*, four volumes quarto, Rome, 1762-4.

Assemani died at Rome in 1768, at the age of eighty. He left MSS., several historical dissertations, and other fragments, on the Christian population of the ancient patriarchate of Antioch, on the nation of the Copts, on the Nestorians, and other Eastern sects, &c., which have been lately published by Monsignor Mai. In his lifetime he published a dissertation on the origin and religion of the ante-Mohammedan Arabs, which he appended to his translation of Benrahebo's Chronicle. Of Assemani's friend Ambarach, we may here mention, that he translated from the Arabic into Latin the work of Stephen, Patriarch of Antioch, on the Origin and the Liturgy of the Maronites. [See MARONITES.]

ASSEMANI, STEPHANUS EVODIUS, nephew of the preceding, was made Bishop of Apamea, and succeeded his uncle as librarian of the Vatican. He published the following works. 1. *Bibliotheca Medico-Laurentianæ et Palatinæ codicum MSS. Orientalium Catalogus*, two volumes folio, 1742, with notes by Gori. 2. *Acta Sanctorum Martyrum Orientalium et Occidentalium*, two volumes folio, Rome, 1748. To this work, which he compiled from MSS. in the Vatican, he added the Acts of St. Simon, called Stylite, in Chaldaic and Latin. He also began a general catalogue of the Vatican MSS. divided into three classes, Oriental, Greek and Latin, Italian and other modern languages, of which, however, he published only the first volume in 1756: a fire which broke out in his chambers having destroyed his papers. Mai has continued parts of this catalogue in his *Scriptorum Veterum nova collectio*, of which the eighth volume has been lately published. Another member of the same family, called Joseph Louis Assemani, published the *Alexandrine Missal*, with the liturgy of the various churches of Egypt, old and modern: *Missale Alexandrinum S. Marci, in quo eucharistica liturgia omnes antiquæ ac recentis Ecclesiarum Ægypti, Græcæ, Copticæ, Arabicæ, et Syriacæ exhibentur*, quarto, Rome, 1731; and a chronology of the Patriarchs of Chaldaea. The Assemani had a rich collection of Arabic and Syriac MSS., which Clemens XIII. purchased for the Vatican Library. Monsignor Mai has lately given catalogues of them. The Syriac MSS. alone are 202 in number.

ASSEMANI, SIMONE, grand nephew of Joseph Simon, and like him born in Syria, came to Italy, and was many years professor of Oriental languages in the university of Padua. He published several works in Italian and in Latin on Arabian literature and history. 1. *Saggio sull' origine, culto, letteratura e costumi degli Arabi, avanti il pseudo profeta Maometto*, octavo, Padua, 1787. 2. *Catalogo dei codici MSS. Orientali nella biblioteca Naniana*, quarto, Padua, 1787-8. To this catalogue he added extracts from some of the works registered in it, such as the lives of several philosophers and a series of the Persian, Arabian, and Turkish monarchs, and also illustrations of the Cufic coins and other antiquities existing in the museum of the same family of Nani.—3. *Globus Cælestis, Cufico-Arabicus*, quarto, Padua, 1790, being a description of the celestial globe in the Borgia museum at Velletri, with a dissertation on the astronomy of the Arabs. It was this Assemani who first exposed the imposture of the Maltese Vella, who pretended to have found, in an Arabic MS. in the convent of S. Martino at Palermo, a diplomatic code of the Sicilian Saracens. Vella made a translation of it, and published it at Palermo in 1789. (*Codice Diplomatico di Sicilia sotto il Governo degli Arabi*, 5 vols. 4to. Palermo, 1789-92.) The work was dedicated to the King of Naples. Assemani, to whom some of the proof sheets had been sent, pronounced the text to be unintelligible, except some lines which were Maltese instead of Arabic. At last Joseph Hager was sent for from Vienna to Palermo, and he having

examined the MS. found it contained a narrative of the life of Mohammed, much interpolated with Maltese words, apparently with the intention of rendering the original text unintelligible. Vella's imposture being now made clear, he was sentenced to imprisonment. (*Cesarotti Opere*, volume xviii.; *Fundgruben des Orients*, volume i.; and also *Allgemeinen Literarischen Anzeigen* for 1795.)

ASSEMBLY, GENERAL, OF SCOTLAND. [See GENERAL ASSEMBLY.]

ASSEMBLY, NATIONAL. [See NATIONAL ASSEMBLY.]

ASSEMBLY OF DIVINES. [See WESTMINSTER ASSEMBLY.]

ASSENT, ROYAL. When a bill has passed through all its stages in both houses of parliament, if it is a bill of supply, it is sent back to the charge of the officers of the House of Commons, in which it had of course originated; but if not a bill of supply, it remains in the House of Lords. The royal assent is always given in the House of Lords, the Commons, however, being also present at the bar, to which they are summoned by the Black Rod. The king may either be present in person, or may signify his assent by letters patent under the great seal, signed with his hand, and communicated to the two houses by commissioners. Power to do this is given by the 33d Henry VIII. chap. 21. The commissioners are usually three or four of the great officers of state. They take their seats, attired in a peculiar costume, on a bench placed between the woolsack and the throne. When the king comes down in person, he is seated on the throne robed and crowned. The bills that have been left in the House of Lords lie on the table; the bills of supply are brought up from the Commons by the Speaker, who, in presenting them, especially at the end of a session, is accustomed to accompany the act with a short speech. In these addresses it is usual to recommend that the money which has been so liberally supplied by his majesty's faithful Commons should be judiciously and economically expended; and a considerable sensation has been sometimes made by the emphasis and solemnity with which this advice has been enforced upon the royal ear. The royal assent to each bill is announced by the clerk of parliament. Having read the title, he says, if it is a bill of supply, '*Le roi remercie ses loyal subjects, accepte leur benevolence, et ainsi le veut*;' if any other public bill, '*Le roi le veut*;' if a private bill, '*Soit fait comme il est désiré*.' What is called an act of grace, that is, an act by which the royal favour or bounty is extended to any party, must be signed by his majesty before it is laid before parliament, where it is only read once in each house, and where, although it may be rejected, it cannot be amended. To such an act there is no further expression of the royal assent, but, having read its title, the clerk of the parliament says, '*Les Prélats, Seigneurs, et Commons, en le présent parlement assemblés, au nom de tous vos autres subjects, remercient tres humblement votre majesté, et prient à Dieu vous donner en santé bone vie et longue*.'

When the royal assent is refused to a bill, the form of announcement is *Le roi s'aviserà*. It is probable that in former times these words were intended to mean what they express, namely, that the king would take the matter into consideration, and merely postponed his decision for the present. There has been no instance of the rejection by the crown of any bill, certainly not of any public bill, which had passed through parliament, for many years. It is commonly stated, even in books of good authority (for instance, in so respectable a work as Chitty's edition of Blackstone), that the last instance was the rejection of the bill for triennial parliaments by William III. in 1693. Tindal, in his continuation of Rapin, says, 'The king let the bill lie on the table for some time, so that men's eyes and expectations were much fixed on the issue of it; but in conclusion he refused to pass it, so the session ended in an ill humour. The rejecting a bill, though an unquestionable right of the crown, has been so seldom practised, that the two houses are apt to think it a hardship when there is a bill denied.' But another instance occurred towards the close of the same year, which was more remarkable, in consequence of its being followed by certain proceedings in parliament, which was sitting at the time. This was the rejection of the bill commonly called the Place Bill, the object of which was to exclude all holders of offices of trust and profit under the crown from the House of Commons. It was presented to the king along with the land-tax bill; and the day after he

had assented to the one and rejected the other, the House of Commons, having resolved itself into a grand committee on the state of the nation, passed the following resolution:— 'That whoever advised the king not to give the royal assent to the act which was to redress a grievance, and take off a scandal upon the proceedings of the Commons in parliament, is an enemy to their majesties and the kingdom; and that a representation be made to the king, to lay before him how few instances have been in former reigns of denying the royal assent to bills for redress of grievances; and the grief of the Commons for his not having given the royal assent to several public bills, and in particular to this bill, which tends so much to the clearing the reputation of this house, after their having so freely voted to supply the public occasions.' An address conformable to the resolution was accordingly presented to his majesty by the whole house. The king returned a polite answer to so much of the address as referred to the confidence that ought to be preserved between himself and the parliament, but took no notice of what was said about the rejection of the bill. When the Commons returned from the royal presence, it was moved in the house 'That application be made to his majesty for a further answer;' but the motion was negatived by a majority of 229 to 28.

Mr. Hatsell, in the second volume of his *Precedents* (edition of 1818), quotes other instances of subsequent date to this. The latest which he discovered was the rejection of a Scotch militia bill by Queen Anne in 1707. In former times the refusal of the royal assent was a common occurrence. Queen Elizabeth once at the end of a session, out of ninety-one bills which were presented to her, rejected forty-eight.

It is the royal assent which makes a bill an act of parliament, and gives it the force of a law. As by a legal fiction the laws passed throughout a whole session of parliament are considered as forming properly only one statute (of which what are popularly called the separate acts are only so many chapters), it used to be a matter of doubt whether the royal assent, at whatever period of the session it might be given, did not make the act operative from the beginning of the session, when no day was particularly mentioned in the body of it as that on which it should come into effect. In order to settle this point, it was ordered by the 33d George III. chap. 13, that the clerk of parliament should for the future endorse on every bill the day on which it received the royal assent, and that from that day, if there was not in it any specification to the contrary, its operation should commence.

It appears that the several forms of words now in use are not, as has been sometimes stated, exactly the same that have been employed in this ceremony from the first institution of parliaments. For instance, it is recorded that Henry VII. gave his assent to the bill of attainder passed in the first year of his reign (1485) against the partisans of Richard III. in the more emphatic terms, *Le roy le voet, en toutz pointz*. On some occasions, of earlier date, the assent is stated to have been given in English. Thus, to a bill of attainder passed against Sir William Oldhall in 1453 (the 31st of Henry VI.), the clerk is recorded in the *Rolls of Parliament* to have announced his majesty's assent as follows: 'The king velle that it be hadde and doon in maner and forme as it is desired.' And in 1459, in the case of an act of attainder against the Duke of York, the Earls of Salisbury, Warwick, and others, the same king gave his assent in the following form: 'The king agreeth to this act, so that by virtue thereof he be not put from his prerogative to shew such mercy and grace as shall please his highness, according to his regalie and dignitie, to any person or persons, whose names be expressed in this act, or to any other that might be hurt by the same.'

In the time of the Commonwealth, an English form was substituted for those in Norman-French, which had been previously and are now in use. On the 1st of October, 1656, the House of Commons resolved 'that when the Lord Protector shall pass a bill, the form of words to be used shall be these, *The Lord Protector doth consent*.' In 1706, also a bill passed the House of Lords, and was read a second time in the House of Commons, for abolishing the use of the French tongue in all proceedings in parliament and courts of justice, in which it was directed, 'that instead of *Le roy le veult*, the words be used, *The king answers Be it so*; instead of *Soit fait come il est désiré*, these words be substituted, *Be it as is prayed*;

where these words, *Le roi remercie ses bons sujets, accepte leur benevolence, et ainsi le veult*, have been used, it shall hereafter be, *The king thanks his good subjects, accepts their benevolence, and answers Be it so*; instead of *Le roi s'avisera*, these words, *The king will consider of it*, be used.' 'Why this bill was rejected by the Commons,' says Hatsell, 'or why its provisions with respect to proceedings in parliament were not adopted in an act which afterwards passed in the year 1731, "That all proceedings in courts of justice should be in English," I never heard any reason assigned.' For further information on this subject, see Hatsell's *Precedents*, especially vol. ii. pp. 338—351 (edition of 1818).

ASSER, *ḤṢṢ*, *Rab Ashe*, properly ASHI, is erroneously written by English and French writers Asser. Ashi was the principal author of the Babylonian Talmud, so called from the place of his residence. He was born at Babylon A.D. 353. His Jewish biographers relate that he was appointed head of the college of Sora, in Babylon, at the age of fourteen; which, if this account be true, is an unparalleled instance of mental precocity. But whether or not full credit may be attached to this statement, Ashi was undoubtedly distinguished very early in life by intellectual powers and acquirements. He died A.D. 426, aged seventy-four.

Rabbi Abraham Ben Dior asserts, in his *Kubbalah*, p. 68, that since the days of Rabbi Jehuda Hammasi, or Rabbenu Hakkadosh, in no one but Ashi had been combined at once knowledge of the law, piety, humility, and magnificence. The expositions of the Mishna delivered by Ashi in his lectures to the students under his care were collected, and form the basis of the Babylonian Talmud. It was his practice to dictate to his pupils each year, in the month of February, a treatise, which he required them to study during six months, and when they returned to him in the month of August, to give him their views of its contents. He incited them to hold arguments on their several sentiments on the subject of the treatise, removed their doubts, and replied to their objections, or confirmed their opinions by the testimony of former sages. The heads of the classes explained at length to the younger students what had been stated succinctly by the master. Prizes were awarded to the most distinguished disciples. Ashi then delivered another treatise, which was in like manner studied during another six months, and in the month of February was discussed. From the matter thus collected, during a course of instruction which lasted sixty years, Ashi composed that part of the Babylonian Talmud which was immediately written by himself. It was continued by his disciples, the number of whom amounted to many thousands. (Compare the *Ts'mach David*, first part, in the years 4127 and 4187; *Sepher Juchasin*, fol. 117; *Halichoth Olam*, p. 18; Wolfii, *Biblio theca Hebraea*, tom. i. p. 224.)

ASSER, or ASSERIUS MENEVENSIS, called ASKER by Ingulphus, and JOHN ASSER by Bale and Pits, was a learned monk of St. David's, whence (the name of that place in Latin being written Monapia or Menevia) he obtained the appellation of Menevensis. Leiland (*Comment. de Script.* i. p. 155) states him to have been of British extraction, and Bale (*Collit. Basil.* 1557, p. 125) says that his instructor in learning at St. David's was John Erigena. We have his own authority (*De Reb. Gest. Angl.* ed. Wise, p. 49) for his being related to an archbishop of St. David's of the name of Novis.

Asser was invited to the court of Alfred the Great, as is generally believed, in or about the year 880, but probably earlier, merely from the reputation of his learning. His own account is (p. 47), that those who were sent to fetch him introduced him to the king at Dore, in Wiltshire, and that the king not only received him graciously, but, at the first interview, pressed him to reside constantly at court. Asser modestly declined the proposal, alleging that it would be a reproach to him to leave a place where he had been nurtured and ordained to the priesthood, for the sake of obtaining preferment elsewhere. King Alfred then desired that he would apportion his time between the court and his monastery, passing six months at one, and six at the other; but Asser was unwilling to comply even with this request, till he had consulted the brethren of his convent. He therefore set out for St. David's, but falling ill at Winchester, lay sick there more than a year. He afterwards pursued his journey, and at length obtained the consent of his brother-monks to accept the offer, as they promised themselves great advantages from the King's favour, and more especially against the oppressions of Hemeld, one

of the petty princes of South Wales, who had occasionally persecuted their archbishop. They, however, requested Asser to prevail upon the king to let him reside quarterly at court and at St. David's, rather than that he should remain absent six months together.

When he came back, he found the king at a place called Leonaford, who received him with every mark of distinction, and with whom he remained at once eight months, reading with him such books as the king possessed. (*Ibid.* p. 50.) Asser states that, on the Christmas eve following, the king presented him with the monasteries of Amgresbyri (supposed to be Amesbury, in Wiltshire), and Banuville (Banwell, in Somersetshire), together with a silk pall of great value, and as much incense as a strong man was able to carry; adding, that these were small things, and that hereafter he should have greater. In a short time Asser had the church of Exeter bestowed upon him; and, at a later period, the bishopric of Sherburn, which, however, he quitted, according to the writer of his life in the *Biographia Britannica*, in 883, though he always retained the title. Thenceforward he constantly attended the court, in the manner before stipulated, and is named as a person in whom he had particular confidence, by King Alfred in his will, which must have been made some time in or before 885, since mention is there made of Esna, bishop of Hereford, who died that year. He bequeathed to Asser one hundred mancuses. (*Will of K. Alfr.* publ. at Oxf. p. 20.) Asser is also mentioned by King Alfred in the epistle prefixed to his translation of Gregory's *Pastorale*, addressed to Wilsig, bishop of London; and there the king does not call him bishop of Sherburn, but minum byrepe, 'my bishop;' acknowledging the help received from him and others in that translation.

It seems to have been the near resemblance which the genius of Asser bore to that of the king which gained him so much of Alfred's confidence; and it was probably on this account that Asser drew up the Memoir of the Life of Alfred, which we still have, and which he dedicated and presented to the king in the year 893. In this work we have a very remarkable account of the manner in which the king and Asser passed their time together.

Asser says that, one day (it was on the feast of St. Martin), having cited in conversation a passage from a particular author, the king was pleased with it, and would have him write it down in the margin of a book which he carried in his bosom; but Asser finding no room to write it there, and yet being desirous to gratify his master, asked Alfred whether he should not provide a few leaves, on which to set down such remarkable things as occurred either in reading or conversation. The king was delighted with this hint, and directed Asser, without delay, to put it into execution. Pursuing this method constantly, their collection began to swell, till at length it became of the size of an ordinary psalter; and this was what the King called his 'Hand-book,' or 'Manual.'

Asser appears to have continued at court during the rest of the reign of Alfred, and probably several years after; but where or when he died is doubtful. The Saxon Chronicle positively fixes the time to the year 910.

The preferments and the works of Asser have both been subjects of controversy. The writer of his life in the *Biographia Britannica* asserts him to have been archbishop of St. David's (Kippis's edit. i. 410), which is much disputed. It seems clear, however, that Asser the monk, who is spoken of as a reader in the public schools at Oxford (Harpfield, *Hist. Eccles.* 161), if such a person did exist, was a different person from the bishop of Sherburn.

Bale and Pits gave the titles of six works ascribed to our Asser. One is, of course, 'The Life of Alfred;' the others are, 1. 'A Commentary on Boethius;' 2. 'Annales Britannice;' 3. 'Aurearum Sententiarum Enchiridion;' 4. 'A Book of Homilies;' 5. 'A Volume of Letters.' The Commentary on Boethius probably means nothing more than his explanation of that author to King Alfred when the king made his Saxon translation. The *Annales* were published by Gale in his Script. xv. at Oxford in 1691, but are believed to be the work of a pseudo-Asser. The *Enchiridion* is, beyond question, Alfred's Manual already noticed. The existence of the two last works, the *Homilies* and *Letters*, is unsupported by any other authority. Many other works (but without specification) are said by Bale and Pits to have been translated into English by Asser.

The '*Annales Rerum Gestarum Alfreði Magni*' were

first published by Archbishop Parker, at the end of Walsingham's *History*, fol. Lond. 1574, and reprinted by Camden in his *Anglia, Normannica, &c.* fol. Francof. 1603. They were again reprinted in an elegant octavo volume at Oxford, by Francis Wise, in 1772: the best edition.

The celebrated manuscript of Asser, formerly in the Cottonian Library, marked Otho A. xii, was burnt in the fire at Westminster in 1731.

(See the '*Annales*,' published by Wise; Tanner's *Bibliotheca Britannico-Hibern.* p. 53; *Biogr. Brit.* art. Ayserius; Chalmers's *Biogr. Dict.*)

ASSESSMENT OF TAXES. [See TAXES.]

ASSESSMENT OF DAMAGES takes place on a writ of inquiry before the sheriff or his deputy, and a jury of the county where an action is laid, in cases where the defendant suffers judgment by default, instead of pleading and joining issue in the action. In such cases, the defendant having admitted a liability to some extent, the only question is as to the amount; and the jury are summoned merely to enquire into and assess the damages, and not as on trials where issue is joined to try the issue *as well as to* assess the damages (*tam ad triandum quam ad inquirendum*). Such assessment is subject to be set aside on motion before the court where the action is brought, in case the jury are improperly returned, or the sheriff has misdirected them in point of law, or the damages are excessive. [See WRIT OF INQUIRY.—DAMAGES.]

ASSETS (from the Norman French *assetz*, sufficient) is the real and personal property of a party deceased, which, either in the hands of his heir or devisee, or of his executor or administrator, is chargeable with the payment of his debts and legacies. Assets are either *personal* or *real*. The former, embracing goods, chattels, debts, &c. devolve on the executor or administrator; and the latter (including all real estate) descend to his heir-at-law, or are devised to his devisee. Assets are also distinguishable into *legal*, or such as render the executor or heir liable to a suit at common law on the part of a creditor; and *equitable*, or such as can only be rendered available by a suit in a court of equity, and are subject to distribution and marshalling among creditors and legatees, according to the peculiar equitable rules of that court.

1st. As to *personal legal assets*. These include all goods, chattels, and moveables, which belonged to the deceased in *action* or *possession* at the time of his death, and which actually come to the executor's or administrator's hands; and also all things which come to the executors or administrators at any time *in lieu* of them. Thus, a lease made to executors, in pursuance of a covenant to grant a lease to the testator in his life; goods delivered to executors under a contract to deliver them to a testator; damages recovered by an executor for breach of a contract made with the testator, are *personal legal assets*. So the young of sheep or cattle of the testator born after his death; the profits made by his executor in carrying on his trade; the value of his mortgaged chattels, redeemed by the executor after his death, are assets of this description.

The locality of the property, in general, does not affect the question whether it is assets or not; it being a maxim that 'assets in any part of the world are assets in every part of the world.' Therefore, stock in foreign funds, or a leasehold for years in Ireland, must, in case of a deficiency of assets in this country, be sold by the executor to satisfy the creditors. By the 5th Geo. II. c. 7. s. 4, houses, lands, negroes, &c. in the plantations of the West Indies, are rendered personal assets, devolving on the executor for satisfaction of debts. And the 9th Geo. IV. c. 33, has produced the same operation on all real estates of British subjects (not being Mohammedans or Gentoos), situate in India within the civil jurisdiction of the British supreme courts at Fort William (Calcutta), Fort St. George (Madras), and Bombay.

As the law protects an executor or administrator from any personal charge so long as he acts rightfully, the assets which render him chargeable to a creditor are, of course, only such as *come to his hands*, and not necessarily all those of which the deceased may die possessed. It was said by Wentworth, a considerable authority on this subject, that if the testator at his death has sheep in Cumberland, bullocks in Wales, fat oxen in Bucks, money, household stuff, and plate in London, and the executor dwells at Coventry, viz. far from all those places, the executor has such an actual possession immediately on the testator's death, that he may maintain trespass against any one

taking them away, and therefore it is doubtful whether these goods must not be considered to have actually come to his hands so as to be assets rendering him chargeable for payment of debts. But it seems now to be the better and more just rule, that if such property should be abstracted by any stranger either before it has been actually possessed by the executor or afterwards, so that it be without any fault of the executor, he will only be liable to account for the damages which he may actually recover against such stranger, notwithstanding such damages may be less than the actual value of the goods. And upon the same principle, goods stolen from the possession of the executor, without blame on his part, will not be considered assets, unless indeed he have neglected an opportunity of selling them for a good price. As to all such personal property of the testator as is merely in *action*, viz. debts and rights of suit, it only in general becomes assets when reduced into possession by the executor; but if he release any such claims, or take a bond for them to himself personally, they then become assets with which he is chargeable. As nothing but what is of pecuniary value is assets, if the deceased were entitled to the next presentation to a living, and died without presenting, the right in the hands of the executor would not be assets, because not legally saleable. It follows from the very definition of *assets*, that they do not embrace property which the testator possesses merely as a trustee, without having any personal beneficial interest therein; and upon the same principle, the executor cannot employ as general personal assets property which is in the testator's hands clothed with a specific trust or appropriation; for instance, bills or notes remitted to the testator to meet acceptances for any particular purpose; nor money received by the executor himself under a specific trust to apply it in payment of his testator's debts.

2. *Personal equitable assets* are such as can only be made available by the help of a court of equity, and which consequently cannot be given in evidence against an executor on his plea of *plene administravit* in a court of law. The distinction between the two classes is most important, and consists not merely in the mode of obtaining payment out of them by a creditor, but also in the scheme of their distribution for payment of debts. While legal assets must be applied in payment of debts, according to certain rules of priority (viz. 1. Funeral charges, &c.—2. Debts to the crown—3. Judgments—4. Recognizances, &c.—5. Rent and specialty debts, as mortgages, bonds, &c.—6. Simple contract debts—7. Legacies),—equitable assets are distributable among all creditors equally, the only distinction recognized in courts of equity being that *debts* are to be preferred to *legacies*. Equitable assets embrace money produced by sale of the testator's real estate, whether his interest in such estate were legal or equitable, and whether it be expressly devised to be sold for payment of debts or not; and the equity of redemption of a mortgage is equitable and not legal assets. So also is any fund over which a man has a general power of appointment, which he exercises; in which case the property will be equitably subject to the claims of his creditors, in preference to those of his legatees or appointees.

3. *Real Assets* comprise all such lands, tenements, &c. as descend to the heir at law of the deceased, and which at common law rendered him chargeable with specialty debts binding the heir. They embrace many things not strictly of a real nature. Thus an annuity, though a personal thing, is, if granted to a man and his heirs for ever, real assets, which descend to the heir; and this is also the case with things accessory to real estate, such as chimney-pieces, wainscots, doors, and other fixtures; and even deer in a park, hares and rabbits in a warren, fish in a private pond or fishery, are held to participate in the nature of real estate, and to descend to the heir as real assets. By the statute 29 Car. II. c. 3, estates *pur autre vie*, limited to the grantee and his heirs, or his heirs, executors, and administrators, during the life of a third party, are declared to be real assets in the hands of the heir. Terms of years being personal chattels, are in general personal assets in the hands of the executor or administrator; but terms which are created or assigned over to attend the inheritance (according to the common mode, in the absence of a general registry, used by conveyancers of protecting the inheritance from judgments and personal charges of the owner) in general follow the nature of the inheritance.

At common law, it was strictly only the real estate descended to the heir which was liable to any of his debts,

and this only to debts by bond or specialty, in which the heir was specifically named. If, therefore, the debtor, after the Statute of Wills, 12 Henry VIII. c. 1, devised away his lands, his creditors were entirely defrauded of their debts. To remedy this evil, the 3d Will. and Mary, c. 14, s. 2, rendered such devises void as against creditors by bond or specialty in which the heir was bound, and enabled all such creditors to sue the devisee of the land jointly with the heir at law. And this act having been construed to apply to the case of creditors on *bond* only, has been wisely repealed, and the same provisions extended by the 1st William IV. c. 47, to creditors, not only on bonds, but on covenants, and all other specialties. But it is not merely all classes of *specialty* creditors that have now a remedy against the real assets of the debtor: the creditors by simple contract obtained such a remedy by the 47th Geo. III. st. 2, c. 74 (re-enacted by 1 Will. IV. c. 47); but this was confined to cases where the debtor, at the time of his death, was a *trader*; and none of the above provisions applied to copyhold estates. But now, by the comprehensive enactment of 3 and 4 William IV. c. 104, all the real estate of the debtor, whether *freehold, customary, or copyhold*, which he shall not, by his last will, have charged with payment of his debts, is rendered assets, to be administered in courts of equity for payment of his debts, as well those due on *simple contract* as on *specialty*; provided that in the administration of assets in courts of equity creditors by specialty in which the heir is bound shall be preferred to creditors by simple contract, or by specialty, in which the heirs are not bound. It is to be observed that this important enactment confines the remedy of simple contract creditors against the real estate to a court of equity, and does not enable a simple contract creditor to sue the heir or devisee at law.

We have hitherto treated of assets merely as regards the rights and claims of the creditor against the executors and administrators, and heirs and devisees of the debtor, in respect of assets personal or real come to their respective hands. It remains to notice the doctrine of the *exoneration of the real estate*, that is, the apportionment of the debtor's liabilities in a court of equity between the two funds of the deceased, the real and the personal estate, and also the *marshalling of assets*, in order to produce a full satisfaction of all creditors. Although a creditor by specialty has, where the deceased leaves both personal and real estate, his choice of remedies either against the one or the other, so that if he sue the heir at law he cannot be met by a plea that the deceased has left personal assets, yet it is a settled rule that the personal estate in the hands of the executor or administrator is the primary and natural fund for the payment of the debts of the deceased, of whatever description. If the creditor, therefore, proceeds against the real estate, descended or devised, the heir or devisee who has sustained the loss shall be allowed to stand in the place of the specialty creditor, and reimburse himself out of the personal estate in the hands of the executor; provided, of course, that such reimbursement will not prejudice any creditor of the deceased: and where the exoneration of the real estate is in favour of the *heir*, it must not disappoint the claim of any legatee, except the residuary legatee, nor the wife's claim to paraphernalia. But a devisee stands in a different situation from the heir; and if he is compelled to pay a bond debt of the deviser, it seems he is entitled to reimbursement out of the personal assets, to the disappointment of general legacies, and even (as it would appear) of specific legacies.

To entitle the heir or devisee to this exoneration out of the personal estate, the debt must be the *proper* debt of the deceased; for if it was a debt charged on the estate when the deceased purchased it, or a debt incurred for money borrowed to pay off then existing charges (whether debts or legacies), the land is then the proper fund for its discharge, and the heir or devisee must take the land *cum onere*, and cannot throw the burden on the personal funds. The rule is the same with respect to both debts and legacies, viz. that the personal estate is the primary and natural fund out of which they are to be paid, and that the real estate is only to be resorted to in aid of the personalty; and even though debts and legacies are, by the will, effectually charged on the real estate, this is only taken for a declaration by the testator that the real estate shall be liable in case of a deficiency of personal assets. But though it requires more than a mere charge of the real estate to exempt the personalty, still a testator is not debarred, if his intention be sufficiently expressed, from effecting such an exemption. As to the

mode of expression in a will requisite to operate this effect, the cases have been very numerous and contradictory, and evidence *dehors* the will has been, in some of them (as it is now held, improperly), resorted to. In earlier cases it was held that *express* words were requisite; but it is now settled that the personal assets will be exempted, if there appear, from the whole testamentary disposition taken together, sufficient to convince a *judicial* mind that the testator meant not merely to charge the real estate, but so to charge it as to exempt the personality.

Marshalling assets is that operation by a court of equity, by which claimants entitled to claim against both the real and personal estate of the deceased are compelled so to elect as not to defeat the claim of other claimants who have only one of these funds to resort to. It is a general rule of equity that if A. have two funds to resort to for his debt, B., having a claim on only one of those funds, may compel A. to have recourse to the other, provided it be necessary for the satisfaction of both. The doctrine and practice of marshalling assets as between creditors by *simple contract* and creditors by *specialty*, seems to be in a great degree superseded by the effect of the late statute 3 and 4 Will. IV. c. 104 (before stated), by which the former have acquired a claim against the freehold and copyhold as well as against the personal property of the deceased debtor. But the same rule of equity exists also in favour of *legatees*, and therefore if a creditor by bond, in which the heir is named, exhaust the personal estate instead of resorting to the heir, so as to leave nothing for payment of legacies, a legatee shall stand in the place of such bond creditor against the real assets *descended* to the heir. But if the real estate were devised to a stranger, it would be otherwise, for in that case it would not be equitable that a general legatee (nor as it seems a specific legatee) should obtain his legacy by throwing the specialty debts upon the *specific devise* of the land. The principle of course applies as between a legatee and a simple contract creditor, where the latter has a claim upon the real assets, which the former has not; as where the testator's estate is generally devised charged with debts but not with legacies. [See EXECUTORS, LEGACIES, WILLS AND TESTAMENTS; and see Williams's *Treatise on the Law of Executors and Administrators*; Bacon's *Abridgment* (7th ed.), tit. *Executors and Administrators, Legacies, Mortgage*.]

ASSIDIANS (חסידים) Chasidim 'Assidim, 1 Maceab.

vii. 13. Chasidier, the *pious*), from the root חסד, or rather

from חסר, a term used to denote either a very good or a very bad action, but more frequently the former. It was a name given to the zealous defenders of the unity of the Deity and the belief of their ancestors, against the attempts of Antiochus Epiphanes and his successors to force the Jews into idolatry. The Assidians, or Chasidim, of those days, found a leader in Mattathias, who gave the signal for armed resistance against the Syrian tyrants, by killing the commander of the king's troops at the idolatrous altar in Modein, near Joppa. Mattathias headed the Chasidim during four years against the Grecomania of those days. These four years are not included by Josephus in the hundred and twenty-six years of the Asmonean dynasty, which he commences from the time at which Judas Maccabi assumed the chief command.

Later Jews called those persons Chasidim who secluded themselves from worldly occupations and pleasures to devote their life solely to religious exercises and bodily chastisements, in the hope either of expiating their own sins or those of others, or of hastening the coming of the Messiah. These Chasidim studied the *kabalah*, and endeavoured by their mortification of the flesh to abstract the spirit from the body, and thus have liberty to enter into communion with God and angels. They fasted frequently, and asserted that they had visions.

Solomon Maimon informs his readers in his *Memoirs* (Berlin, 1792), that some of the Chasidim died in consequence of their austerities, and that others became deranged: he also states that not a few rendered their spiritual profession subservient to their temporal aggrandisement.

About the middle of the eighteenth century a new sect of Chasidim arose, who invented a more comfortable method of ascetic practice. They taught that the union of man with God was effected by contemplation, and that in order to fix the mind on God it is necessary to quicken sensation by the enjoyment of permitted indulgences. They asserted that

mortification of the flesh disturbs that mental tranquillity which is necessary for the contemplation of God. These Chasidim considered that union with God subsists in common religionists only during seasons of prayer, and they taught that prayer should be performed with the greatest exertion and concentration of the mental faculties, in order to unite the praying spirit so intimately with God as to obtain power over all sublunary and celestial beings, and thus to realize all desires. The tsadik is always in communion with God.

After this sect became numerous, some of its members were considered representatives of God, and their words regarded as oracles. The influence of these representatives was based solely upon their appearance of sanctity, and not upon their mental superiority. They therefore endeavoured to bring science into disrepute.

The history of the modern Chasidim is briefly this: Israel Baalschem, i. e. בעל שם, *The Lord of the name*, i. e.

Θεουργός, *Theurgos*, whom Maimon erroneously calls Joel, lived A.D. 1740, in the town of Vlussy, in the circle of Czarkow, in Poland. His partizans assert that his birth was predicted to his father by the prophet Elijah, and that his mother was a hundred years old at the time of his birth, and his father still more advanced in years. While yet in his youth they relate that he overcame some evil spirits, or demons. Baalschem went afterwards to Medzibaze in Podolia, whence he propagated his doctrines, which are contained in a volume written by himself, and edited by his grandson under the title ספר המדות. His testament has been published under the title צוואת ריבש לינע. His birth and miracles are described by his disciple R. Bär Linez, in a volume entitled שבתי הבעשט, *The Habitations of Besht*. The fifth edition was published A.D. 1815. The word בעשט, *Besht*, is formed from the initials of בעל שם טוב, *the Lord of the good name*, or, *the Lord of the name of God*.

From the word Besht, the modern Chasidim have been called Beshtians. The orthodox rabbins opposed in vain the spread of the Chasidim, or Beshtians, by anathema and excommunications. Baalschem based his doctrines upon the cabalistic book of Zohar, recommending a contemplative, inactive life, and frequent bathing in spring water.

The Beshtians soon spread over Wallachia, Moldavia, Hungary, and Gallizia, but their principles were not admitted among the Jews in Germany, France, and Italy. This sect a long time concealed their doctrines and propagated their opinions rather by manuscript copies of their writings than by printed publications; but since 1817 they have printed and circulated more than twenty-five different volumes.

After the death of Baalschem, A.D. 1760, R. Bär of Madziey, R. Mendel Przemislav, and R. Melash of Lyzanz, endeavoured to govern the sect; not as combined triumvirs, but by each assuming the government of his own circle, under the title of צדיק *tsadik*, just or pious. The title of

צדיק was formerly applied to Baalschem by way of distinction, but after his death each of his three most distinguished disciples endeavoured by its assumption to vindicate his own prerogative of conversing with spirits. In conversation the disciples of Baalschem are satisfied with the title of *Abbe* or teacher.

At the present time every shrewd individual, well read in the Talmud and in cabalistical writers, may by hypocrisy obtain the dignity of a צדיק, even if his morals are suspected. But the descendants of Besht have more facility in obtaining this dignity, because they are a kind of hereditary nobility among the Beshtians, the richest of whom feel themselves honoured by a degree of affinity with a צדיק *tsadik*. Besht himself taught in his ספר המדות that by honouring the descendants of the tsadik men might induce God to send the Messiah, and that the son of a tsadik is sanctified from his conception by the holy thoughts of his father, and may be called a son of God and נעם המלך.

The tsadik has no certain salary, but is supported by voluntary gifts, for which he grants his advice to the chasidim in all transactions of life. In case that his advice seems to be unproductive of good, the cause is thought to be in the sinfulness of the receiver, and not in the inappropriateness of the counsel.

The doctrines of the chasidim may be classed under the following three heads:—

I. **אֱמוּנָה וְהַתְקַשְׁרוּת לַצְדִּיק** *faithfulness to wise men and attachment to the tsadik.*

II. **דְּבִקוּת לְשִׁכְיָנָה** *cleaving to the Shechinah.*

III. **עוֹז** *courage.*

This courage may even become insolence and effrontery, so that the chasid may contradict the principles of truth, justice, equity, moderation, and decency, whenever these principles are in collision with the will of the tsadik and that of his sect.

In modern times the chasidim have left off the use of prayer books according to the German and Polish ritual, and have adopted the Spanish and oriental ritual, with which they have mixed many cabalistic elements.

It is the duty of the chasid to shout during prayer, to clap his hands loudly together, or to beat the wall with his hands, to jump about and to move the body as in convulsions. Whoever shouts during prayer with all his might, shakes his whole body, and claps his hands, averts the wrath of God and strengthens his own memory. The chasid must not be prevented by the ridicule of others from obeying in this respect the precepts of the tsadik.

The chasidim do not like to assemble in the common synagogues. In every place where ten chasidim reside they have a room called *klosel* (clausa) for prayer and conversation, both sacred and profane. The chasidim bathe frequently. (See Peter Beer in Ersch and Gruber's *Encyclop.*, and *Geschichte der Lehren und Meinungen aller bestehenden und noch bestehenden religiösen Secten der Juden, und der Geheimlehre oder Kabbalah*, von Peter Beer. Briinn, 1823. Second volume, p. 197—259.)

ASSIENTO TREATY, in Spanish, **EL ASIEN TO DE LOS NEGROS**, and **EL PACTO or TRATADO DEL ASIEN TO**, that is, the compact for the farming, or supply, of negroes. It is plain that the word *Assiento*, though occasionally signifying an assent or agreement, cannot, as is sometimes stated, have that meaning in this expression. Spain, having little or no intercourse with those parts of Africa from which slaves were obtained, used formerly to contract with some other nation having establishments on the western coast of that continent for the supply of its South American possessions with negroes. Such treaties were made first with Portugal, and afterwards with France, each of which countries, in consideration of enjoying a monopoly of the supply of negroes to the South American dominions of Spain, agreed to pay to that crown a certain sum for each negro imported. In both cases the *Assiento* was taken by a commercial association in France—by the Guinea Company, which thereupon took the name of the *Assiento Company* (*Compagnie de l'Assiento*). Both the Portuguese company and the French were ruined by their contract. At the peace of Utrecht, in 1713, the *Assiento*, which the French had held since 1702, was transferred to the English for a period of thirty years. In addition to the exclusive right of importing negroes, the new holders of the contract obtained the privilege of sending every year a ship of 500 (afterwards raised to 600) tons to Spanish America, with goods to be entered and disposed of on payment of the same duties which were exacted from Spanish subjects: the crown of Spain, however, reserving to itself one-fourth of the profits, and five per cent. on the remaining three-fourths. The contract was given by Queen Anne to the South Sea Company, which, however, is understood to have made nothing by it, although it was calculated that there was a profit of cent. per cent. upon the goods imported in the annual ship, which usually amounted in value to about 300,000*l*. So much of this sum as fell to the share of the company was either counterbalanced by the loss attendant on the supply of the 4800 negroes which they were bound to provide every year, or went chiefly into the pockets of their South American agents, many of whom in a few years made large fortunes. The war which broke out in 1739 stopped the further performance of this contract when there were still four years of it to run; and at the peace of Aix-la-Chapelle, in 1748, the claim of England to this remainder of the privilege was given up. Spain, indeed, complained, and probably with justice, that the greatest frauds had been all along committed under the provision of the treaty which allowed the contractors to send a shipload of goods every year to South America. It was alleged that the single ship was made the means of introducing into the American markets a quantity of goods amounting to several

times her own cargo. The public feeling in Spain had been so strongly excited on the subject of this abuse, that it would have been very difficult to obtain the consent of that country to a renewal of the treaty.

ASSIGNAT. One of the earliest financial measures of the constituent assembly, in the French revolution, was to appropriate to national purposes the landed property of the clergy, which, upon the proposition of Mirabeau, was by a large majority declared to be at the disposition of the state. (Thiers, *Histoire de la Révolution Française*, vol. i. p. 194, 2d ed.) Shortly afterwards, the assembly, desirous to profit by this measure, decreed the sale of lands belonging to the crown and the clergy, to the amount of 100 millions of francs, or about sixteen millions sterling (ib. p. 212). To sell at once so large a portion of the surface of France, without lowering the price of land by overloading the market to such an unexampled extent (see Thiers, vol. vii., p. 377), and moreover in a time of mistrust, insecurity, rapid political change, and almost of civil war, was an object of no very easy attainment. It was first proposed that the lands should be transferred to the municipalities, which, not being provided with ready money, might give the state a bond or security for the price, and the state would pay its creditors with these securities, which could, in process of time, be realized, as the municipalities were able successively to sell, at an advantageous price, the lands thus made over to them. The holders of the securities would thus have a claim not on the government but on the municipal bodies, which would be compellable by process of law to pay; and the creditor might moreover extinguish the debt by buying the lands when put up to sale, and by offering the security in payment. But it might happen that the holder of such securities would be unable to realize them, and might not be willing to purchase any of the lands of the state: in order, therefore, to obviate this objection to the securities in question, it was proposed that they should be transferable and be made a legal tender.

There was also another motive for the adoption of this latter expedient. In consequence of the want of confidence and stagnation of trade which prevailed in France at this time, money had become extremely scarce, and much of the current coin had been withdrawn from circulation: the king and queen had even been forced to send their plate to the mint. (Thiers, vol. i. p. 100.) Under these circumstances, it was determined to issue a paper-money, based on the security of the unsold lands belonging to the state. The notes thus issued (each of which was for 100 francs, equal to 1*l*.) were called *assignats*, as representing land which might be transferred or assigned to the holder; and all notes which came back in this manner to the government in payment for national lands were to be cancelled. They moreover bore an interest by the day, like English exchequer bills. The object of this measure was, therefore, to obtain the full value of the confiscated lands of the clergy (which in the actual state of France was impossible), and to supply the deficiency of coin in the circulation (arising from a feeling of insecurity) by a forced issue of inconvertible paper-money, which, as was predicted by M. de Talleyrand, the Bishop of Autun, would inevitably be depreciated, and cause misery and ruin to the holders of it. (Thiers, vol. i. p. 233-7, and note xviii. p. 332.) The first issue of assignats was to the amount of 400 millions, bearing interest: shortly afterwards 800 millions in addition were issued, but without the liability to pay interest (ib. p. 256). The last of these issues was made in September, 1790. But as in the beginning of the following year the legislative assembly sequestered the property of all the emigrants, a numerous and wealthy class, for the benefit of the state (Thiers, vol. ii. p. 51), it was thought that the amount of the national securities having been increased, the issues might be safely increased likewise: accordingly, in September 1792, although 2500 millions had been already issued, a fresh issue to the amount of 200 millions was ordered by the Convention. (Thiers, vol. iii. p. 151.) Towards the end of this year, the double effects of the general insecurity of property and person, and of the depreciation of assignats caused by their over-issue, was felt in the high price of corn, and the unwillingness of the farmers to supply the markets with provisions. Wholly mistaking the causes of this evil, the violent revolutionary party clamoured for an *assize*, or fixed maximum of prices, and severe penalties against *accapareurs*, or engrossers, in order to check the avarice and unjust gains of the rich farmers. The Convention, however, though pressed

both by factions violence and open insurrection, refused at this time to regulate prices by law. (Thiers, vol. iii. p. 311-7.) Prices, however, as was natural, still continued to rise; and although corn and other necessities of life were to be had, their value, as represented in the depreciated paper currency, had been nearly doubled: the washerwomen of Paris came to the Convention, to complain that the price of soap, which had formerly been fourteen sous, had now risen to thirty. On the other hand, the wages of labour had not risen in a corresponding degree (see Senior on *Some Effects of Government Paper*, p. 81): so that the evils arising from the depreciation of the assignats greatly aggravated the poverty and scarcity which would, under any circumstances, have been consequent on the troubles and insecurity of a revolution. The labouring classes accused the rich, the engrossers, and the aristocrats, of the evils which they were suffering, and demanded the imposition of a maximum of prices. Not only however in the Convention did the most violent democrats declare loudly against a maximum, but even in the more popular assembly of the commune, and the still more democratic club of the jacobins, was this measure condemned, frequently amidst the yells and hisses of the galleries. As the Convention refused to give way, Marat, in his newspaper, recommended the pillage of the shops as a means of lowering prices: a measure immediately adopted by the mob of Paris, who began by insisting to have goods at certain fixed prices, and ended by taking the goods without paying for them. (Thiers, vol. iv. p. 38-52.) These and other tumults were however appeased, partly by the interference of the military, and partly by the earnest remonstrances of the authorities: but the evil still went on increasing: corn diminished in quantity and increased in price: the national lands, on account of the uncertainty of their title and the instability of the government, were not sold, and thus the number of assignats was not contracted, and they were continually more and more depreciated.

At length the Convention, thinking that the depreciation might be stopped by laws, made it penal to exchange coin for paper, or to agree to give a higher price if reckoned in paper than if reckoned in coin. Still the over-issue had its natural effects: in June, 1793, one franc in silver was worth three francs in paper: in August it was worth six. Prices rose still higher: all creditors, annuitants, and mortgagees were defrauded of five sixths of their legal rights: and the wages of the labourers were equal in value only to a part of their former earnings. The Convention, unable any longer to resist, in May, 1793, passed a decree which compelled all farmers to declare the quantity of corn in their possession, to take it to the markets, and sell it there only, at a price to be fixed by each commune, according to the prices of the first four months of 1793. No one was to buy more corn than would suffice for a month's consumption, and an infraction of the law was punished by forfeiture of the property bought and a fine of 300 to 1000 francs. The truth of the declaration might be ascertained by domiciliary visits. The commune of Paris also regulated the selling of bread: no person could receive bread at a baker's shop without a certificate obtained from a revolutionary committee, and the quantity was proportioned to the number of the family. A rope was moreover fixed to the door of each baker's shop, so that as the purchasers successively came, they might lay hold of it, and be served in their just order. Many people in this way waited during the whole night: but the tumults and disturbances were so great that they could often only be appeased by force, nor were they at all diminished by a regulation, that the last comers should be served first. A similar maximum of prices was soon established for all other necessities, such as meat, wine, vegetables, wood, salt, leather, linen, woollen, and cotton goods, &c.; and any person who refused to sell them at the legal price was punished with death. Other measures were added to lower the prices of commodities. Every dealer was compelled to declare the amount of his stock; and any one who gave up trade, after having been engaged in it for a year, was imprisoned as a suspected person. A new method of regulating prices was likewise devised, by which a fixed sum was assumed for the cost of production, and certain percentages were added for the expense of carriage, and for the profit of the wholesale and retail dealers. The excessive issue of paper had likewise produced its natural consequence, over inflation, even in times so unfavourable for commercial dealings. Numerous companies were established, of

which the shares soon rose to more than double or treble their original value. These shares being transferable, served in some measure as a paper-currency; upon which, the Convention thinking that they contributed still further to discredit the assignats, suppressed all companies whose shares were transferable or negotiable. The power of establishing such companies was reserved to the government alone.

In August, 1793, there were in circulation 3776 millions of assignats; and by a forced loan of 1000 millions and by the collection of a year's taxes, this amount was subsequently reduced to less than two-thirds: the confidence moreover inspired by the recent successes of the republic against its foreign and domestic enemies tended to increase the value of the securities on which the paper-money ultimately reposed: so that towards the end of 1793 the assignats are stated to have been at par. This effect is attributed by M. Thiers, in his *History of the French Revolution* (vol. v. p. 407), to the severe penal laws against the use of coin: nevertheless we suspect that those who made this statement were deceived by false appearances, and that, neither at this nor any other time, not even at their first issue, did the real value of assignats agree with their nominal value. (Thiers, vol. v. pp. 145-62, 196-208, 399-413.) However, this restoration of the paper-currency, whether real or apparent, was of very short duration, as the wants of the government led to a fresh issue of assignats: so that in June, 1794, the quantity in circulation was 6536 millions. By this time the law of the maximum had become even more oppressive than at first, and it was found necessary to withdraw certain commodities from its operation. Nevertheless, the commission of provisions, which had attempted to perform the part of a commissariat for the whole population of France, began to interfere in a more arbitrary manner with the voluntary dealings of buyers and sellers, and to regulate not only the quantity of bread but also the quantity of meat and wool which each person was to receive. (Thiers, vol. vi. pp. 146-51, 307-14.) Other arbitrary measures connected with the supply of the army, as compulsory requisitions of food and horses, and the levying of large bodies of men, had contributed to paralyse all industry. Thus not only had all commerce and all manufactures ceased, but even the land was in many places untilled. After the fall of Robespierre, the Thermidorian party (as it was called), which then gained the ascendancy, being guided by less violent principles, and being somewhat more enlightened on matters of political economy than their predecessors, induced the Convention to relax a little of its former policy, and succeeded in first excepting all foreign imports from the maximum, and afterwards abolishing it altogether. The transition to a natural system was however attended with great difficulty and danger, as the necessary consequence of the change was a sudden and immense rise of the avowed prices; and trade having been so long prevented from acting for itself, did not at once resume its former habits; so that Paris, in the middle of winter, was almost in danger of starvation, and wood was scarcely more abundant than bread. As at this time the power of the revolutionary government to retain possession of the lands which it had confiscated, and to give a permanently good title to purchasers, was not doubted, it is evident that a fear lest the national lands might not ultimately prove a valuable security did not now tend to discredit the assignats: their depreciation was solely owing to their over-issue, as compared with the wants of the country, and their inconvertibility with the precious metals. The government however began now to find that, although it might for some time gain by issuing inconvertible paper in payment of its own obligations, yet when the depreciated paper came to return upon it in the shape of taxes, it obtained in fact a very small portion of the sum nominally paid. Consequently they argued that, as successive issues depreciated the currency in a regular ratio (which however is very far from being the case), it would be expedient to require a larger sum to be paid for taxes, according to the amount of paper in circulation. It was therefore decreed that, taking a currency of 2000 millions as the standard, a fourth should be added for every 500 millions added to the circulation. Thus, if a sum of 2000 francs was due to the government, it would become 2500 francs when the currency was 2500 millions, 3000 francs when it was 3000 millions, and so on. This rule however was only applied to the taxes and arrears of taxes due to the government, and was not extended to payments made by the government, as to public creditors

or public functionaries. Nor did it comprehend any private dealings between individuals. (Thiers, vol. vii. pp. 40-51, 132-41, 232-89, 368-85, 420-8.) Iniquitous as this regulation was, as employed solely in favour of the government, it would nevertheless have been ineffective if its operation had been more widely extended; for the assignats, instead of being depreciated only a fifth, had now fallen to the 150th part of their nominal value. The taxes being levied in part only in commodities, and being chiefly paid in paper, produced scarcely any thing to the government; which had however undertaken the task of feeding the city of Paris. Had it not in fact furnished something more solid than depreciated assignats to the fundholders and public functionaries, they must have died of starvation. Many, indeed, notwithstanding the scanty and precarious supplies furnished by the government, were threatened with the horrors of famine; and numbers of persons threw themselves every evening into the Seine, in order to save themselves from this extremity. (Storch, *Economie Polit.*, vol. iv. p. 168.)

To such a state of utter pauperism had the nation been reduced by the mismanagement of its finances and the ruin of public credit by the excessive issues of paper, that when the five directors went to the Luxembourg in October 1795, there was not a single piece of furniture in the office. The doorkeeper lent them a rickety table; a sheet of letter-paper, and an inkstand, in order to enable them to write their first message to announce to the two Councils of State that the Directory was established. There was not a single piece of coin in the treasury. The assignats necessary for the ensuing day were printed in the night, and issued in the morning wet from the press. Even before the entry of the directors into office, the sum in circulation amounted to 19,000 millions: a sum unheard of in the annals of financial profligacy. One of their first measures, however, in order to procure silver, was to issue 3000 millions in addition, which produced not much more than 100 million francs.

In this formidable state of things the next measure adopted was worthy of the violent and shortsighted administration from which it emanated. A forced loan of 600 millions was raised from the richest classes, to be paid either in coin, or in assignats at the hundredth part of their nominal value. So that if the current paper was 20,000 millions, a payment of 200 millions would be sufficient to extinguish the whole. The government however refused to sanction this principle as against itself; for in paying the public creditor, it gave the assignat the tenth part of its nominal value. The land-tax and the duties in farm were required to be paid half in kind and half in assignats; the custom-duties, half in corn and half in assignats. In the mean time, until the funds produced by this loan, which was enforced with great severity, could be at the disposition of the state, the government went on issuing assignats till they had absolutely lost all value, and had become waste paper. It therefore anticipated its resources by issuing promissory notes payable in specie, when the forced loan should be collected, and with difficulty prevailed on bankers to discount them to the amount of 60 millions. At this time the Directory gave up the task of supplying Paris with bread, and allowed the bakers' shops to be opened as before: an exception being made in favour of the indigent, and of fundholders and public functionaries whose annual incomes were not more than 5000 francs. The payment of the loan, however, went on slowly, the produce of the government bills was exhausted, and fresh funds were required. Again the resource of assignats was resorted to, and in two months the currency had been raised to 36,000 millions by the issue of 20,000 millions, which even to the government were not worth the 200th part of their nominal value.

By this time some new financial expedient became necessary. It was expected that, by payments of taxes and of the forced loan to the government, the paper in circulation would soon be reduced to 24,000 millions. It was therefore determined to make a new issue of paper, under the name of *mandats*, to the amount of 2400 millions. Of this sum 800 millions were to be employed in extinguishing 34,000 millions of assignats, which were to be taken at a thirtieth part of their legal value: 600 millions were to be allotted to the public service and the other 1200 millions retained in the public coffers. These mandates were to enable any person who was willing to pay the estimated value of any of the national lands to enter at once into possession; and therefore they furnished a somewhat better security than the assignats, as these could only be offered in payment at sales

by auction; and consequently the price of the lands rose in proportion to the depreciation of the paper. The estimate of the lands having been made in 1790 was not true in 1795, at which time they had in some cases lost a half, in others two-thirds or three-fourths of their former value. The mandat of 100 francs, however, at its first issue, was worth only fifteen francs if silver; and the new paper was soon so much discredited that it never got into general circulation, and was not able to drive out the coined money which was now almost universally employed in transactions between individuals. The only holders of mandates were speculators, who took them from the government and sold them to purchasers of national lands. By this entire discredit of the government-paper the prosperity of individuals had been in some measure restored, and trade revived a little from its long sleep. The government was destitute of all resource; its agents received nothing but worthless paper, and refused any longer to do their duties. The armies of the interior were in a state of extreme misery; while those of Germany and Italy were maintained only from the countries where they were quartered. The military hospitals were shut, the gens-d'armes were not paid or equipped, and the high roads were infested with bands of robbers, who sometimes even ventured into the towns.

In a short time the government were forced to abandon the mandates, as they had abandoned the assignats, and to declare that they should be received in payment of taxes and national lands only at their real value. Having fallen to near a seventieth of their ostensible value, they were, in the course of 1796, returned to the government in payment of taxes and for the purchase of lands; and with them ended the revolutionary system of paper money, which probably produced more wide-spreading misery, more sudden changes from comfort to poverty, more iniquity in transactions both between individuals and the government, more loss to all persons engaged in every department of industry and trade, more discontent, disturbance, profligacy, and outrage, than the massacres in September, the war in La Vendée, the proscriptions in the provinces, and all the sanguinary violence of the Reign of Terror.

From the extinction of the mandates to the present time the legal currency of France has been exclusively metallic. (Thiers, vol. viii. pp. 85-9, 103-19, 158-62, 177, 187-91, 334-44, 423-4; Storch, *Cours d'Econ. Pol.*, vol. iv. p. 161.)

ASSIGNEE of a bankrupt. [See **BANKRUPT**.]

ASSIGNEE of an insolvent debtor's estate. [See **INSOLVENT DEBTOR**.]

ASSIGNEE—of bill of lading. [See **BILL OF LADING**.]

ASSIGNEE—of a lease is the party to whom the *whole* interest of the lessee is transferred by assignment, which assignment may be made without the privity or consent of the lessor, unless the lessee is expressly restrained by the lease from assigning over. The assignee becomes liable to the lessor, from the date of the assignment, for the payment of the rent and performance of the covenants in the lease; but such liability is limited to breaches of covenant during the existence of the assignee's interest, and may be got rid of by assigning over all his interest, and this even to an insolvent; for his liability, arising only from *privity of estate*, that is, from the actual enjoyment of the premises leased, ceases with such enjoyment; whereas the lessee remains liable to the rent and covenants during the whole term. It results also from the circumstance of the assignee's liability arising from *privity of estate*, that he is not liable to mere personal covenants which the lessee may have made with the lessor (as *e. g.* to build on premises not demised, or to pay a sum of money in gross), but only to such covenants as run with the land, as for instance, covenants to pay rent, to repair, to reside on the demised premises, to leave part of the land in pasture, to insure premises situate within the weekly bills of mortality, to build a new mill on the site of an old one, &c. [See, further, **COVENANT**.] The assignee, in order to become liable to the covenants, must take the whole estate and interest of the lessee; for if the smallest portion is reserved, he is merely an under-lessee, and not responsible to the original lessor. The interest of the assignee must also be a legal, not merely an equitable interest; and therefore if the lessee devise the premises leased to trustees in trust for A B, A B will not be chargeable as the assignee of the lessee's interest. The interest must also be an interest in lands or tenements; for if a lease is made of chattels (as for instance, of sheep or cows, which sometimes happens), and the lessee covenant for himself and his assigns to redeliver

them, the assignee is not liable to the owner on this covenant; for there is no privity between the assignee and the owner, such privity only existing where the subject of the demise is real estate. Wilnot, C. J. says, in *Bally v. Wells*, 'The covenant in this case is not collateral; but the parties, that is, the lessor and assignee, are total strangers to each other, without any line or thread to unite and tie them together, and to constitute that privity which must subsist between debtor and creditor to support an action.'—(Wilnot, 345.) The assignee may acquire his interest by operation of law as well as by an actual assignment from the lessee, and therefore a tenant by *elegit*, who has purchased a lease under an executor, is liable as assignee to the lessor in respect of his privity of estate. [As to the liability of assignees of bankrupt on the leases of the bankrupt, see **BANKRUPT**.]

ASSIGNMENT, a deed or instrument of transfer, the operative words of which are to 'assign, transfer, and set over,' and which passes both real and personal property. Estates for life and estates for years are the principal real interests which are passed by an assignment: and by the statute of Frauds and Perjuries (29 Car. II.) the assignment of such estates is required to be in writing. An assignment differs from a lease, in being a transfer of the entire interest of the lessor: whereas a lease is carved out of a greater estate, creates the relation of landlord and tenant, and reserves to the lessor a reversion after its expiration. If, however, a deed in effect passes the whole interest of the tenant, it operates as an assignment, though it be in form a lease, and though it reserve a rent. As if A having a term of twenty years in land, grants to B the whole twenty years, reserving a rent: in such case B is assignee of the whole term and interest, and not under-lessee to A; and A, for want of having any reversion, cannot distrain for the rent (a distress being only enforceable where the landlord has a reversion expectant on the determination of the tenancy). A, in such case, can only sue B for the rent as for money due upon a contract. In all under-leases, therefore, it is necessary that part (a dry will suffice) of the original term should remain in the lessor. See Sheppard's *Touchstone*, 200; Black, *Comm.*, v. ii. 326; Bac, *Ab.* (7th edit.) tit. *Assignment*. [See **BILL OF SALE**.]

An *Assignment of Goods, Chattels, &c.*, is frequently made by bill of sale, as to which, see **BILL OF SALE**. As to all goods and chattels *in possession*, no objection ever existed to their transfer and assignment by deed or writing; but with respect to things *in action* (as debts, contracts, right of entry, and suit), according to an ancient rule of the common law, now considerably modified, they could not be assigned over by the party to whom they were due, since the assignment gave to a third party a right of action against the debtor, and thus led to the offence of maintenance—*i. e.* the abetting and supporting of suits in the king's courts by others than the actual parties to them. In the courts of common law this rule exists (with some exceptions) at the present day. Thus, if the obligee in a bond assign over the bond to a third party, the assignee cannot sue on the bond at common law in his own name: but such an assignment generally contains (and ought always to do so) a power of attorney from the obligee to the assignee, to sue in the obligee's name on the bond. Courts of equity have always protected such assignments, and regarded the assignee, for valuable consideration, as the actual owner of the bond: and the courts of common law so far recognise the right of the assignee, that if the obligor, *after notice* of the assignment, pay the money on the bond to the obligee, the courts will not permit him to plead such payment to an action brought by the assignee in the obligor's name on the bond. In order to constitute a good equitable assignment of a bond, or chose in action, writing is not necessary. A personal trust or confidence cannot be assigned over, however able the assignee may be to execute it: and therefore all trust deeds, and settlements contain express provisos for the retiring of trustees, and for fresh appointments, with the consent of the *cestui que trusts*. Neither the future whole-pay nor the future half-pay of an officer are capable of being assigned, it being considered contrary to public policy that a stipend given to a man for his public services should be transferred to another man not capable of performing them. The exceptions to the rule that *chooses in action* are not assignable at law are many. The king might at all times become the assignee of a *chose in action*: and after such an assignment was entitled to have execution against the body, lands, and goods of the debtor. But this preroga-

tive, having been abused by the king's debtors, was restrained by stat. 7 Jac. I. c. 15, by a privy seal, in 12 James I., and by rule of court of 15 Car. I.; and the practice of actually assigning debts to the king by his debtors has long become obsolete. Bills of exchange are assignable by indorsement, in virtue of the custom of merchants [see **BILL OF EXCHANGE**]; and promissory notes, by virtue of the 3 and 4 Ann. cap. 9. Bail bonds are assignable by the sheriff to plaintiff in the suit under 4 Ann. c. 16. s. 20. [See **BAIL**.] Roplevin bonds, by the 11 Geo. II. c. 19. [See **ROPLEVIN**.] The petitioning creditor's bond under a fiat of bankruptcy, by 6 Geo. IV. c. 16. [See **BANKRUPT**. See, further, **BOND**, **CHOSE IN ACTION**, **INSOLVENT DEBTORS**.]

ASSINIBOIN RIVER. [See **RED RIVER**.]

ASSINIBOINS, a tribe of North American Indians, on and near the Assiniboin River.

ASSINT, or **ASSYNT**, a parish in the northern Highlands of Scotland. It is situated on the west coast of the county of Sutherland, adjoining Ross-shire, and has several islands belonging to it. It extends thirty-five miles in length, and twelve in breadth. It is extremely mountainous. Ben More, Assynt, which is the highest mountain in the county, is about 3200 feet above the level of the sea: it consists of quartz rocks. The other remarkable mountains, Soulvén and Quen'ag, which are nearer the coast, consist of the old red sandstone, which assumes the most singularly picturesque shapes, and the beds continue in a remarkably horizontal position, though separated from each other by several miles. The space at the foot of the mountains is generally moss. The surface fit for tillage is very limited, the cultivated spots seldom exceeding a few yards in extent. The occupation of the poorer inhabitants is fishing, especially herring, cod, and ling, and the rearing of cattle. The greater portion of the parish, however, is divided into extensive sheep-walks, stocked with the improved Cheviot breed. Oats, bear, and potatoes form the food of the people, and are the objects of their cultivation.

This district belonged antiently to the Earls of Sutherland, but passing successively through the families of Moray, Kinradd, Macleod, and Mackenzie, it reverted to the same family about a century back, being now the property of the Duchess Countess of Sutherland. There is no wood, properly speaking, but there are considerable districts covered with natural birch, intermixed with the oak, the hazel, the mountain-ash, and the honeysuckle.

A considerable portion of the interior is composed of primitive limestone; marbles of various qualities and colours have been worked, but as they contain small particles of quartz, they are too difficult to saw to come into use.

The parish is now intersected with about forty miles of excellent road, constructed entirely by the late Duke of Sutherland, which has altogether altered the condition of the people and their future prospects.

The coast is rocky and precipitous, with strong tides and a stormy ocean; but it possesses several safe boat harbours; Loch Inver on the south, and Kylesku on the north, are safe roadsteads for larger vessels, and are frequented in spring and autumn in the fishing season.

The parish church was inconveniently situated, so that many of the parishioners never saw it. The minister had, however, one or two preaching stations: but the deficiency of religious instruction has been more effectually supplied by the building of a new church at Store, under the direction of the Parliamentary Commissioners for building churches in the Highlands and Islands of Scotland, with the aid of the late Duke of Sutherland and his duchess, then Marquess and Marchioness of Stafford. Another new place of worship has also been erected by their aid and by subscription at Loch Inver. There are seven schools in Assynt, besides the parochial school: and the public and private scholars in the parish amount to between 500 and 600. The whole population is 3161. Gaelic is the language chiefly read and spoken. (Sir John Sinclair's *Statistical Account of Scotland*; *Parliamentary Reports*, &c.)

ASSISI, a town of the Papal state, in the province of Umbria, and in the administrative delegation of Perugia. It is built on a hill, and near though not upon the high road from Perugia to Foligno, in 43° 5' N. lat., and 12° 33' E. long. It commands a full view of the fine valley of Foligno, watered by the Topino, one of the tributaries of the Tiber. Assisi was the birth-place of St. Francis, the founder of the mendicant order which bears his name, of which it is considered as the metropolis. The Sacro Convento, or

church and monastery in which St. Francis was buried, is a large and splendid building. Two miles from Assisi, by the side of the high road, is the noble church of La Madonna degli Angeli, raised by the architect Vignola, in the centre of which stands the rustic oratory where St. Francis first began his ascetic course of life. It is called the Portiuncula, from its having been the first portion, or property belonging to the order. [See FRANCIS, SAINT.] On the 2nd of August multitudes of pilgrims resort to this sanctuary. Assisium was a Roman municipium, and a place of considerable importance, as may be inferred from the remains of the forum, the thermæ, the aqueducts, and other ruins which are still seen. But the finest piece of antiquity it contains is the Temple of Minerva, transformed into a church dedicated to the Virgin; the portico, which has remained entire and in good preservation, is considered to be the finest specimen of the kind in Italy, after the Pantheon. It consists of six fluted Corinthian columns, with architrave, frieze, and cornice, surmounted by a pediment. The whole is made of travertino; the proportions are good, and the capitals and other ornaments are of fine workmanship. The inscription on the frieze, which was of brass characters, has been unfortunately lost. Only three sides of the ancient cella remain, the posterior part having been lengthened when converted into a church. The columns, including base and capital, are thirty-five feet in height. This portico had been much neglected and injured, until 1758, when the Congregation of the Oratory having purchased it of the Capuchin friars for 2000 scudi, the Superior, Father Fisenodler, of Munich, restored the portico to its original appearance, and cleared it of some adjacent hovels. The house of the Congregation and the public schools are now annexed to the church. Antolini has given a description of the temple, with plates. Among other scattered remains of antiquity is a fine sarcophagus, with a rilievo representing Diana and Endymion; it forms now the table of one of the altars in the church of St. Rufino. Several ancient vases are used as public fountains.

Assisi is a bishop's see. Its population is about 1000. The country around abounds with olive trees, and there are mineral waters in the neighbourhood.

ASSIZE. This word has been introduced into our legal phraseology from the French *assis*, and is ultimately derived from the Latin verb *assideo*, to sit by, or, as Lord Coke translates it, to sit together. The word *assido* is also to be found in legal records and has in law-latin a different meaning from *assideo*, signifying to assess, fix, or ordain. Thus in the *posita*, or formal record of a verdict in a civil action, it is said that the jury find for the plaintiff, *et assidunt damnum ad decem s. lide*; and they assess the damages at ten shillings; and then the judgment of the court is given for the damages 'per juratoris in forma prædicta assessa.' It is possible that the word assize, in cases where it signifies an ordinance, decree, or assessment, may be derived from this word. This etymology is not, however, given by Du Cange, Spelman, or any learned writer on this subject; though it obviously leads much more distinctly to several meanings of the word assize than the derivation from *assideo*. With reference to English law, the word assize has been called by Littleton *nomen æquivoctum*, on account of its application to a great variety of objects, in many of which neither the etymology of the word nor its original meaning can be readily traced. In this article it is proposed to enumerate and explain in a summary manner the various significations of the term.

1. The term assize also signified an ordinance or decree made either immediately by the king, or by virtue of some delegation of the royal authority. Thus the Assizes of Jerusalem were a code of feudal jurisprudence for the new kingdom of Jerusalem, formed in 1099 by an assembly of the Latin barons, and of the clergy and laity under Godfrey of Bouillon. (Gibbon's *Decline and Fall*, vol. xi. p. 93.) In this sense also, in ancient English history, Fleta speaks of 'the laws, customs, and assizes of the realm' (lib. i. cap. 17); and the ordinances made by the great council of nobles and prelates assembled by Henry II. in 1164, and commonly known as the 'Constitutions of Clarendon,' are called by Hoveden '*Assise Henrici Regis factæ apud Clarendonum*.' In like manner the assizes of the forest were rules and regulations made by the courts to which the management of the royal forests belonged.

2. Analogous to these were the assizes or ordinances regulating the price of bread, ale, fuel, and other common

necessaries of life; called in Latin *assise venalium*. The earliest express notice of any regulation of this kind in England is in the reign of King John (1203), when a proclamation was made throughout the kingdom enforcing the observance of the legal assize of bread; but it is probable that there were more ancient ordinances of the same kind. In very early times these '*assise venalium*' appear to have been merely royal ordinances, and their arrangement and superintendence was under the direction of the clerk of the market of the king's household. But at a subsequent period many statutes were passed regulating the assize of articles of common consumption; the earliest of these is the assize of bread and ale, '*assisa panis et cervisie*,' commonly called the stat. of 51 Henry III. though its precise date is somewhat doubtful. The provisions of the act with regard to ale, establishing a scale of prices varying with the price of wheat, were altered in some measure by 23 Henry VIII. c. 4, which left a discretionary power with the justices of the peace of fixing the price of ale within their jurisdiction [see ALE]; but the assize of bread was imposed by this act, and enforced from time to time by orders of the privy council until the reign of Queen Anne. In cities and towns corporate the power of regulating the assize of bread and ale was frequently given by charter to the local authorities, and the interference of the clerk of the King's household was often expressly excluded. Books of assize were formerly published, under authority of the privy council, by the clerk of the market of the king's household, and there is one still in existence which was printed in the reign of Henry VIII. The stat. 8 Anne, c. 19, repealed the 51 Henry III. and imposed a new assize of bread, making various other regulations respecting it. Several subsequent acts have been passed on the subject; but by the 55 Geo. III. c. 99, the practice was expressly abolished in London and its neighbourhood, and in other places it has fallen into disuse. There was also an assize of wood and coal (stat. 31 and 32 Henry VIII. c. 3); and so late as the reign of Queen Anne, we find an act (9 Anne, c. 20) enforcing former regulations for the assize of billet. Besides these, various other articles—wine, fish, tiles, clothes, &c., have at different times been subject to assize. The object of these regulations was the prevention of fraud and monopoly; and it is not surprising that in the early stages of legislation it should have appeared to be one of the first duties of government to secure to its subjects the prime necessities of life at a reasonable and uniform rate. But subsequent experience and more enlightened views have shown, that to attempt to fix by law the prices of commodities, is not only useless and mischievous, but in many cases impracticable; and that when government has established an uniform scale of weights and measures, and, so far as it can be done, an uniform measure of value, the rest may safely be left to competition, and to the mutual bargaining which takes place between the buyer and the seller.

3. The word assize also denoted the peculiar kind of jury by whom the writ of right was formerly tried, who were called the grand assize. The trial by the *grand assize* is said to have been devised by Chief Justice Glanville, in the reign of Henry II., and was a great improvement upon the trial by judicial combat, which it in a great degree superseded. Instead of being left to the senseless and barbarous determination by battle, which had previously been the only mode of deciding a writ of right, the alternative of a trial by the grand assize was offered to the tenant or defendant. Upon his choosing this mode of trial, a writ issued to the sheriff directing him to return four knights, by whom twelve others were to be selected, and the whole sixteen composed the jury, or grand assize by whom the matter of right was tried. The late act of parliament, 3 & 4 Will. IV. c. 27, has now abolished this mode of trial, the cumbersome machinery of which was entirely unfit for the habits of modern society. [See WRIT.] By the law of Scotland, the jury, in criminal cases, are still technically called the assize.

4. The common and popular use of the term assize, at the present day in England, is to denote the sessions of the judges of the superior courts, holden periodically in each county for the purpose of administering civil and criminal justice. These assemblies no doubt originally derived their denomination from the business which was at first exclusively imposed upon them, namely, the trial of writs of assize. According to the common law, assizes could

only be taken (*i. e.* writs of assize could only be tried) by the judges sitting in term at Westminster, or before the justices in eyre at their septennial circuits. This course was productive of great delay to suitors, and much vexation and expense to the juries, or grand assize, who might have to travel from Cornwall or Northumberland, to appear in court at Westminster. To remedy this grievance, it was provided by *Magna Charta*, in 1225, that the judges should visit each county once in every year, to take assizes of novel disseisin and mort d'ancestor. From this provision the name of justices of assize was derived; and by several later acts of parliament various authorities have been given to them by that denomination. By the 13 Edward I. c. 3, (commonly called the statute of Westminster 2), it was enacted, that the justices of assize for each shire should be two sworn judges, associating to themselves one or two discreet knights of the county; and they are directed to take the assizes not more than three times in every year. By the same statute, authority is given them to determine inquisitions of trespass and other pleas pleaded in the courts of King's Bench and Common Pleas. From this important act of parliament the jurisdiction of the judges of assize to try civil causes, other than the writs of assize above mentioned, originally arose; and as, with some modifications, it forms the basis of their civil authority at the present day, it may be desirable to endeavour to explain the complex and argumentative process by which the provisions of the statute are practically effected. Besides the general authority to determine civil issues, it was provided by the statute of Westminster 2, that no inquest in a civil action should be taken by the judges of the superior courts when sitting at Westminster unless the judicial writ which summoned the jury for such inquest appointed a certain day and place for hearing the parties in the county where the cause of action arose. Thus, if a suit arose in Cornwall, the writ from the superior court must direct the sheriff of that county to return a jury at Westminster for the trial of the inquest in the next term, '*unless before*' (*nisi prius*) the term, namely on a certain day specified in the writ, the justices of assize came into Cornwall. This was sure to happen under the directions of a previous clause in the statute of Westminster 2, in the course of the vacation before the ensuing term, and the jury were then summoned before the justices of assize in Cornwall, where the trial took place, and the parties avoided all the trouble and expense of conveying their witnesses and juries to London. The jurisdiction of the judges of *nisi prius* is therefore an annexation to their office of justices of assize; and thus, from the alteration in the state of society since the above laws were made, the principal or substantial part of their jurisdiction has, by the discontinuance of writs of assize, become merely nominal, while their annexed or incidental authority has grown into an institution of immense practical importance.

For several centuries, until a few years ago, the whole of England was divided into six circuits, to each of which two judges of assize were sent twice a year. Previously to the year 1830, the Welsh counties and the county palatine of Chester were independent of the superior courts at Westminster, and their peculiar judges and assizes were appointed by the crown under the provisions of several statutes. This separation of jurisdiction being found inconvenient, the statute 1 William IV. c. 70 increased the number of judges of the superior courts, and enacted that, in future, assizes should be held for the trial and despatch of all matters criminal and civil within the county of Chester and the principality of Wales under commissions issued in the same manner as in the counties of England. Since the passing of this statute, therefore, the assizes throughout the whole of England and Wales (excepting London and Middlesex, where the administration of justice is regulated by peculiar customs and acts of parliament) have been holden twice a year in each county upon a uniform system. In addition to these ordinary assizes, a third assize for the trial of criminals has for the last ten years taken place in the counties of Hertford, Essex, Kent, Sussex, and Surrey.

The judges upon the several circuits derive their civil authority ultimately from the antient statutes of assize and *nisi prius* in the manner before described; but they have also a commission of assize which is issued for each circuit by the crown under the great seal. This commission pursues the authority originally given by *Magna Charta* and the statutes of *nisi prius*, and seems to have been nearly in the same form ever since the passing of those statutes. It

is directed to two of the judges and several serjeants (the latter deriving their authority to be judges of assize from the statute 14 Edward III. c. 16, which mentions 'the king's serjeant sworn,' under which words Lord Coke says that any serjeant at law is intended (2 Inst. 422), and commands them 'to take all the assizes, juries, and certificates, before whatever justices arraigned.' Under the direct authority given by these words, the commissioners have in modern times nothing to do, the 'assizes, juries, and certificates' mentioned in the commission having only a technical reference to the writs of assize, now wholly discontinued. It is stated in most of the common text books that the judges of assize have also a commission of *nisi prius*. This is, however, a mistake, no such commission being known in our law, and the only authority of the judges to try civil causes being annexed to their office of justices of assize in the manner above described.

In certain cases, the justices of assize, as such, have by statute a criminal jurisdiction; but the most important part of their criminal authority is derived from other commissions. The first of these is a general commission of Oyer and Terminer for each circuit, which is directed to the lord chancellor, several officers of state, resident noblemen and magistrates, and the king's counsel and serjeants on their respective circuits; but the judges, king's counsel, and serjeants, are always of the quorum, so that the other commissioners cannot act without one of them. This commission gives the judges of assize express power to try treason, felony, and a great variety of offences against the law of England, committed within the several counties composing their circuit. [See OYER AND TERMINER.]

The judges of assize have also commissions of gaol delivery, which in their legal effect give them several powers, which, as justices of Oyer and Terminer only, they would not possess. They are directed to the judges, the king's counsel, and serjeants on the circuit, and the clerk of assize and associate. Every description of offence is cognizable under this commission; but the commissioners are not authorized to try any persons except such as are in actual or constructive confinement in the gaol specifically mentioned in their commission. There is a distinct commission under the great seal for the delivery of the prisoners in each particular gaol. [See GAOL DELIVERY.]

The judges on their circuits have also a commission of assize. In addition to the above authorities, the judges of the superior courts on the circuits are also fortified by the commission of the peace. The judges of the King's Bench, Common Pleas, and Exchequer, for the time being, are always inserted in the commissions of the peace periodically issued for each English county; and consequently they may exercise all the powers and functions communicated by the commissions of the particular counties which compose their respective circuits.

In practice, the judges of the courts at Westminster choose their circuits by arrangement among themselves on each separate occasion. They are then formally appointed by the king under the sign manual; and the several commissioners are afterwards made out in the Crown Office of the Court of Chancery from a fiat of the lord chancellor.

ASSOCIATION is one of the mental phenomena. It does not rank among the primary powers of the mind, like sensation, perception, and judgment, because it does not form one of the separate steps of all mental operations; nor do its functions consist, like those of memory, in re-embodiment past impressions. It acts as an agent to all these powers, though not a power itself. The office which it performs is to connect and arrange rather than to originate ideas. By its influence over the sensations, perceptions, and judgments, it regulates the succession of the thoughts. When one thought is suggested by another, or when a train of past images is summoned by something present, whether spontaneously or by an exertion of memory, the process by which this effort is made is called association. Dr. Brown has designated it 'the principle of suggestion;' a term which, if its operations were discriminative and voluntary, would be preferable to the one in present use. But suggestion implies deliberation, choice; whereas, it is the province of association to awaken perceptions, not to perceive; to link the thoughts, not to think; to lead the memory to successive images and trains of ideas, between which there is a bond of connexion, not always obvious, but when discovered, traceable to one or other of

those affinities, analogies, or contrasts by which the principle of association acts. Mr. Hume was the first writer who traced the influences of our associations to certain principles, which he denominated 'resemblance, contiguity in time or place, and cause or effect.' 'Contrast' has since been added to these, which completes the classification of those sympathies and predilections, seated in the mind and acting with all the force and certainty of established laws.

It is not pretended that there may not be large classes of our associations not referable to any of these principles, such as the names of things, the terms of art, the words by which we designate moral and intellectual qualities and operations; in short, the whole vocabulary of language, in which there is little or no connexion either in the way of resemblance, contiguity, cause, effect, or contrast with the objects or ideas represented, although none of them ever fail to summon up the images of the things for which they stand. Anomalies like this, when reducible to certain limits, establish rather than invalidate the laws to which they form an exception. Even the terms of a language, when once connected with their representative objects, offer one of the most remarkable illustrations of simple association. In the word *flower*, for instance, there is nothing to stamp upon the mind any particular image. To one who was ignorant of language it would convey no idea; but let the word be explained, let it once be associated with its representative genus of objects, and it instantly calls up the picture of some beautiful plant in blossom whenever the name is seen or pronounced. The distinction between association and memory is here plainly visible. The knowledge of the term *flower* is an act of memory; the knowledge of the object which it represents implies also an act of memory; but the connexion between the name and the object, and still more, between the name and the particular flower that blooms before the mind's eye, are the results of association.

Mr. Hume has annexed to his enunciation of the three principles above enumerated an example illustrative of each. 'That these principles,' he observes, 'serve to connect ideas will not, I believe, be much doubted. A picture naturally leads our thoughts to the original. The mention of one apartment in a building naturally introduces an inquiry or discourse concerning the others. And if we think of a wound, we can scarce forbear reflecting on the pain which follows it.' The first of these illustrations is founded upon the law of resemblance; the second, upon the law of contiguity; the third, upon the law of causation. 'But,' continues he, 'that this enumeration is complete, and that there are no other principles of association except these, may be difficult to prove to the satisfaction of the reader, or even to a man's own satisfaction.'

To whatever principles or laws we ascribe the association of ideas, it is evident enough that there is not only a bond of connexion amongst them, but a bond of order. The greatest irregularity and confusion would obviously prevail in our mental operations, without some regulating principle. That principle is association. It is to mind what the law of attraction is to matter. It draws together ideas connected by common affinities, and repels others that cannot coalesce. When we contemplate the vast number of different impressions made upon the mind in the course of every day, which have to be referred to again, what a confusion would be created, were there not some property in the ideas by which they arrange themselves according to certain invariable laws and relations, designed not only to preserve them, but to promote their restoration at a future period. This reproduction of our thoughts in so perfect a manner, in the order in which they are wanted, comprises one, and not the least remarkable, of the phenomena of association. Most of our ideas are reproduced with facility, but occasionally it is with difficulty they are recovered, owing either to indistinctness in the original impression, or to an imperfection of the associating faculty itself, which is not equally acute in every individual, nor equally active at all times in the same individual.

Sometimes trains of associations *involuntarily* convey the thoughts to subjects foreign to our wishes. They run away, as it were, with our ideas; and, regardless of the unities of time or place, awaken images and recollections which not only startle us by their abruptness, but occasion us at times no little trouble to account for their presence. This mental phenomenon admits of easy explanation. While the volitions of thought are intensely directed to a particular subject, the associations act in subordination to

that which is, for the time, 'the ruling idea of the mind;' when this mental intensity subsides, and the attention ceases to concentrate the faculties of thought, the mind relapses into that desultory state which is its ordinary mood in the absence of excitement. Hence the attention which fixes the thoughts controls the associations; the relaxation of attention which allows the thoughts to wander grants the same license to the associations. A striking illustration of this fact is to be found in what are called reveries—a state of mental ennui, in which the mind shrinks from exertion, and resigns itself to the guidance of the associations. In sleep, this emancipation from mental direction is still more complete; in consequence of which, the order and perspicuity of thought, so conspicuous while attention presides over intellectual exertion, are deranged. Strange contradictions and anomalies present themselves, announcing the suspension of that faculty whose office it is to restrain the wild and involuntary action of the associating power.

It should be added, however, that, although our associations roam at large during slumber, and although they may occasionally refuse to come and go at our bidding at other moments, yet they are capable of being controlled and regulated to a very high degree. A habit of attention is the governing power. Attention implies abstraction from desultory thoughts, and the act of mental direction to a particular subject. The influence of this habit keeps the associations under control; the want of it renders our waking thoughts little less incongruous than the dreams of sleep. It is one of the singular properties of association that it acts upon the moral as strongly as upon the intellectual part of our nature. Not to speak of its influence upon the generous and noble dispositions of the mind, the passions are perverted by an unlicensed association of ideas. Mr. Locke gives an example of this tendency, in reference to the origin of superstitious fear—a weakness less prevalent in the present than in the past generation. He alludes to the vulgar belief in ghosts as spirits of the night. 'The ideas of goblins and sprites have really no more to do with darkness than with light; yet let but a foolish maid inculcate these often on the mind of a child, and raise them there together, possibly he shall never be able to separate them again as long as he lives; but darkness shall ever afterwards bring with it those frightful ideas, and they shall be so joined that he can no more bear the one than the other.'

To avoid this and other errors to which the mind is exposed by an undisciplined use of the associating faculty, the greatest pains ought to be taken to render it not only subordinate but obedient to reason; to place it under the guard of attention, and to fill the intellectual storehouse with such ideas as shall only awaken pure and pleasing associations.

In relation to the phenomena of associations, it is worthy of remark that we are indebted to modern philosophy for the development if not for the discovery of them all. The original elucidation of the principle is ascribed to Mr. Locke, who, in one of the later editions of his 'Essay on the Human Understanding,' added a new chapter entitled 'Of the Association of Ideas,' in which the laws of this power are noticed, and some of its phenomena explained. Soon after, Dr. Hartley in his 'Observations on Man,' investigated the principle more thoroughly, and carried its application from simple ideas to the actions and affections, tracing all the intellectual and moral phenomena up to this source. Mr. Hume, in one of his 'Essays' published almost contemporaneously, showed that the three connecting principles of all ideas are the relations of resemblance, contiguity, and causation, to which some subsequent writer appended a fourth, viz. contrast. In the works of these philosophers is comprised all that is known in reference to the doctrine of association, later writers having done little more than expand or illustrate the views of their predecessors.

ASSOCIATION, AFRICAN. [See AFRICAN ASSOCIATION.]

ASSONANCE, *asonancia*, in Spanish romance and dramatic and in several species of lyric poetry, is a peculiar correspondence in sound in the termination of verses, less complete than that of rhyme. In rhyme (called in Spanish *consonancia*) the vowel in the last accented syllable and all the subsequent consonants and vowels are required to be the same as in the co-rhyming verse; but in *assonance*, though the vowels of the last accented syllable and in all subsequent syllables are the same, the consonants may and

ought to be different. Thus, *bárbaro*, which has the accent on the antepenultima, is an assonant with *edlamo* and *plátano*. *Búscas*, which is accented on the penultima, is an assonant with *cáral* and *siya*. (So in English, *hardy*, *manly*, and *carry*, would be assonants; in German, *loben*, *hoffe*, *oder*.) *Corazón*, which is accented on the last syllable, is assonant with *amór*, *español*, *flor*, *voz*.

Assonants are not, like rhymes, exhibited in insulated pairs, but are continued through the whole poem, or, in dramatic compositions, through an entire act or day (*jornada*), without any other change than the alternation of blank verse with the assonants. Thus, the first, third, fifth, seventh lines, &c. of the act are blank verse, and the second, fourth, sixth, and eighth lines, &c. are all assonants to each other; unless indeed the blank line and the assonanted line which follows it be considered as constituting one long line, terminating with an *asonante*, as in the Arabian prototype supposed to be discovered by Sarmiento in some of the metrical parts of the Koran.

But for this constant recurrence of the same assonance through a long succession of alternate lines, the ear would probably be little struck with this faint species of rhyme, even when proceeding from the mouth of a Spaniard, in which the vowels are so fully and broadly sounded, without being contracted by the use of double consonants, which, while they add to the brilliancy of Italian versification, appear to render it less susceptible of this delicate species of embellishment, so peculiarly adapted to the use of the drama, for which rhyme is perhaps too prominent and too ostentatious an ornament.

Calderón, and the other classical dramatists of Spain, always use *asonantes*. The *asonante* of the drama is that in which the accent is on the penultima, the verse consisting of eight syllables.

In lyric poetry, rhyme is more frequently adopted; but the *endecha*, a species of elegy, and some other lyric measures, require the assonant. The following extracts from romances contain lines alternately blank and assonanted, as is always the case in romantic and in dramatic poetry. In the first of these examples the accent is on the penultima; in the second, on the last syllable:—

Sahó el gallardo Aliatar
Con cien Moriscos gallardos
En defensa de Motril
Y socorro de su hermano,
A caballo salió el Moro,
Y otro día desdichado
En negras andas le vuelven
Por donde salió á caballo.

Maldeciré mi hermosura,
Y también mi mocedad,
Maldeciré el triste día
Que con vos quise casar.

The next is an example of double assonants:—

Aguárdate, dixo el payo
Al enervo de leños.
¿Sabes lo que estoi pensando?
Que eres negro y feo.
Escucha; tambien reparo,
Le gritó mas recio,
En que eres un paxarraco
De mui mal agüero. *Friarte.*

ASSOUAN. [See SYENE.]

ASSUMPSIT is the technical term denoting one of those specific forms of action which were provided, at a very early period of the history of English law, as the course by which redress for particular injuries must be pursued. It is so called from the past tense of the Latin word *assumo*, barbarously applied to signify 'I undertake'; and is taken from the use of this word, describing the defendant's undertaking, in the old Latin pleadings. Thus, the form would be 'that in consideration that the plaintiff had furnished goods to the defendant, the latter undertook, or rather took upon himself (*super se assumpsit*) to pay the former so much money.' The action of *assumpsit* is exclusively used for the recovery of damages occasioned by the breach of a simple contract; that is, a contract not under seal nor of record; and is now more generally adopted than any other form of action in such cases. It cannot, however, be sustained, unless there has

been an express promise to pay money (as in the case of a promissory note), or to do any other act; or unless circumstances have occurred which in reason and justice have created a liability, and from which therefore the law will imply a contract. An example of the latter occurs in the familiar instance of the delivery of goods by a tradesman to a customer: in which case, though no express promise to that effect has been made, it is an inference of law that the customer has promised to pay for them as much as they are worth; and, accordingly, the plaintiff's declaration, or formal relation of his cause of action upon the pleadings, would state the debt generally, and also an *actual* promise to pay it. This would be called an *assumpsit* on a *quantum valebant*. If the consideration were the personal services of the plaintiff, given for the benefit of the employer the latter is supposed to promise to pay as much as the plaintiff 'reasonably deserved to have'; and then the action is called an *assumpsit* upon a *quantum meruit*. So also the character and relative situations of parties will often raise a legal liability, from which an *assumpsit* or undertaking will be implied in the absence of any express contract. Thus, an innkeeper is bound to secure the goods of his guests: in consequence of this liability, the law supposes him to promise to do so; and if the goods are lost or injured, he is liable to an action of *assumpsit* for the damage which the owner may have sustained. In like manner, it is the duty of surgeons and attorneys to use proper care and skill in the service of those who employ them in their respective callings, and being in legal consideration supposed to promise to do so, they are liable to be called upon in an action of *assumpsit* to make compensation in damages for any negligence or want of skill. Where the undertaking, whether express or implied, is founded upon an antecedent debt for an ascertained sum, the action is called *indebitatus assumpsit*. This form of action is of comparatively modern invention, being introduced for the purpose of enabling plaintiffs to evade the *wager of law*, which was allowed in actions of debt on simple contract until the late statute of 3 and 4 William IV. c. 42.

ASSUMPTION, or ASUNCION, the capital city of Paraguay, in South America. It is situated on the eastern bank of the River Paraguay, between the Confuso River on the north, and a branch of the Pileomayo on the south, both which streams fall into the Paraguay. The city, which stands upon a commanding spot, was built in 1535 by a colony of Spaniards under Juan de Salazar; and from the convenience of its situation speedily became a place of some consequence. It was nearly destroyed by fire in 1543, the greater part of the houses being built of wood. From this calamity it speedily recovered; and in 1547 was a place of sufficient importance to be erected into a bishopric. It contains a beautiful cathedral, besides three parish churches and four convents and monasteries. It once contained a college of jesuits. The present population is understood to be comparatively small; not more than 400 or 500 families are said to reside within the city, but a much larger number resort to it for the purpose of traffic, who live in the surrounding country, where the houses, having small farms attached to them, are very numerous. Assumption carried on a considerable trade in the export of hides, tobacco, and sugar; but its principal trade was furnished by the leaves of a species of herb called *matte*, more generally known by the name of Paraguay tea, which article used to be packed in hides and sent for sale to Buenos Ayres, and thence distributed to various parts of Chili and Peru. Great numbers of horned cattle, horses, mules, asses, sheep, and goats, are bred by the farmers, who grow wheat, maize, sugar, tobacco, cotton, mandioc, potatoes and other vegetables. Honey and wax are produced in abundance; and the rivers supply large quantities of fish.

The air in and about Assumption is generally temperate and genial; for the greater part of the year the wind blows from the south.

In the course of the convulsions and revolutions which of late years have disturbed so large a part of South America, Paraguay has become subject to a ruler who has so successfully discouraged all intercourse with foreign countries, as well as with the surrounding states, that the world has been for some time kept in utter ignorance of the state of the country, and the progress and condition of the inhabitants.

The city is in 25° 16' S. lat., and 57° 37' W. long.

(See Henderson's *History of Brazil*, and Thompson's *Alcedo*.)

ASSURANCE. Of late years it has become usual with writers on life contingencies to speak of *assurances* upon lives, instead of *insurances*, reserving the latter term for contingencies not depending on life, as against fire, losses at sea, &c. [See **INSURANCE**, **ANNUITIES**, &c.]

ASSYE, a small town, about twenty-eight miles north of Jaulna, in the province of Bahar, in Hindustan. This place is principally known as having been the scene of a battle fought on the 23rd of Sept. 1803, between the English army, under the present Duke of Wellington, then General Wellesley, and the confederate armies of Dowlut Row Scindia and the Rajah of Nagpore. On this occasion, the troops under General Wellesley consisted of 2000 European and 2500 native soldiers, while the armies to which these were opposed amounted to 30,000 men. Notwithstanding this great disparity of numbers, the battle was forced on by the English general, who found the enemy encamped on the bank of the Kaitua river, which he crossed for the purpose of the attack. It was only by the most determined bravery on the part of the British that they could hope to succeed against such a disparity of numbers; and accordingly, although the cattle employed in bringing on the artillery were soon so far destroyed or disabled that the use of the guns was abandoned, the troops advanced with a steadiness which overawed the enemy, who gave way in all directions, leaving ninety-eight pieces of cannon and seven standards in the hands of the English, and 1200 men dead on the field. The loss on the part of the British was also very great, 425 being killed and 1138 wounded: so that more than one-third of the corps was included among the killed and wounded. (See Mill's *History of British India*.)

ASSYRIA is the name of an ancient empire in western Asia, which ceased to exist before the epoch at which the authentic history of the East is usually considered to commence. As a geographical term, the name Assyria is used in different acceptations. Greek and Roman historians commonly employ it as a general designation of the countries of Babylonia, Mesopotamia, Aturia, and Adiabene; but frequently extend its limits so as to make it comprehend even part of Asia Minor. The Greeks were accustomed to use the name Syria and Syrians in a very vague sense: Herodotus applies the term Syrians to the Cappadocians (i. 6, and i. 72), and he remarks that the Assyrians in the army of Xerxes were by the Greeks called Syrians, while the Eastern nations named them Assyrians (vii. 63). Arrian, on the other hand (who was for some time governor of Cappadocia, and cannot be supposed to have been ignorant of the name of a country so near his own province), in several passages employs the word Assyria where we should have expected he would say Syria; for instance, when he makes Cilicia border on the east upon Assyria (ii. c. 5 and 6). Herodotus does not appear to have given this indefinite sense to the word Assyria: in one passage (ii. 30), the Arabii and Assyrii are named together as bordering upon Egypt: but here Valckenær and Schweighæuser agree that the reading is incorrect, and that *Syrians* should be substituted for *Assyrians*. (But see ii. 111.)

Ptolemy (vi. 1) and the Roman historians confine the name Assyria to a province in the northern part of the Assyrian empire, namely, to the country east of Mesopotamia and the Tigris, which is separated on the north by the Niphates mountains from Armenia, and on the east by the chain of the Zagros from Media; Susiana and Babylonia constitute its southern frontiers. This portion of the ancient Assyrian empire, which comprehends part of the modern Kurdistan, seems to be meant by Herodotus (i. 102) when he speaks of 'those Assyrians that had in their possession the town of Ninus.' The country is divided into three parts by two rivers which rise in the Zagros mountains, and, after traversing Kurdistan, fall into the Tigris. The first is the Lycus, the Zabatus of Xenophon, and the modern Greater Zab: the Ten Thousand Greeks crossed this river in their retreat, probably near the place where it joins the Tigris, and here they found its breadth four plethra, or four hundred Greek feet. (Xen. *Anab.* ii. c. 5.) The second river, the Caprus, also named Zabas, or Anzabas, by the later Greek and Roman writers, is probably the present Lesser Zab: it is not noticed by Xenophon, though he must have passed it towards the end of his first day's march after crossing the Tigris. (See *Anab.* ii. c. 4.) The country to the

north-west of the Lycus, or Zabatus, is by the ancients called Aturia; that to the south-east of that river, as far as the Caprus, is named Adiabene; to the south of the Caprus we find the province of Apolloniatis, farther to the east Chalonitis, and Sittacene towards the confines of Susiana. Ammianus Marcellinus observes (lib. xxiii. c. 20) that the province of Adiabene derives its name from the two rivers between which it is enclosed, the Diaba and Adiab, i. e. the present Greater and Lesser Zab. The Arabian name of Adiabene is Zawabul, which is likewise a derivation of the word Zab. (See Assemani, *Bibliotheca Orientalis*, t. iii. ii. p. 711.)

The name Aturia, or Assyria, as is observed by Dion Cassius (lxxviii. c. 28), is a mere dialectic variety of pronunciation instead of Assyria; and the province thus designated probably was the original central point from which the power as well as the name of Assyria was subsequently spread farther to the south and west. After the dissolution of the Assyrian monarchy through the revolt of the Medes, the name Assyria was again restricted to this northern province, while the southern parts were designated either Babylonia, from the name of the principal town, or Chaldaea, from the name of its inhabitants. Through the conquest of Cyrus, both parts were re-united, and formed one of the most important satrapies of the Persian empire, which we find sometimes named Babylonia and sometimes Assyria. This apparent confusion of the names Babylonia and Assyria is observable even in the later history of these regions, during the wars between the Romans and Parthians. That the province of Adiabene was once comprised under the appellation of Assyria, is distinctly asserted by Pliny (*Hist. Nat.* v. c. 12).

For a detailed account of the natural features of the Assyrian empire we must refer the reader to the articles **BABYLONIA**, **MESOPOTAMIA**, and **KURDISTAN**: in the present notice we confine ourselves to pointing out some of the more important ancient sites of the country.

The celebrated ancient capital, Ninus, founded by the king of the same name, was situated, according to Strabo (xvi. c. 1, t. iii. p. 331, ed. Tauchnitz), in the plains of Aturia, on the river Tigris. The same author says that it fell into decay immediately after the dissolution of the Assyrian monarchy through the Medes; yet Tacitus (*Annal.* xii. c. 13) speaks of the *urbs Ninus, vetustissima sedes Assyriae*, as of a town still existing at his time. In the history of Alexander the Great the town is not noticed, although in his march along the banks of the Tigris, previous to the battle of Gaugamela, he must have been very near the spot where it is supposed to have stood. Its ruins are conjectured by some to be those discovered on the eastern side of the Tigris opposite Mosul; others think that the site of Ninus must be sought farther to the south, as, according to Ptolemy, its distance from the junction of the Zabatus and Tigris was only a few miles.

This town of Ninus must, according to Marnett, be distinguished from another city of the same name, and the Nineveh of Scripture, which was situated in the southern part of Mesopotamia, at no great distance from Babylon. Herodotus, in two different passages (i. 193, ii. 150), distinctly says that it stood on the Tigris: Diodorus (ii. c. 7), on the authority of Ctesias, places it on the Euphrates. A mass of ruins, commonly called the Tower of Nimrod, at a distance of about twelve English miles north-west of Bagdad, is supposed by some, but perhaps without good reason, to mark the site of this city.

The town of Babylon stood, according to Herodotus (i. 180), on both sides of the Euphrates. The account given by him, as well as by Diodorus (ii. c. 7) and Strabo (xvi. c. 1, t. iii. p. 335, ed. Tauchnitz), of its extent, and of the immense size of its walls, is probably exaggerated: but even its present remains prove that it must have been a place of extraordinary magnitude. These have been found at no very great distance towards the north from Kufa, on the Euphrates: the present town of Hillah is situated in the midst of the ruins. (See Rich's *Memoirs on the Ruins of Babylon*, London, 1818.)

Seleucia was founded by Seleucus Nicator, probably soon after the battle of Ipsus. It was situated on a large canal (the Nahr Malcha, or Royal Water), which joined the Euphrates and Tigris, and, according to Pliny (vi. c. 26), at the point where the canal united with the latter stream. On the opposite (the eastern) side of the Tigris stood the town of Ctesiphon, and a little farther to the south that

of Coche or Choche. The foundation of Ctesiphon had been laid by the Macedonians; it did not, however, rise to importance till the time of the Parthian kings, who chose it for their summer residence. (Strabo, xvi. c. 1, t. iii. p. 344, 345, ed. Tauchn.) The ruins of Takht-i-Kesra, on the eastern side of the Tigris, are supposed to mark the situation.

The principal town of the province of Adiabene was Arbela, a name which has been preserved in that of the modern village of Erbil. [See ARBELA.] Curtius (v. 1) notices a copious well of naphtha at Mennis, in the neighbourhood of Arbela: the country around these places still abounds in mineral oil and asphaltum.

The province of Apolloniatis derives its name from that of its principal town, Apollonia: but of the history and precise situation of this place little is known.

History of Assyria.—In the book of Genesis (c. x. v. 10) the state of Assyria is represented as having sprung from that of Babylonia founded by Nimrod. 'The beginning of his dominion,' says the Hebrew text, 'was Babel, Erech, Accad, and Chalneb, in the country of Shinear. From this country Ashur went forth and built Nineveh and Reschoboth, and Calach, also Resen, between Nineveh and Calach; this is a great city.' The Hebrew chronicles leave us in the dark with reference to the history of Assyria till the earlier part of the eighth century before our era. From this time downwards, the names of several kings of Assyria are mentioned. The earliest of them is Phul, the contemporary of Menahem the king of Israel (died B.C. 761), whose dominions he invaded and rendered tributary (2 Kings xv. 19). Tiglath Pileser ruled over Assyria while Pekah (d. B.C. 740) was king of Israel, and Ahaz (d. B.C. 728) king of Judah; he assisted the latter in a war against Pekah and Resen the king of Aram (Syria), invaded their dominions, and led many of their subjects away into captivity. It appears that Tiglath Pileser was induced to take the part of Ahaz against his rival king by the present which Ahaz had made him of the gold and silver found in the temple and in his treasury (2 Kings xvi. 8, 9; xv. 29). Salmanassar, the contemporary of Hosea the king of Israel, and Iliskia (Hezekiah) the king of Judah, put an end to the kingdom of Israel by conquering, after a siege of three years, its capital Samaria (B.C. 722), and leading away the remaining inhabitants of the country as captives into various eastern provinces of his dominions (2 Kings xvii. 5, 6; xviii. 9—11). Among the eastern countries subject to Salmanassar, besides some names not yet well ascertained, Media (Madai) is mentioned (2 Kings xvii. 6; xviii. 11). The immediate successor of Salmanassar seems to have been Sanherib (Sennacherib), who undertook an expedition against Egypt (B.C. 714), in which he invaded Judaea and besieged Jerusalem, but failed in his attempt to take it. (2 Kings xviii. 13; xix. 36; 2 Chron. xxxii. 1—21.) After his return to Nineveh, his capital, Sanherib was killed by two of his own sons, Adrammelech and Shar-Ezer, who after the perpetration of this act fled into the country of Ararat (Armenia), while Esarhaddon, another son of Sanherib, succeeded him on the throne. A king of Assyria named Sargon is mentioned by the prophet Isaiah (xx. 1), who is conjectured by Winer (*Biblisches Real-Lexicon*, i. 119) to have reigned for a short period between Salmanassar and Sanherib.

The only one of these kings whose name has yet been found in the writings of the ancient Greek historians is Sanherib, whom Herodotus (ii. c. 141) mentions under the name Σαραπίδης, and designates as a king of the Arabii and Assyrii, who led an unsuccessful expedition against Egypt during the reign of King Sethos. Herodotus either wrote, or intended to write, a separate work on the Assyrian empire (see Herod. i. 184), and he accordingly adverts but incidentally to the history of that kingdom. Besides Sennacherib he only notices Ninus, the founder of the empire (i. 178), and the last king, Sardanapalus (ii. 150). Diodorus (*Bibl. Hist.* ii.), who chiefly follows Ctesias as his authority, Julius Africanus, Eusebius (*Chron. Armen.* p. 44, &c. ed. Mai and Zohrab, Milan 1818), and Syncellus (*Chronogr.* p. 73, 77, ed. Goar, Venet. 1729, fol.) commence the line of Assyrian kings with Belus and Ninus, and conclude it with Sardanapalus (also named Thonoseconceleros), who, according to Eusebius, was a contemporary of Lyeurgus and of Jeroboam II., the king of Israel (d. B.C. 784).

According to Diodorus, Ninus was the first Assyrian king who distinguished himself by conquest so as to be remembered in history. Assisted by Arimæus, an Arabian chief, he conquered Babylonia, made Armenia tributary, subjected

Media to his dominion, and compelled all the nations of south-western Asia, with the exception only of the Indi and the Bactrians, to acknowledge the supremacy of the Assyrians. He afterwards founded a magnificent city which he called after his own name, Ninus. A second expedition which he undertook against the Bactrians proved more successful than the first had been. He conquered the country, and married Semiramis, then the wife of Onnas, the governor of a Bactrian fort. The fabulous account which Ctesias has given of the birth, education, and early life, as well as of the subsequent exploits of Semiramis (Diodor. ii. c. 4, &c.; compare Bæhr's *Ctesias*, p. 393, &c.), is quite sufficient to remind us that this portion of the Assyrian history bears a decidedly mythological character, and ought therefore to be received with great caution. Semiramis succeeded Ninus on the throne. Diodorus, apparently on the authority of Ctesias, ascribes to her the foundation of the great city of Babylon on the Euphrates. Herodotus (i. 184) calls her a queen of Babylon who made embankments on the river to protect the adjacent country from inundations. Armenian writers make Semiramis the founder of another magnificent town near the lake of Wan, which they call after her name Shamiramakert: the ruins of this town were recently discovered by the German traveller Schulz. [See ARMENIA, p. 361.] Diodorus gives, chiefly from Ctesias, an account of the conquests and warlike achievements of Semiramis, which it is very amusing to read, but which evidently partakes in a high degree of the mythological character that pervades the earlier periods of history generally. She subdues Media, Persia, Egypt, and Ethiopia, but is defeated in an attempt to conquer India. She returns to Bactra, her residence, resigns the government into the hands of her son Ninyas, and dies in the sixty-second year of her age. Unlike his martial parents, Ninyas confined himself to his palace at Ninus, and indulged his fondness for the enjoyment of an inactive and luxurious life. The successors of Ninyas, during thirty generations, followed his example. Teutamus (or Teutamus, as the name is written in some copies of Syncellus), the twentieth successor of Ninyas, is reported to have been contemporary with the war of Troy, whither he sent troops under the command of Memnon the son of Tithonus. The names of the other Assyrian kings are not mentioned by any extant Greek or Roman historian; a list of them is, however, preserved in the Armenian translation of the chronological work of Eusebius (p. 44, &c. ed. Mai and Zohrab). The last of them was Sardanapalus, the thirtieth in succession after Ninus, who even surpassed his predecessors in indolence and voluptuousness. This encouraged the revolt of the Mede Arbaces, who succeeded in putting an end to the dominion of the Assyrians in western Asia.

According to the statement of Herodotus regarding the duration of the subsequent Median empire, as elucidated by Volney in his *Chronologie d'Hérodote* (p. 83, &c., Paris, 1809), the revolt of the Medes (under Arbaces) took place in the year 717 before Christ; and as the same ancient historian (Herod. i. 95) assigns to the empire of the Assyrians a duration of 520 years, it follows that he conceived their dominion to have lasted from the year 1237 till B.C. 717.

Ctesias gives to the Assyrian monarchy a duration of upwards of 1300 years, and differs moreover from Herodotus with regard to the period of its overthrow by the revolt of Arbaces; for he makes the dominion of the Medes last 282 years, and as it may be considered as almost certain that the dissolution of the Median kingdom by Cyrus took place in or about B.C. 561, it follows that its commencement, and the end of the Assyrian empire, are, by the statements of Ctesias, thrown back to the year B.C. 843. Heeren considers the statement of Ctesias as erroneous, and conjectures that the error might have arisen from his having counted some of the Median kings twice over. (*Göttinger Gelehrte Anzeigen*, 1810, No. 4.; Bæhr's *Ctesias Cnidii Reliquiae*, p. 411.) Syncellus assigns to the Assyrian empire a duration of 1460 years, from A.M. 3216 to 4675, and states the number of its kings at forty-one. (Syncell. *Chronogr.* p. 77 and 132, ed. Goar.) According to the Armenian Chronicle of Eusebius (p. 37, &c. ed. Mai and Zohrab), the Assyrian kingdom lasted 1280 years.

With a view to reconcile the data concerning the history of Assyria which occur in the Old Testament with the accounts given of it by the ancient Greek writers, modern historians have assumed the existence of a second Assyrian dynasty

subsequent to the revolt of Arbaces and the fall of Sardinia. This assumption is supported by some passages of Herodotus, in which Assyria is alluded to as a separate state even after the revolt of the Medes. It appears from his statements (see especially Herod. i. c. 95. 102. 106) that by the dissolution of the Assyrian empire, not only the Medes, but likewise the Babylonians and other nations that had formed part of it, resumed their previous separate and independent existence, and that besides the kingdom of Media there continued to be a Babylonian and an Assyrian state. Wars between the Medes and Assyrians are often alluded to. At last the state of Assyria seems to have yielded to the ascendancy of the Medes. Herodotus notices the capture of Ninus by the Medes (i. c. 185) during the reign of Nitocris in Babylon. This event probably led to the final incorporation of Assyria in the Median and subsequently in the Persian monarchy.

ASTACOLITES, in Zoology, one of the names given by ancient geologists to the fossil remains of the long-tailed or lobster-like crustaceans.

ASTACUS (Leach, Desmarest), in Zoology, a genus of long-tailed crustaceous animals, formed by Gronovius from the genus *Cancer* of Linnaeus and of ancient authors, which also comprised the short-tailed crustaceous decapods, with the exception of *Hippa*. Fabricius broke it down into the genera *Pagurus*, *Galathea*, and *Scyllarus*; leaving *Astacus* to represent a certain number of crustaceans, from which he afterwards, having the advantage of Daldorf's labours, separated the genera *Palinurus*, *Palæmon*, *Alpheus*, *Peneus*, and *Crangon*. Our countryman Leach, in adopting the genus as left in its last shape by Fabricius, separates from it the genus *Nephrops*, of which there is only one species recorded, the Norway lobster, *Nephrops Norvegicus*. Desmarest adopts the views of Leach, and the genus *Astacus* is now reduced to very few species.

Of these the most interesting, from their commercial value as food, are the common lobster, *Astacus marinus*, and the crawfish, *Astacus fluvialis*.

The former is found in the greatest abundance on the rocky coasts of this kingdom, in clear water of no very great depth, at the time of depositing its eggs, about the middle of summer. Pennant mentions the great quantities supplied to the London markets, in his time, from the Orkneys and the eastern coasts of Scotland; and states the number annually brought in well-boats from the neighbourhood of Montrose alone at sixty or seventy thousand. But almost incredible as the consumption of this species is, Nature has provided for its security by the most profuse fecundity. Doctor Baster says that he counted 12,114 eggs under the tail of one female lobster, besides those that remained in the body unprotruded.

Lobsters are very voracious, and the fishery for them is carried on sometimes by means of traps, or 'pots,' (as they are called in some places) made of twigs, baited with garbage, lowered into the sea and marked by a buoy; sometimes by nets baited with the same materials; and, in some countries, by torch light, with the aid of a wooden instrument which acts like a forceps or a pair of tongs.

One of the best narratives of the habits of the lobster extant, is to be found in the following letter from Mr. Travis, of Scarborough, to Mr. Pennant, dated on the 25th October, 1768:—

'We have vast numbers of fine lobsters on the rocks, near our coast. The large ones are in general in their best season from the middle of October till the beginning of May. Many of the small ones, and some few of the larger sort, are good all the summer. If they be four inches and a half long, or upwards, from the tip of the head to the end of the back shell, they are called sizeable lobsters. If only four inches, they are esteemed half size; and when sold, two of them are reckoned for one of size. If they be under four inches, they are called *pucks*, and are not saleable to the carriers, though in reality they are in the summer months superior to the large ones in goodness. The pincers of one of the lobster's large claws are furnished with knobs, and those of the other claw are always serrated. With the former it keeps firm hold of the stalks of submarine plants, and with the latter it cuts and minces its food very dexterously. The knobbed, or numb claw, as the fishermen call it, is sometimes on the right and sometimes on the left, indifferently. It is more dangerous to be seized by them with the cutting claw than the other; but, in either case,

the quickest way to get disengaged from the creature is to pluck off its claw. It seems peculiar to the lobster and crab, when their claws are pulled off that they will grow again, but never so large as at first.

The female or hen lobster does not cast her shell the same year that she deposits her *ova*, or, in the common phrase, is in *berry*. When the *ova* first appear under her tail, they are very small and extremely black; but they become, in succession, almost as large as ripe elder-berries before they be deposited, and turn of a dark brown colour, especially towards the end of the time of her depositing them. They continue full and depositing the *ova* in constant succession, as long as any of that black substance can be found in their body, which, when boiled, turns of a beautiful red colour, and is called their *coral*. Hen lobsters are found in berry at all times of the year, but chiefly in winter. It is a common mistake, that a berried hen is always in perfection for the table. When her berries appear large and brownish, she will always be found exhausted, watery, and poor. Though the *ova* be cast at all times of the year, they seem only to come to life during the warm summer months of *July* and *August*. Great numbers of them may then be found, under the appearance of tadpoles, swimming about the little pools left by the tides among the rocks, and many also under their proper form, from half an inch to four inches in length.

In casting their shells, it is hard to conceive how the lobster is able to draw the fish of their large claws out, leaving the shells entire and attached to the shell of their body; in which state they are constantly found. The fishermen say the lobster pines before casting, till the fish in its large claw is no thicker than the quill of a goose, which enables it to draw its parts through the joints and narrow passage near the trunk. The new shell is quite membranous at first, but hardens by degrees. Lobsters only grow in size while their shells are in their soft state. They are chosen for the table by their being heavy in proportion to their size, and by the hardness of their shells on their sides, which, when in perfection, will not yield to moderate pressure. Barnacles and other small shell fish adhering to them are esteemed certain marks of superior goodness. Cock-lobsters are in general better than the hens in winter; they are distinguished by the narrowness of their tails, and by their having a strong spine upon the centre of each of the transverse processes beneath the tail which support the four middle plates of their tails. The fish of a lobster's claw is more tender, delicate, and easy of digestion, than that of the tail. Lobsters are not taken here in pots, as is usual where the water is deeper and more still than it is upon our coast. Our fishermen use a bag net fixed to an iron hoop, about two feet in diameter, and suspended by three lines like a scale. The bag is commonly fish guts tied to the bottom and middle of the net. They can take none in the daytime, except when the water is thick and opaque; they are commonly caught in the night; but even then it is not possible to take any when the sea has that luminous appearance which is supposed to proceed from the *Noctis noctiluca*. In summer, the lobsters are found near the shore, and thence to about six fathoms depth of water; in winter, they are seldom taken in less than twelve or fifteen fathoms. Like other insects, they are much more active and alert in warm weather than in cold. In the water they can run nimbly upon their legs or small claws, and, if alarmed, can spring tail foremost, to a surprising distance, as swift as a bird can fly. The fishermen can see them pass about thirty feet, and by the swiftness of their motion, suppose they may go much farther. *Atheneus* remarks this circumstance, and says, that the *incurratæ* lobsters will spring with the activity of dolphins. Their eyes are raised upon moveable bases, which enables them to see readily every way. When frightened, they will spring from a considerable distance to their hold in the rocks; and what is not less surprising than true, will throw themselves into their hold in that manner through an entrance barely sufficient for their bodies to pass, as is frequently seen by the people who endeavour to take them at *Silly Bridge*. In frosty weather, if any happen to be found near the shore, they are quite torpid and benumbed. A *sizeable* lobster is commonly from one pound to two in weight. There was one taken here this summer which weighed above four,

• When this letter was written the crustaceans generally were classed with insects, but modern investigation has proved that they essentially differ in their organization from those animals.

and the fishermen say they have seen some which were of six pounds, but these are very rare.

There is no doubt that the lobster changes its crust annually: but the mode in which this operation is performed is not satisfactorily known. Some suppose that the old crust is thrown off, and that the animal retires to some lurking place to avoid the voracity of his crust-clad fellows, till his new covering acquires sufficient hardness; others contend that the process is one of absorption, and these ask, in proof of their views of the case, what becomes of the old crusts if there is a true ecdysis or moult, for that the sea-coast at the moulting period would be strewn with them? The most probable conjecture is, that the crust sloughs off piecemeal as it does in the crawfish. Lobsters, in common with most of the crustaceans, have the power of reproduction to a great extent. If a claw be torn off, it is renewed; and if it be injured, the animal will sometimes throw it off by an effort. It seems that any violent shock to the nervous system will cause this act. If a lobster be thrown into boiling water, it will generally throw off its large claws on the instant; and the same effect has been produced by plunging the animal, when in full life, into spirit. Pennant goes so far as to make them out to be very nervous subjects indeed. 'Lobsters,' says he, 'fear thunder, and are apt to cast their claws on a loud clap. I am told they will do the same on firing a great gun: and that when men-of-war meet a lobster-boat, a peculiar threat is used, that if the master does not sell them good lobsters they will *salute him*.'

That the lobster was well known to the ancients appears from the quotation in Mr. Travis's letter, and from many other evidences. It will be sufficient to add that, under the name of *στάρκω*, Aristotle, in the second chapter of the fourth book of his *History of Animals*, gives a most faithful and elaborate account of the species which is still an inhabitant of the Mediterranean.

The crawfish, *Asellus fluvialis*, is to be found in the fresh waters of Europe and the north of Asia. It thrives best in rivers, where, in holes in the banks and under stones, it lies in wait for the small molluscous animals, little fishes, the larvae of insects, and decomposing animal substances, which form its prey. Desmarest says that it will live for upwards of twenty years, and that it becomes large in proportion to its age; that, towards the end of spring, it casts off the pieces which form its shell, and, some days after, becomes covered with a crust as solid as the former one, but larger, sometimes by as much as one-fifth. The eggs, which are excluded about two months after impregnation, are collected under the lower part of the body or tail, as it is popularly called, after the manner of the hen-lobster. From these proceed the young crawfishes, which are very small and soft, but which bear an exact resemblance to the parent, under whose tail they are nursed for several days.

The crawfish is taken either by nets or by bundles of thorns, in which flesh in a state of decomposition is placed. It is also taken by inserting the hand into the hole which it inhabits; and, at night, it is caught by means of lighted torches. Plot, in his *History of Staffinshire*, quotes Cardan, who says, that this species is a sign of the goodness of water; for in the best water they are boiled into the reddest colour. [See CRUSTACEA.]

ASTARTE, Aethoret or Aetharoth, one of the deities of Phœnicia, of whose attributes and character we are unable to give a detailed account, from the scantiness of the information transmitted respecting her. The author of the treatise *De Deo Syriis*, usually ascribed to Lucian, says, that she is the same as the Greek Selene (moon); but Cicero (*Nat. Deor.* iii. 23) considers her as the fourth Venus, the wife of Adonis. Herodian (v. 15) tells us that the Africans call her Urania, which, however, is a Greek name, and the Phœnicians, Astroarche (queen of stars). By others she is thought to be the Here (Juno) of the Greeks, but we think the opinion of Cicero is most consistent with the few facts we know respecting her, and that she was nothing else than the planet Venus, whom the Phœnicians worshipped as Astarte. She is frequently mentioned in the Holy Scriptures in connexion with Baal, as seducing the Israelites from their duty. (Judges ii. 13, iii. 17; 1 Sam. vii. 4, xii. 10.) Astarte had a magnificent temple at Sidon, where she seems to have been the principal divinity. Some mythologists speak of Hierapolis in Syria as the central point of her worship, but they have confounded her with Derceto. The island of Cyprus re-

ceived her religious rites from Phœnicia, and this divinity became known there as Aphrodite. The rose and the lotus were sacred to her, and, among animals, the lion, the horse, the boar, the lobster, and the pigeon. (See Selden, *De Diis Syriis*, p. 244; Höck, *Creta*, Göttingen, 1823; Münter, *Der Tempel der Himmlischen Götting zu Paphos*, Kopenhagen, 1824.)

ASTARTE, in Zoology, a genus of bivalves or conchifers, with two muscular impressions and a simple mantle-line. The hinge has two divaricated teeth in the right hand valve; in the other, one distinct and one obsolete tooth, and the rudiment of a lateral tooth. The ligament is external.

The species consist of some of the *Veneres* of Montagu, one of which is a *Crassina*. (Lam.) Some of them are English shells, and they are generally found on the sandy mud of coasts at a depth which ranges from near the surface to ten fathoms.

The crag, the green-sand, and some of the old fossiliferous beds, afford many species.

ASTBURY, a parish in Cheshire, (with a population in 1831 of 14,673) in which is the town of Congleton. [See CONGLETON.]

ASTER, a genus of plants belonging to the natural order Compositæ, and comprehending a great multitude of species scattered over all parts of the world, especially North America and New Holland. Many of them are handsome herbaceous plants, others are small-leaved shrubs, and the remainder are mere weeds. They are not of sufficient importance to claim any special notice in this work: the best account of them is the *Genera et Species Asteracearum*, by Nees & Esenbeck.

ASTERIAS. (Lam.), a genus of radiated animals widely diffused over the seas. The Linnæan genus comprised every form of radiation which appears in the tribe, but the genus *sterias* of Lamarck includes only the starfishes properly so called. These are divided into two sections, 'the scintillated starfishes,' and 'the radiated starfishes.' The former have an angular body, the lobes or rays of which are short, their length not exceeding the diameter of the disk; the latter have a body furnished with elongated rays, whose length far exceeds the diameter of the disk.

Tiedemann has given the anatomy of these animals in a most elaborate and accurate work, and shown the adaptation of their organisation to their locomotion and general habits.

Each ray is furnished with a longitudinal furrow on its lower side, and this furrow is pierced laterally with small holes, through which pass the feet or tentacula, which are membranous, cylindrical, and terminated each of them with a little disk, which performs the office of a cupping glass, somewhat in the same manner as the acetabula or suckers of the cuttle-fishes. By elongating or shortening these numerous little organs, and by fixing them by means of their terminal disks, the progressive motions of the starfish are regulated. The rest of the lower surface is furnished with small moveable spines, which also assist progression. The whole surface is also pierced by pores, through which pass tubes much smaller than the feet, serving probably to absorb the water, and to introduce it into the general cavity, for the purposes of a kind of respiration. A large stomach lies close to the mouth; and two ramified caeca, each suspended to a kind of mesentery, are given off to each ray, which is also furnished with two ovaries, by means of which the animals are supposed to reproduce their species without the aid of a second individual. A fine chord, which surrounds the mouth, and sends a branch to each arm, is considered as the development of their nervous system.

Asterias tessellata may be taken as an example of the scintillated division. It is a widely diffused species. Of the radiated division, *Asterias glacialis*, common starfish or five-finger, may be selected as an illustration. This is common in our seas, and is supposed to be very destructive to oysters. Bishop Sprat, in his history of the Royal Society, where he treats of the common oyster, has the following passage: 'There are great penalties, by the Admiralty Court, laid upon those that fish out of those grounds which the court appoints, or that destroy the *cultch*, or that take any oysters that are not of size, or that do not tread under their feet or throw upon the shore, a fish which they call a *five-finger*, resembling a spur-rowel; because that fish gets into the oysters when they gape, and sucks them out.'

Some of the species are subject to the attacks of a para-

[*Asterias tessellata*.]

sitic testaceous mollusc (*Styliifer*, Brod.), which burrows in their integument, and there remains in a kind of cyst. [See COMATULA, EURYALE, GORGONOCEPHALUS, OPHIURA.]

ASTERISM, a collection of stars, formerly used for constellation, but now appropriated to signify any small cluster, which it is either desirable to distinguish from the rest of the constellation in which it lies, or which is not a part of any particular constellation.

ASTEROIDS. The small planets have been sometimes designated by this name. [See JUNO, VESTA, CERES, PALLAS.]

ASTHMA. [See BRONCHITIS.]

ASTI, the province of, one of the six intendenze or subdivisions of the division of Alessandria, in Piedmont. It is bounded on the west and north by the province of Turin, on the south by that of Alba, on the south-east by Alessandria Proper, and on the north-east by the province of Casale. It is watered by the Tanaro and its tributaries. The ground is hilly, and well adapted for the cultivation of the vine. A sort of sparkling fine-flavoured white wine, somewhat resembling champagne, is made here, and known by the name of *vino d'Asti*: the soil is also fertile in corn and fruit-trees, especially mulberries, whose leaves serve to feed the silk-worms. The province of Asti contains, besides the capital, several small towns—such as Villanova, S. Damiano, and Montechiaro, and eighty-seven communes, with 118,000 inhabitants.

ASTI, the town of, lies on the left or northern bank of the Tanaro, on the high road from Turin to Alessandria, and nearly half way between these cities, in $41^{\circ} 57'$ N. lat., and $80^{\circ} 12'$ E. long. Asta was a town of the ancient Ligurians: it was taken and devastated by the Gauls, under Bellovesus, about B.C. 400: it afterwards made alliance with Rome, and submitted to Hannibal on his invasion of Italy. In the subsequent war of Rome against the Ligurians, Asta submitted to the Romans, but retained its municipal rights. The Romans soon after founded in its neighbourhood the colony of Pollentia, not far from the confluence of the Stura and the Tanaro. Asta having been again taken and destroyed, in a new irruption of the Gauls, was rebuilt by Pompey the Great, on his return from Spain, B.C. 60, and assumed the name of Asta Pompeia. Vespasian at a later date sent many families from Rome to Asta. Asta was devastated by the Goths, under Alaric, and restored by Narses; and taken again by Alboin, who put to death many of the inhabitants. It was erected into a duchy by the Longobards. It afterwards submitted to Charlemagne, and under his indolent successors governed itself, with its consuls, as a republic, like most Italian cities, under the influence of its bishops. In 1060, the people of Asti, after many quarrels with those of Pollentia, about the limits of their respective territories, being reinforced by the citizens of Pavia, took Pollentia, killed many of its inhabitants, completely destroyed the town, leaving not a house standing, and threw the materials into the Tanaro. When the Emperor Frederic I. of Hohenstauffen came to Italy, the Marquis of Monferrat, who wished to extend his jurisdiction over Asti, but found opposition from the citizens, complained of them to the emperor, who placed the town under the ban of the empire; and having taken it, set it on

fire, when many people perished by the sword or in the flames, A.D. 1155. Asti afterwards joined the Lombard league: at this time several of its families migrated to the new town of Alessandria, and the Bishop of Asti repaired to Constance, where the peace between the emperor and the Italian towns was signed. After this, Asti attained a considerable degree of prosperity, its citizens surrounded it with walls, and (after the then fashion in North Italy) had their podestà, or chief magistrate, chosen out of another town, and their council of trust composed of nobles and plebeians. They had frequent wars with the Marquises of Monferrat, as well as with the Marquises of Saluzzo; the latter of whom made peace, by receiving from the city the investiture of certain lands, for which they acknowledged themselves its vassals. The people of Asti had once manufactures of cloth: but their wealth was chiefly derived from banking or money-lending, for which business they had counting-houses in France, Flanders, and other countries. In 1218 they built the town of Villanova d'Asti, which was to them a sort of colony. About this time the factions of the Guelphs and Ghibelines broke out in Asti, and distracted the citizens for many years after; sometimes one faction prevailing, and sometimes the other, and each by turns driving its antagonist out of the city. Tired of these civil struggles, the people of Asti chose for their captain one of the princes of the house of Savoy, who obtained the investiture of it from the Emperor Henry VII., in 1313: but soon after the people revolted, and gave themselves up to Robert, King of Naples. Asti afterwards fell into the hands of the Visconti of Milan; and Duke Gian Galeazzo, in 1387, gave Asti as a dowry to his daughter Valentina, on her marriage with Louis, brother of Charles VI. of France. It remained in the possession of the French till 1529, when it was given up to the Emperor Charles V., by the peace of Cambrai. Charles gave Asti to his relation Beatriz of Portugal, who married Charles III., Duke of Savoy: since which it has remained attached to the dominions of that house.

Asti is a large city, but not peopled in proportion to its size. In the quarter where the palaces of the nobility are, the streets are rather wide, but little frequented. The most remarkable palaces are those of Tinco, Rovero, Bretonni, Massetti, and Allieri, in the last of which Vittorio Allieri was born in 1719. The rest of the town is badly built, and there is not much appearance of trade or industry. Of the churches, the most remarkable are the cathedral S. Secondo, which is dedicated to the first bishop of Asti, and la Consolata. Asti is a bishop's see, and the residence of the intendente of the province. It has eight parish churches, a court of justice, and a royal college, with chairs of philosophy, theology, and surgery. Its population in 1825 was stated in the *Royal Sardinian Calendar* at 22,000 inhabitants.

ASTLE, THOMAS, the author of a work on the *Origin and Progress of Writing*, and of various other antiquarian publications. He was the son of Daniel Astle, who was keeper of Needwood Forest, and whose ancestors were proprietors of the manor of Fould in Staffordshire. Thomas appears to have been born at Voxall, in that county, in 1731. At the usual age he was sent to the office of an attorney in his native town, but his taste inclining him more to the study of general antiquities than to his profession, he came up to London: where, about the year 1763, he became known to Mr. Grenville, then First Lord of the Treasury and Chancellor of the Exchequer, and was employed by him in the arrangement of papers, and other business which required a knowledge of ancient hand-writing. Soon after this, Mr. Astle married the only daughter of the Reverend Philip Morant, the author of the *History of Essex*, and by this connexion he eventually inherited the property of his father-in-law, which was considerable. In 1765 he was appointed by Mr. Grenville to the office of receiver-general of sixpence in the pound on the civil list. In 1770, on the death of Mr. Morant, who had till then superintended the printing of the Ancient Records of Parliament begun five years before, Astle was appointed by the House of Lords to take his place, and he presided over the publication till its completion in 1775. He was then made chief clerk in the Record Office in the Tower; and some years after he succeeded to the place of Keeper. He was, besides, a Fellow of the Royal and Antiquarian Societies, and, till his death, one of the Trustees of the British Museum. He died at his house at Battersea River, near Clapham, on the 1st of December, 1803. Mr. Astle is the author of a number of

articles in the *Archæologia*, and also of several separate publications, a list of which may be found in Watt's *Bibliotheca Britannica*, and in Chalmers's *Biographical Dictionary*, from the last of which authorities we have taken the facts in this notice. The work by which he is best known is his *Origin and Progress of Writing*, first published in quarto in 1784, and again in 1803, in the same form. The latter edition appears to be an exact copy of the former, except that it contains an engraved portrait of the author, and an appendix 'On the Radical Letters of the Pelasgians, and their Derivatives,' a tract of a few pages, which had been first printed in part in the seventh volume of the *Archæologia* in 1785. Watt mentions what he calls 'an improved edition' of the work on Writing, published in 4to. in 1794, which we have not seen. He afterwards calls the edition of 1803 the second edition. Besides the works enumerated by Chalmers and Watt, there is a reprint, in 4 vols. 4to., published in 1807 and following years, of Grose's *Antiquarian Repertory* (first published in 1775), on the title-page of which the name of Astle is given as one of the compilers along with that of Grose. Mr. Astle's library, which was very curious, was purchased by the Royal Institution for a thousand pounds.

ASTOLPHUS succeeded his brother Ratchis as king of the Longobards A.D. 750, Ratchis having voluntarily abdicated, and retired into the monastery of Monte Cassino. Astolphus, who was bold and ambitious, aimed at driving away the Greeks from Italy; he took Ravenna, expelled the Exarch, and conquered the Pentapolis, which comprised part of the present March of Ancona. In 752 he turned his arms against the duchy of Rome, which still acknowledged the authority of the eastern empire, tempered however by the influence of the popes. Stephen II. sent ambassadors to Astolphus with splendid gifts, and obtained a truce for forty years. Four months after, however, Astolphus broke the truce, and required the Romans to swear allegiance to him, and pay a capitation tax; threatening them with fire and sword in case of non-compliance. Pope Stephen, despairing of assistance from the indolent Byzantine court, had recourse to Pepin, king of the Franks, and he himself repaired to Paris, where he crowned Pepin, and bestowed on his two sons Carloman and Charles (afterwards Charlemagne) the title of Patricians of Rome, A.D. 753. Pepin now invited Astolphus to restore the Exarchate to the empire, and to let Rome enjoy peace, but his request failing of effect, he assembled his barons, marched an army into Italy, defeated Astolphus, and besieged him in the city of Pavia. A treaty was concluded through the pope's mediation, by which Astolphus agreed to the above conditions. Pepin then returned into France. This was the first interference of the French in the affairs of Italy.

Astolphus did not keep his word, but in 755 marched against Rome, and laid siege to it. The pope wrote to Pepin, who crossed the Alps a second time, and again besieged Astolphus in Pavia. Astolphus now sued for peace; he paid a large sum to Pepin for the expenses of the war, and gave up the Exarchate, including Comacchio, as well as the Pentapolis, which were not restored by Pepin to the empire, but bestowed by him on the see of St. Peter. Pepin sent the abbot of St. Denis, who received the keys of the various towns from Astolphus's commissioners, and deposited them on the altar of St. Peter at Rome. This was the origin of the temporal power of the popes, as independent sovereigns. A difference of opinion exists with regard to the terms of this donation, the act of which, if it ever existed in writing, has been lost. The territory thus given up, however, included the country of Ravenna and the province since called Romagna. The duchy of Rome was not included in it. Astolphus died in 756, owing to a fall from his horse. Having no son, he was succeeded by Desiderius, one of the Longobard dukes. Astolphus, during his quarrels with the pope, founded several monasteries, in one of which his daughters took the veil. (Muratori, *Annali d'Italia*; Mosheim's *Ecclesiastical History*.)

ASTON. [See BIRMINGHAM.]

ASTORGA, the ASTURICA AUGUSTA of the Romans, once the capital of the Astures, and now an episcopal town in the kingdom of Leon. Pliny (iii. 3) calls it a magnificent city. It is situated near the Tuerto, in a plain, bounded on the N. and N.W. by the mountains of Asturias; it is about twenty-six miles W. by S. of Leon, and lies in 42° 27' N. lat., 6° 10' W. long. Its vega, or plain, is very extensive and fertile, and produces excellent wheat, rye,

barley, flax, and pasture. The town, which is surrounded by a wall now in ruins, contains 3972 inhabitants, including the suburbs, four parishes, and two convents. The chapter consists of the bishop, twelve dignitaries, and twenty-two canons, all resident. The diocese contains 913 parishes. The cathedral is Gothic, and deserves to be visited on account of its altar mayor, or high altar, which is one of the best works of the famous Gaspar Becerra. This altar was built in 1569, and cost 30,000 ducats (about 3300*l.*). There is also at Astorga a castle belonging to the marquis of that name, which is in a state of dilapidation.

It was at Astorga that Napoleon assembled his army, consisting of 80,000 men, with 200 pieces of cannon, when in pursuit of General Moore, on the 1st of January, 1809. In September of the same year it was occupied by the Spanish general, Santocildes. The old ramparts were strengthened by fresh works, and the place garrisoned with 2000 men. On the 22d of March, 1810, it was invested by General Junot. Santocildes, with provisions scarcely sufficient for twenty days, without ammunition, or a force to protect the place and divert the enemy outside of the walls, defended it against the vigorous attacks of the French for nearly a month. On the 20th of April, the French being already masters of the suburbs of Puerta-de-Hierro, Rotobia, and San Andres, the Spanish general offered to capitulate. Junot refused the terms proposed, and the place was carried by assault on the evening of the 21st. In 1812, Santocildes, with the Galician army, succeeded in reducing the place again, and made prisoners of the garrison, amounting to 1200 men.

(See Miñano; Ponz, *Viage de España*, tom. xi. carta 6, No. 92—99; Napier's *History of the Peninsular War*, vol. iii. book x. ch. vii.; *Annals of the Peninsular Campaigns*.)

ASTRABAD, or ASTERABAD, a province of small extent in the N.E. part of Persia. It is bounded on the north by the Caspian Sea and the Desert, on the south by the Elburz mountains, on the west by Mazanderan, and on the east by the river Gorgan, which is by some writers called Jorjan.

Except in the immediate neighbourhood of its rivers, the country is of a mountainous character. The level lands are pleasant, and extremely fruitful, producing, among other things, grapes of an uncommon size. In other parts the soil is sandy and sterile.

The province is nearly surrounded by rivers, which abound with fish, principally sturgeon and salmon. The chief town, also called Astrabad, is ten miles from the shores of the Caspian, and stands in 36° 50' N. lat., and 54° 35' E. long. The site of Astrabad has been placed so far from the sea, though the shores of the Caspian offered such great advantages, both in a commercial and military point of view. The town is believed to owe its origin to Yezid ibn Mehloob, an Arab general, and to have been built towards the end of the first century of the Mohammedan era. The circumference of the place is about three miles and a half; the whole of this extent is surrounded by a high and thick wall, which is now in a ruinous condition. The streets are for the most part paved, and their cleanliness is promoted by a drain which runs through the centre of them. The town does not contain any public buildings which are worthy of remark.

A lake, which extends from a point three miles north-east of Astrabad towards the Caspian, has usually been considered as a gulf of that sea, and is so laid down in some maps. Lieutenant Conolly, whose travels in that quarter have recently been published, says that the waters of this lake do not approach nearer to the Caspian than three miles, and have no communication with it. He adds, that 'the water being confined, stagnates in summer, and the inhabitants of Astrabad suffer from the malaria that is caused by it.'

Astrabad is a frontier town, and chiefly inhabited by Kujurs, from which tribe the present shah of Persia has his origin: it is governed by a prince of the blood royal. The country on the northern bank of the Gorgan, ten miles from Astrabad, is inhabited by Turcomans, who are only in name tributary to the Persian government, and carry on against their more settled neighbours a constant petty predatory warfare, seizing Persian subjects whenever they can find opportunity, and selling them into slavery. (See Fraser's *Historical and Descriptive Account of Persia*; Lieutenant Conolly's *Overland Journey to the North of India*.)

ASTRÆA (zoology), a genus of fixed polypifers, sometimes incrusting marine bodies, sometimes collected in an hemispherical or globular mass which is sometimes, but rarely, lobated. The upper surface is covered with orbicular or subangular starry disks, which are lamellar and sessile. Each disk is the seat of a polype, with a single row of numerous arms, in the centre of which is the mouth. Lamarck divides these corals into two sections: the first, consisting of species whose starry disks are separated from each other, leaving interstices between them; and the second, of species whose starry disks are contiguous. Of the first section, *Astræa rotulosa*, an inhabitant of the West

[*Astræa rotulosa*.]

Indian seas, is an example: of the second, *Astræa favosa*, common in the seas of the East Indies, affords a good illustration. The species are numerous.

[*Astræa favosa*.]

ASTRAGAL, a moulding used in architecture, and applied principally to the upper ends of the shafts of columns and to their bases. It is also used in the entablatures of the Roman Doric, the Ionic, Corinthian, and Composite orders. The term is derived from the Greek ἀστράγαλος, which signifies the bone on which the tibia rests, and sometimes a vertebra. The form of this moulding is semicircular, projecting from a vertical diameter. The surface is usually worked plain, although there are Roman examples of its being carved to represent leaves, as in the arch of the goldsmiths at Rome, or reeds bound together, as in the pedestal of Trajan's column. The astragal cut into beads is common to Greek and Roman architecture.

The apparent use of the astragal is, to bind the parts of columns and entablatures together, for which purpose it is employed both at the top of the shaft where the capital commences, and at the bottom where the base terminates. Many of the parts also of the entablature are bound together with the astragal moulding.

In Egyptian architecture, bands curved after the manner of astragals seem to bind the reeds of which the shaft of the column often appears to be formed. In the monument of Lysicrates at Athens, supposed to be one of the oldest examples of the Corinthian order, it has been conjectured that the hollow between the top of the shaft and the lower part of the capital of the column formerly received a metal

Sections of astragal mouldings, and elevations of astragal mouldings carved.—*a*, section of an astragal from the three columns of the temple of Jupiter [Stator], in the Campo Vaccino, at Rome; *b*, astragal used in the base of the Ionic order of the temple of Minerva Polias at Priene; *c*, enriched astragal used in the arch of the goldsmiths at Rome; *d*, enriched astragal of the pedestal of Trajan's column at Rome; *e*, astragal cut into beads.

ring of the form of an astragal, by which means, if the conjecture be well founded, the parts, from the contrast of colour, would appear to be more distinctly bound together. The most remarkable example of the use of the astragal in Grecian architecture is in the base employed in the Ionic temple of Minerva Polias at Priene; which has been imitated by Mr. Cockerell in the portico in the front of Hanover Chapel, Regent-street. In the temple of Jupiter Olympius, at Athens, the astragal at the top of the column appears to have a channel cut underneath it. (See Stuart, vol. iii.) This, however, is very unusual.

For the application of the astragal in architecture, see **BASK**, **CAPITAL**, **ENTABLATURE**, and **FILLET**.

ASTRAGALUS, an extensive genus of leguminous plants, the most remarkable species of which is the *Astragalus verus*, from which the substance called gum tragacanth is obtained. This is a small bush, with pinnated gray leaves, terminated by a spiny midrib, and half covering clusters of axillary pale yellow flowers: it is found in many parts of the Levant. Although the principal part of the tragacanth of commerce is said to be furnished by this species, it is certain that it is also procured from several others, such as *A. creticus*, which is the Putorion of Dioscorides, and *A. aristatus*, which still bears in the Peloponnesus the classical name of Tragakantha.

A few kinds of astragalus are cultivated in gardens; but they are for the most part mere botanical curiosities: the most complete account of them will be found in the second volume of De Candolle's *Prodromus*.

ASTRAKHIAN, formerly called Astorokan, a khannate or kingdom in the western part of the Asiatic possessions of the Russian crown, extends northward from the banks of the Terek to the sources of the Ufa in the Yekaterinburg chain of the Ural range, and eastward from the mountains of the Volga to the south-western limits of Siberia. It lies therefore between 43° and 54° N. lat., and 41° and 60° E. long. It was one of the numerous sovereignties which Gengis-Khan and his successors incorporated with the gigantic empire of the Moguls, erected by them in the first half of the thirteenth century, but was wrested from it by Batu, his grandson, the great chief of the 'Golden Horde,' and united with the independent monarchy of Kapshak, which had the Jaik or Ural and Dnieper for its boundaries, and fell to pieces in the middle of the fifteenth century. For the next hundred years, the territory of Astrakhan, following the example of the Crimea, Kasan, and Nogay-Tartary, maintained itself as a separate state under khans of its own: and the owners of a soil 'where none but swords and lances had grown, now prospered by the arts of peace.' But Astrakhan commands the western shores of the Caspian, and the mouths of the great Volga—two natural advantages of themselves sufficient to awaken the cupidity of a formidable and encroaching neighbour. In 1552 the khannate of Kasan had been added by Ivan, the great Tzar of Muscovy, to his extensive conquests; and two years afterwards, an insult to the envoy of Ivan the Second, his successor, from the khan of Astrakhan, afforded a pretext for the subjugation of the principality itself. A Russian army was sent against the town,

the khan and his subjects took to flight, and Ivan's forces entered it, as Napoleon's entered Moscow two hundred and sixty years afterwards, greeted by naked walls and tenantless buildings. Ivan repopulated the town, and prevailed upon five hundred nobles and ten thousand Astrakhanese to swear fealty to him; the oath containing a recognition of his subjects' title to the same privilege as the natives, of using the whole line of fishery down the Volga from Kasan to the Caspian sea. Ivan was indeed ever intent upon opening new sources of trade and affluence for his subjects, as well as of political dominion for his successors. The conquest of this country was considered of so splendid a nature by the grand duke himself, that, when signing public documents, he afterwards attached its date, in conjunction with that of the conquest of Kasan, to his autograph. The khannate was comprehended in the same government with the Caucasian territories, until the year 1801, at which time part of it (the province of Caucasus or Georgiewsk) was annexed to the government of the Caucasus, and the remainder divided into three distinct governments; those of Astrakhan, Saratoff, and Orenburg. The latter have a surface exceeding that of the French or Austrian dominions, whilst their population scarcely exceeds a fifteenth part of the population of either of those monarchies; for the three governments, though extending over a space of upwards of three hundred thousand square miles, according to Weydemeyer, Hassel, and others, do not contain more than 2,600,000 inhabitants. As each of the present subdivisions of this khannate will form the subject of a separate description, we have here said as much as is requisite by way of introduction to them.

Astrakhan, the least and southernmost of the three governments, extends in a northerly direction from the banks of the lower Kuma and Manysh to the frontiers of the government of Orenburg, and eastward from the borders of that of Saratoff to the line of the Ural, next to the steppes of the Kirghish-Cossacks; it is comprised between the 45th and 52d degrees of N. lat., and the 44th and 52d degrees of east longitude, and contains an area estimated at eighty-four thousand square miles, the south and south-eastern parts of which are bounded by the Caspian. The land is, with little exception, an enormous plain, lying below the level of the ocean and Black Sea. It is divided into two parts, or steppes, by the monarch of European rivers, the Volga (a name derived from the Sarmatian, signifying 'the Great'), which winds through Astrakhan from north-west to south-east, for at least two hundred miles; the high and precipitous character of its right bank in some parts contrasting singularly with the low land which spreads out upon its left. The soil is saturated in almost every direction with salt; the very atmosphere, the rain, and dew, are charged with it; and briny lakes are of frequent occurrence. This immense plain lies so low on the 'Kalmutzkian,' or eastern side of the river, that the waters of the Caspian are driven over it for many miles, when the wind has blown for any length of time from the south east; even vessels are at times borne by the overflow some miles inland, and stranded in the midst of the steppe, where the only alternative is to break them up. 'Here,' says Potocki, 'where the eye has no object to dwell upon but the azure sky, the steppe and lakes encrusted with salt, I was astonished to meet with a large ship lying on her beam-ends in the heart of the steppe, between Batkaly and Talagai. I learnt that, a year before, a south easter, which had prevailed for several weeks, had inundated the country, and forced several vessels a distance of seventy vershs (forty six miles) from the shore. All but the ship in question had been taken to pieces and removed.' This traveller confirms what Pallas and Gmelin had observed before him on the optical deception which the Astrakhan steppes present: the range of sight is extended, and every object is increased in apparent magnitude. In his own case he mistook human beings for obelisks, and low heath-bushes for 'Karatsus' of ten feet height; the laden camel became, to appearance, a moving mountain. When on the Caspian, another optical deception accompanied the rising of the sun: the coast and vessels upon it seemed elevated high in the air. Even the horses in the steppe took fright at the whirlwind of trees which apparently drove across the waste: yet they were but bushes, which the blast had torn up by the roots and scattered over it. At Yenotayewsk, where the Volga winds between five islands, this portion of the steppe assumes a bluish or bluish-green tint, which

it acquires from the abundance of an extremely aromatic species of wormwood. Neither wood nor forest are found throughout the whole province, nor a tree on any spot, except a few groups of oaks, poplars, birches, elms, and wild mulberry-trees, along the banks of some of the rivers. When, however, the snows dissolve, the dry and arid steppes put on, in many parts, a gay and verdant appearance; a carpet of flowers is spread over them, and they afford a rich and refreshing pasture for the cattle, whilst the low land, which is irrigated by the adjacent streams, produces excellent grass—a valuable resource for pasture in summer, and, when cut and dried, for winter stock. Though ill-adapted to the purposes of agriculture, the Astrakhan steppes abound, in the summer season, with choice herbs, asparagus, capers, horse-radish, leeks, and liquorice; the latter, which thrives luxuriantly along the banks of the Volga, attains a height of nearly four feet, and the root is equal in size to a stout man's arm; this root is carried down to Astrakhan, where the juice is expressed, and sold in considerable quantities. The sulsole also is of exuberant growth, and affords a supply of excellent soda. Here and there hills of sand and gypsum occur, some few of them extensive ranges, particularly the Tshipshatshi group, east of the Volga, which is a favourite resort for the native dealers; it may be observed too of the sand-hills, that the prevalence of easterly winds is constantly impelling them farther to the west. Rocks, either of lime-stone or sand-stone, rarely occur; but the province is full of extensive moors, the soil of which consists of a deep spongy saline loam, which bears no vegetation whatever on its surface: its edges only are skirted with saline plants. A country which both Georgi and Pallas conceive to have formed part of the bed of the Caspian in past ages, cannot fail to be rich in one mineral production at least:—the salt, which both the Caspian shore and the soil, lakes, and moors of Astrakhan afford in exhaustless quantities and of superior quality, is perhaps the most valuable commodity which this province possesses. The bottom of many of its lakes, such as the Etsen, Bagd, and especially the Sakrsky, which yields upwards of a million of pounds weight annually, is one mass of crystallized salt; the Tshipshatshi is a perfect mountain of salt, and the summit of Bogdo-oola (about 48° N. lat. 46° 40' E. long.) is crowned by a hill composed entirely of this valuable mineral. The soil is rich likewise in saltpetre, and the works established five and twenty miles north of the capital have alone, and for many years past, produced a thousand tons and more in the twelve months. There are but few districts in Astrakhan which have any claim to be called fertile, and even these owe their fertility to artificial means. They are situated chiefly in the immediate neighbourhood of the Volga, Akhtuba, and Ural, and consist of plots of arable and garden ground, the produce of which is considerable, owing to a judicious system of irrigation. These are the only spots in the province where fruit, vegetables, grain, or vines,* are cultivated. Of all its vegetable productions, there is none more remarkable than the great water-lily, the *nymphaea nelumbo* of Linnaeus, which, we are told, is not found in any other part of the Russian empire, except at a place about five miles from the city of Astrakhan. Erdmann, who visited the spot in 1811, reports, that its leaves are two feet in diameter, and float upon the surface of the water; the stalk which bears them rises perpendicularly between six and eight feet from the bed of the water, and forms so complete a carpet, that its surface is scarcely discernible: from between these leaves issue stout runners, which terminate in a splendid rose-coloured flower of delicious fragrance. The plant is held in deep veneration by the Hindoos and natives of Tibet, from a belief that their divinities re-appear after death in the shape of these richly-scented flowers. The nuts, or capsules, of the plant are also in great request among them; and the flowers are distilled at Astrakhan into a water, which has the taste of amber, and, used as a cosmetic, gives softness to the skin. The mulberry and tobacco plant have been cultivated of late years with partial success; some cotton is grown on the line of the Volga, and madder has been introduced on its

* Humboldt, indeed, reports (in his *Geology and Climatology of Asia*) that finer grapes do not exist, even in Italy or the Canaries, than at Astrakhan; but these, as well as other fruit and vegetables, however fine to the eye, are watery and insipid to the palate. The wine which is produced here is of equally indifferent quality; and we believe it to be well ascertained, that no juice of the grape which may be termed potable can be produced, unless the average temperature of the year is at least 47½° or 48°.

banks. The annual produce of maize and other grain is 11,000 chetworts (about 8000 quarters). The whole province, in short, whether the eye ranges over the Astrakhanian steppe south-west of the Volga, or the Kalmutzkaian east of it, would appear to approximate, in its general features, to the regions of the Nile: the rain scarcely ever descends upon it, its noble stream irrigates the soil with periodical inundations, and its people live under tents, herding with the camel and the zebra; 'yet no two climates under the sun,' observes Potocki, 'can offer a greater contrast; the physiognomy of the two countries is entirely dissimilar.'

The climate of Astrakhan is a 'climate of extremes'; it is generally warm, and unhealthy for those not inured to it from their childhood, in consequence of the vapours constantly exhalant from the greater part of its surface. A dry and parching heat prevails in summer, when the thermometer frequently stands, even in the shade, at 100° of Fahrenheit; yet the nights are in general nipping, and the winds deposit the saline particles with which the air is charged in such profusion, that every object appears veiled in the morning with hoar-frost. Autumn is of short duration: the winter colds, when the north wind blows, sink the quicksilver to 30° below zero, and the principal arm of the Volga, with a breadth of 750 yards, becomes covered with ice capable of sustaining loaded sledges. The various streams throughout Astrakhan are commonly closed at the end of November, but the February thaws invest the face of nature with so instantaneous a spring, that, wherever the soil is not barren, it smiles with renovated verdure under the influence of a few days' sun.

The productiveness which nature seems to have denied to the land, she has lavished upon the coasts and rivers. The great element of the prosperity of Astrakhan is the waters of the Volga, which is scarcely equalled by any other stream in the world for abundance of fish. This noble river, whose course is diverted by the mountains of its own name, which are a branch of the extensive line of the Ural, from a northerly to a south-easterly direction, at a short distance before it enters the western frontier of this province, flows through it in constantly increasing breadth and with a more winding course: before its fall into the Caspian, about thirty miles below Astrakhan, it branches into eight principal arms and sixty-five subsidiary outlets, forming this quarter of the province into a delta of seventy islands. In the spring of the year its fishing grounds, particularly between the sea and the capital, are so abundantly stocked with the sturgeon, *sevruga*, *saxou* (carp?), pike, seal, salmon, shad, and every other species which inhabit the Caspian, as to employ upwards of five thousand vessels, and twice that number of persons, who are brought by the fisheries from remote places. The singlass and sturgeons' roe, or caviar, which add to the luxuries of our English tables, are chiefly the fruits of Tartar and Kalmutck industry. The whole produce of the Astrakhan fisheries along the Volga has been estimated as yielding a clear annual profit of 220,000*l.* to those concerned in them. The traffic on this river is another source of prosperity to the province: above five thousand *ladia*, *kayouki*, and *moseli* (ships, barks, and rafts), freighted with their respective cargoes of salt, grain, and timber, descend this stream in the course of the year, but from the difficulties of the voyage up the river, most of them are broken up and sold at Astrakhan, the 'Alexandria,' as it has been denominated, 'of the Scythian Nile.'

An expanse of sand and swamps above 250 miles in breadth, extending north-east of the delta, separates the Volga from the Ural, which forms the eastern boundary of Astrakhan and the western limit of the Kirghish-Cossack steppe: the waters of the latter stream are moderately clear, abound in fish, and are navigable for barks up the whole of its tortuous course northwards from the Caspian, and beyond the point where it quits this province to enter that of Orenburg, a distance of at least 400 miles. Both banks of this river are lined by a dreary waste of rushes, and (west of it, in the Astrakhan district) are inhabited by the Cossacks of the Ural, who resort to its banks at certain seasons of the year for the purpose of fishing. They sell their fish in the interior of Russia, frequently to the extent of two millions of roubles (90,000*l.*) per annum. The scene which occurs at the winter fishery is of a singular description, for the fish must be taken under the ice. Several thousands of Cos-

sacks, duly licensed, hasten to the spot in their sledges, each provided with a pronged instrument, pikes, and other weapons; they station themselves on their arrival so as to form an extended line, from which none dare advance a single step under pain of having their instruments broken over their heads by the guards appointed to preserve order. The signal for the onslaught is made by the attaman of the fishery starting forward in his sledge: the whole line then breaks ground, and each rushes onwards to some spot in the frozen stream, where he effects an opening in the ice, and in a moment thousands of pikes are in motion. The dealers from the interior follow at the fisherman's elbow, and bargain for the fish before it is caught, a salvo, however, being made in behalf of the emperor, to whom the first fruits of the fishery belong. The chancery of the Uralian army derives a revenue of 4000*l.* a year from the several fisheries. But 'it frequently happens,' as a recent *Report on the Fisheries of the Caspian* observes, 'that during this (winter) fishing a violent wind blows off shore, and drives the ice, with both fish and fishermen on it, out to sea; the poor fellows are inevitably doomed to a watery grave, unless the wind should shift and blow them on shore again. We are assured by the most experienced fishermen, that their horses have a foreboding of this wind's coming on, suddenly show great uneasiness, and become almost unmanageable. Their masters, who are anything but indifferent to this signal, at once abandon their post, and hasten back to land; the sagacious animals appearing full as eager as themselves to gain it.' The other streams of note which water Astrakhan are the Akhtuba, a considerable arm of the Volga, which branches off from the left bank six miles above Tzaritzyn, runs for 280 miles close to and parallel with the main stream, and falls into the Caspian near Krasnoyarsk; and the Greater and Lesser Uzeen, which rise in the province of Saratoff, and, like many other inconsiderable rivers in this region, lose themselves in lakes on the steppes. The latter, among which we may name the Bogda, Bashushat-kou, and Kamysh-Samara, are so many storehouses of salt, and are turned to good account by the Astrakhanese.

In the low lands on the banks of the Volga fossil elephant bones are occasionally found. Among other existing animals, there are in Astrakhan the wild ass, camel, and antelope-saiga [see *Asiat. Res.* p. 73], whose horns are semi-transparent; there are also the bustard, kite, falcon, pheasant, and snipe. The tarantula, scorpion, and locust, occur in Astrakhan; and Pallas speaks of having seen many porcupines with ears, one of which he observed in the act of devouring a living serpent by the tail, which could neither resist nor extricate itself. The natives are herdsmen and graziers as well as fishers; droves of horned cattle are kept wherever there is pasture, and are turned out half-starved from their winter quarters as soon as the snow has disappeared. Goats are also reared, not so much for the sake of their milk or flesh, as of their hides, with which the Russian prepares morocco-leather: there is a fine species of hair too, which either falls from the animal's back, or is combed from it, out of which a stuff of beautiful texture is occasionally woven. But the greatest resource possessed by the rural population and nomadic tribes of the province is their flocks. These consist principally of a native breed, the Kirghish or Astrakhan species; it is of larger size than any other sheep in Asiatic Russia, somewhat resembles the deer in shape, has a wild appearance, and is distinguished by its immense bushy tail, which has been found in some instances to weigh as much as forty pounds. When full-grown, the wool of this breed is short and coarse; but the lamb yields a fine and beautiful fleece, which the dealers call a 'crumel,' the bulk of them being imported from the Crimea. The richer class of proprietors in this and other western provinces of Asiatic Russia have begun of late years not only to introduce the Merino, Saxon, Silesian, and other finer fleeced breeds among their flocks, but to cross and improve the native sheep with them. To the Kalmutck, Tartar, and Cossack, however, there is no animal in Astrakhan so valuable as the horse; the Kalmutck, in particular, uses the flesh and milk for the support of his household, the skin for his clothing, and the sinews for his ropes, tackle, &c. The Kalmutck species is diminutive, fiery yet tractable, and very hardy: even in winter they are wholly dependent upon what the snow-coated steppe may afford, and are consequently ill-conditioned in general, and wild; they herd close together both for society and defence, and each party is

subordinate to one of the males as their leader. When attacked by wolves or other wild beasts, they collect into a body, and repel the attack of the enemy with their heels. The whole number of domesticated animals in the province has been estimated by a recent writer at 4,000,000 sheep, 1,000,000 horses, 500,000 camels, and 200,000 horned cattle.

The population of Astrakhan is composed of a motley group of Russians, Cossacks, Tartars, Kalmucks, Armenians, Indians, and other settlers from various parts of Europe and Asia, whom the highest estimate does not state as exceeding 225,000 individuals, and the lowest, which, as it is made on native authority, is probably nearest to the fact, sets down at 80,000. Nearly one-half of this population would appear to consist of Kalmucks, who occupy large tracts to the east of the Volga; the number of their kibitkes, or tents, being computed at 13,100. Another considerable portion of the population is composed of the Cossacks of the Ural, who are esteemed the finest, the wealthiest, and the bravest Cossack corps in the Russian service, whence they have acquired the appellation of 'the Eye of the Army,' and garrison the small forts along the line of their native river; some have estimated the number of their fighting-men at 20,000, but this would give an amount of population to this single race of Astrakhanese, which would far exceed any estimate yet formed of their numbers. Independently of these, there are a few colonies of Tartars of Kasan extraction, about 1600 yurtas or tents of Nomadic Kunduroff-Tartars, or Manguttes, descendants of the Nogay horde, who lead a wandering life in the regions of the Lower Akhtuba; and, as some writers report, 12,000 kibitkes of Bukay-Tartars, who settled in the districts between the Volga and the Lesser Uzen about thirty years ago, and made an attempt to remove to the steppes east of the Ural in the year 1829, but were forced back by superior force.

To the principal branches of industry already enumerated we may add the manufacturing of magnesia, tallow, and soap, in considerable quantities, distilleries of brandy and spirits, some large leather, and a few silk and cotton, manufactories. Astrakhan soap is in much request among the Russians on account of its firm substance and fragrant scent. The Volga, which secures a ready access to the eastern shores of the Caspian Sea, has hitherto rendered the capital of this province the principal seat of the traffic carried on between Asia and the Russian dominions.

Astrakhan is politically divided into four circles: Astrakhan, Krasno-yarsk, Yenotayewsk, and Tsherno-yarsk; but there are no spots in it deserving of any distinct notice excepting the capital, from which the whole province derives its name, and Uralskoi, the chief town of the Cossacks of the Ural. Of the remainder, the short account which follows will convey a sufficient idea. At a distance of somewhat less than five miles above the city of Astrakhan, we find *Kalmüzkoi-Basar*, a place on the right bank of the Volga, in which all sale and barter between the townsmen and the wandering people of the steppes is carried on. In the marketplace stands the Russian, with his brandy, bread, and coarse household stuff; the Armenian with his wine and inferior stuffs for clothing; the Tartar, in quest of sheep for the Astrakhan market; and the Circassian, hard at work in making ironware and leather articles. Here the Kalmuck also resorts with his supply of domestic manufactures, cattle, and felt. 'These sons of the steppe are seldom a match for their customers,' says Potocki. 'Here you may see Tartars from Kuma, Kuban, and the Five Mountains; Truchmens, Nogays, Kiptshaks, and Cossacks from the Jaik;' but, above all, it was this traveller's fortune to meet a Kirghisian embassy in the Bazar, 'who had but little of the air of diplomatists about them.'

About nineteen miles to the north-east of Astrakhan lies 'Krasno-yar,' the capital of the circle of that name; a small town of about 2000 inhabitants, with two churches, built on an island formed by the Algara, the Akhtuba, and Basan, three arms of the Volga, and surrounded by dilapidated walls with wooden towers, which were constructed by the Tzar Alexis Michailovitch to protect the town against the incursions of the Cossacks and Kalmucks. The inhabitants live comfortably upon the produce of their fishery, and of their gardens, orchards, and vineyards, which are situated on each side of the hills, east of the town. It is celebrated for its asparagus, the eatable stem of which is above twenty inches in length.—Yenotayewsk, another capital of a circle, situated on the steep right bank of the Volga, is the seat of a tribunal, which has jurisdiction

over the 4900 kibitkes of Kalmucks who pass the winter in its vicinity: it is a circle of houses, built round a small fortress, and inhabited by Cossacks and traders.—Tsherno-yar, also the capital of the circle in which it lies, and a well-fortified town, is likewise on the right bank of the Volga, about 150 miles north-west of Astrakhan. It consists of 300 houses, is built in the shape of a polygon, with five entire and two semi-bastions, has a stone church embellished with two towers, having gilt cupolas, is an opulent place, and contains between 1500 and 2000 inhabitants. The circle of Krasno-yarsk comprehends the tract of country which lies along the course of the Ural, and is inhabited by the Cossacks who take their name from that river. At its influx into the Caspian stands the small but strong fortress of 'Guri-Gorodok,' built upon an island, thirteen miles up the river and 500 south-west of Orenburg, under the government of which province it was placed in 1753. The inundations, which cover the whole face of the island in the spring, render it in the highest degree unhealthy; it is consequently inhabited by few individuals besides those composing a regiment of Cossacks and a company of infantry. A redoubt, called the Guriewskoi-Redout, lies about twelve miles farther up the river. Along the line of the Ural are numerous *Walagys*, or fishing villages, erected for the fishermen of the crown, containing dwellings, store-houses, workshops, rope and net yards, every convenience for boiling down oil and making caviar, and even cellars for ice, which is used for keeping the fish fresh. (Georgi, Pallas, Gamba, Potocki, Sommer, Stein, &c.)

ASTRAKHAN (city). The present capital of the government of this name is about six miles higher up the Volga, as some maintain, than the Astrakhan, or rather Adshotarkhan, which was the metropolis of the ancient kingdom, and, according to Forster, was demolished, together with Sarai, its neighbour (the 'urbs magna, sedes regia Tartarorum' of Abulfeda), by Timour in the winter of 1395. Other writers however are of opinion that the ancient capital stood between the banks of the Akhtuba and the Volga, forty-six miles higher than the present city, on a spot which was occupied by a manufactory of saltpetre some years ago. Both of these conjectures rest on plausible grounds, for both sites contain the remains of extensive buildings; and each of these masses of ruins has contributed large portions of the stone with which the public edifices in the modern capital are constructed. Astrakhan, which is become the principal seat of Russian intercourse with Asia and the storehouse of fish for the whole empire, stands on the island of Zaietshy Bugor, or 'the Hare's Mound,' which lies between the small river Kutum and the Volga, about thirty miles from its mouth, and 820 miles south-east of Moscow. It has a navigable communication also with St. Petersburg, from which it is upwards of 1200 miles distant; yet its importance must always remain of a limited character. Astrakhan ranks however as the eighth town in the Russian dominions; its stationary population being about 40,000,* and its whole circumference rather more than three miles. The uneven ground on which it stands, its half-decayed battlements, and a multitude of steeples, minarets, and cupolas, give it a handsome appearance at a distance; and the effect is heightened by contrast with the flat marshy ground which surrounds it. The climate of such a site cannot rank among the healthiest; and it is liable, moreover, to very sudden changes of temperature: yet, as the average population throughout the year, including the thousands who resort to the spot in the fishing seasons, cannot be under 50,000, and the average deaths do not, according to Gamba, exceed 1400, the mortality, which amounts to 1 individual in about 36, is not much greater than that for all Russia, which amounts to 1 in 38; or even for France, where Biekes estimates it at 1 in 39. A long canal traverses Astrakhan from east to west, the direction of its greatest length. The town is irregularly built, and the houses present a singular medley of European and Asiatic taste; they are constructed principally of wood, and are in number between 4000 and 4200. Astrakhan is the seat of an Armenian as well as Greek archbishopric, under the former of whom there are four, and under the latter twenty-five, churches; besides these, the Roman Catholics, Lutherans, and Hindoos, have each their separate place of worship, and the Mohammedans

* In 1827 Weydemeyer stated the number of inhabitants to be 37,000, which is double the number which the town contained at the close of the last century, when Georgi says the official return reported it to be only 14,023.

have nineteen mescheds or mosques. There is a Scotch mission too in the town, which, Keppel tells us, is a branch of a colony at Karass in Circassia or Cabardia, whose affairs are managed by their own laws, except in criminal cases; they are at liberty to make converts of Mohammedans or heathens; pay no taxes but about five kopecks (one half-penny) for each acre of arable land, and are authorized to purchase Russian or Georgian slaves, provided they emancipate them at the end of five years. Independently of an academy for marine cadets and a Greek seminary for ecclesiastics, there are a high-school, a district grammar-school, and four inferior schools in the town for the education of native-born subjects: two printing-houses (a Russian and an Armenian) are sufficient to supply its present wants. The chief architectural ornaments of Astrakhan are the 'Kreml' or citadel, which contains the cathedral and barracks; the 'new' or 'white' town, so called from its being embellished with the principal government buildings and the three factory halls, one for the use of the Russian, another for the Asiatic, and a third for the Hindoo dealers; the beautiful street inhabited by the Persian merchants, on each side of which runs an arcade, supported by handsome columns; and the cathedral, which was erected in 1696, and, like most ecclesiastical edifices in Russia, consists of a massive parallelogram with four small cupolas on the roof, and a large one in the centre, from which the building receives its light. The interior is splendidly though not very tastefully decorated; but it is prized among the followers of the Greek faith principally on account of its holy treasures—an effigy of the Virgin Mary, whose paraphernalia are said to have cost 800*l.*; six valuable mitres inlaid with pearls and precious stones of extraordinary size; a baptismal font of massive silver, ninety-eight pounds in weight; and some fifty or more splendid attires for the celebration of the mass, one of which has been four centuries in use. The Jesuits' and Greek-Armenian churches are also handsome structures; but the most singular building is a beautiful mesched of free-stone, lately erected by a wealthy private individual, which differs in every respect from the usual form of Mohammedan mosques, and resembles the Christian churches of the East in shape. The 'Kreml' is an ancient Tartar fortress, surrounded by stone walls and battlements eighteen feet high. The remainder of the town comprises sixteen 'slobods' or suburbs, beyond which the progress of modern improvement has transformed moor and swamp into places of public resort and agreeable promenades. Warazi, a Greek of large property, has been the great reformer of Astrakhan in every thing concerning the improvements outside of the town; which are not only extensive, but judiciously planned and executed.

It has been calculated that, in the fishing season, the population of Astrakhan is increased by at least 30,000 souls; a motley concourse, collected from almost every quarter of Asia and Europe, of whom nearly one third are Russians. The latter, with the exception of a few noblemen, and the military and civilians, are exclusively traders, and many of them in affluent circumstances. 'You cannot form an idea,' says Gamba, who visited Astrakhan in 1820, 'of the throng of splendid equipages which make their appearance on festive occasions, particularly at Easter. The dress of the women is of the most sumptuous description at these seasons: they are attired in a robe of gold or silver tissue; and the head, arms, neck, and waist, are covered with pearls and precious stones.' The Russian of Astrakhan has, however, adhered in general to his old customs and predilections; he remains no less an enemy than ever to a shaven chin and the fumes of tobacco, or any other innovation: he has continued stationary in taste, and in intellect too, if it be true, as Erdmann reports, that 'his only resource, when in society, is eating, drinking, and card-playing.' The Tartar inhabitants of the town are stated by Gamba at 10,000; they are of three distinct races, the Ghilan (of Western Persia), Bucharian, and Agriskhan (or 'mixed race,' being the issue of Hindoos settled in Astrakhan and Tartar women), each of whom occupy a separate division of the Tartar slobod. These settlers are highly commended by the same writer for their unswerving integrity. The Armenians are among the richest traders in the town: a considerable proportion of them have laid aside their robes, caftans, broad trowsers, small boots, and high fur caps, and adopted the European costume; but their wives and daughters still move about, covered from head to foot with an enormous white veil, which conceals the whole person except

a small part of the face. The Georgians of Astrakhan are mostly mechanics, and the better class of them are very cleanly, and show much taste in their household arrangements. As temporary residents only we may include the dealers who visit Astrakhan from China and Bucharia; the Kalmuck, too, is accounted a stranger, although he has his wooden hut or felt tent permanently standing in the outskirts of the town. Fishing is his constant occupation. The Hindoo population, though on the increase, does not exceed three or four hundred: most of this race are natives of Multan and Lahore, and they bear the reputation of living but for the gratification of two master-passions—love of flowers and love of money. Their stores in the Indian bazaar have, each of them, a flower bed in front; and they are never without a nosegay between their fingers, which goes the round of every customer's nose. Their business is to lend money on as usurious terms as possible, and their accumulations being seconded by the utmost simplicity and parsimony in their mode of living, they rise quickly into affluence. We need only allude to the European residents as a motley assemblage of traders, artisans, teachers, government officers, and artists from north, south, east, and west.

The establishments for weaving silks and cottons at Astrakhan are nearly one hundred in number: it manufactures also considerable quantities of leather, particularly a superior description of morocco and shagreen, as well as tallow and soap. The numerous gardens in the town and its environs produce, by means of irrigation, several fine species of fruit, especially grapes, of which above a dozen sorts are frequently seen in a single ground: these are dried, and form a considerable article of export to the interior of Russia. In all respects, this place has long held the same station with regard to the trade of the south, which St. Petersburg, Riga, and Archangel occupy with regard to that of the north, of Russia: but its commerce is greatly on the decline, for in 1821 it employed between four and five hundred vessels of all sizes, which landed merchandise in the town to the amount of 310,000*l.* (7,119,615 roubles), and took on board wares in return to the value of 310,000*l.* (6,955,545 *ro.*), whereas, in 1832, the importations did not exceed 20,700*l.* (452,317 *ro.*), nor the exportations 11,800*l.* (913,029 *ro.*) in value. In the latter of these years, however, the trade of Astrakhan was much crippled by the combined effects of the cholera and the disturbances which broke out in Daghestan. The business of buying and selling, more than one half of which has been engrossed by the Armenians, is conducted in twenty-eight khans or bazaars, which contain 1500 stores built of stone, and 560 wooden stalls. Raw silk and silk goods, cotton and cotton-yarn, drugs, dye-stuffs, carpets, oil, rice, and other eastern productions, form the chief importations: the exportations are principally woollen cloth, linens, cochineal, velvet, iron, salt, fruits, fish, wine, liquorice, soda, hides, skins, and grain.

In speaking of the province itself, we mentioned the great fisheries carried on in the Caspian and along the Volga. The fisheries of the Volga centre principally at Astrakhan, or rather on the branches of the river some distance below it. Every wear has its group of huts, with a little church attached to it, in which from two to three score fishermen reside: they are divided into divers, catchers, salting-men, and makers of caviar and isinglass. Each little colony is provided with spacious ice cellars, which contain compartments for storing away the fish when salted, with intervals between the compartments which are filled with ice. The spring fishery opens with the spawning season, when the ice breaks up, and the fish enter the river from the Caspian; they are preceded by innumerable shoals of small fry, some descriptions of which, particularly the obla, are caught and used as bait for the larger species which succeed them, such as the sevruga, sturgeon, and bidonga. The fishing season, both on the Volga and Caspian, closes about the middle of May, when the fishermen return for a time to Astrakhan, and sell their stock. The fish move out of the Volga in the autumn; and this is a signal for the men to recommence their operations, which are prolonged to the depth of winter: the fish being frozen at this season when they are brought to land, are more easily preserved. Prince Kourakhin is the proprietor of the fisheries at the mouth of the river and within the territory of the town of Astrakhan, but he has gratuitously given the right of fishing to the citizens: and this is no inconsiderable donation, for there have been years in which he has ceded

his entire right for 40,000*l*. Many of the Astrakhan dealers also send out parties in spring and autumn to take the seals along the shores of the Caspian islands, where they are flayed and salted, and forwarded to Astrakhan for the sake of their skins and the oil extracted from the carcass.

Besides the ruins of Adshotarkhan, to which we have already referred, vestiges of Tartar dominion in former ages lie scattered in various directions over the steppes which surround Astrakhan. The greater part of them are sepulchral mounds, here and there distinguished by uncouth figures, carved in stone: their features and attire obviously stamp them of Mongolian origin. There is probably no monument of this description more curious than the sepulchral mound near Prishibinskoi, a village on the Akhtuba. It is raised on a quadrangular substructure of earth, and consists of six flat vaults abutting one against another, the whole being about 900 feet in circuit and 18 feet in height. The mortar with which the walls are cemented has become as solid as the hardest stone, and resists the impression of the strongest instruments. It would seem, from the vessels and ornaments which have been found within it, that this structure was formerly a place of interment for some princely family. Astrakhan has a dockyard and arsenal, and is the port of rendezvous for the Russian ships of war which cruise in the Caspian. It is in 46° 21' N. lat., and 47° 55' E. long.

ASTRINGENTS (from *astringo*, to constringe, or bring closer together), are agents which contract the fibres of the muscles and blood-vessels, and lessen the flow of fluids, whether it be the secretions of the glands proceeding from their natural orifices in excessive quantity, or the contents of the blood-vessels escaping by their exhalant extremities, or by an unnatural opening (or rupture). They produce this effect, generally by a vital, but sometimes by a chemical action. Their power is manifested first, and often solely, on the part to which they are applied; yet in many instances it is extended by sympathy very rapidly over the whole body, as is observed when the acerb juice of the sloe is brought in contact with the tongue. The sensation then experienced may be considered the best general test of the presence of *astringency*, which cannot be ascribed to any one principle, but is owing to tannin, gallic acid, and hæmatine, in vegetable astringents, and is possessed by acids, and many metallic salts among mineral agents; and is also one of the effects of the application of cold to the body. In vegetables, the astringent principles are found chiefly in the bark (as oak), the root (as rhutany and tormentil), and the wood (as logwood). As wood and bark form parts of *exogenous* trees only, it is only from this section of the vegetable kingdom that any astringent principles can be obtained. [See explanation of the term *exogenous*, under the article *AGE OF TREES*, vol. i. p. 202.] Sir Humphry Davy found that the inner layer of the bark possessed the greatest quantity of the astringent principle: this is the natural consequence of the mode in which the sap descends from the leaves, viz., through this inner layer of bark, whence it occasionally passes into the wood, which will then be found to possess principles similar to those of the bark. Most astringent vegetables are red, owing to the presence of an acid in excess—which is often manifest to the taste, as in rumex, or sorrel. In metallic astringents, when super-salts, the excess of acid, is also very perceptible to the taste, as in alum, which is a supersulphate of alumina and potassa.

The particular principle to which any substance is indebted for its astringent power may be ascertained by appropriate tests. When *tannin* exists in plants, its presence may be proved by an insoluble precipitate taking place on the addition of a concentrated solution of gelatin. The precipitate is a compound in definite proportions of tannin and gelatin, being forty-six of tannin and fifty-four of gelatin. Gelatin has therefore been proposed by Sir Humphry Davy as a test of the quantity of tannin in different astringent vegetables. (See *Philosophical Transactions*, 1803.) But in the practical application of this test there are some sources of fallacy difficult to guard against. (See Papers by Dr. Bostock in Nicholson's *Journal*, vol. xxiv. 1809, and by Mr. E. B. Stephens, in *Annals of Philosophy*, New Series, vol. x. p. 401.) Tannin rarely exists alone, though it probably does so in catechu, but mostly along with gallic acid. Extractive is also a frequent accompaniment of tannin, and is of considerable service, assisting its action in the process of tanning. Gallic acid strikes a bluish-black precipitate with all the salts of iron, but a solution of the persul-

phate is the ordinary test. Hæmatine exists in logwood, along with tannin and extractive. It may be known by combining with oxide of lead without undergoing any change.

The effect of astringents which is due to their chemical action is nearly the same in dead as in living animal matter; their long-continued application to the skin will produce a condition similar to that of a tanned hide. They are, therefore, sometimes employed to effect this, when internal parts are exposed, to change them from a secreting to a non-secreting surface—such as in irreducible prolapsed uterus. Their use in this way, however, is very limited; while their vital action is extensive and important. The chief effects of astringents are to contract the muscular and vascular tissues, to diminish secretion, and lessen irritability; and in many instances to impart strength, or increased tone, to an organ or part. Their action is always greatest on the part to which they are applied. When a drop of diluted acetic or sulphuric acid is applied to the skin, whiteness of the part is observed, which soon disappears, and the natural colour, or even a more intensely red one, follows. If this is frequently repeated, the structure of the part is changed, it ceases to secrete, is no longer pliant, but becomes stiff and inflexible. The loss of colour is owing to the diminished calibre of the blood-vessels, which no longer admit the red globules. During the absence of these, the sensibility of the part is less than natural; just as cold and torpid fingers lose their fineness of touch. Nearly similar effects may be supposed to follow the internal administration of astringents, the action of which is greatest on the intestinal canal, and less on parts remote from this: yet it deserves to be remarked, that as the intestinal canal is a mucous membrane, and possesses a muscular structure, parts of a similar structure are more influenced by astringents introduced into the stomach than other parts are; hence, increased secretion from the mucous membrane of the lungs, or from the lining membrane of the bladder, or flow of blood from arteries, is more effectually checked by astringents, than increased exhalation from serous surfaces. There is reason to believe that the astringent principle of many plants does not enter into the circulation, but passes along the whole course of the intestinal canal without being absorbed: for Sir Humphry Davy found, that when tannin is present in grasses, as it is in that of *aftermath crops*, it is voided in the dung of the animals which feed upon it. (See Davy, *Elements of Agricultural Chemistry*, Appendix, p. lxi.) But that of other plants enters the system so rapidly, that the astringency of the *uva ursi*, or bear's whortleberry, can be detected in the urine forty-five minutes after it has been swallowed. In the case of those which do not enter into the circulation, any beneficial effect which they exert upon remote organs must be attributed to that sympathy which exists in so great and unquestionable a degree between the stomach and almost every organ of the body. That such vegetable substances, while passing along the intestinal canal, promote the fulfilment of its functions, is obvious, from the effects following the use of food in which astringent principles are absent. Plants possessing astringent powers and bitter principles, such as tormentil and the bog-bean, are very efficacious in preventing the rot in sheep, (as has been already stated under Anthelmintics,) while watery grasses, among which no astringent plants grow, favour the generation of worms.

The primary sympathetic effect of several of the astringents which ultimately enter into the circulation, is the most valuable in some of the cases in which they are employed, such as dilute sulphuric acid, which often checks hæmorrhage by closing a bleeding vessel, before any of it can be conceived to have been conveyed directly to the bleeding orifice; it checks the flow of blood in the same way as cold suddenly applied to the surface or skin does. The tonic effect of many astringents, after their use for some time, first on the digestive organs, and afterwards upon the whole system, and more especially upon any weak organ, must be admitted, and borne in mind, in forming our estimate of their utility in a curative point of view. Without attempting to account for the ultimate cause of the action of astringents, to do which successfully seems impracticable in the present imperfect state of our knowledge, it may be stated, that under their influence a tension of the parts is produced, during which the muscular and vascular structures acquire an increase of power, and secreting surfaces and glands produce less fluid but more natural secretions. Some, indeed, lessen the action of the heart, and so

stop the flow of blood from dilated or ruptured vessels, such as the preparations of lead, which though in some degree astringent, ought to be considered as *sedatives*; while others which combine with and neutralize the unhealthy or excessive secretions, as lime and its carbonate with the secreted fluids of the intestinal canal, are more properly termed *absorbents* than astringents. When astringents are applied directly to the bleeding vessels, such as to external wounds, or to the nostrils or gums, they are termed *styptics*, and in such cases they often act chemically as well as vitally.

Before proceeding to consider the cases in which astringents may be advantageously used, an enumeration of the most common and valuable substances may be given. Of vegetable astringents the chief are *barks*, as of oak and willow, the best kind of the former of which is obtained from the *quercus robur* of Linnæus (the true British oak), which is synonymous with the *quercus pedunculata* of Willdenow, while the inferior sort is obtained from the *quercus sessiflora* of Salisb., which is synonymous with the *quercus robur* of Willdenow. The best willow-bark is procured from the *salix pentandra*, or sweet bay-leaved willow, though very excellent bark is yielded by the *salix Russeliana*, or Bedford willow.

Roots, as of tormentil, from *potentilla tormentilla*; bistort (*polygonum bistorta*); common avens, from *geum urbanum*, which are British plants; and rhatany, *Krameria triandra*; rhubarb (*rheum palmatum*); pomegranate (*punica granatum*), which are exotic plants; leaves of *oreostaphylos* (*uva ursi*), petals of the *rosa gallica*, fruits of *prunus spinosa*, or sloe-thorn (*punica granatum*), and secreted juices of many plants, as kino, from *pterocarpus Senegalensis*, and several others; and catechu, from *acacia catechu*, and galls, from *quercus infectoria*; in all of which the astringent principle is tannin, with more or less of gallic acid; and lastly log-wood, (*hæmatoxylon Campechianum*), in which hæmamine as well as tannin possesses an astringent property. Acetic acid must also be classed among the vegetable astringents.

The mineral astringents are, diluted sulphuric acid, and salts of iron, zinc, copper, silver, and the salts of lead. Cold, in whatever way applied, is also a valuable astringent. In treating of the employment of astringents as curative agents, it is necessary to distinguish between their action as local, direct, and often chemical, and their action as general, influencing remote organs, their effects upon which are vital rather than chemical; also between their mere astringent power and their tonic power. The beneficial effects of many of the above-named astringents in checking increased secretion, is doubtless often due to their tonic power; for as in a weak state of the system, or of any particular gland, the secretions are generally profuse in quantity, a return to the healthy proportion and quality can only be insured by increasing the power or tone of the body or gland, which astringents do by bringing the living tissues into a closer or more compact state, and which tonics do by heightening the vitality of the debilitated structures. Hence astringents are beneficially employed in diseases where a laxity of the muscular and vascular tissues exists, accompanied with imperfect discharge of the functions of the secreting organs. The stomach and intestinal canal being the channel by which is conveyed the material necessary for the nourishment and vigour of the system, and for maintaining a capacity to discharge their functions in the other organs of the body, an impaired state of the structure and functions of this canal extends to every other part. The re-establishment of its healthy condition is a primary object in endeavouring to cure many diseases. Of these, intermittent and remittent fevers may be taken as an example, since in these there is always great debility of the digestive organs and of all the parts which have the most intimate sympathy with them, such as the skin. Astringents possessed of a tonic power have therefore mostly been resorted to in order to remove this debility; cinchona-bark, willow-bark, and many others, have been used with this intention. These, however, are to be avoided whenever any acute inflammation exists, which must first be subdued by appropriate means before tonic astringents can be safely or advantageously used. In diseased states of the intestinal canal, in which greatly increased or unhealthy secretions take place, as diarrhoea, dysentery, and cholera, the most careful inquiry should be made into the cause of the disease, that if it has its origin in an inflammatory condition of the mucous membrane of the intestine, or is owing to the presence of any acrid sub-

stance, the former may be overcome by antiphlogistic measures, and the latter be removed by purgatives. When the increased flow from the intestines is connected with increased determination towards these parts, owing to the application of cold to the outer surface suppressing the secretion of the skin, which has the greatest sympathy with the internal surface, and which consequently is excited to double action, a preternatural quantity of secreted fluid is produced. The most effectual, as well as only safe, means of diminishing this, in the early stages of its occurrence, is the employment of diaphoretics, or such medicines as restore the action of the skin; after which, should the discharge continue, mild astringents may be used, of which logwood or tormentil is the best. A preliminary treatment is likewise required in dysentery: in the common cholera a purgative should generally be given before any astringent is administered.

In the bilious cholera of autumn, after the employment of suitable purgatives, nothing seems to act more effectually as an astringent than the infusion of cusparia, or angustura bark, with dilute nitric acid; to which, in some cases, a small portion of laudanum may be added at first, but afterwards omitted. Nor in the epidemic cholera, as far as a very limited experience enables us to judge, has more marked benefit followed the use of any means than has resulted from the employment of this combination, which speedily checks the liquid discharges, and restores the circulation and animal heat.

Diarrhoea, or looseness of bowels, proceeding from acid secretions, is best removed by the astringents which combine chemically with these—such as lime, or its carbonate, which are rendered more suitable by uniting them with aromatics, an excellent form of which is supplied by the *polio carbonatis calcis* of the Edinburgh pharmacopœia. Sometimes, in order to increase the astringent power, as it is supposed, carbonate of lime is prescribed along with the vegetable astringents; but nothing is more erroneous than this proceeding, by which a decomposition is occasioned, which destroys the virtues of both the ingredients. Nor is the combination of opium with chalk less objectionable.

The next most important class of diseases in which astringents may be employed are termed hæmorrhages, or a discharge of blood, either from the exhalant extremities of the arteries, when they are gorged or when they are too much relaxed, or from the wounded or ruptured coats of any blood-vessel. The above distinction refers to the difference, between active and passive hæmorrhage, or that which takes place when the system is too full of blood and the vessels propel it with great force; the other, which takes place when the power of the vessel is greatly below the natural standard. In the former, astringents cannot safely be employed at the commencement of the flow of blood, but time should be allowed for the vessels to unload themselves; or a vein should be opened, cooling saline medicines administered, cold air admitted freely to the surface of the body, and, under competent medical attendance, opium or laudanum may be given; after which, astringents will either not be required, or if so, may be safely used.

In passive hæmorrhage they may be employed from the commencement; and perhaps, in most cases, a saturated solution of alum in the infusion of roses is to be preferred, though the tincture of the murate of iron is very eligible when the kidney is the source of the bloody discharge, as acetate of lead is when the lungs are the organs whence the blood flows. So long as lead is kept in the state of an acetate, its administration is perfectly safe: it should therefore always be accompanied with dilute acetic acid.

Bleeding from the nostrils or gums may be checked by the direct application of styptics: such as preparations of zinc or copper. Nitrate of silver will frequently stop the flow of blood from a leech bite. Cold should, in most cases, be employed along with the other means; even alone it is often successful, especially in the form of water poured from a height in uterine hæmorrhage. Ruspini's styptic, which is said to be a solution of gallic acid in alcohol, is sometimes useful, where other means have failed.

The application of astringents to more limited examples of loss of tone or increased flow of secreted fluids, need not be extensively noticed here. After acute inflammation of the eye, proper antiphlogistic means having been used, astringent applications are very serviceable, especially those of zinc and nitrate of silver, either in solution or made into an ointment. Scrofulous inflammation of the eye is often benefited by them, if internal means be also used. Saliva-

tion, or excessive flow of saliva, occurring either spontaneously or from the use of mercury or other means, is often effectually checked by nitrate of silver, or decoction of the rhus glabrum, or by iodine. Nitrate of silver, by lessening the inflammation which gives rise to them, also frequently removes morbid discharges from other mucous surfaces besides those we have specially noticed; an effect which also often follows the use of diluted chloride of soda. The colliquative sweats of hectic fever are best checked by giving internally dilute sulphuric acid, and sponging the skin with vinegar and water.

Astringent substances are decomposed by, or decompose, many others, which therefore should not be given at the same time with them; such, for example, as ipecacuanha with most of the vegetable astringents which contain tannin, by which an insoluble tannate of emetina is formed: when kino is united with calumba, a purgative action follows. All astringent vegetables containing tannin, except oak-bark, decompose tartrate of antimony, and are therefore the best antidotes to it.

The ancient Egyptians would appear to have been acquainted with the power of astringents in preserving vegetable as well as animal substances, and they seem to have dipped the coarse cloths in which the mummies were enveloped in some astringent liquid, which tanned the skin, and rendered it less subject to change, as well as excluded the air from the interior of the body. The article employed by them with this view is supposed to have been some sort of kino. The same substance is used by the Chinese to dye cotton for their nankeens.

This property of astringents may be usefully applied for the preservation of all kinds of cordage, fishing-lines, and nets, which last much longer if steeped in an infusion of oak-bark. Though inferior in preserving power to the plan of Mr. Kyan, it may be applicable in some cases where his is inadmissible. [See ANTISEPTICS.]

For further information on astringents, see Dr. A. T. Thomson's *Elements of Materia Medica and Therapeutics*, vol. ii., in which much recent valuable matter is brought together.

[For the employment of astringents in the arts, see DYEING AND TANNING; and also *Library of Entertaining Knowledge*—Vegetable Substances; Materials of Manufactures, p. 178.]

ASTROCARYUM, a genus of palms found in small groups, or in single specimens, in the tropical parts of Ame-

rica, of middling stature, and of a very singular appearance on account of the spines with which they are armed. Their stems are covered all over, except at the places where the leaves are set on, with stiff and very numerous prickles. The leaves are pinnated. The fruit resembles cocoa-nuts.

These plants are found exclusively in South America, where several species were collected by Dr. Von Martius, the great illustrator of the palm tribe. Among the more remarkable are, *Astrocaryum murimuri*, a common inhabitant of swampy places in the neighbourhood of Para, where it is called *murumuri*; the flesh of the fruit resembles the melon in flavour and the musk in odour, and is considered a great delicacy by the Americans. We give a figure of it, but so much reduced, that the armature of the stem cannot be shown. Its leaves are found to be an excellent thatch.

Another species, *A. airi*, has very hard wood, which is much used for bows, and similar purposes, where hardness and toughness are required.

The fibres of the leaves of *A. tacuma* are much valued for fishing-nets. (See Martius, *Palms*, p. 69, &c.)

ASTROLABE, from two Greek words signifying *to take the stars*. It has an earlier and a later meaning. As used by Ptolemy, it may stand for any circular instrument used for observations of the stars; but in the sixteenth and seventeenth centuries, it signified a projection of the sphere upon a plane, being used in the same sense as the word *Planisphere*. To this small projection, which had a graduated rim, sights were added, for the purpose of taking altitudes; and in this state it was the constant companion and badge of office of the astrologer. In later times, before the invention of Hadley's quadrant, a graduated circular rim with sights attached, called an astrolabe, was used for taking altitudes at sea, as further described in *Bion, Traité des Instrumens de Mathématique*, Hague, 1723. In the older sense of the word every one of our modern astronomical instruments is a part of the astrolabe, the principle of which we proceed to describe.

If a solid circle be fixed in any one position, and a tube be fixed upon its centre, round which it may be allowed to move, as in the adjoining diagram; and if the line C D be drawn upon the circle, pointing towards any object Q in the

heavens which lies in the plane of the circle, it is obvious that, by turning the tube AB towards any other object P in the plane of the circle, the angle B O D will be the angle subtended by the two objects P and Q at the eye, or their angular distance upon a common globe. This angle may be measured, if the circumference of the circle be graduated. Thus, suppose the plane of the circle to pass through the poles N and S, and C D to point towards the equator; then when the tube points towards the star, N O B its north polar distance, or B O D its declination, may be measured. Or if the circle be fixed in the plane of the equator, and C D be made to point towards the vernal equinox at the same moment at which the tube points towards the star, then the angle D O B will be the right ascension of the star.

A collection of circles, such as the *Armillary Sphere*, might therefore, by furnishing each circle with tubes, be made a complete astrolabe. The practical difficulty consists in keeping so many circles exactly in their proper relative positions. The distinction between the astrolabe of the ancients and the circular instruments of the moderns, is as follows: First, the ancients endeavoured to form an astrolabe of two circles, so as to measure both latitude and longitude, or both right ascension and declination, by the same instrument; while the moderns, in most cases, measure only one of the two. Secondly, the ancient instruments were made to revolve, to find the star, or were furnished with at least one revolving circle, moving round the pole of

[*Astrocaryum murimuri*.]

the equator or ecliptic, according as declination or latitude was to be measured. The moderns for the most part fix their instruments in the meridian and wait for the star. But the *equatorial*, the altitude and azimuth *circle*, and the *theodolite*, are strictly astrolabes, according to the ancient meaning of the term.

Hipparchus is the first we know of who can be reasonably supposed to have made use of an astrolabe. But, at the same time, there are reasons for supposing that Eratosthenes, a century before Hipparchus, made use of a circle fixed in the meridian, for measuring the obliquity of the ecliptic. He is also said to have erected armillary circles at Alexandria. Ptolemy does not mention Hipparchus expressly; but he was in all respects his follower, and therefore probably, in describing his own instrument, he is only repeating that of his great predecessor. And Nicholas Cabasilas (an ecclesiastic of the fourteenth century, cited by Delambre) attributes to Hipparchus an instrument consisting of an equator, a meridian, and two tropics. It is impossible, from what we know of Hipparchus, that he could have done without something of the sort. At the same time, between Hipparchus and Ptolemy we have no observations to settle this point.

The description of Ptolemy (*Syntaxis*, book v. ch. i.) is follows:—Fix two perfectly equal circles at right angles to each other, and let one represent the ecliptic, and the other the solstitial colure. In the poles of the ecliptic place cylinders, projecting within and without beyond the rims of the solstitial colure, and fix on these cylinders as pivots outer and inner circles, which shall revolve freely without and within the first mentioned circles. These are evidently circles of longitude. Within the innermost, and in its plane, place a lighter circle, sliding by friction, and having two sights diametrically opposite, by which the latitude of any celestial phenomenon may be observed when the instrument is adjusted, *i. e.* when the circle representing the ecliptic is in the plane of the true ecliptic. To effect this, cylindrical pivots are inserted in the solstitial colure in the points corresponding to the poles of the equator, and the whole of the apparatus is suspended within a circle which is placed in the meridian of the place of observation. The ecliptic being divided from its interior to its exterior rim, the outer of the circles of longitude is set to the division corresponding to the longitude of the sun, as given in the solar tables,

and the whole is then turned round the poles of the equator, until the plane of the ecliptic and the plane of the outer circle of longitude pass through the sun. The instrument is then adjusted, the inner circle of longitude and its sliding limb with sights is turned to the moon, and the angle read off upon this circle is the latitude of the moon, while the angle read off on the interior edge of the ecliptic is the longitude.

When stars are observed, it is sufficient to make the plane of the outer circle of longitude pass through the moon or any known star after setting that circle to the known longitude of the moon or star. The observation then takes place as before.

No material improvement upon this construction appears to have been made by the Arabs, who in some instances used very large instruments of the kind. A more skillful variety of the astrolabe is here shown, described by Tycho Brahe, from whose *Astronomic Instaurate Mechanica* the preceding cut is taken.

The outermost circle represents the meridian; the axis passes through the poles, and there is a revolving equator and hour-circle fixed together. The sights on the circles are moveable; but instead of using opposite sights, the small cylinder which projects from the axis is employed, for example, to measure the declination of a star, the hour-circle is moved till it passes through the star, and a sight is then placed so that the star may be seen through it on the edge of the cylindrical pin which projects from the centre of the axis, both on looking above and below the cylinder, the orifice of the sight being made just large enough to admit of this. The angular distance of the sight from the equatorial circle is then the declination of the star. To measure the difference of right ascension of two stars, two observers take two sights on the equator, which they adjust till each sees his star just on the axis, both on one side of it and the other. The angular distance of the sights is then the difference of right ascension of the stars.

The plumb line shows whether the meridian is exactly vertical, and the screws at the feet are employed to raise or lower either end when necessary.

We give one more step between the ancient and modern instruments, from the same work of Tycho Brahe.

The hour-circle is now disengaged from the equator and independent of it. The polar axis is directly supported, and

not made to depend upon the position of the meridian. This is perhaps sufficiently near to the modern equatorial to be considered as the first instrument of the kind.

ASTROLOGY. If this word were used in a sense analogous with that of *geology* or *theology*, it would mean simply the *science of the stars*; while *astronomy* might mean the science of their order and arrangement. But the term, at least when coupled with the epithet *judicial*, has always signified the discovery of future events by means of the position of the heavenly bodies. The two words *astrology* (*ἀστρολογία*) and *astronomy* (*ἀστρονομία*) seem to have been used in the same sense by the Greeks, at least till about the Christian æra. Cicero (*Offic.* i. 6.) uses the word *astrologia* to express astronomical knowledge.

It has long been unusual to produce any arguments against this pretended science; but there are two considerations which make us think it may be useful to show those who are unacquainted with it a few of its details. The first is, that works, seriously professing to inculcate and defend the principles of astrology, have been published within the last twenty years in this country, and are still sold, almost exclusively, by some booksellers: the second, that several of our most popular almanacs do actually give astrological predictions at the present time. This may be a mere matter of amusement with the more enlightened; but we are afraid there are some who play with edge-tools in reading the fooleries of the works alluded to. The love of the marvellous is not under proper regulation, even in the minds of many who do not go the length of supposing astrology credible; and we shall therefore perhaps do good service in showing what the system really is, and what consequences its adoption must lead to.

It must moreover be remembered that our old English writers, particularly the dramatists, cannot be well understood without some information upon the leading terms and principles of this art; which therefore may be as lawfully studied as the history of Jupiter and the Metamorphoses of Ovid.

The science which, under the name of astrology, or some term of equivalent meaning, found universal belief among all the nations of antiquity except the Greeks, and also prevailed through the whole world of the middle ages, is based upon the supposition that the heavenly bodies are the instruments by which the Creator regulates the course of events in this world, giving them different powers according to their different positions. This is the description of the more learned astrologers: for we need hardly say, that the ignorant have made the stars themselves the agents, just as the image of the Deity has generally come in time to be regarded by the vulgar as the Deity himself. Looking at the more credible description, it might be philosophical for a newly created being, in possession of rational powers, to suspend his opinion on such a point till he had observed facts enough to affirm or deny the connexion asserted to exist between the places of the planets and his own fortunes. That there is nothing repugnant to human nature in the basis of astrology is sufficiently proved by the number of great minds which have been led by it, when properly prepared by education; and the present age must recollect that the arguments which are now held conclusive against astrology got their strength in the minds of most people from no other circumstance than that which formerly was the prop of considerations which were held equally decisive in favour of it, namely, the bias of education. The real arguments against astrology are, first, that it is self-contradictory; secondly, that its predictions are not borne out by facts. To see the first of these, we must describe the leading principles of the art.

In the following globes, the circle projected horizontally represents the horizon, the double circle the meridian, and the other four circles are drawn at equal distances from the meridian and horizon, through the north and south points of the

while the diurnal revolution of the globe takes place under them. The twelve divisions are called the twelve *houses* of heaven, and are numbered in the order in which they would rise, if the circles, accompanied the diurnal revolution. Every heavenly body passes through the twelve houses in twenty-four hours, but is not always in the same house with the same stars, except at the equator. For it is evident that, in order to have two bodies always in the same house, the revolution must take place round the north and south poles of the heavens, which poles are in the horizon only to a spectator on the equator itself. The principal point attended to in each house is the part of the zodiac which occupies it; and the place of any planet in the house is the distance of the body from the cusp, or boundary circle, measured on the zodiac. The following fanciful method of representing the twelve houses was in universal use, and the readers of almanacs must be familiar with it.

The twelve triangles represent the twelve houses of heaven, as marked by the Roman numerals. The time is April 16, 1784, at half past six in the morning. On the boundary of each house is written the part of the ecliptic which is to be found on it. For instance, on the cusp of the twelfth house that is just rising is the point of the ecliptic which is in $4^{\circ} 11'$ of Gemini. The boundary between the ninth and tenth houses is in 1° of Aquarius. The whole sign of Scorpio is in the sixth house, the boundaries of which are therefore in Libra and Sagittarius. The planets are placed in their proper positions in the houses: thus Mercury (♂) appears to be in the twelfth house, at $22^{\circ} 16'$ from the boundary of the eleventh and twelfth.

But, on all the preceding points, it must be observed that great authorities differ very much. From among the obscurity and confusion which prevail in old treatises, we are able to collect this much, that some of them draw the boundary lines of the houses in such a way as to cut the ecliptic into twelve equal parts, instead of the prime vertical, as we have done; others draw the boundaries through the poles, instead of the north and south points of the horizon. The future destinies of mankind are rendered very uncertain by such diversity of opinion; but this we have found, that the followers of each system complain just as much of the rest, as if they had some reason to show for their own. For instance, Peletarius, or Pelletier, who introduced algebra into France, and wrote on the horoscope in 1563, expresses himself thus: 'Some cut the horizon into equal parts, some a vertical circle, some the equator, some the ecliptic, some a parallel: whence it is not wonderful that a difficult art should be involved in fresh obscurity; for who can possibly see a living likeness in a mirror which is put out of shape in so many ways?' His own system is the equal division of the zodiac; and his argument for it, independently of old authorities, is the incongruity of letting the poles of the ecliptic have nothing to do with a matter which so nearly concerns the zodiac. *Minimeque convenit, zodiacos suos polos esse inutiles in eo negotio quod zodiacum maxime proprium est.* The placing of the signs in the equator he treats as a dream, and seems perfectly satisfied with the preceding reason.

The houses have different powers. The strongest of all is the first, which contains the part of the heaven about to rise: this is called the *ascendant*; and the point of the ecliptic which is just rising is called the *horoscope*. The next house in power is the tenth, which is coming on the

latte, thus dividing the whole heavens, visible and invisible, into twelve equal parts. Let these circles remain immovable.

meridian, &c. The first is the house of life; the second, of riches; the third, of brethren; the fourth, of parents; the fifth, of children; the sixth, of health; the seventh, of marriage; the eighth, of death; the ninth, of religion; the tenth, of dignities; the eleventh, of friends; the twelfth, of enemies. Each house has one of the heavenly bodies as its lord, who is stronger in his own house than in any other, as a but fit; and of two planets equally strong in other respects, he who is in the strongest house is the stronger. Now conceive all plants, animals, minerals, countries, &c., parcelled out under the different planets, which exercise their influence in abundance of different ways, according to the houses they may happen to be in for the time, and their positions relatively to each other—the result will be as good an idea of the mysteries of astrology as it is worth any body's while to obtain.

We shall now give some examples of the application of the science; and this we do principally, because in the mystical announcements which issue from our press, the darkness of the hints which are given throw a poetical gloom over the subject. This no doubt is interesting, and is not sporting too much with the credulity of the age, or with the chance of detection; but it is a foul libel on the powers of astrology. Thus, in 1815, instead of announcing some such prediction as the following—'Mars in the house of death portends, we are afraid, some new disasters, by war or other cause: a personage will strive against the new order of things, but, if we mistake not, the conjunction of Luna and Saturn in the twelfth house bodes him no good'—instead, we say, of such an unsatisfactory prophecy, a real believer in astrology—such as it was before it fell from its high estate—might have traced Napoleon from Elba to Waterloo; have calculated the very moment of the advance of the Prussians, and described the sword-knot of the captain of the Bellerophon. Thus we have the story of a Jew, in the time of the caliph Al Mansur, who was able to detect, by means of the heavenly bodies, that certain words just written upon a paper, which he was not allowed to see, were the names of a plant and an animal. But lest any one should imagine that perhaps the later astrologers have given up the attainment of information so minute, and have confined themselves to such general indications as those of our almanacs, which, as they mean nothing, may as reasonably be drawn from the stars as elsewhere, we take the following instances from a work published in 1817, which we will not name, and which we would willingly suppose to have been written in irony, if it were not that its size (two volumes quarto, with tables) and style are both evidences either of real belief, or intentional attempt to deceive.

A man who was born June 24, 1758, at eight minutes after ten in the morning, committed a murder, and was by many supposed to be insane. Pending his trial, an astrologer was requested to point out by the stars whether this defence would be established or not. The nativity was cast, that is, the position of the heavens at the aforesaid time was laid down, and the nativity having been rectified (a process amounting to giving the prophet a power of making almost any change he pleases), the result was as follows.

'Mercury being lord of the ascendant, irradiated by a malefic quartile aspect of the planet Mars, and afflicted by an opposition with Jupiter, declares that the native shall be involved in an abyss of troubles and afflictions, even to the hazard of his life.'—'The quartile of Mercury and Mars, particularly when Mercury is constituted principal significator, hath implication of high crimes and misdemeanors.'

—'Upon a further inspection of the figure, we find a baneful quartile aspect of Mars and Jupiter, with a mischievous opposition of Saturn and Mars. To the first of these we are to attribute the dissolute manners of the native.'—'Here is unquestionably a favourable trine of the Sun and Saturn; but no great good can result from it, because the Sun is lord of the twelfth house, posited in the tenth, and out of all his essential dignities; at the same time that Saturn is lord of the sixth, located therein, and both the significators are under the dominion of the evil *genii*, vitiating the mind and affections of the native.'—'At the time the unhappy native was prompted to commit this barbarous act, the Moon came to an opposition of Mars by direct direction, while she occupied the cusp of the seventh house, which represents the unfortunate woman.'—'The Sun I find to be giver of life, posited in the tenth house, the house of justice; Mercury, lord of the ascendant, being in Gemini, an airy sign, and the Moon likewise in an airy sign, show the manner of the

native's death, that he would die suspended in the air; while the opposition of four planets in the radix, and the mundane quartile of the Sun and Mars from the tenth, the house of justice, show the quality of it—namely, that it should be in due course of law, by the hands of the common hangman, and not by suicide.'—'I brought up the direction of death with great nicety and precision, and found he would be plunged into eternity when the Sun came to the anaretical point of the midheaven, and met the noxious beams of the Moon and Mars in opposition, which thus constituted is ever productive of a violent death.'

We now give the following opinion upon a case of a projected marriage, in which the lady, suspecting an attachment elsewhere on the part of her intended husband, inquires whether it will ever take place. The position of the heavens is supposed to be laid down at the moment of asking the question.

'The Sun is significator of the lady; and Saturn, lord of the seventh house, is significator of the gentleman. It must also be observed, that in this, and all questions relative to matrimony, Mars and the Sun are the natural significators of a woman's marriage; and Venus and the Moon are those of a man's. Now Saturn, the gentleman's significator, is remarkably well posited in the fifth house, and has Venus within his orb, applying to him by conjunction; which is a very powerful indication that his affections are sincere and honourable, and that his mind is fully bent to the marriage state. The Sun, likewise, being in a sextile aspect with Mars, the lady's significator of marriage, plainly shows her inclination to matrimony to be strongly fixed, and her affections to be perfectly sincere.'

'The next thing to be considered is, whether there be any frustration or impeding aspect between these significators, and I find the Moon and Venus, the gentleman's significators of marriage, are applying to a quartile aspect with each other. This is an evident proof that the marriage is prolonged by the interference of some other woman of this gentleman's intimate acquaintance, because the aspect is made in a feminine sign; but as the Moon, in separating from Venus, applies to a perfect trine with Mars, the querent's principal significator of marriage, and also to a sextile of the sun, her natural significator in the figure, it totally removes the evil effects of the malefic aspect, and leaves the path free and unobstructed to the gates of Hymen. This opinion is greatly strengthened by considering the mode in which their significators are severally disposed. Saturn disposes of the Sun, who is posited in the terms of Venus, and Venus, Saturn, and the Moon, are all disposed of by the benevolent planet Jupiter, who is himself disposed of by Mars, the principal significator of this lady's marriage, and who thus triumphs over every obstacle to the celebration of their nuptials. I therefore could not hesitate in declaring to the lady, in the fullest and most satisfactory terms, that the gentleman who courted her had a sincere and tender regard for her; and that, though some circumstances might have happened rather unfavourable to her wishes, yet she might rest perfectly assured that he was the man allotted to be her husband.'

'Apparently well satisfied with these declarations, she proceeded to inquire in what length of time this desirable circumstance might come to pass. To gratify her wishes in this particular, I referred again to the figure, where the Moon wants upwards of eleven degrees of forming a perfect sextile aspect with the Sun, the lord of the ascendant, and the same to Mars, her significator of marriage, and therefore, by converting the degree into time by the rule heretofore given, I fixed her marriage at about the end of three months, assuring her it could not exceed that time.'

On looking at the examples we have chosen, we see that they refer to matters which are proverbially under the control of destiny; we therefore take another, which has more connexion with the common affairs of life. It consists of directions for dealing in the smaller sorts of cattle, such as sheep, hogs, &c., and will fully exp' on the risk of such speculations.

'If the lord of the sixth and the lord of the second are conjunction, in a good house of heaven, the querent may thrive by them (i.e. small cattle); or if they be in sextile or trine, the same. The lord of the sixth, casting a friendly aspect to the part of Fortune, or being in good configuration with the dispositor thereof, denotes much good to the querent by dealing in small cattle; but if, on the contrary, the lord of the sixth be unfortunate, and in evil aspect with the lord of

the ascendant or second, or cast malignant rays to either of their cusps, the querent will lose by dealing in small cattle. If the lord of the sixth be in quartile, or in opposition to the dispositor of the part of Fortune, or the Moon, the querent cannot thrive by dealing in small cattle. The same if the lord of the sixth be afflicted either by Saturn, Mars, or the Dragon's Tail; or be found either retrograde, combust, eulent, or peregrine. The Dragon's Tail and Mars show much loss therein by knaves and thieves, and ill bargains, &c.; and Saturn denotes much damage by the rot or murder.

That the antient system of astrology contained the most contradictory assertions may be made evident in very few words. The position of the heavens at the time of birth settled every man's character of body and mind, the various fortunes he would meet with, and his relative positions with regard to friends and enemies. Thus, every one who was born at or very near the same time as Alexander the Great, in the same country, would have a right to expect a somewhat similar career; and twin brothers could never fail to have the same horoscope, and therefore the same success in life; and though the subject of a particular horoscope should travel over the whole world, and thereby come under the influence of positions of the heavens which never could have occurred at his birthplace, yet these would be always ready to tell him (when properly looked at) whether the present moment was favourable or unfavourable to any pursuit he had in view. To take a case that might have occurred: suppose two men had engaged to throw dice against each other for their whole fortunes, and that each went the night before to consult different astrologers in the same town. To them it would not be necessary to tell their names, or exhibit their horoscopes; the present position of the heavens would be sufficient for pointing out a favourable hour, and if both astrologers worked by the same rules, as they ought to do, they would both arrive at the same result: that is, the same would be recommended to both inquirers, though one of them must certainly lose.

The astrologers never made any allowance for the precession of the equinoxes. Thus, though the constellation Aries is now in the sign Taurus, and the influences of its stars ought to have moved with them, we find that the astronomical Aries, or the first thirty degrees of the ecliptic, is used for the constellation. Under the circumstances, this is of little consequence; but such a practice would be fatal to astronomy.

That observed facts did stubbornly refuse to fulfil the predictions of the planets need hardly be told. In the fifteenth century, Stæffler foretold a universal deluge which should take place in 1524, in consequence of three planets being then in conjunction in a watery sign. All Europe was in consternation; and those who could find the means built boats in readiness. Voltaire mentions a doctor of Toulouse who made an ark for himself and his friends. Such a circumstance shows the hold which astrology had upon men's minds, from which, had it been true, it never could have been forced; for though a *new* truth, even when capable of easy verification, is introduced with difficulty, it is altogether absurd to suppose that a science, the correctness of which was of every-day experience, should drop and become exploded, not for want of cultivators, but of believers. The former we have, perhaps, even now, and a few of the latter, though only among the most ignorant of the community. The art is, at present, under the ban of the law, in order that designing persons may have at least one access stopped to the pockets of the credulous. By the statute of the first of James I. c. 12, sorcery of all species was prohibited, though it does not appear certain that this term included astrology; but by the vagrant act, 5 Geo. IV. c. 8, sec. 4, all 'persons pretending to tell fortunes, or using any subtle craft, means, or device, by palmistry or otherwise, to deceive and impose upon any of his Majesty's subjects,' are rogues and vagabonds—that is, punishable by any magistrate, with three months' imprisonment and hard labour.

The history of judicial astrology, at least up to the middle of the fifteenth century, is very nearly that of astronomy, since the later branch of the science, except among the Greeks, was mostly cultivated for the sake of the former. Hence to it, as to alchemy, we owe many really useful discoveries. It is a singular fact, that the first lunar tables which were constructed on the Newtonian theory were intended to be subservient to the calculation of nativ-

ties; there is no question that the necessity which the astrologer lay under, of being ready, at any moment, to lay down the positions of the heavenly bodies, produced great numbers of useful tables and observations; and the Greek works which have been preserved by the Arabs were valued principally for the use to which their mathematics could be turned in astrology. The origin of the science is beyond the reach of history, nor is it much worth while to collect all that is known on this point. It certainly came into Europe from the East, where it is mentioned in the earliest records of every nation. The Chinese are said to have placed it on the same footing with agriculture and medicine; the Chaldeans cultivated it sedulously, and the invention is attributed to them by Suidas (cited by Montucla, iv. 372). The Hindoos have long regulated the most important actions of their lives by the stars (see introduction to the *Liliuti*); but Mr. Colebrooke has shown (*Hindoo Algebra*, preface, p. 80) that several of their fundamental terms are not Sanscrit, from which he apparently leaves us to conclude that he thinks the science neither antient nor indigenous in India. Among the Egyptians, it was of great antiquity; but it is not mentioned in the books of Moses, unless included in magic or sorcery, which is most probable. The books of Isaiah and Jeremiah allude directly to it in several places, as also that of Daniel. During the captivity, the Jews appear to have learnt the art, and from that time probably, but certainly in the earlier centuries of the Christian æra, became much addicted to it. Several of the more celebrated writers on astrology under the caliphs were Jews, as Messahalah, Moses ben Maimon, Solomon Iarchus, whose almanacs we have mentioned as among the earliest published, and many others.

In Greece, at least during the classical ages, judicial astrology found no reception: nor do we trace any marks of it even in the earlier astronomical writers of that country. The system was little in harmony with the allegorical mythology which prevailed there; and the oracles afforded perhaps sufficient nourishment to the appetite for the marvellous. But among the Romans, astrology was cultivated with avidity from the time of the conquest of Egypt, in spite of several edicts of the senate. In the second century, the whole world was astrological; and even Ptolemy was infected. There is a work entitled 'Tetrabiblos' attributed to him, which is entirely devoted to astrology; and though its genuineness has been doubted by some, merely because it is astrological, there appears no sufficient reason to reject it. (See Delambre, *Hist. Ast. Anc.*, ii. p. 543.)

All the followers of Mohammed are and have been astrologers. The predestinarian doctrines of their system render the transition easy and natural: for, as we have seen, the science of astrology is based upon the notion of the necessity of human actions. The establishment of the Moors in Spain, and the crusades, caused the introduction or the increased cultivation of the art among the descendants of the barbarians who destroyed the Roman empire; probably the former, for we have no distinct traces either of astronomy or astrology among the northern nations. But the predestinarian principle assumed a modified form, more consistent with the belief of the Catholic church. It was said that the stars only incline, but cannot compel; which position, while it left the will free, was a most convenient explanation of any failure in the predictions. The Greek and Roman Christians of the earlier centuries had in many instances received the whole of astrology; in others the modified belief above mentioned. Origen, though he recognises the stars as rational beings, yet, in his *Philocalia*, contends that the stars neither incline nor compel, but only prophesy or point out what men will do without exerting any influence. He then gives a long and curious argument against their compelling power, without explaining how it does not hold equally against their predicting faculty. St. Augustin (cited by Vossius) argues against astrology altogether. The church, in its public capacity, condemned the art in the first councils of Braga and Toledo, and in the Decretals (cited by Vossius). The doctrine of astrology was among the errors imputed to the Priscillianists. But many zealous catholics in later times adopted the same opinions, and among them churchmen of the highest rank, such as the Cardinal d'Ailly (died in 1425), who calculated the horoscope of Jesus Christ. The astrology of comets, which is hardly yet out of date, has even been recognized by a Pope: in the fifteenth century Calixtus III. directed prayers and anathemas against a comet

which had either assisted in or predicted the success of the Turks against the Christians.

The establishment of the Copernican system was the death of astrology; and that upon an argument not one bit stronger against it than preceding systems for it. When it was found that the earth was only one among other planets, it soon came to be reckoned absurd by many that our little globe should be of such consequence as to be the peculiar care of the whole system. But why should the principle of non-interference have been preferred to that of the balance of power? We have lost a charming opportunity of discovering what goes on in other planets.

The last of the astrologers was Morin, best known as the opponent of Gassendi. The latter had in his youth studied and believed in the art, but had afterwards renounced and written against it. The former, who worked for thirty years at a book on astrology, and was besides an opponent of the motion of the earth, predicted his opponent's death repeatedly, but was always wrong. He also foretold the death of Louis XIII., with no better success. Since his death, which took place in 1636, the science has gradually sunk, and we believe has in no case been adopted by any real astronomer.

ASTRONOMY signifies the *laws of the stars*, and is applied generally to all that relates to the motions and theory of the heavenly bodies, as well as of the earth. If we except general terms, such as *science*, there is perhaps no single word which implies so many and different employments of the human intellect. We shall therefore confine ourselves here to a slight sketch of the annals of the science, and a few general considerations, pointing out at the same time the articles which should be consulted for further details.

The work of the astronomer begins in the observatory, where means are provided for noting the positions of the stars. Of the instruments by which this is done, see the principle and details in the articles INSTRUMENTS (ASTRONOMICAL), CLOCK, PENDULUM, OBSERVATORY. There are two classes of observations: the first, of known bodies, of which the places are so nearly determined that no question remains except about quantities less than a second of time, or its corresponding quantity, fifteen seconds of space [see ANGLE]; and for this class the consideration what phenomena shall be observed is made to rest entirely upon the instruments, those phenomena being preferred, for the observation of which the steadiest instruments can be made. These move only in the meridian, and the star is waited for. The second class of observations, such as those of comets, double stars, and all mere appearances, which require an instrument that can be pointed to any part of the heavens, or can be made to follow a star, is performed by telescopes, which are made to revolve with the heavens. [See EQUATORIAL.]

The second division of astronomical labour is the department of the mathematician only. The observations as they come from the instruments are subject to all the errors of the latter; and no perfect instruments can be constructed. The best circle that can be made is slightly oval; the best pivot that can be turned will not be truly cylindrical. The question now comes, in what manner to compare different species or sets of observations, so that the discordances themselves shall point out the quantity and quality of the instrumental errors; and how from thence to derive the corrections necessary for future observations. Also, how to choose the time and manner of observation, so that any particular error, whether of instruments or theory, shall be least, if the observer be desirous of avoiding it, or greatest, if he wish to detect and measure it. Every-day experience shows: that there is no better test of the progress of observation than the discovery of new instrumental errors, provided only the quantities in question become less and less. The angular error which now sets an observer to work to correct his result is less than the six-hundredth part of that which would have been sufficient to annoy Ptolemy or Hipparchus. And in speaking of an instrument, we may consider the observer himself as a most material part, on the combined power of whose eye, ear, and judgment, the correctness of the observation depends. It is hardly to be expected that, even under precisely the same circumstances, two observers should note the same phenomenon so as to agree within a small fraction of a second; and recent experiments on phenomena noted with both the eye and hand, have demonstrated the existence of small differences between different

observers, attributable only to their different habits of perception or physical constitution. On this point see EQUATION (PERSONAL).

When observations have been, as nearly as possible, freed from instrumental errors, the next step would be, if we could imagine a system of astronomy only in its infancy, with instruments as near perfection as our own, to deduce, by combination of mathematical reasoning and calculation, the real places of the stars for some one moment, and the magnitudes and laws of the various motions to which they are subject, whether periodical or permanent, and whether arising out of the motion of the earth or out of a proper motion of the stars themselves; and for the solar system, to determine the relative motions and positions of the planets and their satellites, which can only be done by the previous measurement of the earth and subsequent comparison of the results of one observatory with those of another. But these primitive determinations have always been in progress with the instruments, and results have increased in accuracy with the power of observing; so that instead of working afresh for the determination of *elements*, as they are called, almost the whole of modern astronomy is a process of correction of those which have been previously obtained. This greatly facilitates operations: for the reason of which see DIFFERENTIAL CALCULUS, APPROXIMATION. The measurement of the earth itself, and the determination of its figure, which is the basis of planetary astronomy, so far as ascertaining the actual dimensions of our system is concerned, will be treated as a separate science under the name of GEODESY, though it is a constituent part of astronomy, both as to the methods by which it is carried on, and the objects for which it is undertaken.

The third department of astronomy, being that which requires the most extended knowledge of mathematics, and the highest exercise of thought, is that which goes under the name of *physical astronomy*, and consists in the combination of the various phenomena as actually observed, in order to find out what are their physical causes, and according to what laws those causes act. It is evident, that without some success in this branch of the science, there can be no power of *prediction*, except what arises from the presumption that preceding phenomena have run their whole possible round, so that nothing *can* happen except a repetition of what *has* happened. To a rough view this seems to be the case, and is so in a great measure; but to the instruments of an observatory there appears *no* such complete *periodicity*. To this head we should refer such questions as those of REFRACTION, ABERRATION, and GRAVITATION. The term physical astronomy is usually applied to investigations connected with the latter only; but both etymology and analogy warrant its extension to the former. Under this, also, we must place all questions connected with the physical constitution of the various planets, so far as that can become known. Of the great increase which the predicting power of astronomy has received since Newton deduced the motions of our system from the simple law of attraction, there is no need to speak; but we shall notice one peculiar use of that principle, by which the results of observation are anticipated, and the first and second of our divisions of astronomy advanced, while at the same time the *experimentum crucis* of the truth of the principle is furnished. There are many small inequalities of the solar system, which, though not likely to show themselves, mixed up as they are with so many others, are yet certain to be found, if looked for at the time when their effects are most sensible. The results of theory point out that a certain inequality, whose law and approximate magnitude it gives, should be found in the motion of a certain body, if the Newtonian principle be correct. On being looked for in the manner which the nature of the inequality itself shows to be most advantageous, it is found accordingly, and its *exact* magnitude, as ascertained by observation, is often of use in correcting that obtained from theory. For example, had it not been for methods of this kind, our knowledge of the motions of Jupiter's satellites, which is yet far from mature, would have been in a state of the merest infancy.

If the theory had arrived at a degree of completeness, towards which it has been and is rapidly tending, nothing more would be necessary for the determination of the motions of the solar system than the knowledge of the actual positions, velocities, and directions of the velocities of the bodies composing it, at some one moment, or of any

other quantities in which the above were mixed up, and from which they could be obtained by calculation. But up to the present time it has been necessary to use more data of observation than the preceding, and it is only within the last ten years that tables of the moon, from the first-mentioned data alone, have been published by Baron Damoiseau, to which we shall afterwards refer. These tables differ from the mixed tables hitherto used by about half a second of time in right ascension, and two seconds of space in declination. (This is the mean comparison of the tables of Damoiseau and Burckhardt for January, 1834, and may be deduced from the more extensive comparison given in the *Nautical Almanac* for 1835.) But the tables themselves in common use differ from actual observation by quantities of about the same (or rather greater) magnitude, and it has not yet been ascertained which of the two sets of tables are more correct. But we have no doubt that the Cambridge observatory will decide this question in the course of the present year.

For the details of the actual state of astronomy we must refer the reader to such articles as STARS, SOLAR SYSTEM, &c., and the names of the several planets. We shall now proceed to a sketch of the history, or rather the *annals*, of astronomy, referring for fuller information either to the *History of Astronomy*, published by the Society, or to the complete and magnificent works of Delambre on the subject. The latter we have followed in great measure as to disputed questions of fact; and the form in which this work is written will render verification easy in any personal matter, though chronological reference is rather difficult.

The real history of *written* astronomy, that is, of actually recorded and moderately correct observations, in sufficient number to constitute a body of science, commences with Hipparchus, about 160 years before our era. Prior to his time, it is difficult to do more than speculate upon the few facts which are left to us. That astronomical observation of a certain description began in the very earliest ages, there can be no doubt; but more than could be but one instrument, the horizon, and but one theory, the actual motion of the heavenly bodies round the earth. The earliest observations mentioned are those of the rising and setting of stars, which led to the registration of the different appearances presented by the heavens in the course of a year, to which may be added lunar and solar eclipses, and comets. The rapid motion of the moon in the heavens would probably have caused the lunar zodiac to be first marked out, though it is clear that the solar zodiac was of a very early date. Astronomical observation has always been one of the accompaniments of civilization, both in modern and ancient times; and however much we may conceive ourselves entitled to look down upon the notions of our predecessors, we must not forget that in speaking of any country which possessed an astronomical theory worth so much as laughing at in modern times, we place that country in the list of exceptions to the rule which prevailed through the greater number. If the Chaldean system appear insufficient, or the Ptolemaic complicated, these are yet real results of thought, and, to a certain extent, actual representations of fact. Mungo Park mentions an African tribe, whose opinion it was that the inhabitants of the west fried the sun when he got down to them, and after heating him sufficiently for next day's service, took him round by a private passage to the east. If we could collect the astronomy of the whole ancient world, there can be little doubt that the comparatively humble efforts to which we are coming would appear miracles of sense and reflection, among theories not much superior to those of Park's Africans.

The nations who are known to have cultivated astronomy before the Christian era are the Chinese, Indians, Chaldeans, Egyptians, and Greeks. The first made it a matter of politics, the three next of religious observance, and all four applied it to astrology. Among the Greeks only, the science had no reference either to politics, religion, or sooth-saying; and here it throve with a vigour which permits us to make the astronomy of Hipparchus and Ptolemy a part of the chain which ends with Newton and Laplace. What we know of the four first-mentioned nations is not sufficiently certain or definite to warrant our drawing very positive conclusions as to the time when they began to study the science; and the question is rendered the more difficult by the pretensions to antiquity which have been advanced in favour of each by well-informed men of modern times. Each nation has its advocates, who maintain that the Chinese, the Indians,

the Chaldeans, or the Egyptians, were the first astronomers, which is of itself sufficient to prove that the question is doubtful. Fortunately it is of little consequence; and also the astronomy of the first and two last is of a character and extent which will justify our saying that, be it very ancient or not, there is nothing on the face of it which needs the supposition of any very long time having been expended upon it. The Hindoo astronomy, on the other hand, though certainly more extensive and correct, may have been, for anything that can be shown to the contrary, received from the Arabs of the middle ages. At least such is the opinion of Laplace, Delambre, and several celebrated Anglo-Indians, who have had means of knowing more of the subject than either. But this question is one of difficulty, and ought not to be considered as finally settled.

The Chinese have some annals which were translated by De Mailla, a Jesuit missionary at Peking, 1777-1785. They claim to go back to the year B.C. 2857, but of astronomical phenomena they record hardly anything, except eclipses of the sun, and the appearance of comets, and of the former nothing but the fact and the day of their happening. They state that the astronomers by profession were obliged, on pain of death, to predict every eclipse that occurred, and that, even after such phenomena were found capable of prediction, it was the practice to shout, beat drums, &c., during every to frighten away the monster which they supposed to be devouring the sun. The mathematicians, in spite of their responsibility, were forbidden to make any alteration in their theories or methods, without the consent of the emperor. The loss of many methods, asserted to have been formerly practised, is attributed to the burning of all scientific books by one of their princes, B.C. 221. But perhaps the loss was not great; for Gaulus, who recalculated their asserted eclipses, could not verify more than one of a date anterior to the time of Ptolemy; and even that one is doubtful. The fact of the motions of the planets was known to the Chinese, but not the precession of the equinoxes, till about A.D. 400. They had also the Metonic and Calippic periods. For the account of the more modern Chinese astronomy, we must refer to the article CHINA; the improvements which were gradually introduced in the earlier ages of the Christian era might have been, and probably were, the work of Europeans.

The question with regard to the Hindoos is not whether their astronomy is sufficiently high in its pretensions to make it worth while to enquire into its antiquity, but whether an astronomical system of a very advanced character, which certainly was found among them, is or is not as old as they assert it to be. This system is found in certain tables which have been brought into Europe by Legentil [S. TRIVALORE, TABLES OF], and in an original work [S. SURHYA SHIDDIANTA]; and it may be fairly considered as about equal to the European system of the twelfth century. The epoch claimed by the tables is B.C. 3102, the beginning of the Cali-yug, or iron age of Hindoo mythology, at which time a conjunction of all the planets is asserted. But this has too figurative a character; and moreover, the elements of the tables are hardly such as would have been derived from observations actually made at that period. That the epoch is fictitious may be readily believed; but the question is, was this fictitious epoch formed by Hindoos from their own observations before the Christian era, or was the system introduced by the Arabs, or by direct communication with the Greeks? On the one hand it is argued that the Indian tables, being in many respects a mean between those of Ptolemy and Albategnius, may have been derived from those two; on the other hand, the remarkable correctness of several points, and the known character of the people in question, whose advances in mathematics cannot be doubted, and whose habits have, throughout recorded history, induced them to repel all connexion with foreigners, are urged in favour of the originality of their system. Those who are curious may consult Bailly's *Hist. de l'Astronomie Indienne*, on the one hand, or Delambre, on the other; but this question has unfortunately been treated with considerable spirit of system on both sides.

The Chaldeans, according to Diodorus, had long observed the risings and settings of the heavenly bodies, as well as eclipses. They had the celebrated Metonic period of nineteen years, and it is supposed that Meton obtained it from them, though this point is doubtful. They had also other periods, the meaning of which has caused discussion. [See SAROS, NEROS.] Simplicius, a commentator on Aristotle,

relates that a series of eclipses preserved at Babylon was transmitted by Alexander to Aristotle, and contained the observations of 1903 years preceding the conquest of Babylon by the Macedonians. But Ptolemy gives only a few of them, the earliest of these not reaching higher than B.C. 720. They are of the roughest kind, the times being given only in hours, and the part of the diameter eclipsed within a quarter; but nevertheless they are the earliest trustworthy observations we possess, and led, in the hands of Halley, to the discovery of the acceleration of the moon's mean motion. We find also among the Chaldeans the use of the clepsydra as a clock, of the gnomon as an instrument for measuring solstices, and of the hemispherical dial called by the Greeks *κακρη*, for ascertaining the positions of the sun. By the clepsydra they were enabled to divide the ecliptic nearly into twelve equal parts, and are thus said to have invented the zodiac. [See BEROSUS, CHALDEA.]

The Egyptians have left us no observations, and few astronomical relics the meaning of which can be made very clear, though it is probable that they were the first instructors of the Greeks. Their year was of 365 days; for their method of correcting it, see NOTHIC PERIOD. They observed eclipses, but none have come to us; they foretold comets, according to Diodorus; but as this author also mentions at the same time that they foretold future events, it becomes doubtful whether we are to understand that their predictions were successful. The idea attributed to them that Mercury and Venus moved round the sun is not mentioned by Ptolemy; whose silence on this and many other points, writing as he did in Egypt, is remarkable, unless it be admitted at once as a proof of exaggeration in the preceding accounts. The correct manner in which some of the pyramids are said to be placed north and south has always been quoted as a ground of suspicion, that these buildings had some astronomical use. The zodiac has also been attributed to the Egyptians. [See DENDERAH, ZODIAC OF.] The only attempt at a measure which we have remaining is one of the diameter of the sun, the meaning of which is obscure; but if what Delambre mentions (without citing his authority) be true, that they measured time by the distance run by a horse, as well as by the clepsydra, we need not be surprised that Ptolemy found no assistance from their ancient observations. The story of Thales teaching the Egyptians how to find the height of the pyramids by the shadow, and that in Herodotus, of his being told by them that the sun had twice risen in the west, are, so far as their credit goes, confirmations of the opinion generally formed of Egyptian astronomy. [See MANETHO, EGYPT.]

With regard to the astronomy of the Greeks previously to the earliest extant works, there is little to be said. The Ionian school, founded by Thales B.C. 600, followed in succession by Anaximander, Anaximenes, and Anaxagoras [see all these names], added little or nothing to practical astronomy. If Thales announced the eclipse of B.C. 610 [see ALYATRES], it was the *par* only; and the opinion of the earth's motion, attributed to Anaximander (whom see), rests on slender foundation. The school of Croton, founded by Pythagoras (whom see) about B.C. 500, and sustained by Philolans, produced no observers, though it certainly adopted the opinion of the earth's motion. Meton, B.C. 432, introduced the cycle of nineteen years; Calippus, B.C. 330, introduced the improvement on the former known by his name. Eudoxus of Cnidos, B.C. 370, brought into Greece, according to Pliny, the year of 365½ days, and wrote some works, one of which exists in the poetical version of Aratus. Timochares and Aristyllus, B.C. 300 (?) made the observations which afterwards enabled Hipparchus to discover the precession. Pytheas, about the time of Alexander, measured the latitude of Marseilles with tolerable accuracy. The work of Aristotle on astronomy is lost; and what is still more to be regretted, that of his disciple Eudemos on the history of astronomy. The poem on the Sphere attributed to Euphrades, B.C. 450, is probably much more modern.

We now come to the period of history, and of the Alexandrian school. This article being for reference only, we shall condense as much as possible the principal discoveries of the succeeding astronomers, in order of time. This could not be done in the chain of surmises mixed with history which we have just finished, since it is important to avoid confounding what is known with what is only supposed. For further information refer to the name at the beginning of each paragraph.

Autolycus, B.C. 300. His books are the earliest which are extant in the Greek language on astronomy. They are two—1. On the sphere in motion. 2. On the rising and setting of the stars. He appears to have considered the year as exactly 365 days.

Euclid of Alexandria, B.C. 300. The Elements of Euclid show that the Greeks of his time had no trigonometry. There is another work attributed to him, entitled *Phenomena*, which is no more than a treatise on the doctrine of the sphere.

Aratus of Cilicia, B.C. 281, has left an astronomical poem, chiefly taken from Eudoxus, and valuable on account of the commentary of Hipparchus.

Aristarchus of Samos, B.C. 280. His work on the magnitudes and distances of the sun and moon is the first attempt to measure the relative distances of these two bodies, by observing their angular distance at the time of half moon. To him also is attributed the opinion that the earth revolves round the sun.

Mancho the Egyptian, B.C. 260. His history is lost, but a poem attributed to him remains. It is a description of the heavens, filled with astrology, and containing no observations.

Erastosthenes of Cyrene, B.C. 240, is said to have observed with some celebrated astrolabes which he erected at Alexandria, which remained standing till the time of Ptolemy. Various works are attributed to him, for which see his life. He observed (either with a gnomon or with a meridian circle) [see ASTROLABE] the obliquity of the ecliptic, and the latitude of Alexandria; and in the latter, and the fact that at Syene the sun was vertical in the summer solstice, he deduced an approximation to the earth's magnitude. His approximation makes a degree to be 700 fathoms. A catalogue of stars attributed to him (the oldest extant) is probably spurious, but shows that, in and about his time, the method of referring stars to their latitudes and longitudes was not practised. His value of the obliquity of the ecliptic 11 parts out of 166 of the whole circumference was adopted by Hipparchus and Ptolemy.

Archimedes of Syracuse died B.C. 212. He observed solstices, and attempted to measure the sun's diameter. His writings show that trigonometry was as yet unknown.

Hipparchus (of Bithynia?), B.C. 160 (?) 125, the all the Greeks in astronomy. In his youth he wrote a commentary on Aratus. [See ARATUS.] He discovered the precession of the equinoxes, by comparing his own observations with those of Aristyllus and Timochares, or others of his predecessors. He was the first who employed processes analogous to those of plane and spherical trigonometry, for which he constructed a table of chords. He first used *right ascensions* and *declinations*, which he afterwards abandoned in favour of *latitudes* and *longitudes*. He suggested the method of referring terrestrial positions to latitude and longitude, and was probably the inventor of the stereographic projection. He determined the mean motion of the sun and of its apogee, the inequality of the sun's motion, and the length of the year, to greater exactness than his predecessors. He found the mean motion of the moon, of her nodes, and of her apogee; her parallax, eccentricity, the equation of her centre, and inclination of her orbit. His observations also led him to suspect another inequality in the moon's motion, which Ptolemy afterwards discovered (the evection). He calculated eclipses, and used the results in the improvement of the Elements. He made one of the first steps towards a correct representation of phenomena, by supposing the sun to move round the earth in a circle, the earth not being at the centre. His catalogue of the longitudes and latitudes of 1024 stars was the first at all worthy of the name. If Hipparchus had possessed the pendulum and the telescope, fifty years might have enabled his successors to place astronomy in the state in which it stood at the birth of Newton. Considering his means, his observations are perhaps unequalled.

After the death of Hipparchus there is no astronomer of consequence till Ptolemy. Between them we have

Hypsicles of Alexandria, B.C. 146, wrote the 14th and 15th books of the Elements of Euclid, which contain some astronomical propositions.

Geminus (of Rhodes?) B.C. 70, wrote an introduction to the heavenly phenomena, containing no new discovery. It would seem he was not an observer.

Posidonius about the same time attempted to verify the measure of the earth of Eratosthenes. His writings are all

lost, but many of his opinions are preserved in Cleomedes and Strabo. He remarked (though probably he was not the first who did so) the connexion of high water with the southing of the moon.

Theodosius of Bithynia, B.C. 50, left a work on spherical geometry, another on climates, and a third on the phenomena of day and night.

Sosigenes of Alexandria, B.C. 50, corrected the calendar under Julius Caesar.

Hyginus left an astronomical description of the heavens.

Manilius, a Roman, A.D. 10, wrote an astronomical and astrological poem.

Seneca, A.D. 50. His book on natural philosophy contains many pieces of information on astronomical history, but is principally remarkable for his bold opinions on the nature of comets. These he declares to be planets, whose laws he predicted would one day be calculated, and that posterity would wonder how things so simple could have so long escaped notice.

Menelaus, A.D. 80, has left three books of spherical trigonometry.

Theon of Smyrna, A.D. 117? wrote on astronomy, and made a collection of astronomical works. His observations are cited by Ptolemy.

Cleomedes wrote on astronomy. He certainly lived after Posidonius, but whether before or after Ptolemy is uncertain. He is usually considered as having lived under Augustus Cæsar.

We must suppose that there were many real observers between the epochs of Hipparchus and Ptolemy; but from the loss of even their names, and the silence of Ptolemy himself, it is clear that no discovery of any importance was made.

Ptolemy of Alexandria, A.D. 130–150. We must briefly mention his works, his system, and his discoveries. The *μαθηματικὴ σύνταξις*, or *mathematical collection*, afterwards called *μεγάλη σύνταξις*, and, by the Arabs, the *Almagest* [see ALMAGEST, SYNOPSIS], is the work from which we derive most of our knowledge of the Greek astronomy. We find there a full account of the observations and discoveries of Hipparchus; those of Ptolemy himself; the reasons and elements of his system; various mechanical arguments against the motion of the earth, which show that the first principles of dynamics were utterly unknown: a description of the heavens and the milky way, and a catalogue of stars, which we may be nearly certain was that of Hipparchus, reduced to his own time by an assumed value for the precession, but which has been asserted to have been corrected by new observations; a theory of the planetary motions; the length of the year; the instruments he employed, &c.

The Ptolemaic system [for more detail of which see PTOLEMAIC SYSTEM] was an attempt to represent the motions of the planets by supposing them to move uniformly in circles, the centres of which circles themselves moved uniformly in circles round the earth. The angular motions of the planets, as then known, were sufficiently well represented by this system; not so their changes of distance from the earth, as seen in their apparent diameters. This was the universal system of after-times till Copernicus.

The principal discovery of Ptolemy is that of the LUNAR EJECTION (which see), an inequality such as would be caused by an alternate increase and diminution of the eccentricity of the moon's orbit. He also discovered the REFRACTION (which see), and made some tolerably correct experiments to determine its law. He explained the apparent enlargement of the discs of the sun and moon when near the horizon. He extended the projection of the sphere of Hipparchus. He entered into the investigation of every point which Hipparchus had touched; in some instances finding more correct values; in others, altering without amending. He was not an astronomer only, but wrote on geography, music, chronology, mechanics, and, unfortunately, on astrology. [See PTOLEMY.]

With Ptolemy the originality of the Greek school ends. We must come to the Arabs before we find anything worth particular notice.

Sertus Empiricus, A.D. 173, described and wrote against the Chaldean astrology.

Censorinus, A.D. 238, wrote an astrological work on the day of nativity, containing historical information with regard to astronomy.

Julius Firmicus Maternus, A.D. 370, wrote on astronomy.

Pappus of Alexandria, A.D. 383. His commentary on Ptolemy is nearly all lost.

Theon of Alexandria, A.D. 385, the most celebrated commentator on Ptolemy. He was a good mathematician, but no great astronomer. He has however left some tables, and a method of constructing almanacs.

Hypatia (his daughter), murdered A.D. 415, the first female on record celebrated for her scientific talents. She wrote one book of her father's commentary, and constructed some tables.

Martianus Capella, A.D. 470, in his *Satyricon*, has some astronomical notions, among which is the following: that Mercury and Venus move round the sun. Cicero and Macrobius give the same idea; but the passage of Martianus is remarkable as being reported to have turned the attention of Copernicus to the system which bears his name.

Thins of Athens, A.D. 500, has left six observations of lunar occultations and solstices: the only observations recorded between Ptolemy and the Arabs.

Simplecius, A.D. 546, has left a commentary on, and description of, the astronomical work of Aristotle, which we have mentioned as lost.

Proclus Diadochus (not the commentator of Euclid), A.D. 550, wrote a commentary on the astrology of Aristotle, and a description of astronomical phenomena.

Isidore, archbishop of Hispalis (Seville), A.D. 636, wrote a theological work on astronomy.

Bele, A.D. 720, and *Barlaam* the monk, A.D. 1330, are attached to the preceding by Delambre. Both wrote astronomical works of little distinct merit. The last Greek writer on astronomy, of the least note, is *Michel Psellus*, A.D. 1050.

It is remarkable that, excepting his own commentators, few of the authors immediately preceding ever quote Ptolemy. Had it not been for the Arabs, the writings of the latter must have been lost.

The Alexandrian school was destroyed by the Saracens under Omar, A.D. 640; and the rise of astronomy among the eastern Saracens dates from the building of Bagdad by the caliph Al Mansur, in the year 762. In the reign of this prince, translations of the Greek writers were begun; and with nearly the same instruments, and the same theory, as Ptolemy, a career of four centuries of observation commenced, during which many astronomical elements, and, in particular, the obliquity of the ecliptic, and the precession of the equinoxes, were more accurately determined.

In the reign of Al Mamun, son of Harun al Rashid, himself a diligent observer, great encouragement was given to astronomy. A degree of the meridian was measured, but with what accuracy cannot be known, from our ignorance of the measure employed.

Albategnius, or *Al-Batani*, A.D. 850, discovered the motion of the solar apogee, corrected the value of the precession, the solar eccentricity, and the obliquity of the ecliptic; and published tables. He is the first who made use of sines (instead of chords) and versed sines. He found the length of the year more accurately. He is, beyond all doubt, the only distinguished observer of whom we know anything between Hipparchus and Tycho Brahe.

Alfraganus, or *Al-Fergani*, and *Thabet ben Korrah*, both about A.D. 950. The first has left a work on astronomy; the second is principally remarkable by his having revived an old notion of the Greeks (not mentioned by Ptolemy, but by Theon) of a variation in the position of the ecliptic, which has been called a *trepidation*. (See *Hist. Ast.*, *Library of Useful Knowledge*, p. 33.)

Ebn Yunis, and *Abul-Wefa*, about A.D. 1000. The former, an Egyptian, an observer and mathematician of great merit, has left a work containing tables and observations. He first noted the time of the beginning and end of an eclipse by taking the altitude of a star. His work shows an increasing knowledge of trigonometry. He was the first who employed subsidiary angles. *Abul-Wefa* first formally used tangents, cotangents, and secants, which *Albategnius* had overlooked. He gave tables of tangents and cotangents.

Alphetradius of Morocco, A.D. 1050, attempted a new explanation of the planetary motions, not worthy of further notice.

Arsachel, a Spanish Moor, A.D. 1080, has left some tables [see TOLEDO, TABLES OF] of indifferent accuracy. His contemporary, *Alhazen*, wrote on refraction. *Geber*, also a Spaniard, (about A.D. 1080?) made some improvements in spherical trigonometry. He introduced the use of the cosine.

Abul Hassan, about A.D. 1200, has left a catalogue of stars, and some improvements in dialling.

We have Persian tables (of the eleventh century?) translated by George Chrysococca, a Greek physician, in the fourteenth century; but the best known are those of Nasir-eddin, published A.D. 1270, under the protection of Hulagu, grandson of Jenghis Khan, and conqueror of Persia. The Persians have a method of intercalating their solar years, which, though complicated, is of surprising accuracy, but when they first began to employ it is unknown. [See CALENDAR.]

Ulug Beg, grandson of Timur, A.D. 1433. This prince made a large number of observations at Samarcand. His catalogue of stars of the date above-mentioned, was, in its day, the most correct ever published. He also gave tables of geographical latitudes and longitudes. The Emperor Akbar (sixth from Timur, died 1605) also encouraged astronomy, and caused many Hindoo works to be translated into Persian.

In China, *Cochoon-King*, A.D. 1250, patronised by Kublai, brother of Hulagu, and fifth successor of Jenghis Khan in the partial conquest which that prince made of China, made a great number of good observations. He introduced spherical trigonometry, and rejected the ancient chronology.

Since the fifteenth century, astronomy has declined throughout the East. The Chinese received many methods from the Jesuits, but to little purpose. Among the Hindoos, there are very few who can understand the ancient writings. The Turks and Persians have little besides astrology. We now proceed with the chain of European astronomy.

Astronomy was introduced again into Europe by means of the Greek writers, mostly through translations from the Arabic. The first translation of the *Almagest* was made under the auspices of the Emperor Frederic II., about A.D. 1230.

Sacroboscus (an Englishman named *Holywood*), A.D. 1220, wrote a work on the sphere taken from Ptolemy, &c. It continued for a long time in great repute. He also wrote on the Calendar. About the same time, *Jordanus* wrote a curious work on the Plainsphere.

Alonso X., king of Castile, A.D. 1252, with the assistance of Arabs and Jews, formed the first European tables. They differ little from those of Ptolemy. [See ALONSO'S TABLES.]

Roger Bacon, A.D. 1255, wrote on the phenomena of astronomy. (For writers of this period, not worth naming, see Delambre, *Hist. Ast. Moy.* pp. 258, 111.)

The Cardinal *Cusa*, A.D. 1410, wrote on the correction of the Calendar. He is said to have maintained the motion of the earth.

George Purbach, A.D. 1460, extended trigonometrical tables, and published a theory of the planets based on that of Ptolemy.

John Müller, called *Regiomontanus*, (died A.D. 1476,) made an abridgment of the *Almagest*, published more extensive trigonometrical tables, extended various parts of trigonometry, and was an observer, though not, in this respect, superior to some of the Arabs. His almanacs were the first which were worthy of the name, and were in great repute.

The two last-mentioned writers deserve some special notice, though it cannot be said that they made any direct advances either in theory or observation. Their writings, and the facilities afforded by their tables, undoubtedly did much to promote a taste for astronomy.

George of Trebizond, called *Trapezuntinus*, who died A.D. 1486, first translated the *Almagest* from the Greek into Latin.

Giachini, A.D. 1495, published tables similar to those of *Alonso*.

Waltherus, died A.D. 1504, a pupil of Regiomontanus, made numerous observations, which were often reprinted.

The following names are inserted that the reader may know to what names to refer for the astronomy of the time immediately preceding the promulgation of the system of Copernicus. Except in this point of view, there is but little interest attached to their labours:

Riccius, A.D. 1521, wrote a work on astronomy, containing much historical discussion.

Werner (died A.D. 1528) gave a more correct value of the precession.

Stöffler (died about A.D. 1531) published almanacs for fifty years; wrote on the astrolabe, &c.

Munster (died A.D. 1552) wrote on clocks and dials.

Fracastorius (died A.D. 1543) wrote on the heavenly motions.

In 1523, *Fernel*, who died in 1558, gave a very correct measure of a degree of the meridian, from such insufficient observations, that, as Delambre remarks, the correctness must have been accidental.

Copernicus, born 1473, died 1543. Applied himself to astronomy from A.D. 1500. In 1540, he had finished his tables of the planets, and his work *On the Revolutions of the Heavenly Bodies*, containing an explanation of the COPERNICAN SYSTEM, which, it is almost unnecessary to say, was a revival of the opinions of the Pythagorean school on the motion of the earth. It was published in 1543, and its author died immediately afterwards. Copernicus improved the lunar tables, and gave, to a considerable extent, an explanation of celestial phenomena upon his own system. His book is a mixture of his own original and sagacious notions and of the old philosophy: and he was far from being able to answer the mechanical objections of his time. What might have struck so bold a thinker, had he lived to face opposition, cannot be told, but as the history stands, we shall come to the time of Galileo before we find all objections satisfactorily answered.

From this period, at which the preservation of printed works commences, our limits will not permit our giving more than the names of many astronomers. The reader must refer to the several articles. The following is the list of those who are worth mention between Copernicus and the death of Tycho Brahé; the dates are generally those of death, but where that is not known, the date in brackets is that of the publication of some work.

Copernicus	1543	Vigenera	(1578)
Apian	1552	Stadt	1579
Gauricus	(1552)	Schreckenfuchs	1579
Reinhold	1553	Bressus	1581
Piccolomini	1553	John of Padua	1582
Orontius Finens	1555	Raimar	(1585)
Gemma Frisius	1555	Schöner	1590
Royas	(1555)	Mœsthus	1590
Bassantin	1557	William, Landgrave of Hesse Cassel	1592
Reccorde	1558	Mercator, G.	1594
Carelli	1558	Digges	1595
Vinet	1564	Rothman	1596
Benedict	(1574)	Galucci	(1597)
Mantolheus	1575	Pun	1598
Rheticus	1576	Tycho Brahé	1601
Nomen	1577		

Of these must be mentioned

Reinhold, the friend of Copernicus, and advocate of his doctrines, who formed the *PRÆFIXE TABLES* (which see).

Reccorde, who wrote the first *English* treatise on the celestial phenomena.

Rheticus, editor of the *Opus Palatinum*, a large trigonometrical table (which see).

Mantolheus, author and editor of several works and tables.

Nomen, inventor of an ingenious method of division of the circle, which has often caused it to be supposed that he anticipated the invention of Vernier.

Mercator (*Gerard*), who gave the first idea of the projection known by his name.

Up to this time, the means of observation had been undergoing gradual improvement, more by attention to the construction of the older instruments, than by the introduction of any new principle. The Copernican theory had its advocates, but was not yet adopted by many. Algebra had been introduced into most parts of Europe, but was not yet in a state to furnish much assistance in trigonometry. Logarithms were not yet invented, nor do we find the *instruments* fixed in the *meridian*, the *telescope*, or the *pendulum clock*. The first *observer*, who made any important additions to the phenomena of the heavens as received from the Arabs, was Tycho Brahé, to whom we now come.

Tycho Brahé, born 1546, began to study astronomy 1560; commenced his observations at Hoene, an island near Copenhagen, 1582; was driven from thence, 1597, died 1601. He made a catalogue of the fixed stars, more accurate than any which preceded; gave the first table of refractions; discovered the *variation* and *annual equation* (which see) of the moon, the variation of the motion of her nodes, and of the inclination of her orbit, and that of the obliquity of the ecliptic. What was essentially as great a service as any of the preceding, he discarded the *trepidation* of the pre-

cession, already mentioned, which had more or less infected all tables up to his time; he also ascertained that comets (those of his day, of course) were further removed from the earth than the moon; in fact, that they had no parallax which his instruments could discover, thus refuting the notion that they were atmospheric bodies. He greatly improved and extended the instruments in use as well as all the methods of observation.

Tycho Brahé did not admit the Copernican theory; but substituted for it one of his own, usually known by the name of the *Tychonic system*. This consisted in supposing the sun to move round the earth, but all the other planets to move round the sun, being also carried with it round the earth. This system explains all the appearances as well as that of Copernicus; and we must say (though it is always usual to reproach Tycho for refusing to admit the simple system of Copernicus) that by this means the *then* unanswerable arguments against the Copernican system were avoided. In fact, there is nothing but the *aberration of light* (a comparatively recent discovery), which is demonstrably conclusive in favour of the motion of the earth. [See ABERRATION, MOTION (APPARENT).] The system of Tycho is said to have been promulgated by some of the ancients, at least with regard to the inferior planets.

The reformation (as it was called) of the calendar took place in 1582, under Pope Gregory XIII. As the views of those who made the change were rather theological than astronomical, we shall only here mention the fact and the disputes it gave rise to: referring for further information to CALENDAR, CLAVIUS, VITTA, SCALIGER (JOSEPH).

From the time of the death of Tycho Brahé, to that of Newton, which forms the next great epoch in the history of astronomy, we can only dwell generally on a few leading discoveries. To enable the reader to search further, we give a table of all the names between the deaths of Tycho Brahé and Newton which Delambre has thought worthy of any mention, with some few additions. The names mentioned from 1581 to 1727, which are not in this list, will be found in the next. The year of death is given opposite to each name; or where that is not known, the year of some publication is given in brackets. The dates are principally from Weidler, and several from Delambre, compared with those in the first edition of Lalande's *Astronomy*.

Tycho Brahé	1601	Galileo	1642
Bayer	(1603)	Gascoyne	1644
Vietta	1603	Herigonius	(1644)
Nunez	(1605)	Langrenus	1644
Scaliger, Jo.	1609	Bartoli	(1644)
Clavius	1612	Rheita	(1645)
Pitiscus	1613	Fontana	(1646)
Calvisius	1615	Cavalierius	1647
J. B. Porta	1615	Longomontanus	1647
Wright	1615	Durret	(1649)
Fabricius	1616	Argoli	1650
Magini	1617	Descartes	1650
Napier	1617	Scheiner	1650
Uranus	(1619)	Wing	(1651)
Tarde	(1620)	Petavius	1652
Marius	1624	Gassendi	1655
Adr. Romanus	1625	Licetus	1656
Gunter	1626	Morinus	1656
Snellius	1626	Tacquet	1660
Wendelinus	(1626)	Street	(1661)
Blaeu	(1628)	Malvasia	(1662)
Vlaeq	(1628)	Leyra	(1663)
Briggs	1630	Cunitia (Maria)	1664
Malapertius	1630	Deusingius	1666
Vernier	(1631)	Lubienietzky	(1667)
Kepler	1631	Townley	(1670)
Lansberg	1632	Riccioli	1671
Stevinus	1633	Mutus	(1673)
Bartschius	1633	Roberval	1675
Byrge	1633	De Billy	1679
Norwood	(1633)	Borelli	1679
Habrecht	1634	Doerfel	(1680)
Metius	1635	Lefevre	1683
Schickhardt	1635	Picard	1684
Peyrese	1637	Hevelius	1687
Reinerius	1639	Pound	(1687)
Horrox	1641	Greenwood	(1689)
Crabtree	1641	Seth Ward	1689

Auzout	1693	Cassini, Dom.	1712
Bouillaud	1694	Cotes	1716
Mercator, Nic.	1694	Leibnitz	1716
Mouton	1694	Lahire, Phil.	1718
Buot	1695	Lahire, Gabriel P.	1719
Huyghens	1695	Flamsteed	1719
Rieber	1696	Keill	1721
Hooke	1703	Wren	1723
Duhamel	1706	Wurzelbaur	(1725)
Gregory, Dav.	1708	Newton	1727
Roemer	1710		

As we approach an age in which discoveries proceed rapidly, it would disturb the order of time if we were to enumerate those of individuals together. We shall therefore give the dates in chronological order of the principal accessions to the science, keeping, according to our original plan, only enough to direct the attention of the reader to points worthy of further reference.

1581, or thereabouts, Galileo remarks the isochronism of the pendulum.

1596. Kepler's *Mysterium Cosmographicum*, containing fanciful analogies between the orbits of the planets and the regular solids of geometry.

1603. Bayer's maps, in which the stars are first denoted by letters.

1604. Kepler approximates more nearly to the law of refraction.

1609. Galileo made a telescope from a general description of a magnifying instrument made by one Jansen, in Holland. He used a concave object glass, Jansen a convex. Kepler publishes his work on Mars, in which he establishes, from Tycho Brahé's observations, the elliptic form of the orbit, and the proportionality of the areas to the times. These are called *Kepler's first and second laws*.

1610. Galileo announces the discoveries of Jupiter's satellites—of spots on the moon—of nebulae—of some new appearances in Saturn, afterwards found to proceed from the ring—phases of Venus. He also discovers the diurnal libration of the moon, and that in latitude. Harriot observes the spots on the sun. (This fact has only been known from examination of Harriot's papers in the present century. It appears he got telescopes from Holland.)

1611. Lyceum academy founded. Galileo observes the spots on the sun.

1614. Napier's invention of logarithms.

1616. Prohibition of the theory of Copernicus by the Roman court.

1617. Snellius measures an arc of the meridian at Leyden. This was the first done by *triangulation*; but astronomical instruments were not yet sufficiently perfect to make this method much better than the old one.

1618. Kepler announces his *third law*, that the squares of the periodic times of the planets are in proportion to the cubes of their distances from the sun.

1619. Snellius discovers the law of refraction from one medium into another.

1626. Wendelinus determines the diminution of the obliquity of the ecliptic. He also extended Kepler's law to Jupiter's satellites, and ascertained the sun's parallax.

1627. The *Rudolphine Tables* published by Kepler, from the observations of Tycho Brahé.

1631. Gassendi first observed the transit of Mercury over the sun's disc—measured the diameter of Mercury, and predicted that of Venus with success. Vernier publishes his invention of the instrument which bears his name.

1633. Norwood measured the meridian from York to London, and gave a more accurate value of the degree than his predecessors. Descartes produced his system of vortices. Galileo is obliged to recant his Copernican opinions by the Inquisition of Rome.

1639. Horrox and Crabtree first observed a transit of Venus over the sun's disc. The former ascertained the diameter of Venus. They were the only two who saw this particular transit.

1640. Gascoyne applied the telescope to the quadrant, and a micrometer to the telescope.

1646. Fontana observes Jupiter's belts.

1647. *Selenographia* of Hevelius, in which the moon's libration in longitude is announced.

1650. Scheiner constructs a convex object-glass telescope.

1654. Huyghens completes the discovery of Saturn's ring.

1655. Huyghens discovers Saturn's fourth satellite.
 1657. Academia del Cimento founded.
 1658. Huyghens made the first pendulum clock.
 1659. Huyghens improved the micrometer.
 1660. Mouton applied the simple pendulum to observations of differences of right ascension, and measured the sun's diameter very correctly by it.
 1662. Royal Society of London incorporated. Cassini begins his researches on refraction.
 1663. Gregory makes his reflecting telescope.
 1665. Cassini determines the time of rotation of Jupiter, and publishes the first Tables of the Satellites.
 1666. Cassini determines the rotation of Mars, and makes a first approximation to that of Venus. Academy of Sciences founded at Paris, and observatory first thought of and commenced in the following year. Auzout applied the micrometer to the telescope without any knowledge of Gascoyne. Newton first turned his attention to gravitation.
 1667. Auzout and Picard applied the telescope to the mural quadrant, without knowing that Gascoyne had preceded them.
 1668. Cassini's second Tables of Jupiter's Satellites.
 1669. Newton made his first reflecting telescope.
 1670. Mouton's first use of interpolations.
 1671. Picard and Lahire publish their degree of the meridian, obtained by measuring from Paris to Amiens. Richer, in a voyage to Cayenne, observes the shortening of the seconds' pendulum in approaching the equator. Cassini discovers Saturn's fifth satellite. Flamsteed begins observing at Derby. Cassini begins the observations which led to his discovery of the inclination of the lunar equator, and the coincidence of its nodes with those of the orbit.
 1672. Cassini discovers Saturn's third satellite.
 1673. Huyghens publishes his *Horologium Oscillatorium*, in which are found the first theorems on central forces and centrifugal force. Flamsteed explains the equation of time.
 1674. Hook revived the idea of attraction, but without assigning any law, or connecting it with any observed facts. Spring watches made under the direction of Huyghens.
 1675. Roemer announces his discovery of the velocity of light by means of Jupiter's satellites. Greenwich observatory founded.
 1679. Halley (who went to St. Helena for the purpose) published his *Catalogue of Southern Stars*.
 1679. Appearance of the *Commissance des Tems*.
 1680. Flamsteed gave the law of the annual equation of the moon, and corrected the tables accordingly.
 1682. Newton, who had laid aside his theory of gravitation when he found it not capable of verification by taking the best measures of the earth in use, hears of Picard's more accurate measurement, tries it, and finds a remarkable degree of nearness to the result deduced from his celebrated law.
 1683. Cassini and Lahire discontinue till 1700 the arc begun in 1680.
 1684. Cassini discovers Saturn's first and second satellite.
 1687. Newton publishes the *Principia*.
 1689. Roemer first used the transit instrument; that is, fixed a telescope in the meridian for the purpose of observing transits.
 1690. Huyghens' theoretical determination of the ellipticity of the earth. Catalogue of Hevelius published.
 1693. Cassini's third tables of Jupiter's satellites. Announcement of his discoveries on libration. Halley discovers the acceleration of the moon's mean motion.
 1700. The Cassinis (D. and J.) extend the arc which the former had begun southward.
 1705. Halley first predicted the return of a comet, viz. that of 1758.
 1711. Berlin Observatory founded.
 1714. J. Cassini discovers the inclination of the orbit of Saturn's fifth satellite.
 1715. J. Cassini discovers the divisions of Saturn's ring.
 1718. Bradley publishes his tables of Jupiter's satellites. J. Cassini and Maraldi complete at Dunkirk the arc begun by Cassini.
 1725. Flamsteed's *Historia Cœlestis*. Petersburg Observatory founded. Harrison's compensation pendulum.
 1726. Blanchini determines the rotation of Venus.
 1726. Graham invented the mercurial pendulum.

1727. Bradley discovers aberration. Death of Newton

We have now brought the history to a most remarkable epoch. The great comparative perfection of instruments, the invention of the telescope, of the micrometer, of the clock, of logarithms, the introduction of algebra, the invention of fluxions, and the establishment of the theory of gravitation, in England at least, were so many steps each of magnitude unequalled in former times. But the most meritorious labours of the preceding table are not those which make most show. It takes as much space to say that Cassini discovered a satellite of Saturn as that Flamsteed published the *Historia Cœlestis*; but the first might have been left to the present day without much loss, whereas the latter was a new era in sideral astronomy. It would have done more for astronomy than the mathematical Syntaxis of Ptolemy, had it been similarly circumscribed: that is, the work of Ptolemy contained only a simple account of what had been done before, with no material improvements either in methods or instruments; whereas that of Flamsteed contained both, and gave a catalogue of stars such as had not been published before. [See FLAMSTEED.] We cannot here help noticing the great use of scientific societies. The theory of Newton was lying idle in his hands for ten years, because he doubted its conformity to fact; and had he not happened one evening at the Royal Society to hear accidentally of the measurement of Picard, it is possible that the *Principia* might never have been published. Various methods and instruments have been invented over again by those who were ignorant of what their predecessors had done: the practical inconvenience of which is obvious, added to the injury accruing to science by the national feeling which discussions concerning the right to inventions has produced in several instances.

The distinct part of Newton's great discovery, which is seldom well understood by any who have not studied it, is — not the notion of attraction, which had occurred to many among the ancients, and to Borelli, it is stated, and Hook among the moderns — not the law, which had been suggested by Bouillaud or Bullialdus — but the proof that the mechanical deductions from this law of attraction really do represent the celestial phenomena: a combination of improvements in mechanics and mathematics which none but the inventor of fluxions could have made, and a specimen of sagacity which it needed the author of the optics to display. Still less is it true, as many believe, that the Newtonian theory is the Copernican, when they speak of Newton as the establishers of the latter. After what we have said, it is unnecessary to discuss this further than to observe, that it was Galileo who destroyed the mechanical objections to the notions of Copernicus, by the sound system of dynamics of which he was the inventor, and who re-enforced the notions of Copernicus, by arguments of the most forcible character drawn from probability. But it was Bradley who by his discovery of Aberration (which saw) furnished the direct and unanswerable proof of the earth's motion: and it is a coincidence worth remembering, that the year of the death of Newton was that of this remarkable accession as well to physics as to practical astronomy.

We shall now proceed to sketch the annals of astronomy from the death of Newton to the present time.

The interval between the death of Newton and the present time may be divided into two parts: the first reaching to the end of the century, abounding in magnificent discoveries both of analysis and observation; the remainder more distinguished by efforts to extend, correct, and methodize the results of the first. In giving a few, as well of the distinguished names, as of their discoveries, we cannot help observing with regret, that in all the histories which have been published, as well of astronomers as of their labours, very little attention has been paid to chronology, and the dates given in different works very often differ. In fact, we know of no work to which we can refer the reader in which he will be certain to find the exact dates of all the principal researches. Lalande's *Bibliographie Astronomique* and Professor Airy's report to the British Association are honorable exceptions in most points, and to them we have been much indebted. The latter is confined to the present century. In collecting, therefore, such facts as have come in our way, we do not pretend to give a complete list of what has been done, or even of the principal points.

The following is the list of names from the death of Newton, arranged in the same manner as the preceding. —

Leadbetter	(1728)	Maraldi II. (J. D.)	1788
Maraldi, J. P.	1729	Roy	1789
Blanchini	1729	Favre	1790
Louville	1732	Legendre	1792
Manfredi	1739	Hell	1792
Sharp	1742	Triesnecker	(1792)
Halley	1742	Baillly	1793
Bird	(1745)	Saron	1794
Maclaurin	1746	Du Séjour	1794
Châtelet (Mad. du)	1749	Pingré	1796
Graham	1751	Maraldi, J. P. III.	1797
Whiston	1755	Borda	1799
Marinoni	1755	Lemoumier	1799
Cassini II. (James)	1756	Montucla	1799
Fontenelle	1756	Liesganig	1799
Ximenes	(1757)	Svanberg	(1800)
Bouguer	1758	Cassini IV. (Comte)	(1800)
Maupertuis	1759	Ramsden	1800
Gödin	1760	Cousin	1800
Simpson, T.	1760	Bary	1801
Dollond	1761	Jeaurat	1803
Bradley	1762	Méchain	1804
Lacaille	1762	La Lande, J.	1807
Mayer, T.	1762	Cavendish	1810
Bliss	1764	Maskelyne	1811
Horrebow	1764	Lagrange	1813
Clairaut	1765	Wollaston, Fr.	1815
De L'Isle	1768	Messier	1817
Beccaria	(1768)	Burkhardt	1817
Frisi	(1768)	Mudge	1821
Chappe	1769	Herschel, W.	1822
Long	1770	Delambre	1822
Pemberton	1771	Lambton	1822
Fontane	1771	Hutton	1823
La Condamine	1774	Bode	1826
Harrison	1776	Fraunhofer	1826
Ferguson	1776	Pozzi	1826
Reznas	1776	Laplace	1827
Zanetti	1782	Wollaston, W.	1828
Wargentin	1783	Young	1829
Mayer, G.	1783	Fallows	1831
Lexell	(1783)	Pons	1831
D'Alembert	1783	Foster	1831
Euler	1783	Orion	1832
Cassini III. (De Thury)	1784	Zach	1832
Boscovich	1787	Groenbridge	1832
Mason	1787	Legendre	1833
Fouchy	1788	Brioschi	1833
		Caturegh	1833

1731. Hadley's quadrant invented.

1732. Maraldi (II.) improves the theory of the satellites of Jupiter by observation. The introduction, by Maupertuis, of the Newtonian Theory into France. Wright's Lunar Tables.

1736. Maupertuis, &c. measure an arc in Lapland, and Bouguer and La Condamine in Peru.

1737. Lacaille and Cassini de Thury re-measure the arc of D. Cassini. Clairaut improves the theory of the figure of the earth.

1739. Dunthorn's Lunar Tables.

1740. J. Cassini's Astronomy published, containing many new tables from his own and his father's observations.

1741. Euler's *Theoria Motuum*, &c. the first analytical work on the planetary motions.

1745. Bradley discovers the nutation. Bird began to improve the graduation of mathematical instruments.

1746. Euler's Solar and Lunar Tables. Wargentin's Tables of Jupiter's Satellites.

1747. Euler, Clairaut, and D'Alembert. Various researches in the planetary theory. Mayer's confirmation of Cassini's theory of libration, by observation.

1748. Bouguer proposes a micrometer with two object-glasses, but not that of Dollond. Euler's prize essay on the motions of Jupiter and Saturn.

1749. Euler's and D'Alembert's researches on the procession, D'Alembert's on the nutation, Clairaut's on the motion of the Lunar Apogee. Halley's Tables.

1750. Mayer first uses *equations of condition*. Boscovich measures an arc at Rimini.

1751. Lacaille goes to observe at the Cape of Good Hope.

1752. Lacaille measures an arc at the Cape.

1753. Dollond makes his double object-glass micrometer.

Mayer's first idea of the repeating circle.

1754. Chappe publishes the solar and lunar tables of Halley. Clairaut's Lunar Tables.

1756. D'Alembert's researches on the figure of the earth; Euler's on the variation of the elements of elliptic orbits. Mayer's catalogue of zodiacal stars. Clairaut's researches on the perturbations of comets.

1757. Lacaille's *Astronomie Fundamenta*.

1758. Lacaille's Solar Tables. Dollond's achromatic object glass. Clairaut and Lalande's researches on Halley's comet.

1759. Lalande publishes Halley's Planetary Tables.

1761. Transit of Venus. Maskelyne at St. Helena.

1762. Euler and Clairaut's researches on the perturbations of comets.

1763. Lacaille's catalogue of southern stars.

1764. Lalande confirms Mayer's observations of libration. Lagrange's prize essay on libration, containing the first application of the principle of vertical velocities. Mason and Dixon begin the measurement of an arc in Pennsylvania.

1765. Harrison gains the parliamentary reward for his chronometer.

1766. Lagrange—theory of Jupiter's Satellites. Bailly's ditto.

1767. First *Nautical Almanac*.

1768. Beccaria measures an arc in Piedmont, and Liesganig in Hungary.

1769. Transit of Venus.

1770. Mayer's Solar and Lunar Tables.

1771. Bailly's further researches on Jupiter's satellites.

1772. *Bode's law* of the distances of the planets.

1773. Lagrange's researches on the attraction of spheroids. Laplace on the secular inequalities of the solar system.

1774. Maskelyne's observations on local attraction at Schehallien.

1780. Mason's Lunar Tables.

1781. Herschel discovers the new planet now called Uranus. Messier's catalogue of Nebulae.

1782. Laplace finds the elements of the orbit of Uranus. Laplace's researches on the attraction of spheroids.

1783. Nouet's tables of Uranus.

1784. Laplace's researches on the stability of the solar system, on the relation between the longitudes of Jupiter's first three satellites, and on the great inequality of Jupiter and Saturn. General Roy measures a base on Heunslow Heath for the connexion of the observatories of Paris and Greenwich. Herschel's catalogue of Nebulae.

1786. Lagrange gives the differential equations for the variations of the elliptic elements.

1787. Laplace's theory of Saturn's ring, and explanation of the acceleration of the moon's mean motion. Herschel discovers two satellites of Uranus. Legendre and General Roy finish the connexion of the observatories of Paris and Greenwich. Beginning of the trigonometrical survey in England. Herschel's first observations with his forty-foot telescope.

1788. Lagrange's *Mécanique Analytique*.

1789. Herschel measures the rotation of Saturn, and discovers the first and second satellites of Saturn. Delambre's tables of Jupiter and Saturn.

1790. Herschel determines the rotation of Saturn's ring, and discovers two more satellites of Uranus. Delambre's tables of Uranus. Maskelyne's catalogue.

1792. Beginning of the French survey. Taylor's Logarithms. Lalande's improved Planetary Tables. Zach's first Solar Tables, and Catalogue of Stars. The *eightieth* comet, whose orbit has been calculated, discovered by Miss Herschel.

1793. Laplace on the satellites of Jupiter and figure of the Earth. Schröter determines the rotation of Venus.

1794. Herschel discovers the fifth and sixth satellites of Uranus. No one, except Sir W. Herschel, has ever seen all the satellites of Uranus. Sir J. Herschel has very lately determined some elements of the first and second, which accord very closely with those given by his father. He has not found the rest, which may arise from the unfavourable southern position of the planet.

1795. Herschel's observations on variable stars, and separation of the milky way into stars.

1796. Establishment of the French Institute. Herschel gives strong presumptions that the rotations of Jupiter's satellites are of the same duration as their orbital revolutions. Oriani on the perturbations of Mercury.

1797. Delambre's observations on refraction. Laplace's theory of tides.

1798. Cavendish demonstrates and measures the mutual attraction of metal balls.

1799. Commencement of the *Mécanique Céleste*.

1799-1804. Humboldt's voyage and observations in South America.

1800. Wollaston's circumpolar catalogue. Bode's maps and catalogue. Mudge begins his great arc of the meridian, from the Isle of Wight to Clifton in Yorkshire.

1801. Lalande's catalogue. Piazzi discovers the planet Ceres. Swanberg begins the measurement of an arc in Lapland.

1802. Olbers discovers the planet Pallas. Lambton begins the measurement of an arc in India. Herschel's catalogue of Nebulae.

1803. Cagnoli's catalogue. Herschel observes the changes in the position of double stars.

1804. Harding discovers the planet Juno. Piazzi gives the proper motion of 300 stars. Zach's Solar Tables.

1805. Legendre, method of least squares. Discussion on the parallax of the fixed stars, from this date to 1825.

1806. Completion of the French survey by Méchain and Delambre. Delambre's Solar Tables, and Tables of Refraction. Burg's Lunar Tables. Carlini's Tables of Refraction. Pond's catalogue of North Polar Distances (altitude and azimuth instrument). Herschel suspects the motion of the whole solar system towards the constellation Hercules.

1807. Olbers discovers the planet Vesta. Extension of the French arc into Spain. Piazzi's catalogue of 120 stars.

1808. Lagrange and Laplace's Researches on the Planetary Theory.

1809. Troughton improves the division of graduated instruments. Ivory's Theorems on the Figure of the Earth.

1810. Groombridge's Tables of Refraction. Carlini's Solar Tables. Lindenau's Tables of Venus.

1811. Lindenau's Tables of Mars.

1812. Troughton's mural circle mounted at Greenwich. Zach's Tables of Aberration. Burekhardt's Tables of the Moon.

1813. Bessel's Refractions (from Bradley). Lindenau's Tables of Mercury. Pond's catalogue of North Polar Distances (circle).

1814. Piazzi's catalogue of 7616 stars, the best and largest extant.

1815. Brinkley's Tables of Refraction.

1816. Lindenau's Determination of the Nutation. Poisson's Researches on the Planetary Perturbations.

1817. Delambre's Tables of Jupiter's Satellites.

1818. Bessel's *Fundamenta Astronomiæ*. Pons discovers a comet of short period, now called by the name of Encke.

1820. Astronomical Society of London founded.

1821. Observatory of the Cape of Good Hope founded. Bouvard's Tables of Jupiter, Saturn, and Uranus. The Greenwich Observatory first introduced circle observations by reflexion. Poisson on the Precession of the Equinoxes.

1822. Paramatta observatory founded. Harding's *Atlas Cœlestis*.

1823. Beginning of the erection of Cambridge observatory. Ivory's Researches on Refraction. Encke infers a resisting medium of very little density, from observations of the comet of 1818 (an unsettled point).

1824. Herschel, J., and South, Catalogue of Double Stars. Damoiseau's Lunar Tables.

1825. Commencement of Berlin zones. Second mural circle (Jones) erected at Greenwich.

1826. Biela discovers the comet of short period known by his name.

1827. Astronomical Society's Catalogue. Struve's Catalogue of 3112 Double Stars.

1828. Professor Airy discovers a long inequality in the motions of the Earth and Venus. Captain Kater's vertical collimator.

1829. Pond's Catalogue of 720 Stars. Poisson on the Attraction of Spheroids.

1830. Sir J. Herschel's Measures of 1236 Double Stars.

The following list of public observatories now in action is taken from the Report to the British Association above cited:—

Greenwich.

Oxford.

Cambridge.

Edinburgh.

Dublin.

Armagh.

C. of Good Hope.

Paramatta.

Madras.

Bombay.

St. Helena.

Paris.

Marselles.

Geneva.

Turin.

Milan.

Padua.

Bologna.

Modena.

Naples.

Palermo.

Abo.

Altona.

Bremen.

Christiania.

Dorpat.

Copenhagen.

Königsberg.

Berlin.

Gotha.

Mannheim.

Speyer.

Munich.

Göttingen.

Vienna.

Cracow.

Warsaw.

Wilna.

Ofen.

Kremsmünster.

Brussels.

Cadix.

There is no public observatory in America. We find in Lalande (*Bibliographie, &c.*) notices of the following, not mentioned in the above list, and, we presume, extinct:—St. Peter-burg, Malta, Danzig, Lisbon, and Weissenburg. That of St. Peter-burg is about to be re-established. There is much information on different observatories in Bernoulli's *Letters* (Berlin, 1777), and in Quetelet's *Correspondance, &c.*, a mathematical periodical now published at Brussels. The *Nautical Almanac* always contains a list of observatories, with their latitudes and longitudes.

To attempt to describe what is now doing and has been done within the last few years would be difficult, and would lead us beyond moderate limits. Undoubtedly, the principal actual accession to our knowledge of the system of the universe is the investigation of the law and quantity of the rotation of double stars. By this, for which the world is principally indebted to Sir J. Herschel and Professor Struve, many new connected systems are added to our list, and the computation of the orbits has proceeded, in several instances, to that degree of precision which justifies the prediction of future positions. [For further details, see STRUVE (DYNAMICS).]

The enormous masses of observations which are now published every year are silently affording the means of increased accuracy in every department, and are rapidly seized and applied for the improvement of the theory. Though we give no account of what is actually in progress, we shall, in various succeeding articles, perhaps be able to supply this defect; and there are some channels which we hope will become open to us during the course of this work.

Among the subjects which we have touched on slightly, we must refer to COMETS, PSEUDOPHIA, GEODESY.

Works on the History of Astronomy.—Sherburn's edition of Manilius (London, 1675) contains a list and short account of a very large number of astronomers, and has been much used by succeeding authors. It is superseded by the *Bibliographie* of Lalande (Paris, 1803), which gives a list of every astronomical work, with its title, and also an enormous alphabetical list of astronomers. This work also contains the history of astronomy from 1781 to 1802. Weidler's *Historia Astronomiæ* (Wittenberg, 1741) is a valuable collection of facts, and may be consulted with better chance of finding a date than any we have seen. Costard's *History of Astronomy* (London, 1767) is of little use for reference, but would be instructive to a reader who has not much mathematics. It is well spoken of by Lalande. Bailly's *Histoires*—1. Of Ancient Astronomy (Paris, 1775); 2. Of Modern Astronomy up to 1730 (Paris, 1778); 3. Of Modern Astronomy from 1730 to 1781 (Paris, 1782); 4. Of Indian and Oriental Astronomy (Paris, 1787)—are entirely devoted to a system, and should be looked at with caution. *The Histories* of Delambre—1. Of Ancient Astronomy (Paris, 1817); 2. Of the Middle Ages (Paris, 1819); 3. Of Modern Times (Paris, 1821); 4. Of the Eighteenth Century (posthumous) (Paris, 1827)—contain a full description and discussion in order of persons, not of time, which render them difficult of reference, but still they are the best works of the kind. The historians of mathematics—Vossius, Montucla, Kästner, Bossut, and Delambre, *Rapport Historique, &c.* (Paris, 1810)—treat astronomy as a part of their subject. The small work of Laplace, *Précis sur l'Histoire de l'Astronomie* (Paris, 1821), which is also to be found in the *Système du Monde*, is delightfully written; and there is also much information in the historical chapters of the fifth volume of the *Mécanique Céleste*, and occasionally in the other volumes. Lalande's *Astronomy* was called *la Grosse Gazette* by a rival, on account of the varied historical and mythological information which it contains. Hutton's *Dictionary*, and Martin's *Biographia Philosophica*, contain information on English astronomers which is not to be found in the foreign works;

and there is a good deal in Thomson's *History of the Royal Society*. For the history of astronomy from 1781 to 1810, there is Voiron, *Histoire, &c., depuis 1781 jusqu'à 1811*, which contains an interesting account of physical discoveries, and the measures of the earth; but it is very imperfect in dates. There is a tract on the history of astronomy by Dominic Cassini, published in 1693, which we have not seen. For a further list of writers, see Lalande's *Bibliographie*. The general reader may consult with advantage the *History of Astronomy*, and the *Lives of Kepler and Galileo*, in the *Library of Useful Knowledge*, or of Natural Philosophy in the *Cabinet Cyclopaedia*.

In addition, we may refer to the *éloges* published by the Academy of Sciences, which are to be found in their *Memoirs*; to the two separate collections of *éloges* by D'Alembert and Condorcet; to the *Annual Reports of the Royal Society, Astronomical Society, and British Association*.

ASTRUC, JOHN, a French physician of great eminence, was born at Sauve, in Languedoc, in the year 1684: he studied in the University of Montpellier, and took the degree of doctor in medicine in 1703. In 1706, being then only twenty-two years of age, he began to teach medicine in the same university, acting as substitute to Chirac, one of its professors, who had been forced to attend the French army. In 1710 Astruc obtained by competition the chair of anatomy and medicine in the University of Toulouse, where he revived the study of anatomy. The reputation, however, which he now acquired caused him to be soon recalled to Montpellier, where he occupied a medical chair from 1715 to 1728, when he resorted to Paris, chiefly urged, it is said, by the desire to have access to the great literary stores of that capital. On his arrival at Paris, he was induced to accept the situation of first physician to the king of Poland and elector of Saxony, but after a very short stay at Dresden he returned to Paris, and was, in 1730, appointed a consulting physician to the king of France, and in 1741, professor of medicine in the College of France. He became a member of the medical faculty of Paris in 1743, and died in 1766, at the advanced age of 82.

Astruc does not seem to have been endowed with an intellect of a very superior cast, and no great discovery is attached to his name; nevertheless, he acquired great celebrity among his contemporaries, both as a teacher and as an author; and the integrity of his character was justly appreciated. A simple and happy method in treating the subjects which he taught, and an easy, clear, and eloquent language, recommended him as a lecturer. His writings displayed a solid and extensive acquaintance with the history of literature and science, unusual among his countrymen even at that time, the result of the unvaried assiduity with which from his early youth, and during the whole of his long career, he applied himself to bibliographical learning. Astruc has left a considerable number of works on medicine, on the topography of Languedoc, his native country, on metaphysics, and even on sacred history. We shall allude only to the more important of his literary labours.

His first writings referred to the theory of *digestion*, which he endeavoured to explain according to the principles then prevalent of the philosophy of Descartes. This subject led him at one time into a discussion with Vieussens, and at another into a dispute with Pitet, in which both adversaries probably were equally distant from the truth; but Astruc had greatly the advantage, in as far as he always kept within the bounds of calm and dignified language, while Pitet was full of violence and abuse. When, in 1720, the plague spread its ravages in Marseilles and its environs, Astruc published three successive treatises on this subject, in which he showed the disease to be contagious, and insisted on the necessity of quarantine measures. After his arrival in Paris, he took an active part on the renewal of those contests which had so long prevailed between the physicians and the surgeons of that capital, and his pamphlets seem to have materially contributed to bring about the victory which the physicians gained on this occasion (in 1734) in a court of law. A treatise on *Tumours and Ulcers*, which appeared in 1759, and which, being merely an abstract of Astruc's lectures, contains nothing new, was, in 1761, followed by a treatise on the *Diseases of Women*, in which the author displayed his usual erudition. Astruc's most extensive work, however, and that which has more than all others served to establish his high reputation, is the book *De Morbis Venereis*, first published in one vol. 4to., Paris, 1736, and afterwards enlarged to two vols. 4to.

in the second edition, 1740. The practical part of this work has ceased to have any value, in consequence of the various changes which time has brought about in our notions of the diseases treated of; but the literary history of the disease, which occupies the latter half of the work, and embraces a chronological account of above six hundred authors on the subject, will always be referred to as a valuable document of bibliographical research. Yet the list of authors collected by Astruc is by no means complete—a German writer, Gertanner, having since added about 300 names not mentioned by Astruc. Astruc was a strenuous partisan of the opinion that syphilis had been imported into Europe by the discoverers of America, and the historical evidence brought forward by him in support of this hypothesis has been the chief cause of its general adoption. He does not, however, seem to have been altogether impartial in this inquiry, and more recent investigations have tended to invalidate his hypothesis, by showing on the one hand that traces of syphilis have occurred in Europe at all periods of history; and on the other, that the silence of the great majority of Spanish and Portuguese contemporary chronicles on the events supposed to have attended the introduction of the new disease, is irreconcilable with the statements on the authority of which the American origin of syphilis is maintained. The first edition of this work was translated into English by William Barrowby, M.D., Lond. 1737, 2 vols. 8vo.

A full account of Astruc's life has been given by Lorry in his posthumous edition of that author's *Mémoires pour servir à l'Histoire de la Faculté de Montpellier*, Paris, 1767. See also Hazon, *Notice des Hommes Célèbres de la Fac. Méd. de Paris*, (Paris, 1778,) p. 256; and the *Biographie Médicale*, tom. i.

ASTUR, in Zoology, a genus of hawks formed by Bechstein, and characterised by a short beak bent downwards from the base and convex above, with somewhat oval nostrils. The feet are rather short, and the toes (of which the exterior are united at the base by a membrane) are long.

Numerous species of this genus are diffused over all parts of the world; but Europe only contains one, *Astur palumbarius*, the goshawk, so highly prized by the falconers of old, and famous for its flights at cranes, geese, pheasants, and partridges.

ASTURIAS, Principality of, a province of Spain, situated between 42° 58' and 43° 10' N. lat., and 4° 30' and 7° 8' W. long.; it is bounded on the east by that district of Old Castile commonly called Montañas de Santander, on the west by Galicia, on the south by the kingdom of Leon, and on the north by the Bay of Biscay. A chain of mountains, called by some geographers the Asturian Pyrenees, forms the entire southern boundary. This boundary runs from near the source of the Ebro, in a western direction, taking the different denominations of Sierra de Sejos, the highest point of which is at an elevation of 5700 feet above the level of the sea; Sierra de Alba, 6960; Sierra de Pajares, 8628; Sierra de Peñaranda, 11,031; Sierra de Peñamelera or Peñamelera, 9165. To this last point, the range bears the name of Montañas de Asturias, the Mons Vindius of Ptolemy. It then branches out in different directions, and crossing the provinces of Leon, Galicia, and the north of Portugal, abuts on the ocean at the points of Cape Ortegal, Finisterre, and Silleiro, north of the Minho. The southern slope of this range is very abrupt; but on the north it gradually diminishes in height as it approaches the sea. The main mass is composed of calcareous rocks, little inferior in height to the Aquitanian Pyrenees, and covered with snow the greater part of the year. Marble and a hard sort of sand-stone used for grinding stones, are also found, as well as copper, succinum or mineral amber, though not of the purest kind, cinnabar, iron, zinc, lead, antimony, jet, and coals, of which the Asturias transport every year 4500 tons into the interior of the peninsula. About three miles west of Oviedo, at a place called Las Caldas, is a spring of mineral water almost at the boiling point, which flows out of a calcareous rock. At the distance of a musket-shot from that spring is a ruined castle built of limestone, in which a sort of inferior amethyst is found imbedded, erroneously taken for diamonds by Casal in his *Historia Natural y Médica de Asturias*.

The mountainous parts of the province are covered with forests of oak, beech, chestnut, and other trees, which supply the arsenal of Ferrol with excellent timber. It is a common practice in Asturias to cut large boards out of the chestnut

trees without entirely destroying them. Don Mariano Lagasca says, that he saw several of these trees, half of the trunk of which had been sawed off in this manner, and still continued, for several years, to produce abundant fruit, without presenting any outward appearance of decay. These forests abound with bears, wolves, foxes, and other species of wild animals. There are likewise several medicinal plants, among which is the hellebore; six species of the erica or heath, two of the angelica, the sarsaparilla, and the dulcamara, have been made known by the celebrated botanist just quoted, Don M. Lagasca. The hills are covered with brush-wood, cistus, and furze, which the inhabitants use for fuel. They make the same use of the turf or peat, which is found in great abundance in the western districts.

The offsets of the great range form numerous lateral valleys, drained by a number of rivers which flow from the mountains, generally in a direction from south to north. The principal of these rivers are the Sella, in the eastern part of the province, the Nalon, the Navia, and the Eo in the extreme west, which also forms the boundary between Asturias and Galicia in the lower part of its course.

The coast of Asturias is so exceedingly bold and rocky, that its ports can only receive small trading vessels and fishing boats. There are a great number of small ports and *rias* (mouths of rivers), up many of which the sea-water ascends three or four miles into the interior. The principal ports, from east to west, are Llanes, Ribadesella, Llastres, Villavieja, Gijón, Caudas, Luanco near the cape of Peñas, Aviles, Muros on the ria of Pravia, Cudillero, Luarca, Navia, and Castropol opposite to Ribadeo in Galicia. The harbours of Ribadesella and Cudillero are safe and commodious: and the former has good docks capable of receiving ships of forty guns.

The Nalon has its source on the northern slope of the Asturian mountains (43° N. lat., and 5° $21'$ W. long.), and flows W.N.W. by Oviedo, forming, as it empties itself into the sea, the ria of Pravia. Its affluents are the Caudal, the Turbia, and the Nareca, all on the left bank. The Navia rises near the village of Zebrero in Galicia, enters Asturias on the west, and flowing almost due north forms the ria to which it gives the name. The course of these two rivers cannot much exceed sixty miles.

The valleys are exceedingly fertile, and afford pasture for numerous horned cattle, pigs, and horses. The horses are of small size, but renowned for their strength and swiftness. The rocks on the sea shore are covered with sea weeds, polypæ, and zoophytes, which the farmers use as manure. On some of these rocks the *rocceila tinctoria*, or true dyer's orchel or archil, is found. Fruit is also very plentiful in this province. Chestnuts, hazel-nuts, apples, and pears, are the chief varieties. The vine is cultivated in the commune of Cangas de Tineo, and near Aviles, in a district called Candamo: in both places a sort of light and agreeable wine is made for home use, far superior to the chacoli of Biscaya. There is however a deficiency of this article, which is abundantly compensated for by the excellent cider, easily obtained in every part of the province. Cognition wheat is not generally cultivated here: not however, as Antillon says, on account of the dampness and cold of the climate, but because the Asturians prefer the *escanda* or spelt wheat, and the Indian corn, to any other sort of grain. The best species of common wheat is raised in great perfection: but the *escanda* is better adapted to the climate, and the species cultivated in Asturias is so much esteemed by the natives, that in many districts the leases, which provide for the payment of the rent in kind, contain a stipulation that no sort of corn shall be offered in payment except *escanda*. Besides the excellent quality of the bread made from *escanda*, it is observed that it keeps moist and fresh much longer than that made from any other sort of grain. The Indian corn being planted much thinner than any other sort of corn, leaves sufficient space between the rows for the growth of pumpkins. The Asturian farmers also plant *judas* or scarlet-runners together with the Indian corn, so that the judas climb up its stem: and thus they have three kinds of produce growing together on the same ground. The stem of the Indian corn affords a nutritious food for the cows in winter: with the grain they make bread, and with it they also feed their fowls and pigs: the ear or head they use for fuel after the corn has been thrashed out.

The climate of Asturias is exceedingly damp and cold in the mountainous parts: but in the valleys, and particularly on the sea-coast, it is so mild and temperate, that

orange and lemon trees grow in the open air. In the seventeenth century great quantities of this delicious fruit were exported from Asturias to the northern countries of Europe; but since the free trade between South America and the ports of the Mediterranean has been established, the raising of those trees has been abandoned in Asturias, the fruit of that principality not being able to compete in its abundance and quality with that produced in the southern provinces, which is carried back by foreign vessels that visit the Spanish ports on the Mediterranean. Among the other vegetable productions, the parsnip may be mentioned as indigenous in Asturias.

Both the seas and rivers of this province produce the most delicate fish in the peninsula, which is sent to the market of Madrid both fresh and pickled.

Asturias is divided into *concejos*, or communes, of which there are 118. The superintendence of these *concejos* is distributed among fifty-six towns: they contain 668 parishes, 3665 villages, and 23 convents for both sexes. The population, according to the census of 1808, amounted to 364,238 souls, upon a surface of about 2148 English square miles; but the *Mapa de España*, published by the geographical establishment at Madrid in 1834, estimates the population at 434,635. The area, however, seems a great deal less than what is marked on some maps as belonging to Asturias. The area given by Antillon is calculated in the maps of Lopez, which are far from correct. Bory St. Vincent says, that Asturias is forty leagues long, and from ten to twelve wide. Muñoz allows it thirty-six leagues in length and sixteen in breadth. If we allow it an area of 400 square leagues of twenty-five to a degree, the area will be above 3000 square miles.

A military governor, an intendant, and an *audiencia*, or a civil and criminal high court of law, preside respectively over the military, fiscal or financial, and judicial affairs of the principality. The internal administration is directed by the common council of the respective *concejos*. There is also an ecclesiastical tribunal and one bishop. For the education of the youth there is a university at the capital, Oviedo, several seminaries, and the Instituto Asturiano at Gijón, on the coast, founded by the illustrious patriot Don Gaspar M. de Jovellanos in 1791, and provided with professors of mathematics, mineralogy, and navigation.

The only manufactures of Asturias are, a royal manufactory of fire arms at Turbia, a few others belonging to private individuals in the fabrication of copper and earthenware, jet trinkets, some tanneries, and looms for common woollen and linen stuffs, principally for home consumption. With these exceptions, its manufactures are not in a more advanced state than in the rest of the peninsula. The real cause of this deficiency is the want of inland communication with Castile. Till within a few years there was not a single road for carriages of any sort, and all the traffic with that part of the kingdom was carried on by means of mules and horses. The principal road, which is the new Camino Real de Asturias, and runs from Madrid to Medina de Rio Seco, passing through Mayorza, Munsilla, Leon, Pola de Lena to Oviedo, has been recently made. There is also another road between Oviedo and Gado about twelve miles N.N.W. of Oviedo. The principal *puertos*, or passages across the mountain, are, reckoning from east to west, Tama, Piedrafita, Pajares, Somiedo, Letariegos, Cerrado, and Pannellera.

According to the historian Garibay, a Celtic tribe called Astyres, or Astires, at a very early period passed from Gaul into Spain, and settled in the north and north-west districts. They inhabited a territory much more extensive than the modern Asturias, for it reached to the banks of the Duero. Their chief town was Astura, now Astorga, in Leon. They were but very imperfectly known by the Romans, who often confounded them with their neighbours, the Gallieni. For a long period they lived unknown in their valleys, without exciting either the envy or jealousy of the neighbouring nations. Augustus Caesar partly subdued them, and at the fall of the Roman empire, they shared the same fate with the other Roman provinces in the Peninsula. When the hordes of Turk and Muza overthrew the Gothic monarchy in the Peninsula, those few who escaped the sword of the infidels, or refused to bend their necks beneath the ignominious yoke, sought an asylum in the fastnesses of the Asturian mountains, and headed by the immortal Pelayo, dared alone to defy the power of the victorious Crescent. Alxaman Suleyman,

and Mmuza, or Manuza, who successively attempted to penetrate into this province, remained with their hosts buried in the deep ravines of Cobadonga; and these were the first of a succession of triumphs, which at length ended with the total expulsion of the Mohammedans from Spain. Twelve kings reigned successively in Asturias, from 718, in which Pelayo was proclaimed, until 914, when having extended their conquests over almost one-fourth of the Peninsula, they assumed the title of kings of Leon; Ordoño the Second was the first who established his court at the city of Leon. In 1388, the Infante Don Enrique, the eldest son of Juan I., was styled Principe de Asturias, from which period the eldest sons and daughters of the kings of Spain have taken that title. 'It is in the inhabitants of Asturias,' says Bory de Saint Vincent, 'that the naturalist can discover the characteristic features of that Celtic race, which we consider to be the third of the Japhetic race.' The Asturians speak the Castilian language.

The Asturians are strong and robust, frugal, honest, intelligent, not very active, but constant in their labours, passionately fond of their country, proud of their noble descent, and of having never mixed their blood with any of the nations that have had dominion over the Peninsula. (See Antillon, Miñano, Garibay, and Casal, *Historia Natural y Medica de Asturias; Orographie de l'Europe, &c.*)

ASTYAGES. [See MEDIA.]

ASY, or AZY, the river of Antioch. [See ORONTES.]

ASYLUM, the Latin and English form of the Greek *ἀσυλον*, which is generally supposed to be made up of *ἀσιν* and the root of the verb *αἵμα*, 'to plunder,' and therefore to signify, properly a place free from robbery or violence. Some, however, have derived the Greek word from the Hebrew *עֵדֶן*, 'a grove;' the earliest asylums, it is said, having been usually groves sacred to certain divinities. It is a pretty, rather than perhaps a very convincing illustration of this etymology, which is afforded by Virgil's expression as to the asylum opened by Romulus, —

*• Hinc innocecentem, quem Romulus hec asylum
Rebelle, —* JES. VIII. c. 333.

The tradition was, that Romulus made an asylum of the Palatine Hill preparatory to the building of Rome. Plutarch tells us that he dedicated the place to the god Asyleus. (Plut. *Romul.* 9.)

Probably all that is meant by these stories is, that in those ages whoever joined a new community received shelter and protection; and even if he had committed any crime, was neither punished by those whose associate he had become, nor surrendered to the vengeance of the laws or customs he had violated. Such an asylum was not an appointed place of refuge established by general consent; it was merely a congregation of outlaws bidding defiance to the institutions of the country in which they had settled, and proclaiming their willingness to receive all who chose to come to them.

But both in the Grecian states, and in Rome, the temples, or at least some of them, were endowed with the privilege of affording protection to all who fled to them, even although they had committed the worst crimes. The practice seems to have been, that they could not be dragged from these sanctuaries; but that, nevertheless, they might be forced to come out, not only by being prevented from receiving food while they remained, but even by such compulsory measures as the application of fire to the building. (See Thucyd. i. 126, 134.; Herodot. vi. 80.) Anything appears to have been permitted except the actual dragging forth of the criminal. Eventually, these places of refuge became great nuisances, being, especially among the Greek cities, established in such numbers as sometimes almost to put an end to the administration of justice. After Greece had become a part of the Roman empire, an attempt was made to repress this evil by an order of the senate, directed to all the pretended asylums, to produce legal proofs of the privilege which they claimed. (Tacit. *Annal.* iii. 60, &c.) Many were put down in consequence of not being able to satisfy this demand. At last, all the asylums throughout the empire were abolished by an edict of the Emperor Tiberius. (Sueton. in *Vita Tiberii*, cap. 37.)

The term *ἀσυλον* was given as an epithet to certain divinities; as, for example, to the Ephesian Diana. It is also found on medals as an epithet of certain cities; in which application it probably denoted that the city or district was under the protection of both of two otherwise belligerent powers, and enjoyed accordingly the privileges of neutral ground.

After the decline and fall of Paganism, the privilege of serving as asylums for malefactors was obtained by the Christian temples. The credit of conferring this honour upon churches in general is attributed to Pope Boniface V., in the beginning of the seventh century; but more than two hundred years before, certain sacred buildings of the new religion are said to have been declared asylums by the Emperor Honorius. The asylums thus established eventually grew throughout all Christendom to be a still more intolerable abuse than those of the antient world had been. In most countries, not only churches and convents, with their precincts, but even the houses of the bishops, came to be at length endowed with the privilege of sanctuary. In all these places the most atrocious malefactors might be found bidding defiance to the civil power. At the same time, there can be no doubt, that while in this way criminals were frequently rescued from justice, protection was also sometimes afforded to the innocent, who would not otherwise have been enabled to escape the oppression or private enmity which pursued them under the perverted forms of law. The institution was one of the many which then existed, having the effect of throwing the regulating power of society into the hands of the clergy, who certainly were, upon the whole, the class in whose hands such a discretion was by far least likely to be abused. When communities, however, assumed a more settled state, and the law became strong with the progress of civilization, the rights which had at one time armed the church as a useful champion against tyranny, became not only unnecessary but mischievous. The church maintained a long and hard struggle in defence of its old supremacy; and in the face of the stand thus made, and in opposition to antient habits, and the popular superstition by which they were guarded, it was only very cautiously that attempts could be made to mitigate the evil. For a long time the legal extent of the privilege of sanctuary appears to have been matter of violent dispute between the church and the civil power. In this country, it was not till the year 1487, in the reign of Henry VII., that by a bull of Pope Innocent VIII. it was declared, that if thieves, robbers, and murderers, having taken refuge in sanctuaries, should sally out and commit fresh offences, and then return to their place of shelter, they might be taken out by the king's officers. It was only by an Act of Parliament passed in 1534, after the Reformation, that persons accused of treason were debarred of the privilege of sanctuary. After the complete establishment of the Reformation, however, in the reign of Elizabeth, neither the churches nor sanctuaries of any other description were allowed to become places of refuge for either murderers or other criminals. But various buildings and precincts in and near London, continued for a long time after this to afford shelter to debtors. At length, in 1697, all such sanctuaries, or pretended sanctuaries, were finally suppressed by the Act 8 and 9 William III. chap. 26.

In Scotland, the precincts of the palace of Holyrood in Edinburgh still remain a sanctuary for debtors. The boundaries of this privileged place are somewhat extensive, comprehending the whole of what is called 'the King's Park,' in which is the remarkable hill called 'Arthur's Seat.' The debtors find lodgings in a short street, the privileged part of which is divided from the remainder by a kennel running across it. Holyrood retains its privilege of sanctuary as being a royal palace; but it is singular as being now the only palace in this country any part of the precincts of which is the property, or at least in the occupation, of private individuals, and therefore open to the public generally.

In England, a legal asylum, or privileged place, is called a sanctuary; and this use of the word sanctuary appears to be peculiar to the English language. Both in this country and in America, the name of asylum is commonly given to benevolent institutions intended to afford shelter neither to criminals nor to debtors, but to some particular description of the merely unfortunate or destitute. Thus there are in London,—the Asylum for Recovery of Health, Asylum for the Deaf and Dumb Children of the Poor, Asylum for the Cure of Scrofula and Cancer, Licensed Victuallers' Asylum, Surrey Asylum for Employment of Discharged Prisoners, Westminster Asylum for Persons who have been Prosecuted for First Offences, Invalid Asylum for Females, &c.

The Jewish Cities of Refuge, established by Moses and

Joshua, may be quoted as the most remarkable instance on record of a system of asylum founded and protected by the state itself for the shelter of persons who had violated the law. These cities, as we are informed in the twentieth chapter of the Book of Joshua, were six in number, three on each side of the Jordan. They only, however, protected the person who had killed another unawares. With regard to such a person the command was, 'If the avenger of blood pursue after him, then they shall not deliver the slayer up into his hand; because he smote his neighbour unwittingly, and hated him not beforetime. And he shall dwell in that city, until he stand before the congregation for judgment, and until the death of the high priest that shall be in those days; then shall the slayer return, and come unto his own city, and unto his own house, unto the city from whence he fled.' (Joshua xx. 5, 6.) This institution may be regarded as an ingenious device for protecting, on the one hand, the guiltless author of the homicide from the popular resentment, which his unfortunate act would have been likely to draw upon him; and cherishing, on the other, in the public mind, that natural horror at the shedding of human blood, which, in such a state of society, it would have been so dangerous to suffer to be weakened. We see the same principle in the deodand awarded by our law in the case of the accidental destruction of life by any inanimate object.

One of the most curious instances of the privilege of sanctuary, is that long enjoyed in Scotland by the descendants of the celebrated Macduff, Thane of Fife, the dethroner of the usurper Macbeth. It is said to have been granted at the request of the thane by Malcolm III. (Cannmore), on his recovery of the crown of his ancestors soon after the middle of the eleventh century. By this grant it was declared that any person, being related to the chief of the clan Macduff within the ninth degree, who should have committed homicide without premeditation, should have his punishment remitted for a fine, on flying to Macduff's Cross, which stood near Lindores, in Fifeshire. Although this, however, is the account of the old Scottish historians, it is probable that the privilege only conferred upon the offender a right of being exempted from all other courts of jurisdiction, except that of the Earl of Fife. Sir Walter Scott, in his *Minstrelsy of the Scottish Border*, has printed a Latin document of the date of A.D. 1291, in which the privilege to this latter extent is pleaded in favour of an Alexander de Moravia, an ancestor of the present Mr. Moray of Abercromby. The original deed still exists. Of Macduff's Cross only the pedestal now remains, the cross itself having been destroyed at the Reformation. It bore a metrical inscription, in a strange half-Latin jargon, the varying copies of which, still preserved, have given much occupation to the antiquaries. (See Sibbald's *History of Fife*, particularly the second edition, 8vo. Cupar-Fife, 1802; Cunningham's *Essay upon Macduff's Cross*; and Camden's *Britannia*, by Gough.)

ASYMPTOTE (*ἀσυμπτωτική*), a compound Greek word signifying *which does not fall with*, if taken literally with respect to two lines, it would mean that they do not meet one another. But it is used only in speaking of two lines (one of which at least must be curved) which continually approach each other, but never meet; so that the distance between them diminishes without limit, or they may be brought to any degree of nearness, without ever actually meeting.

This appears a paradox to beginners in geometry, who are generally unable to imagine it possible that two lines should continue to approach one another for ever, without absolute contact. But this arises from their confounding the thing called a straight line in practice (which is not a straight line, but a thin stroke of black lead or ink, as the case may be) with the straight line of geometry, which has neither breadth nor thickness, but only length. And they also imagine that if two lines might be asymptotic, the fact might be made visible; which is impossible, unless the eye

could be made to distinguish any distance, however small. But if the unassisted eye cannot detect a white space between two black lines, unless that space be a thousandth of an inch in breadth, which is about the truth, it is evident that two geometrical surfaces with asymptotic boundaries, such as $A B C$, $D E C$ would appear to coincide from the point where the distance between them is about the thousandth part of an inch. The idea of a geometrical asymptote is therefore an effort of pure reason, and the possibility of it must be made manifest to the mind, not to the senses.

$A L M B C D$ is a vessel of water, of which the sides and bottom are extended indefinitely towards G and R ; the end $A L$ is fixed, but the end $B M$ is moveable parallel to its first position, so as always to form a water tight obstacle; by which means the length of the vessel may be increased to any extent, while its breadth and height remain the same. Let the water be a perfect fluid, without any adhesion to the sides of the vessel (which is mathematically possible, though not physically), and let the bottom of the vessel be geometrically horizontal. Then, as the end $B M$ changes its position and moves towards $G R$, it is manifest that the vessel will grow larger, and the level of the water will fall. Suppose the side $L K$ to be of glass. Thus when the vessel ends at $E P$, the water may stand at $S V$; when the end is at $F Q$, the water may stand at $T W$, and so on. But the level of the water never can fall absolutely to the bottom $C K$; for so long as the preceding mathematical suppositions hold good, and there is some water in the vessel, it must stand at some determinate height above the bottom. As the end $B M$ moves to the right, let the curve $M V W$, &c., mark out the positions of the level upon the edge of the moving end, as is done in the diagram. Then for the reason above given, this curve never can meet the line $C K$, though obviously in a state of continual approach towards it. Hence the curve $M V W$ and the line $C K$ are asymptotes.

As another illustration, let there be two parallel lines $A B$, $C D$, the perpendicular distance of which is $A C$; and from A , with different radii, describe arcs of circles $P 1$, $Q 2$, $R 3$, &c. From $A B$ on all these circles measure arcs equal in length to the straight line $A C$; that is,

let $P 1$, $Q 2$, $R 3$, ... $W 7$, &c., be all equal to $A C$. Now it is plain that the arcs $Q q$, $R r$, &c., are all greater than $A C$, and will continue so, however great the radius may be; for $A C$ is the shortest distance which can be drawn from one parallel to the other. But as the radius is extended, the arcs $T t$, $V v$, &c., become more upright, as a person unused to geometrical phraseology would say, that is, more and more nearly coincident with a perpendicular drawn from $A B$; they also become more and more nearly equal to $A C$. Hence the points 5, 6, 7, &c., come nearer and nearer to $C D$, with which they would actually coincide, if it were possible that one of the arcs could become equal to $A C$. Hence the curve, 1, 2, 3, &c., is an asymptote to $C D$.

The mathematical theory of asymptotes will be found in all works on the theory of curves, and in most on the differential calculus. The following are the most general notions which it will be within our limits to give, and will be understood by a moderately well-informed mathematician. If the equation of a curve be $y = \phi(x)$, and if the function $\phi(x)$ can be separated into two others, say $\psi(x)$ and $\chi(x)$, of which $\chi(x)$ diminishes without limit either when x is increased without limit, or made to approach without limit to any given quantity: then the curve whose equation is $y = \psi(x)$ is an asymptote to the curve whose equation is $y = \phi(x)$ or $\psi(x) + \chi(x)$. For the difference of the ordinates of the two curves (to a common value of x) is $\chi(x)$, which diminishes without limit. For instance, let the first curve have the equation

$$y = \frac{b \cdot x}{x - a}$$

since $\frac{b \cdot x}{x - a}$ is $b + \frac{ab}{x - a}$, of which $\frac{ab}{x - a}$ decreases without limit when x is increased without limit, it follows that the straight line having the equation $y = b$ is an asymptote to the curve. If the preceding equation be reversed and put under the form

$$x = \frac{a y}{y - b}$$

similar reasoning will show that the straight line where equation is $x = a$ is also an asymptote. If the first expression be developed in inverse powers of x , giving

$$y = b + \frac{b a}{x} + \frac{b a^2}{x^2} + \frac{b a^3}{x^3} + \&c.$$

the equations of curves which are asymptotes to the preceding may be found by taking any of the preceding terms for y , provided b be always one. Such are

$$y = b + \frac{b a}{x}$$

$$y = b + \frac{b a^2}{x^2} + \frac{b a^3}{x^3}$$

or generally, any curve whose equation is

$$y = b + \chi(x)$$

where $\chi(x)$ diminishes without limit, when x is increased without limit, is an asymptote to the preceding. Observe that a curve may first cut another, then recede from it, and afterwards become an asymptote to it.

The following is a mere sketch of the most general method of finding asymptotes to algebraical curves. The first part of the method detects the number and direction of the *rectilinear* asymptotes, those only excepted which are parallel to either axis of co-ordinates, which will easily admit of a separate determination.

Clear the equation of all radicals. Suppose it then of the second degree, though the same reasoning applies to all degrees. Its form will then be (putting all the highest terms on one side)

$$a y^2 + b x y + c x^2 = d y + e x + f.$$

The following theorem can then be demonstrated. If the equation

$$a y^2 + b x y + c x^2 = 0 \quad (A)$$

be possible, then it is the collective equation of two lines passing through the origin of co-ordinates, which two lines are parallel to two asymptotes of the curve and the curve can have no others. It is a well-known theorem that any algebraical equation between x and y , which is homogenous with respect to these letters, is not the equation of a curve, but of a collection of straight lines passing through the origin. Thus the asymptotes of the curve of the third degree will be determined by the solution of an equation of the form

$$a x^3 + b x^2 y + c x y^2 + d y^3 = 0$$

which may belong either to one or three straight lines.

If $y = kx + l$ be the equation of an asymptote, the value of k may be any one of the values of $\frac{y}{x}$ determined from the equation (A). To find l , remember that any homogenous algebraical expression of the m th degree, containing x and y , may be expressed by the form

$$x^m \phi\left(\frac{y}{x}\right)$$

and let the equation of the curve, when its various sets of homogenous terms have been collected, be

$$x^m \phi\left(\frac{y}{x}\right) + x^{m-1} f\left(\frac{y}{x}\right) + \&c. = 0$$

Then if $\phi'(k)$ represent the differential coefficient of $\phi(k)$, the equation of the asymptote is

$$y = kx + \frac{f(k)}{\phi'(k)}$$

when the highest dimension in the equation exceeds the next highest by more than one, all the asymptotes must pass through the origin of co-ordinates.

The term asymptote is first found in the Conic Sections of Apollonius: and the properties of the hyperbolic asymptote are found in the second book of his Conic Sections.

ASZOD, a well-built market-town of Lower Hungary, in the circle of Waitzen, and on the Galga, about twenty-three miles N.E. of Pesth. The Podmanitzky family have a large and handsome mansion near it, which is celebrated for its extensive cabinet of coins and its museum of natural history. The inhabitants are remarkably industrious, good mechanics, and carry on considerable trade, as well in cloaks lined with sheepskins, which they dye blue and green and export to distant markets in great quantities, as in corn and wine, the produce of the delightful valley in which the town is situated. Aszod contains two churches, a synagogue, and nearly 5000 inhabitants. 47° 39' N. lat., 19° 29' E. long. (Bertuch.)

ATABEKS are the rulers of several of the small principalities into which the empire of the Seljuk Turks, soon after its establishment, became divided, during the eleventh, twelfth, and thirteenth centuries. The word Atabek is of Turkish origin, and properly signifies 'The Father of the Prince,' or, as Abulfeida explains it (*Ann. Mosl.* t. iii. p. 226. ed. Reiske), 'a faithful Parent.' According to the same author, the first chief honoured with the title of Atabek was Nizam-al-Mulk, the vizir of the third Seljuk sultan, Malek-shah, who at the same time gave him the town of Tus as his property; yet neither the title nor the honours of sovereignty remained hereditary in his family. But several powerful emirs at the court of the Seljuks, on whom this title was conferred, continued to use it after they had made themselves the almost independent masters of separate provinces, in which they enjoyed all the prerogatives of sovereignty, with this exception only, that in the public prayers at the mosques the name of the reigning Seljuk prince was mentioned before theirs. Four dynasties of Atabeks are particularly noticed in eastern history: those of Syria (and Irak), those of Azerbaijan, those of Persia, and those of Laristan.

Atabeks of Syria and Irak. The founder of the first dynasty of Atabeks was Kasim addaulah Aksankar, originally a manluk or slave, but who had by degrees raised himself to a station of great influence at the Seljuk court. Sultan Malek-shah, the son of Alp Arslan, yielding to the request of the nobles, who were jealous of the power of Aksankar, in order to get rid of his presence at court, appointed him governor of the towns of Haleb, Hama, Manbej, and Laodicea (A.D. 1086). After Malek-shah's death, Aksankar, instead of taking the part of his children, became the supporter of Tutush, another Seljuk prince in Syria. But Tutush, so far from rewarding the services which Aksankar had rendered him, deprived him of a portion of his previous government, and finally of his life (A.D. 1094). Emad-eddin Zenghi, the son of Aksankar, who was only ten years old when his father was executed, early distinguished himself by military services in several Seljuk armies, and in A.D. 1122 received Basra as a fief from the Seljuk sultan Mahmud, besides which he was appointed governor of Bagdad. In consequence of the then alarming ascendancy of the Christian kingdom established by the crusaders in Palestine, Emad-eddin was sent to Mosul, in order to resist their further encroachments. He succeeded (A.D. 1127) in making himself master of Haleb, and of a considerable portion of Syria, over which country he thenceforward ruled as an independent sovereign. European chroniclers of the history of the crusades call him Sanguin, which is a corruption of Zenghi. After his death (A.D. 1145) a dissension arose between his two sons, Seif-eddin Ghazi and Nureddin Mahmud: they agreed at last that Seif-eddin should reign at Mosul, and Nureddin at Haleb. The Mosul branch continued to govern till the incursion of the Mogols into Syria, when Mosul fell into their power, A.D. 1260. To the dominion of the Atabeks of Haleb an end was put by Saladin, A.D. 1183; who, however, allowed a side branch of this dynasty to continue in the cities of Sanjar and Nisibin till A.D. 1219.

Atabeks of Azerbaijan.—Ildeghiz, who, from the condition of a slave, had successively risen to the rank of an officer at the court of the Seljuk Sultan Mas'ud, was, in A.D. 1136, invested with the dignity of Atabek, and at the same time appointed governor of Azerbaijan and Kurdistan. He kept an army of fifty thousand horse, and increased his dominions by conquest. Though still under allegiance to the sultan, he was almost independent in the government of Azerbaijan.

Four of his descendants successively ruled over Azerbaijan till the year 1225, when they were obliged to yield to the power of Jelal-eddin, sultan of Khwarezm.

Atabeks of Persia.—A line of Atabeks, of Turcoman origin, the descendants of Salgar, ruled over Fars, or Persia Proper from A.D. 1148 till 1264. The first of these Atabeks was Mozaffer-eddin, and he was followed by ten others, the reigns of some of whom were, however, of very short duration. Their residence was at Shiraz. The last of this dynasty was Ayesha Khatun, a princess, who was confirmed by Hulagu in her character as sovereign, but reigned no longer than one year, and died in A.D. 1264. From their ancestor, Salgar, these Atabeks of Persia are sometimes named Salgarides.

Atabeks of Laristan.—Abu Taher, an officer of the Atabeks of Persia, had been sent with an army into Laristan, a province on the north-eastern side of the Persian Gulf. He conquered it, but instead of giving it up to his masters, he assumed himself the independent dominion over it, and took the title of Atabek. Takla, the grandson and third successor of Abu Taher, was reigning over Laristan when Hulagu invaded the country, who deposed and killed him, but allowed his son, Shems-eddin Alp Argun, to succeed him in the government. By the permission, and with the support, of the Mogol emperors, Yussuf Shah, the son of Alp Argun, followed next, and he was succeeded by his son Afrasiab. The latter had, by several acts of cruelty, drawn upon himself the displeasure of the emperor Gazan Khan, who ordered him to be executed, and appointed Nosrat-eddin Ahmed, a son of Alp Argun, as his successor. He was followed by Rokn-eddin, a son of Yussuf Shah. Mozaffer-eddin Afrasiab, the son and successor of Rokn-eddin, was the last of the Atabeks of Laristan. (See D'Herbelot, *Bibliothèque Orientale*, art. Atabekian. De Guignes, *Histoire des Huns*, vol. i. p. 251, &c.)

ATACAMA is a district belonging to the department of Potosi in Bolivia, in South America, and comprehends all the country of that republic which lies to the west of the Andes along the Pacific Ocean. It is of considerable extent, its northern boundary being formed by the river Loa, which separates it from Peru, and runs between 21° and 22° S. lat., and its southern by the river Salado, which partly divides it from Chili, and flows near 26° S. lat., so that it extends along the coast upwards of 210 miles, with a breadth of from 25 to 40 miles. It is divided into the Upper (Sierra) and Lower country. The Sierra comprehends the smaller part of its surface, that which lies on the N.E. within the chain of the Andes, and contains some fertile valleys, in which the common fruits and seeds of the South American Sierras are cultivated. The surrounding mountains contain mines of gold and silver, but they are not worked, and are inhabited by numerous herds of vicuñas, which the Indians hunt, selling their skin and eating their flesh, which is tender and of excellent taste. The Lower country presents over nearly all its surface nothing but an uninhabited and uninhabitable desert, consisting of wide plains covered with a dark brown, and in some places quite black sand, with here and there a streak of white. On the plains rise some high ridges and a few immense rounded knolls: but in no part are any traces of vegetation to be discovered. This description is particularly applicable to the southern part, which extends towards the boundary of Chili, in which many Spaniards perished for want of water at the time of the first conquest, and which is known under the name of the desert of Atacama. Towards the boundary of Peru, a few rivers descend from the Andes, and along their courses valleys extend, in which a rich vegetation is displayed, the soil producing bananas, cotton, figs, vines, and other fruits and vegetables. The most considerable of these rivers is the Cobija, at the mouth of which is a good harbour and a small town, the inhabitants of which are principally occupied with fishing for congers, which they salt and export to the interior and to other ports: this town is now called Puerto de la Mar. In other parts of the coast a species of cod, called *tollo*, is caught in abundance and likewise exported. The interior districts contain veins of crystal of various colours, of jasper, tale, copper, blue vitriol, and alum. No rain ever falls on this coast, but in a few places the soil is occasionally refreshed by mists and dews. In the desert, sand-spouts are of frequent occurrence. (Alcedo, Captain Basil Hall, Humboldt.)

ATAHUALLPA, called by some historians **ATABALLIPA**, was the son of Huayna Capac, the eleventh Inca of

Perú, by a princess of Quitú, or Quito. According to the laws of Perú the incas were only allowed to marry their sisters, or some other female of their own family: every other union was considered unlawful, and the fruit of such a union illegitimate. Atahualpa could not, on this account, succeed his father. Huayna Capac, who loved him passionately, considering, moreover, the rank of his mother, was desirous that Atahualpa should succeed him in the throne of Quito, which kingdom had been added to his empire. He accordingly communicated his desire to the hereditary prince Huascar, who acquiesced in the will of his father: and at the death of the inca, which, according to Garcilaso, took place in 1523, Atahualpa ascended the throne of Quito. Huascar promised his brother to leave him undisturbed in the possession of his kingdom, on condition that he should not make any new conquests on his own territory, and that he should render him homage as his liege lord. Atahualpa replied submissively to this proposal, and asked his brother's permission to visit Cuzco to celebrate the obsequies of their deceased father, and likewise to render him homage. Having obtained this permission, he gave secret orders to his principal officers to assemble as many men as they could, and without making any warlike appearance, to march towards Cuzco in small bodies. In this manner he assembled an army of more than 30,000 veterans who had served under his father. These preparations, secretly as they were made, excited suspicion in the minds of some of the old governors of the provinces, who acquainted Huascar with their fears. But before the inca had time to prepare himself, more than 20,000 men belonging to Atahualpa had crossed the Apurimac, and were within a hundred miles of Cuzco. They then cast off the mask, and presented themselves as enemies. Huascar assembled as large an army as he could muster, and offered them battle in a plain six miles from Cuzco. The battle was obstinate and bloody, and at last victory declared in favour of Atahualpa. Huascar attempted to escape with a thousand men, but was taken prisoner. A messenger was sent to his brother, who was at Sausa, or Jaña, to acquaint him with the result of the battle. He ordered Huascar to be kept in chains, and summoned all the individuals of the inca's family to appear at Cuzco, under the specious pretext of some affairs of importance both to the family and to the state: but his real intention was to destroy them, that he might possess the throne without fear of being disturbed. Atahualpa accordingly gave orders to his general, who caused more than 200 of the inca's family to be put to death, without sparing either age or sex. Some were beheaded, others precipitated from rocks, women and children were hung by their hair from trees, and left to die there. These inhuman executions, which were continued during two years, took place in a field near Cuzco, called, on that account, Yahuapampa, or the field of blood. The unfortunate Huascar, whenever one of these atrocious acts took place, was brought to the scene of blood, dressed in mourning, and with a rope tied round his neck, to witness the death of his relations. The servants of the household of the inca were likewise destroyed, and as these were the inhabitants of all the towns in the neighbourhood of Cuzco, the number of the victims cannot be estimated.

In the midst of these civil discords, the Spaniards arrived in Peru. Atahualpa, who was at Cassamarca, or Caxamarca, terrified at the accounts which he received of them, and knowing that the unfortunate Huascar had sought their assistance, sent an embassy, accompanied by a rich present, with a view to gain the favour of the invaders. The ambassador was very civilly received by Francisco Pizarro, who, on his part, sent his brother Hernando to visit Atahualpa, to offer him his friend's aid, and to acquaint him with his intentions, which were no other than to contribute with all his power to the happiness of both him and his subjects. On the following day, Atahualpa, accompanied by 8000 men unarmed, went to visit Pizarro. On his arrival, Father Valverde, in a long harangue, endeavoured to acquaint the inca with the doctrines of the catholic religion, and declared to him that his kingdom had been given by the pope, the vicar of God, to the mighty Emperor Carlos, and that consequently he was bound to surrender it, otherwise both he and his subjects would be destroyed with fire and sword. The inca, amazed at such a proposal, and uttering a deep sigh, answered by his interpreter, that, comparing the tenour of their former with their present discourse, he could infer nothing else but that

both they and their king were either tyrants, who went about the world plundering and usurping the kingdoms of others, or a scourge sent by God to punish mankind: that he could not conceive how he was to acknowledge three lords, and surrender his kingdom only to one: that if, with any justice, he could be bound to pay tribute to any, it should be to the pope, or rather to God, and not to the emperor. The Spaniards would not suffer the inca to finish his discourse. The cavalry fell upon the unarmed multitude who had assembled, attracted by the novelty of the sight, sabring and trampling under the feet of their horses old men, women, and children. Francisco Pizarro, at the head of the infantry, attacked the guard of Atahualpa, who, at the command of their inca, offered no resistance; the Spaniards, after seizing Atahualpa, and loading him with chains, conducted him as a prisoner to the royal seat of the incas at Caxamarca.

Atahualpa offered Pizarro, for his ransom, to cover the pavement of his prison with vessels full of gold and silver; and having observed, by the countenances of the Spaniards, that they either were not satisfied with the offer, or doubted the possibility of its accomplishment, he raised his hand as high as he could reach, and making a mark in the wall, promised to fill the room up to that height with the same precious metals. Pizarro agreed to this proposal, and the inca gave the necessary orders for procuring the ransom. Atahualpa, though imprisoned, was in communication with his generals, and ordered them to remove his brother to Jauja. Here Huascar saw two officers of Pizarro, and again implored their interference in his behalf. This circumstance having reached the ears of Atahualpa, he ordered him to be put to death. The unfortunate Huascar, in his last moments, said, 'I am deprived of my kingdom and existence by a tyrant, but he will not enjoy long his usurped power.'

A Peruvian renegade, called Felipillo, who served as an interpreter to the Spaniards, aiming at the possession of one of the wives of Atahualpa, falsely accused him of having secretly given orders to his subjects to arm against them. The inca was accordingly brought to trial. Some of the Spanish officers, whose names are mentioned by Garcilaso, remonstrated against the injustice of such proceedings, and endeavoured to prove to those who were of a contrary opinion that they would disgrace the Spanish character by their ungrateful behaviour to a man who had received them with such kindness, and to whom they had moreover pledged their word to set him at liberty after having received the sum agreed upon for his ransom; and finally, that if he was to be tried, he should be sent to Spain to be judged by the emperor. Almagro and his party, who had just arrived, and were eager to seize upon the treasure of Atahualpa, pretended that he ought to be tried by a military commission. This last opinion prevailed. He was tried and condemned to be burned alive on several false and ridiculous charges, the chief of which were the false one abovementioned, and the murder of his brother. On his way to the place of execution, he desired to be baptized, in consequence of which he was strangled only. It is said that he exhibited great courage and firmness in his last moments. Atahualpa is described by the Spanish historians as a man of handsome and noble presence, of a clear, quick, and penetrating mind, cunning, sagacious, and brave. Garcilaso relates of him the following anecdote:—while in prison he had observed some Spaniards reading and writing, and he thought that this accomplishment was not a thing learnt, but a faculty which all the Spaniards possessed; and in order to verify his opinion, he asked one soldier to write the word Dios (God) on the nail of his thumb. He then asked every Spaniard that came near him to read it, and as he received from all the same answer, he was confirmed in his opinion; but on putting the question to Francisco Pizarro, and finding that he was unable to answer it, he discovered that it was a science acquired. From that moment he formed so mean an idea of Pizarro, that he treated him with the greatest contempt.

See Vega (El Inca Garcilaso), *Comentarios Reales de los Incas*, part i., book 9, chap. 2 to the end; part ii., book 10, chap. 17, folio edition, Madrid, 1723.

ATA-MELIK, or with his complete name, ALA-EDDIN ATA-MELIK AL-JOWAINI, was born (probably A.D. 1226 or 1227) in the district of Jowain near Nishapur in Khorasan, in which country his father Boha-eddin successively filled several offices of importance under the Mogol

government. Ata-Melik received a careful education; but at an early age political employments withdrew his attention from literary pursuits. Argun, the governor of Khorasan, chose him for his companion on two journeys into Tartary, and in 1251 introduced him at the court of the Mogol emperor Mangu Khan, at Karakorum. Here Ata-Melik remained for a considerable time, and began to write his great work on the history of the Mogols, on account of which he undertook several excursions into Mawaralnahr, Turkestan, and the antient country of the Uighurs. We are not informed of the precise period at which Ata-Melik quitted Karakorum. But when Argun was, in A.D. 1255, again called to the court of Mangu Khan, he left his son Kerai-Melik, with Ata-Melik, in the camp of Sultan Hulaku, the brother of Mangu Khan, as governors of Khorasan, Irak, and Mazenderan, during his absence. Ata-Melik soon gained the entire confidence of Hulaku: as a proof of this, it is recorded that he induced him by his intercession to rebuild the town of Jenushan, which had been destroyed by the Mogols when they first conquered Khorasan. He afterwards accompanied Hulaku in his expedition against the Abbasside caliph Mostaseim; and after the capture of Bagdad by the Mogols (A.D. 1258), he was appointed prefect of that city, while on his brother Shems-uddin the dignity of vizir was conferred. Both continued to hold these offices under Abaka Khan, the successor of Hulaku, and the province of Bagdad, which had suffered much from the incursion of the Mogols, began to flourish again under their administration. But in consequence of a charge of peculation brought against Ata-Melik, he was thrown into prison, and deprived of every thing he possessed, even of his wife and children, who were sold as slaves. Sultan Ahmed, the successor of Abaka Khan, relieved him from this distressing situation, and prevailed upon him, much against his wish, to resume his former office. But soon after this Argun, the son of Abaka Khan, defeated Ahmed and made himself master of Bagdad; and it appears that the apprehension of a renewal of the former rigorous judicial proceedings against himself accelerated the death of Ata-Melik, which took place a few days after Argun's entry into Bagdad (A.D. 1282). His work on the history of the Mogols, entitled *Jehan-kushai* (i. e. the conquest of the world), is by some of the most esteemed Oriental writers (e. g. Abulfaraj, Mirkhond, &c.) referred to as the principal authority on that subject. A manuscript, said to contain the greater part of it, is preserved in the Royal Library at Paris. (See a Memoir on the life and writings of Ata-Melik, by Quatremère, in the *Mémoires de l'Orient*, vol. i., p. 220, &c.)

ATAULPHUS, brother-in-law of Alaric, king of the Visigoths, assisted him in his invasion of Italy. After Alaric's death, near Cosenza, Ataulphus was elected his successor, A.D. 411. In the following year he led his bands out of Italy into Gaul, with the intention, as it would appear, of joining Jovinus, who had revolted against the empire, and of sharing the Gauls with him. Jovinus not being inclined to an alliance with the Goths, Ataulphus sent messengers to Honorius offering him peace, and at the same time attacked and defeated Jovinus, who was taken and put to death. Placidia, the sister of Honorius, had been for some time a captive with Ataulphus, who at last prevailed on her to give him her hand. The marriage took place at Narbo (Narbonne) in southern Gaul, at the beginning of the year A.D. 414. Ataulphus appeared on the occasion dressed after the Roman fashion, and presented his bride with many vases full of gold and jewels taken at the plunder of Rome in A.D. 410. Ataulphus afterwards passed into Spain, where he was treacherously killed at Barcelona by one of his equestrians, A.D. 417. A child that he had by Placidia, and to whom he had given the name of Theodosius, died before him. Vullia, the successor of Ataulphus, restored Placidia to her brother Honorius, who gave her in marriage to the consul Constantius. (Jornandes, Zosimus, Orosius, and Gibbon.)

ATBARA, a river of Nubia. [See TACAZZE and NILK.]

ATCHAFALAYA (an Indian word, signifying *lost water*) is the upper outlet of the Mississippi, which detaches itself from the main stream on the right bank in 31° N. lat., and 14° 47' W. long. from Washington. The Atchafalaya is here about 110 yards wide, and the Mississippi nearly half a mile. When the Mississippi is low, the water sometimes runs backward from the Atchafalaya into the Great River; but when the Mississippi is at its height, there is an immense mass of water sent down the Atchafalaya, and a

great extent of country between the Atchafalaya and the Mississippi, and also to the west of the Atchafalaya, is thus annually inundated. The Atchafalaya has a general southern course for thirty-five miles till it is joined by the Courtableau from the N.W., which comes from the hilly pine-forests between the Red River and the head of Calcasieu. From the junction of the Courtableau, the Atchafalaya runs S.S.E. for twenty miles; here one stream runs into the long narrow lake called Cheetimaches, and the other branch runs eastward fifteen miles, and receives the Plaquemine, another branch of the Mississippi detached from the main stream, on the right. The Atchafalaya now runs a little E. of S. for thirty miles, and enters the bay called Atchafalaya Bay. About twenty miles above its mouth it is joined on the west by the Teche, which rises in the prairies of Opelousas, and has an entire course of about 200 miles.

The Atchafalaya is remarkable for a phenomenon called the Raft, which occurs in several places in its course. This raft consists of the rubbish brought down the Mississippi and thrown at some remote time into the Atchafalaya, where it has been caught in the bends of this narrow and tortuous stream, and has received successive augmentations by more recent floating trees. This raft is not always stationary, but when disturbed by the rise of the waters, it breaks off in large masses, which soon lodge again in some angle of the river. Several points are marked in Darby's map where the navigation is impeded by these accumulations of interlaced trees. The timber rises and falls with the river floods. The spring-tides in the Gulf of Mexico, which are not more than three feet, ascend the Atchafalaya when its waters are low to a point above the junction of this stream with the Courtableau—a fact which shows that this portion of the country has a very small elevation above the Gulf, or perhaps none at all. (See Darby's *Geography of the United States*.)

ATCHEEN, or ACHEEN (properly ACIEH), is one of the petty kingdoms into which the island of Sumatra is divided. It occupies the north-western extremity of the island, and borders generally on the country of the Battas. The kingdom does not extend inland farther than about fifty miles. It stretches along the coast to the south-westward as far as the town of Barns, in 2° N. lat. and 98° 30' E. long. On the northern coast the territory of Atcheen reaches as far eastward as Karti, in 5° 10' N. lat. and 97° 40' E. long.

When the Portuguese, early in the sixteenth century, were prosecuting their discoveries and conquests in the Indian Seas, a fleet of five ships, under the command of Diego Lopes de Sequeira, first reached the island of Sumatra, and anchored at Pedir, then a principal port on the north-west coast, within the kingdom of Atcheen. Here the Portuguese found trading vessels from Pegu, from Bengal, and from other eastern countries: this was in September, 1509. It was nearly a century later (June, 1602) when the first English ships visited that country. These were the fleet under the command of Sir James Lancaster, who bore a letter from the queen of England, and was received by the sovereign of Atcheen with every mark of respect. On this occasion a regular commercial treaty between the two governments was drawn up and executed. The chief object of contemplated traffic was pepper, for which article Europe was principally dependent at that time upon the Dutch. Very little advantage was taken of the treaty here mentioned until the year 1659, when the reigning queen of Atcheen, having granted some additional privileges to the English East India Company, a factory was established by that body in the capital of her dominions. The trade, however, was never very flourishing in this quarter, and may be said to have ceased upon the establishment of the Company's settlement at Bencoolen, on the south coast of Sumatra, from the neighbourhood of which place the pepper was principally collected.

A 'treaty of friendship and alliance' was concluded with the Sultan of Atcheen, in April, 1819, by Sir Stamford Raffles, acting on behalf of the government of the East India Company, whereby the right of trading freely to all the ports of that kingdom was assured to the British upon the payment of 'fixed and declared rates of duty.' By this treaty His Highness likewise engaged 'not to grant to any person whatever a monopoly of the produce of his states, and to exclude the subjects of every other European power, and likewise all Americans, from a fixed habitation or residence in his dominions.'

On the occasion of concluding this treaty, the East India Company advanced to the Sultan of Atcheen a loan of 50,000 dollars, and presented to him as a gift six pair of brass field-pieces, and a considerable quantity of ammunition and military stores.

The government of Atcheen is an hereditary monarchy, and the king or sultan is limited in his authority only by the power of the greater vassals, so that the bulk of the people are not in the enjoyment of much political liberty. The whole kingdom is divided into about 190 small districts or communities, equivalent to our parishes. These districts are grouped together in various numbers, varying from 20 to 26, under the management of a provincial governor. The state revenues are made up of offerings in grain, cattle, and money, sent from each district, and delivered at the king's store; but the principal income of the crown consists in customs-duties imposed upon the import and export of merchandise.

The climate of this part of the island is comparatively healthy. The country is more free than most of the other parts from stagnant waters and from woods, for which reason the inhabitants are likewise less liable to fevers and dysenteries.

A chain of mountains, in some parts double and in others treble, runs from near the north-western point through the whole extent of Sumatra, including, of course, the territory of Atcheen. These mountains, as well as the rivers and other principal geographical features of the country, will be described in our general account of the island.

The Atchinese are in general taller and stouter, and their complexions darker, than those of the other inhabitants of Sumatra. They are likewise considered to be of more active and industrious habits, as well as more sagacious. They are fond of commercial adventure, and their degree of knowledge, more particularly as regards other countries, is greater than that possessed by other races of Sumatrans who do not engage so largely in commerce. This superiority of character and intelligence has been attributed as much to a considerable admixture of Malay blood, as to the great intercourse which has for ages existed between their ports and the western parts of India.

The language in use among the Atchinese is one of the general dialects of the Eastern Islands: in writing they make use of the Malayan character. In religion they are followers of Mohammed, and maintain the forms and ceremonies of the Moslem faith with much strictness.

Atcheen is now no longer, as it once was, the great mart for Eastern products, but it still carries on a very considerable traffic with the Coromandel coast, to which it furnishes old-dust, raw silk, betel-nut, pepper, sulphur, camphor, and benzoin; receiving in return salt and cotton piece-goods. The camphor and benzoin exported from Atcheen are mostly procured by internal commerce from their neighbours the Battas. A considerable trade is also carried on between Atcheen and the British settlements of Singapore and Prince of Wales's Island.

The few arts and manufactures known in other parts of Sumatra are likewise pursued in the kingdom of Atcheen, where some of them are carried to a greater degree of perfection. A fabric of thick cotton cloth and of striped or chequered stuffs is carried on, and affords a considerable supply for the Malayan peninsula. A sort of rich silk goods is also manufactured, but not to so great an extent now as formerly. This falling off has been attributed to a failure in the breed of silk-worms, but as such an accident could have been very easily repaired, it is probable that there are other causes for the decay.

The soil throughout the kingdom is for the most part light and fertile, producing abundant crops of rice and excellent vegetables, as well as of cotton and the finest tropical fruits, including the mango and mangustin, which are here of delicious quality. Cattle and all kinds of provisions are abundant and at reasonable prices, and the Atchinese display their superior intelligence as much in their better skill in agriculture as they do in their greater commercial enterprise. This kingdom furnishes the same description of animals as are common throughout the island. Elephants are found here domesticated, and were probably originally imported.

(See Marsden's *History of Sumatra*; Captain Forrest's *Voyage to the Mergu Archipelago*; and *Early Records of the East India Company, as given in the Appendix to the Report of the Select Committee of the House of Lords*.)

on *Foreign Trade in 1820-21*. Barros, *Asia*, Dec. II. liv. iv. cap. 3.

ATCHEEN, or ACHEEN, the capital of the kingdom of the same name in Sumatra, is situated at the north-western extremity of the island in $5^{\circ} 35'$ N. lat., and $95^{\circ} 45'$ E. long.

The town stands on a river which empties itself by several channels near to Atcheen-head, and is about a league from the sea, where the shipping lie in a roadstead, which is securely sheltered by several small islands. The river having a bar at its mouth, with a depth of no more than four feet at low water during spring-tides, only the small vessels of the country can enter; and even of these many are prevented from passing over the bar during the dry monsoon.

The town, which is said to be populous and to contain 8000 houses, is situated on a plain in a wide valley formed like an amphitheatre by ranges of lofty hills. The houses are all detached; they are built of bamboo and rough timber, and are mostly raised on piles some feet above the ground in order to guard against the effects of inundations. The wealth of the inhabitants has occasioned the erection of a greater number of mosques and other public buildings than are usually seen in towns of similar magnitude in the Malayan peninsula. The palace of the Sultan is built more with a view to strength than beauty, and is surrounded by a moat and strong walls. Near to the gate are several pieces of brass ordnance of an extraordinary size. Most of these are of Portuguese make, but two among them are English, and were sent as a present by King James the First to the Sultan of Atcheen: the bore of one of these pieces is eighteen inches, and of the other twenty two inches diameter.

Owing to the plan of its construction, and the luxuriant growth of the numerous trees which surround and intersect it, the town, when seen from a short distance, has a very pleasing and picturesque appearance. The country beyond it exhibits a high degree of cultivation, and contains many small villages with white mosques, which add to the beauty of the scene. (See Marsden's *History of Sumatra* and Forrest's *Voyage to the Mergui Archipelago*.)

ATCHUJEFF, ATCHUK, or ATCHU, an island on the eastern shore of the Sea of Azof, one side of it being formed by the Sea of that name, and the other three sides by branches of the Kuban. It lies to the N.E. of Taman, or Phanagoria, but is more mountainous and as full of swamps as that island. Among the spots of note upon it are a castle with a port, also called Atchujeff, the fortifications of which are of wood: Kirman, on the principal branch of the Kuban, which was the most considerable place in this part of the world in the fourteenth century; and Cozadji, a small town on the Kurnli-Kuban. The inhabitants of the island, who are Cossacks of the Black Sea, consist wholly of fishermen, and despatch large quantities of sturgeons in a dried state, caviar, fish-fat, and isinglass, to Constantinople. It is comprised at present in the Russian government of Tauria.

A TELES, in zoology, a genus of *Sapajous*, or American monkeys, formed by M. Geoffroy St. Hilaire, and presenting numerous and remarkable modifications of organic structure, which readily distinguish them from all other groups of quadrumanes. The most prominent characters of the genus consist in their long, attenuated, and powerfully prehensile tails; fore-hands either entirely deprived of thumbs, or having only a very small rudiment of that organ; and their dental system, which, like that of all the American quadrumanes, consists of two molar teeth in each jaw, one on each side, more than are found either in man, or in the hundred genera of the old world. The first and last of these modifications are common to the ateles and other American genera; the second is shared with them only by the *colobi*, a small African genus, consisting only of two species, neither of which has been observed by any zoologist since the days of Pennant, and with whose other characters we are very imperfectly acquainted. The ateles are further distinguished by their small round heads, corpulent bodies, and remarkably long slender limbs, which characteristics giving these animals much of the general appearance of a spider, have procured for them the appellation of *spider-monkeys*, by which they are commonly known. Like all the other quadrumanes of the new world, they are destitute of cheek pouches and callosities, characters which approximate them in some measure to the real apes. The skull of the ateles

is rounder and the brain larger than in the common monkeys; the forehead also is more elevated, and the muzzle less prominent. The eyes are widely separated from one another by the base of the nose; the nostrils open laterally, and are separated by a thick cartilaginous partition: the ear only differs from that of man in having no inferior lobe; the mouth is small; the lips thin and extensible; and the hair generally long, coarse, and of a glossy appearance.

But the organs of locomotion chiefly distinguish the ateles. The anterior extremities, in particular, are by their length and the slenderness of their form out of all proportion with the other parts; they are in general, as above observed, destitute of thumbs; or if some species are provided with this organ, it is only in a rudimentary form, and consists merely of a flat nail, or at most of a single joint. On the posterior extremities, on the contrary, the thumb is largely developed, placed far back towards the heel, and is completely opposable to the fingers. But these animals possess, in their long and muscular tail, an organ of prehension much more powerful than the other extremities; it executes, in fact, all the functions of a fifth limb, though probably, on account of its distance from the seat of sensation, it is not endowed with a very delicate sense of touch. For six or seven inches from the point it is naked and callous on the under surface: and it is by this portion that the animal hangs suspended from the branches, or swings itself from tree to tree with an ease and velocity almost incredible.

Their entire organization is adapted exclusively to an arboreal life; on the earth nothing can be more awkward and embarrassed than their motions. They trail themselves along with a slow and vacillating gait, sometimes using their long fore-arms as crutches, and resting upon their half-closed fists whilst they project the body and hind legs forward; at other times walking in a crouching position on the hind legs only, balanced by the long arms and tail, which are elevated in front and rear respectively, and always ready to take advantage of any object by which to avail themselves of their natural powers of progression. But in proportion to their embarrassment on a plain surface is their dexterity and agility among the trees of their native forests. Here they live in numerous troops, mutually support one another in danger, beat and expel the less favourably organised *sakis* from the vicinity of their cantonments, and exercise a perfect tyranny over all the other arboreal mammals of their neighbourhood. Though leaves and wild fruits compose the principal part of their food, yet they do not reject flesh, but hunt after insects and the eggs and young of birds, and are even said to adopt the stratagem of fishing for crabs with their long tails. They are exceedingly intelligent, easily domesticated, and soon become strongly attached to those who treat them kindly: they exhibit none of the petulance and insatiable curiosity of the common monkeys; their character, on the contrary, is grave, and approaches even to melancholy: but if their passions are less violent, and more difficult to excite, their affections are infinitely stronger; and if they are without the amusing tricks of the monkeys, so likewise are they without their sickleness and mischief.

Dampier relates, that when a troop of ateles have occasion to pass any of the larger rivers of South America, they select a situation in which the trees are highest and project farthest over the stream; then mounting to the top-most branches, they form a long chain by grasping one another's tails successively. This chain being allowed to hang freely at the lower end, whilst it is suspended from the top, is put in motion, and successively swung backwards and forwards till it acquires an impetus sufficient to carry it over to the opposite bank. When this is accomplished, the animal at the lower end catches the first branch which comes within his reach, and mounts to the highest, where as soon as he is firmly attached, the other end of the chain is permitted to swing, and thus the whole troop are passed over. The ateles, as well indeed as all the other American quadrumanes, are esteemed as an article of food by the native Indians; and even Europeans, whom curiosity or necessity has induced to taste it, report their flesh to be white, juicy, and agreeable. The only thing disgusting about it is a strong resemblance which the whole body, and particularly the head and hands, bear to those of a young infant. Nor is it without being strongly disposed to question the nature of the act, that European sportsmen, unac-

customed to shooting monkeys, witness for the first time the dying struggles of these animals. Without uttering a complaint, they silently watch the blood as it flows from the wound, from time to time turning their eyes upon the sportsman with an expression of reproach which cannot be misinterpreted: some travellers even go so far as to assert that the companions of the wounded individual will not only assist him to climb beyond the reach of further danger, but will even chew leaves and apply them to the wound for the purpose of stopping the hemorrhage. The following species of ateles have been distinguished and characterised by naturalists and travellers:—

1. The *Quata* (*A. paniscus*, Geoff.), or, as the French write it, *couïta*, is a large species, covered with long coarse hair, of a glossy black colour; the belly is protuberant, the head small and round, the limbs long and slender, the fore-hands entirely deprived of thumbs, the tail robust and powerful, the eyes and cheeks deeply sunk, and the face copper colour. On the back and outsides of the limbs the hair is very long and thick, but the belly and groins are nearly naked, and the mammae of the females are placed in the armpits. The hair of the head is directed forwards, and the ears, concealed beneath it, differ from those of the human species only in having no inferior lobe. This species is very common in the woods of Surinam and Brazil. It is active and intelligent, and unites considerable prudence and penetration to great gentleness of disposition. They go in large companies, and when they meet with a man or any animal which is strange to them, come down to the lower branches of the trees to examine them, and having satisfied their curiosity, begin to pelt them with sticks, and endeavour to frighten them away. They cannot leap, but exhibit the most surprising agility in swinging from tree to tree. Acosta, in his *History of the West Indies*, relates the following anecdote of a quata which belonged to the Governor of Carthagena:—‘They sent him,’ says he, ‘to the tavern for wine, putting the pot in one hand and the money in the other; they could not possibly get the money out of his hand before his pot was full of wine. If any children met him in the street, and threw stones at him, he would set his pot down and cast stones against the children, till he had assured his way, then would he return to carry home his pot. And what is more,

[The Quata. *Ateles paniscus*.]

although he was a good bibber of wine, yet he would never touch it till leave was given him.’

2. The *Chuva* (*A. marginatus*, Geoff.) closely resembles the quata in physiognomy, size, and proportions; the quality and colour of the hair are also the same in both, except that the face of the chuva is surrounded with a rim of white, which, on the forehead particularly, is broad, and directed upwards, so as to encounter the hair of the occiput, and form a low crest on the top of the head. The hair of the fore-arm is directed partially towards the elbow; like that of the body it is long and coarse, and though perfectly black,

has not the glossy appearance of the quata's covering. The face is nearly naked, and tan-coloured; the palms of the hands, soles of the feet, and callous part of the tail, are violet black, and the whole skin beneath the hair appears to be of the same hue. According to Humboldt, who discovered this species on the banks of the Amazon, the male and female differ in the colour of the circle which surrounds the face, and which he describes as yellow in the former and white in the latter. A young male, examined by M. Geoffroy St. Hilaire, did not present this difference: but, as in many other instances, it is probable that the young males of this species have at first the colours of the female, and that it is only on attaining their adult state that they assume those marks which distinguish their sex. It appears also that individuals differ considerably in the extent as well as the colour of this circle. The specimens described by MM. Humboldt and Geoffroy had it entirely surrounding the face; that examined by M. F. Cuvier had only the hair of the cheeks and forehead white; and, finally, there is at present a female in the gardens of the Zoological Society of London, in which the latter part alone differs in colour from the rest of the head. In this individual the hair of the forehead is much shorter and more thinly scattered than on other parts; it covers the whole extent of the forehead, is turned upwards, and is of a silvery-grey colour, whilst that of the surrounding parts is deep black. The disposition and manners differ in no respect from those of the quata.

3. The *Cuyou* (*A. ater*, F. Cuv.) is considered by MM. Geoffroy and Desmarest as a variety of the quata; but M. F. Cuvier, from observations made upon the living animal, has recognised and described it as a distinct species. It must however be confessed, that it approaches so nearly to the quata as to render further observations necessary to determine the question of their specific difference. The size, form, and colour are the same in both, and the only marked distinction reported by M. Cuvier consists in the colour of the face, which is black in the cuyou and copper coloured in the quata. ‘The hair,’ says M. Cuvier, ‘is long, and of a harsh silky quality. It is rather shorter on the head and tail than on the rest of the body, where it falls backwards in the ordinary way, but on the head it is directed forward, and falls over the face.’

4. The *Marimonda* (*A. Belzebub*, Geoff.) has the top of the head, the back, sides, and external surface of the extremities black, and all the under parts, the cheeks, throat, breast, belly, inside of the limbs, and under surface of the tail for its first half, white, with a slight shade of yellow. The naked parts are violet black, except immediately about the eyes, which are surrounded by a flesh-coloured circle.

[The Marimonda. *Ateles Belzebub*.]

This species, according to Humboldt, replaces the common quata in Spanish Guyana, where it is extremely common, and is eaten by the Indians. ‘It is,’ says this celebrated traveller, ‘an animal very slow in its movements, and of a gentle, melancholy, and timid character; if it occasionally bites, it does so only in its fits of terror. The marimondas unite in great companies, and form the most grotesque groups. All their attitudes announce the extremity of sloth.

I have frequently seen them, when exposed to the heat of a tropical sun, throw their heads backwards, turn their eyes upwards, bend their arms over their backs, and remain motionless in this extraordinary position for many hours together. The young of this species appear to have the upper parts of the body mixed slightly with grey, but this mixture gradually disappears as it grows towards maturity, till the adult animal presents the uniform black above and white below, as already described.

5. The *A. melanocheir* (Geoff.), of which we are unacquainted with the native Indian name, is also a distinct species. The head, members, and tail are black, or dark brown, on the superior surface; the internal face of the arms and fore-arms as far as the wrists, and of the thighs and legs, the under surface of the tail, the throat, breast, belly, and sides of the hips, are white or silvery grey; the shoulders are yellowish grey, and the remainder of the upper parts of the body, as well as the whiskers, are pure grey: the four hands and the naked part of the tail are black, as are also the face, the cheeks, and the under half of the nose; but round the mouth and eyes is flesh-coloured. The hair is uniformly of a silky quality: that on the black and white parts is of the same colour throughout, but on the grey parts it is annulated with alternate rings of black and white. This species, as well as all those hitherto described, is entirely deprived of the fore-thumb, and does not even exhibit a rudiment of that organ. Only a single individual has been observed alive; its manners are the same as those of the ateles in general, but its habitat has not been definitely determined. A specimen preserved in the Museum of the Jardin des Plantes presents a distribution of colours which differs in some degree from what is here described; but it is not improbable that the difference arises in a great measure from the fading which naturally takes place in the colours of skins which have been long mounted and exposed to the action of the atmosphere, if indeed it be more than an accidental or individual distinction.

6. The *A. Arachnoïdes*, or Brown Quata, as it is called by Baron Cuvier, partakes, in fact, very much of the characters and appearance of the common quata, from which it is principally distinguished by its uniform reddish-brown colour. This species, when full grown, measures rather better than two feet in length; the tail is about a couple of inches longer than the body; the fore legs are one foot nine inches long, the hind legs one foot eight, and the hand six inches. The hair is short, fine, and soft, and that of the forehead is directed backwards, contrary to what is usually observed in the other ateles; the back and upper parts of the body are, generally speaking, well furnished, but the breast, belly, and groins are nearly naked, or at least but sparingly covered with scattered hairs, of a longer and coarser quality than those on other parts; the root of the tail is rather thick and bushy, but it is gradually attenuated towards the point, and, for the last ten inches, naked underneath. The general colour is uniform chestnut-brown, the first of these colours becoming clearer and more intense upon the head, and more especially round the eyes: the forehead is bordered by a circle of stiff coarse black hairs, beneath which a semicircle of light silvery grey passes over the eyes in the form of brows, and becomes gradually more and more obscure, till it is finally lost in the uniform reddish-brown of the temples. The face is naked and flesh-coloured, the under parts of the body of a silvery grey slightly tinged with yellow, with the exception of the abdomen, which, as well as the inner surface of the thighs, and the naked stripe underneath the tail, are of a bright red colour. The manners and habits of this species are unknown in its native forests: those which have been observed in a state of confinement exhibited all the gentleness and listless apathy of character which distinguish the ateles from the common monkeys of South America, as eminently as they do the gibbons of the Indian isles from the other quadrumanes of the Old World. Except in the total want of the thumb on the anterior extremities, the *A. Arachnoïdes* approaches very nearly to the following species, and appears, indeed, to be intermediate between it and the common quata.

7. The mono, or miriki (*A. hypoxanthus*, Kuhl) inhabits the forests in the interior of Brazil, and, as has just been observed, approaches very nearly to the *A. Arachnoïdes*, as well in the colour of its fur as in the general form and proportions of its body and members; but it is readily distinguished from that species as well as from all

the other ateles hitherto described, by the presence of a small rudimentary thumb on the fore-hands. The face also

[The Mono, *Ateles Hypoxanthus*.]

is more uniformly covered with hair than in the generality of the other species, being naked only about the region of the eyes; the hairs which compose the eyebrows are long, black, and directed upwards; the cheeks, lips, nose, and a narrow line descending from the forehead, are covered with short hairs of a pale yellowish-white colour; the chin also is furnished with short hair of the same colour and quality, but intermixed with thinly scattered long black hairs, forming a species of beard, and extending over the upper lip in the form of thin moustaches. The ears are small and nearly concealed by the hair of the head, which though not very long, is thickly furnished, and of a pale grey colour slightly tinged with yellow. The whole body and members are of a uniform greyish fawn colour, only differing in the greater degree of intensity which distinguishes the back and upper parts from those beneath, and in the lighter grey tinge which predominates on the extremities. The backs of the fingers are hairy down to the very nails, and there is a rudiment of a thumb on the fore feet, covered with a short compressed nail.

The mono was discovered by Prince Maximilian of Neuvièd, during his travels in Brazil. It is the largest species of the quadrumanes which inhabit the part of the country through which that scientific traveller passed, and though sufficiently common in particular districts, appears to have upon the whole but a very limited geographical range. Its hide is said to be more impervious to moisture than any other description of fur known in that part of the world, and for this reason the Brazilian sportsmen have cases of the skin of the mono made to protect the locks of their guns from the rain.

8. The chameck (*A. subpentadactylus*, Geoffroy), the last species of the genus distinctly known at present, resembles the mono in having a small rudimentary thumb on the anterior extremities, but it is without a nail, and in other respects the two animals are sufficiently distinguished by their difference of colour and habitat. The chameck indeed approaches more nearly in external form and appearance to the quata than to any other of its congeners, being furnished with a similar coat of long dense hair, of an intense and uniform black colour; but it may be readily distinguished from that species by the presence of the rudimentary thumb on the anterior members, as well as by its

size, which considerably exceeds that of the quata. It has a protuberant muzzle, and its lips, like those of the quata, are capable of prolongation; the forehead is high; the face, cheeks, ears, and chin, are naked and of a brown colour, with a few long black hairs thinly scattered over them; the hair of the head is long, matted, and directed forwards over the forehead, that of the body and members very long and thick: the fingers, both upon the anterior and posterior extremities, are long, slender, and nearly naked; the tail is considerably longer than the body, very thick and covered at the base with close shaggy hair, but attenuated towards the point, where it is more sparingly furnished with shorter hair, and entirely naked underneath.

This species inhabits Guyana and some of the neighbouring provinces of Brazil. Von Sack, in his *Voyage to Surinam*, gives the following account of its manners under the name of quata, with which species its general appearance probably causes it to be frequently confounded. 'The quatta,' says this author, 'is of a very docile disposition, and capable of being quite domesticated: I have seen a pair of them at a gentleman's house at Paramaribo, which were quite at liberty; when the female negroes were employed at their needlework, they used to come and sit amongst them, and play with a piece of paper, and afterwards go out to gambol upon the trees, but never went over to the neighbouring gardens; and they knew well the usual hour of dinner at their master's, when they would come to the gallery, look in at the windows, though without attempting to enter into the room, being aware that this was a liberty not allowed them; they therefore patiently waited for their dinner on the outside.'

ATELLANÆ FA'BULÆ, a species of comedy which was common among the people of Campania, and was thence introduced at Rome, where it met with much favour. The name of Atellanæ, or Atellanice, was derived from Atella, an ancient town of Campania, now ruined, the site of which is about two miles S.E. of the modern town of Aversa, and near the village of Sant Elpidio. The Atellanæ were also known by the name of 'Ludi Osci,' on account of the name of the people among whom they originated. The Roman writers have transmitted to us a few brief detached traits of the nature of these plays, of which no specimen has reached us. The Atellanæ seem to have somewhat resembled the Greek Satyric drama, with this difference, that, instead of satyrs and other fantastic characters, they had real Oscan characters, or actors speaking their own dialect, and who were the representatives of some peculiar class or description of people of that country, much in the same manner as the Brighella, Arlecchino, Polcinella, &c. of the modern Italian stage, who are meant as caricatures of the peculiarities of certain classes in their respective provinces, and who speak each his own dialect in all its native humour. Indeed these modern *maschere*, as the Italians call them, may be considered as the descendants of the old Oscan characters in the Atellanæ. One of these Oscan characters was Macchus, a sort of clown or fool. There were others called Buccones, i. e., babblers, empty talkers. (Diomedes de Grammatica, lib. i. and iii.) The Atellanæ differed from the *comœdia precatata*, which represented high characters, as well as from the *tabernaria*, which exhibited vulgar ones; the Atellanæ were a mixture of high and low, pathetic and burlesque, without however degenerating into trivialities or buffoonery. They seem to have been a union of high comedy and its parody. They were also distinct from the performances of the *mimi*, who indulged in scurrilities and in obscene jokes and gestures. (Cicero, *Epistola ad Papirium*.) Macrobius (*Saturn. III.*) draws the distinction between the Atellanæ and the *mimi*; 'the latter made use of the Roman language, and not of the Oscan, like the Atellanæ; the performances of the *mimi* consisted of one act, while the Atellanæ and other comedies had five, with *exodia* (interludes consisting of songs) between the acts; lastly, the *mimi* had not the accompaniment of the tibicena, nor of vocal music like the others.' Valerius Maximus (lib. ii. ch. 4), speaking of the Atellanæ, says, that their jests were tempered by Italian strictness of taste; and Donatus extols their antique natural elegance. Even in their satirical allusions their object was to provoke joyous laughter, rather than excite feelings of hatred or contempt. It would appear that their humour dealt chiefly in ingenious allusions and equivocations clothed in decent words, the meaning of which could only be caught by the better-educated and more refined classes.

The Atellanæ were performed by Roman citizens, who were not thereby disgraced, like the common *histriones*, or actors; their names were not erased from the roll of their tribes, and they were not obliged to take off their masks at the will of the audience. In course of time, however, and in the general corruption of morals under the empire, the Atellanæ degenerated; common mercenary players appeared in them, and they became as loose in their language as the performances of the *mimi*. This may explain the different judgments given of the Atellanæ by different writers. The *exodia*, or interludes played between the acts of the Atellanæ, are mentioned by Juvenal (*Sat. VI.*), and Suetonius quotes from one of them a line in which Tiberius was alluded to as an old goat; the pun resting on the word *capris*, which means goats as well as the island (Capræ) noted as the scene of Tiberius's depravity. When Galba entered Rome, an actor in one of the Atellanæ began singing the first line of a familiar tune: 'Venit i Simius a villa,' i. e. *the baboon is come to town*, which the audience immediately took up, and continued the song in chorus, repeating the first line as a burthen.

The Atellanæ were written in verse, chiefly iambic, with a frequent recurrence of tribrachs and other trisyllabic feet. Lucius Sylla, the famous dictator, is said to have written Atellanæ. Quintus Novius, who flourished soon after Sylla's abdication, wrote about fifty plays of this kind the titles of some of them have come down to us; as *Macchus Exul*, i. e. *Macchus in Exile*; *Vindemiatores*, or the *Vintagers*; *Gallinaria*, or the *Poulterer*; *Surdus*, the *Deaf Man*, &c. Lucius Pomponius of Bononia, who lived about the same time, wrote *Macchus Miles*, i. e. *Macchus Soldier*, the *Pseudo Agamemnon*, &c. The Atellanæ afterwards fell into neglect, but were revived by a certain Mummius, mentioned by Macrobius, who however does not state the epoch of the revival. They were, as we have seen, in full vigour under the emperors. (Scaliger, *Poetices*, lib. i.; Pitiscus, *Lexicon Antiquitatum Romanarum*, &c.)

A TEMPO, in music (Ital. *in time*), signifies, that after any change in motion, by retardation or acceleration, the original movement is to be restored.

ATFĪH, a province of Vésâtâh, or middle Egypt, stretching along the right or eastern bank of the Nile for nearly one hundred miles in length. It is bounded on the north by the province of Cairo; on the west by the Nile, which separates it from the province of Benisouef; on the south by the province of Minieh; and on the east by the desert and mountains which extend to the coast of the Red Sea. Atfih, the capital of the province, is a small town of about 4000 inhabitants, near the site of the ancient Aphroditopolis, or city of Venus, 40 miles south of Cairo and 20 miles N. by E. of Benisouef, in 29° 28' N. lat., and 31° 28' E. long. From the village of Bayâd, which stands on the Atfih side of the Nile, opposite Benisouef, is a path leading eastwards through the rocky desert and over Mount Kalccl into the sandy plain of El Arabah, i. e. of the *chariots*, and thence to the monasteries of St. Anthony and St. Paul on Mount Kolzim, near the coast of the Red Sea. Rich quarries of marble of different colours were worked in this district in ancient times. The province of Atfih is not so rich as the opposite one of Benisouef, the stripe of productive land being here much narrower on the right than on the left bank of the Nile. It contains many villages, but no place deserving the name of a town, except Atfih. (Belzoni's and Burckhardt's *Travels*, and the French work, *Description de l'Egypte*.)

ATH or AATH, a handsome town in the kingdom of Belgium and the province of Henegouwen (Hainaut), on the Dender, an affluent of the Schelde, 50° 36' N. lat., 3° 46' E. long., and 32 miles W.S.W. of Brussels.

This town was enlarged and strengthened by Albert of Beijeren, Count of Holland and Hainault. In 1667, on the French taking Ath, it was strongly fortified by Vauban: the French lost it again in 1678. The Hôtel-de-Ville is a handsome building, and the spire of the church of St. Julian is also much admired. Ath has a new arsenal, with seven bomb-proof magazines. It has also a college with 150 pupils at present, a school of design, a school for poor children of both sexes, and eight private schools. It has also an hospital, a theatre, and an establishment for orphans. The manufactures are caps, hats, gloves, cotton and linen cloth, bleaching, and asbestos cloth. It carries on also some trade in grain, and in the products of the neighbouring country, among which are tobacco, poppies, and rape. The popu-

lation is 8789, of whom 4322 are males, and 4467 females. (Van der Maelen's *Tables*.)

Ath is also the name of one of the six districts into which Hainault is divided. It contains about 194 square miles, of which only a small part is uncultivated. The urban population is 11,831, and the rural 78,564, making a total of 90,395. The district sends one senator and two representatives to the chambers at Brussels. The whole number of children of both sexes in the schools for primary instruction (both communal and private) was 8695 in 1832, of whom 4986 were boys and 3709 girls.

ATHABASCA, or **ATHAPESCOW**, the name of a river and lake in the north-western territory of America. The Athabasca river, which is also called the Elk river, has its sources near the Rocky Mountains, but has not yet been sufficiently explored to admit of its course being minutely described. It flows generally in a northerly direction, but sometimes runs due east, and in its windings receives the waters of the lesser Slave Lake by its outlet the lesser Slave River; it is also joined by the Pembina, Red-Deer, Clear-Water, and Red Willow Rivers. Athabasca River falls into the lake of the same name by several channels, the principal one of which is at the south-western extremity of the lake nearly opposite to Fort Chipewyan and Fort Wedderburn, which are trading stations established by the North-West and Hudson's Bay Companies, during the time of their rivalry. In the remoter part of its course and above its confluence with Clear-Water river, the Athabasca is likewise known under the name of *Rivière à la Pêche*.

Athabasca Lake, frequently called the Lake of the Hills, is situated about 170 miles south-west of the great Slave Lake. It is of an elongated shape, lying in a direction nearly east and west. It is nearly 200 miles long, but its general width, which gradually decreases towards its eastern extremity, does not exceed fourteen or fifteen miles. The northern shore of this lake is high and rocky; and to this circumstance it owes its title of Lake of the Hills. The rocks here mentioned are composed of sienite, over which a thin soil is spread, which is sufficient for the support of a variety of firs and poplars, as well as many shrubs, lichens, and mosses. The south shore of the lake, near to the forts, is quite level, and consists of alluvial soil. Lying between the different mouths of the Elk River, it is marshy in many parts and subject to be flooded. Advancing towards the east, the shore rises into barren sandy hills, incapable of supporting vegetable life; and still further in the same direction, near the mouth of Stone River, the soil is composed of primitive rocks. Fort Chipewyan, which, as already stated, is near the south-western extremity of the lake, was observed by Franklin to be situated in 53° 42' N. lat., and 111° 18' W. long.

This establishment is conveniently situated for communicating with the Slave and Peace Rivers, from whence the canoes of the traders assemble in the spring and autumn. In the spring they bring the collection of furs that has been made at the different out-ports during the winter; and in the autumn they receive a supply of stores for the equipment of the Indians during the hunting season.

The residents of the two establishments at Athabasca Lake depend for subsistence almost entirely upon the fish which it supplies. The kinds which are most abundant are trout, carp, pike, methye, and attahawmegh. These are usually taken in sufficient abundance throughout the winter, at the distance of eighteen miles from the stations. On the thawing of the ice, the fish remove into some smaller lakes and the rivers on the south shore, where they are nearer to the forts; but the mode of transport by water being less certain than over the ice, it sometimes happens that the residents are kept without a supply of food for two or three days together.

The traders are also supplied with the flesh of the buffalo and moose deer by the hunters, who find these animals at some distance from the forts, and convey the meat there in a dried or pounded state.

(See Franklin's *Journey to the Shores of the Polar Sea*; Bouchette's *Statistical Survey*; McGregor's *British America*.)

ATHALIAH. The name עֲתָלְיָה, or עֲתָלְיָה, means *whom the Eternal remembers*.

Athaliah is considered to be the daughter of Ahab, king of Samaria (who 'did evil above all that were before him'), and of his wife Jezebel, the daughter of Ethbaal, king of the Zidonians. She is also called the daughter of Omri, who was the father of Ahab; but by comparing the various passages, it seems that she was the daughter of Ahab, and grand-daughter of Omri.

Athaliah became the wife of Jehoram, king of Judah, who walked in the idolatrous ways of the house of Ahab, for 'he had the daughter of Ahab to wife, and he wrought that which was evil in the eyes of the Lord.' Jehoram died in the year B.C. 855, and the kingdom devolved upon Ahaziah his youngest son. Athaliah, who possessed much influence in the government of her son, used it for bad purposes. On the untimely death of Ahaziah, Athaliah conceived and executed the horrid purpose of a general massacre of all the male branches of the royal family. 'She arose and slew all the seed-royal of the house of Judah; thus, by murdering her hands in the blood of her grand-children, she completed the work of devastation which Jehu had begun.'

Athaliah ascended the throne which she had thus rendered vacant B.C. 854, and reigned during six years. In the seventh year of her reign the sound of rejoicing within the precincts of the temple reached her ears, and the acclamations of the soldiers and priests proclaiming a king, brought Athaliah in person to the scene of tumult. She there found, to her great consternation, a son of Ahaziah with a crown upon his head, and acknowledged as sovereign of Judah by the assembled multitude. Jehoash, the daughter of Jehoram, king of Judah, sister of Ahaziah (2 Kings xi. 2) and wife of Jehoiada the high-priest, had saved an infant from the general slaughter of the royal race, and had concealed him during six years within the temple, guarding him so carefully that no notice of his existence had reached Athaliah. When Jehoash had attained the age of seven years, Jehoiada assembled the priests and soldiers, and producing Jehoash before them, anointed him king. Athaliah, on reaching the crowd, endeavoured to excite a reaction in her own favour, by raising a cry of 'treason'; but in vain, for Jehoiada gave instant order that she should be removed from the sacred inclosure and slain. The command was immediately obeyed, B.C. 878 (See 2 Kings ix. 25; xi. 2 Chron. xxi. 5, 7-12; xxii. 2-10; xxiii.). The discovery of Jehoash is the subject of a fine tragedy of Racine, written by command of Madame de Maintenon, to be performed before Louis XIV. by young ladies of well-reputed families, educated in the seminary established by Madame de Maintenon at St. Cyr. The tragedy was composed for the express purpose of affording a combination of poetic beauty and dramatic interest with purity of moral sentiment and the inculcation of religious instruction.

ATHANAGILDE, a captain of the Spanish Goths revolted against his king, Agila, and being joined by a Roman force from Gaul, sent by the emperor Justinian defeated and killed Agila, near Seville, A.D. 551. Athanagilde was then proclaimed king of the Goths in Spain. He afterwards quarrelled with his Roman allies, whom he endeavoured, but not successfully, to drive out of Spain. He reigned, however, fourteen years over that part of the country which was occupied by the Visigoths, and his administration has been spoken of by the historians as firm and judicious. He had two daughters, one of whom, Galsuinda, he gave in marriage to Chilperic, the French king of Soissons; and the other, Brunehaut, married Sieghert, king of Metz, or Austrasia, and became famous in French history. [See BRUNEHAUT.] Athanagilde died at Toledo in 567. After an interregnum, he was succeeded by Liuva. Mariana, in his *History of Spain*, mentions a village near Guimaraens, in Portugal, which was still in his time called Athanagilda, having been built during the reign of this king.
